As for the Town—the socially submerged—whom I knew only because I had an office in the place and was professionally rooted there, I gained nothing but discomfort. I have already said that in earlier years the enmity of Billington, the Surveyor whom I had displaced at Albion Works, and who

was accepted as the leading architect in the town, was dreadful. I had to meet him on one or two occasions and the avowed hostility of his manner—he was a much older man than I—was shocking in its intensity. When I passed him in the streets, as I frequently did, it was with the stiff-legged tension of bristling dogs set at a trigger to spring at each other's throats.

The Surveyor to the Urban District Council was, as I have said, violently hostile to me; he was offensive in his manner, and apparently desired an open quarrel. I lived this down in about eighteen months, and won a good-humoured toleration from him; but when I set up an office, eighteen months later, again, he came up to me in the street and said, almost savagely: "I see we have to thank the Eureka Plough Company for bringing another architect into the town." This, I do not doubt, was the general ground of resentment of me; for this man was only an imported official: he did not belong to the place and could only have been expressing the jealousy of those with whom his life was identified. This unfortunate man, who was only about forty-five, had a paralytic stroke which, it was known, had ended his working life. I went to see him in his home and found him flushed and tremulous; but even at that moment, when he knew I had come to let him feel that I, who had never made ground for quarrel with him, bore no ill-feeling against him for his provocations, he kept me at arm's length. He told me he was "quite well"; was trivial and insincere and faintly ironical; and entirely refused any sign of good feeling or admission of significance in the occasion.

As regards Billington, I refrained from making trouble for him, as I might have done when taking charge of work which he, as architect, had lately relinquished; and avoided obstructing him at all times. After some years I was given to understand that he had no ill-feeling towards me, although I was, at about the same time, considerately sent a message from a sham great lady of the neighbourhood: "You may tell your friend Mr. Whistlow that he cannot hope to practice as an architect while Mr. Billington is here." I never, however, accosted Billington. We could not meet on equal terms, either socially or professionally, and to allow intimacy was to risk quarrelling.

For much the same reason I knew none of the three other "architects"—one of whom had been a foreman plumber—who practised in the place chiefly as surveyors and land agents; for the town was a hotbed of petty intrigue and wirepulling and quarrelling, and I avoided all concern with its affairs, and never built anything in the place except a small church and houses for some of my acquaintances.

In all this I acted by instinct; I did not know where I was, so to speak, and could scarcely find reasons for what I did, and certainly knew nothing of my motives. My gradual emergence into established practice was accomplished by following my instincts; and although I might write interminably on the subject, I have said enough to show the influences to which those instincts reacted.

It was instinct that led me to rent an office in an obscure backwater of the town, and to avoid the publicity which other professional men in the place sought. I had a repugnance to appearing in rivalry with my brother architects; I was, in fact, ashamed to be an architect, and ashamed also to be associated with the place in any connection. In thus cutting myself off, and going my own way and thinking my own thoughts, and knowing little or nothing of what occupied the accretions of spinal marrow that served my fellow-townsmen for brains, it seems to me I did well; for I could not have engaged in that field without in some degree sharing its interests and taking a part in its politics, and in doing so I should have surrendered something of my native proclivities.

The office I rented for twenty pounds a year was a small detached building which had been put up at the bottom of a doctor's garden to serve as a dispensary in days when doctors in the provinces supplied medicines to their patients and the "doctor's boy" was a familiar figure. It provided me with a general office and private and drawing offices, and gave on to a *cul-de-sac* opening off a by-street, so that I was as remote and secluded as I could desire. As I had no commissions, and no paid employment, except for the Eureka Plough Company, my only need, in the way of staff, was for a boy to keep the office open and answer the telephone. Binger, the person I engaged for these duties, was recommended by an acquaintance in whose house he had been employed under the butler. My acquaintance was interested in the boy, who had expressed willingness to become an architect—which, considering the standard of accomplishment understood by the term in Nollingborough, and the fact that Binger was sixteen, was not so wild an ambition as might appear.

Binger could not write or spell or figure except as a child of seven might, so that though I felt some responsibility for his future, it was difficult to know how to help him, for he refused to realize his deficiencies, and the tasks I set him—for his own advantage—were neglected, for I was much out of the office.

I used to bring sandwiches with me, and sometimes lunch at the office, and once, being out of beer, I asked Binger to get me a bottle. He took the money, but before he had shut the door, returned to inform me he was a teetotaller, and that he would be soiled by contact with the bottle. "It is conscientious, Sir," he explained. I was shocked that a need of mine should pollute the soul of this young creature. I told him I was sorry I had been so thoughtless; yet it was upon this very point of disparity of conscience that I had to part from Binger, whose destiny proved to be a higher one than that of any architect.

I noticed that sometimes, when I came into his office, Binger made hurried and furtive motions of pushing something out of sight into his pocket or under his papers. The thing became so flagrant in deceitful purpose that I one day said: "What is it you hide from me whenever I come into the room?"

I do not know what answer I expected, but it was certainly not the one I got:

"Hymns, Sir."

"*Hymns!*"

"Yes, Sir. I got to learn 'em," and he pulled out a much-thumbed booklet and explained that he was going to be a lay preacher—I think that was the term—and mentioned the name of a leading Nonconformist in the town who was sponsoring him. I told Binger that it was no good his engaging at my office if his heart was not in his work; that he knew I wished to help him, and that he ought to confide in me and not deceive me. Binger overflowed with protestations of good intentions and, clasping his thick red hands, hoped I would overlook it, just this once, Sir, and seemed to consider his offence a good deal more rank than I did.

The only effect of this interview was to make Binger more secretive and more fawning and sycophantic than before, which increased his repulsiveness, for it spoke only of deceit. My final severance with him must have taxed the poor lad's capacity for forgiveness severely, for I wrecked love's young dream.

Next to my office building was the yard gate of the adjoining house, and once, when I turned the corner, my eye was caught by a female figure escaping like a rat to sanctuary behind this gate. Nothing but the consternation of the flying skirts would have warned me; but when I found Binger absorbed in an ideal of concentration and oozing merit so furiously that the office flowed with it, I knew that he was on a friendly footing with the scullery maid next door, and that their friendship was of a kind of which he had cause to be ashamed. A week or two later, as I entered my door, this same little bit of a girl bolted out past

me like a frightened rabbit, and doubled in through the adjoining gates; and a violent movement and slapping of papers in his office told me of Binger's frantic effort to establish a pose of sedulous dutifulness before I came in. Poor Binger clasped his hands, shivered, and protested—"overlook it just this once, Sir, it shall not occur again"; but I saw no chance of helping him to better ways of thinking, and the preacher accordingly went forth to preach.

The first private commission I had after I set up at 1 Towler Street, Nollingborough, with a brass plate bearing also the name of Philip Garston and our Charles Street address, was for a London client; and I should not mention it except that this was the first time I ever acted professionally for a lady; the first time I ever had a member of the aristocracy for a client; and the first of the two occasions in my life when I have fallen out with anyone who has employed me. Both those catastrophes, distressing as they were, give me no grounds for self-reproach, for they were due to my upholding the rights of the builder as against the interests of my client, and, unless I had borne unjustly on honest and deserving men, were inevitable.

Lady Pendragon was a Viscountess, a widow with marriageable (very) daughters, and a house in Belgrave Square. I had met her at my friend, Mrs. Torrington's, and it was to that friend's good offices that I owed the commission to carry out minor alterations and redecoration of reception rooms at Lady Pendragon's house. Lady Pendragon had a hurried, restless, aloof manner, but she was, as I had reasons to know, a good-hearted woman with many close friends; she was, however, circumscribed by the limitations of her class, and her idea of the social order was probably very much what was general before the Reform Bill, or even before the French Revolution. She was perfectly frank and agreeable in her manner to me, but only, I thought, as she would have been to her piano tuner or hairdresser; for I was always kept at arm's length, and no trivial interchanges or other the least trespasses on intimacy were ever permissible.

My estimate of the cost of the work was about £800—as values then were. I was told that this figure was satisfactory, so that when I secured from a small but good builder known to Garston a tender for seventy pounds less, I supposed that I should be directed to accept it. In this, however, I had not reckoned with the highly refined reasoning processes of the female mind. I was told, "Bunter's estimate is far too much; I could not dream of paying such a sum." Things were arranged by the usual process of reconciling the client to paying a little more and getting a little less than was originally hoped, and the work was put in hand; but I received continual letters from the builder saying that her Ladyship wanted one thing or another, and asking for my authority for orders she had given as variations or extras. I could only write to my client pointing out the obvious misunderstandings and oversights implied in her orders; or accepting her instructions and recording that an extra was involved. This brought me letters which only added confusion to the muddle and left me at a loss to understand what the lady's wishes could be.

Interviews scarcely served to clear the ground, for though I got precise instructions which I recorded in confirmatory letters, I was aware that Lady Pendragon herself did not realize the bearing of one matter on another, for she could hold only one idea in her head at a time and that only briefly—her mind, in fact, worked with the violent waywardness of a newly-hatched bluebottle on a sunny day.

At last, the job was finished—and well finished; but still there were other things that "the Bunter man has got to do." Bunter was notified of these other things by scraps of paper—stray half-sheets torn from old letters—in her Ladyship's handwriting: "Mr. Bunter, Lady Pendragon wants the cupboard made to open inside;" or, "Mr. Bunter, the stairs must be all white instead of at sides." The end of it was that I had to write plainly to the Right Hon. the Viscountess and tell her that the builder's liabilities were limited by the contract; that I, as her architect, was the person named in the contract to decide whether the builder had properly carried out his contract or not; and that I held that Mr. Bunter had done so and had so informed him. I sent Bunter a copy of this letter and advised him not to take notice of any further demands he might receive. This action on my part put me for ever in the black books of Lady Pendragon, and earned me such a bad name as an architect with my friend Mrs. Torrington that she never again, as she might readily have done, introduced my name to the favourable consideration of acquaintances who were in need of an architect.

However, I had Bunter's gratitude, which he marked in quite a touching way a couple of years later. The builder's account and my own were promptly paid without question by her Ladyship's agents, in a neat gesture of washing hands of me and all connected with me; but before I had to recognize and bewail my misfortune, my mind was fully taken up by activities that gave me no heart for regrets of any kind.

NEXT WEEK: XIX—FORGING AHEAD

The previous instalments appeared as follows:

May 27.	i: I am Articled.
June 3.	ii: Episodes of Pupilage.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Demolished Houses

MR. CHAMBERLAIN, the Minister of Health, stated that up to June 30 last eighty-seven unfit houses in clearance areas and thirteen unfit houses in improvement areas had been demolished. Up to August 31 last 278 houses had been completed under the Housing Act, 1930.

The Statue of Lord Haig

Major Cohen asked the Under Secretary of State for the Home Department, as representing the First Commissioner of Works, whether he would reconsider the decision arrived at by his predecessor regarding the statue of the late Lord Haig, seeing that the statue in question had been publicly condemned by Lady Haig, by the British Legion, and by public opinion generally.

Major Oliver Stanley said that the sculptor selected to execute the memorial statue was commissioned to carry out the work seven months ago, and this was now in progress. In those circumstances the First Commissioner of Works was unable to cancel the appointment of the sculptor.

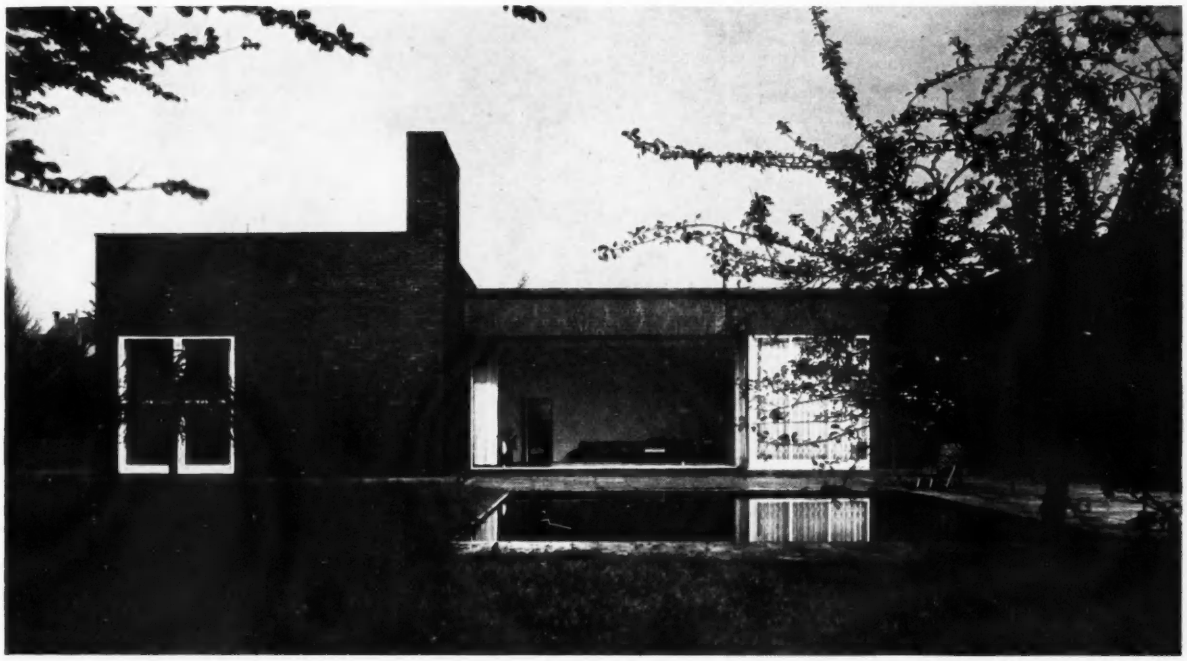
Progress of the Bills, etc.

On Thursday of last week the Public Works Loans Bill was read in the House of Lords for the first time, and on the same day the Finance (No. 2) and Housing (Financial Provisions) Act (1924) Amendment Bills were also read in the House of Commons for the first time.

On the previous day the Road Fund (Advances) resolution was agreed to in Committee.

A VILLA IN BRICK AT INNSBRUCK, AUSTRIA

DESIGNED BY LOIS WELZENBACHER



The garden room groups well with the swimming pool, and the brickwork of this and other elevations has interesting details. All the courses are of stretchers; over the large white window behind the tree these are laid vertically to give the effect of a lintol.

THIS villa is typical of the work of Welzenbacher, who, though not widely known in this country, has built many charming houses in Austria. Favouring brickwork generally in preference to concrete, the architect has here contrived to use his bricks in an amusing manner, and has in several places left them unplastered in portions of the internal walls, where, with deeply-raked joints, they contrast with the plain wall surfaces and provide a pleasing serrated finish at the angles.

The external walls are raked less deeply, and the bricks are used decoratively, all courses being of stretchers running either horizontally or vertically to produce patterns. Over the large window facing the swimming pool, courses running vertically are used to give a satisfactory lintol effect.

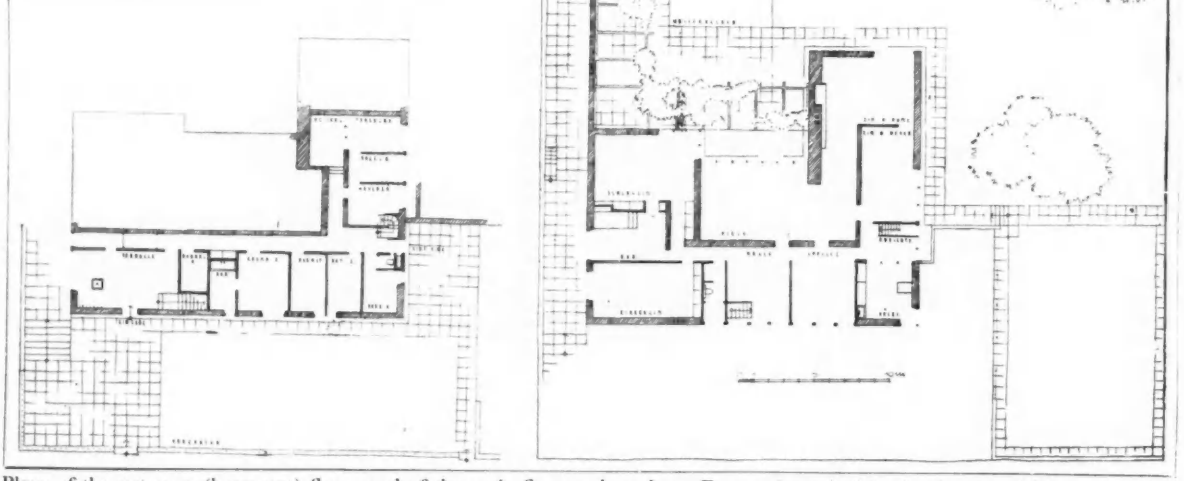
This view of the main entrance shows still more clearly the manner in which the brickwork is formed into patterning. Within doors is a large hall at the lower level of the sloping site.

The plan is dictated by a slope in the site from the entrance front, upwards towards the garden, which the architect has used with skill to suit his particular purpose. Servants' quarters, services and stores are arranged at the lower level, over only a part of the site, and above, on the main floor, are planned the living-rooms, dining-room and kitchen, and bedrooms, etc. The main entrance opens into a large hall at the lower level, from which the principal stair ascends to the lounge hall on the main floor.

The free planning which lends so much charm to the modern Continental interior, and enables every inch of space to be used to advantage, has given here a spaciousness connected as a rule with a larger type of house. The proportion of the individual rooms has been carefully studied, and is aided by

The interior of the garden room, looking out across one corner of the swimming pool. The architect has chosen and designed all the furnishings. Here is seen a large rush mat, coarsely woven; the corded upholstery is in brilliant colours; the flooring, as throughout the house, is of polished wood blocks laid with alternate graining.

the varying ceiling heights. The furniture has been designed and skilfully placed by the architect to form part of the general scheme (see the supplement with this issue, which gives details of a mirror, a writing-table and the fitted kitchen). F. Y.



Plans of the entrance (basement) floor; and of the main floor and garden. From a large hall in the former, which is otherwise devoted to dark-room, guest room and bathroom, *en suite*, and service and heating apartments, a stair leads to a spacious upper hall with dining-room and kitchen adjacent, to the right, and nursery, bath and bedroom to the left. There are also a ladies' room (boudoir) and men's room (library). All these are clustered about the central garden room.

LETTERS FROM READERS

Housing and National Economy

SIR,—Will you permit me to make a few observations on Mr. McKellen's letter on the housing situation which appeared in your issue for September 16?

For years past housing administrators have unanimously agreed that Britain's gigantic post-war housing problem can only be solved by continuous national effort over a long period of years. This fact was recognized by Parliament in 1924, when the Housing (Financial Provisions) Act, 1924, was passed, with the consent of all parties, during the late Mr. John Wheatley's term of office as Minister of Health. The Bill was described by Mr. Wheatley as "a treaty with the local authorities, a treaty with the building industry, and a charter for the tenants," and the Government circular (No. 520) explaining its provisions stated that the object of the Act was :

> To establish continuity in dealing with the housing problem, and by the adoption of a long and continuous programme of building to ensure such a development of all the resources of the building industry as will guarantee the production of houses on a scale sufficient to overcome the present serious shortage of houses.

Mr. Wheatley was able to convince the House of Commons that stability of output of houses for letting could only be obtained by guaranteeing an adequate Exchequer subvention to local authorities over a term of fifteen years from 1924. The houses were to be of good standard, with an average density of twelve to the acre in urban areas (eight in agricultural parishes), and were to be let generally at appropriate normal rents.

Whatever the present state of our national finances may be, it cannot be denied that there is still today in many parts of the country a serious shortage of dwellings for the lower-paid wage-earners. Ample proof of this fact will be found in the latest annual reports of the medical officers of health, who point out in vehement language the deplorable effect of insanitary housing conditions upon the health of tens of thousands of working-class families. While, therefore, there may be grounds for stricter administration in the letting of State-assisted dwellings, it cannot be true economy to call for the curtailment of municipal housing programmes at this time. Nor must we forget, in our study of economics, that not fewer than 151,155 insured building trade operatives were recorded as unemployed in Great Britain at July 27, 1931.

It would appear that the National Federation of House Builders does not relish the competition of municipal housing. This is difficult to understand, inasmuch as private enterprise can still qualify for Exchequer assistance under the Act of 1924 at the rate of £7 10s. per house annually for forty years (equivalent to a grant of £134), provided that the special conditions as regards the rents to be charged, etc., are complied with.

It is even more difficult to appreciate Mr. McKellen's contention that unassisted private enterprise could overcome the present acute shortage of cheaply rented houses, especially as he himself addressed a letter to you on October 29, 1930, in which he stated :

> The National Federation of House Builders is convinced that it is impossible for private enterprise to build houses to rent to tenants without financial assistance by means of subsidies and loans on mortgage.

The Federation has also suggested, in its report to the late Government, that housing standards should be lowered—a proposal which the leaders of the National Housing Council will never accept.

JOHN G. MARTIN
(SECRETARY, NATIONAL HOUSING AND TOWN PLANNING COUNCIL)

Art and Industry

SIR,—I read with interest Mr. Noel Carrington's letter in a recent issue, calling attention to the formation of a Board of Trade Committee to deal with the relationship between Art and Industry. In that letter he advocated the planning of an International Exhibition for three or five years hence to exemplify "Design in Civilization."

As an architect turned schoolmaster, I am interested not only in the future of design for its own sake, and for the sake of its effects on character and happiness, but that boys who leave school—where they are no longer to be trained so much to administer estates and dependencies, as to be leaders in industry, commerce and all creative arts—and who enter industry, should find there scope for their talents and ideals.

I wish to show that the present depression is but one more reason why the Committee should be taken seriously by designers and industrialists alike.

Under the old system, which has contributed to the present depression, what has in fact been the relationship between industry and art ? It may be summed up in two phrases—"the ear to the ground" and "the boy in the office." The industrialist listened for the first faint footfall of fashion, and when he thought he heard it, a "boy in the office" with an untrained knack of design and a knowledge of the practical requirements embodied it. Typical results of this system on the product were the antique fashion which was expensive and inconvenient—like the Tudor villa; the modern convenience disguised as antique—like the electric stove basket-grate; or the inconvenient "modern" fitment which is modern for the sake of being "Modern."

The result on trade has been ever-changing fashions, hard to foretell, and a series of unaccountable slumps and booms. The public, not really satisfied with anything, moved discontentedly from one thing to another.

The system was thus unsatisfactory to both industrialist and customer, but it was hard to avoid, for it was the result of two causes. Designers were not practical enough, and industrialists had not perhaps enough faith in the power of a sound product to win through on its merits. Today the first of these causes exists no more. There is a more than adequate supply of practical and artistically-trained designers. It is the most important task of the Committee to show how these men can be fitted into key positions as designers in industry.

The effect on trade would be a growing confidence in the customer and a consequent steady and growing demand. Violent fluctuations of fashion would tend to disappear, for demand would be based on sound taste keeping pace with and appreciating each fresh improvement in design. But, it may be argued, "this taste does not exist." The reply is, that this public taste *is* forming, to judge only by public appreciation of good new buildings, "Underground" posters, Swedish products and the like ; and, secondly, that there are ways of stimulating its formation. It is here that Mr. Carrington's suggestion comes in.

By means of a carefully-planned series of individual Trade Exhibitions, judiciously advertised, industrialists might carry the public with them at each stage of their improvements. Further public interest might be stimulated, and public taste guided, by the appointment of panels of artists, architects and engineers, so constituted as really to command public confidence, which would award prizes in competitions in each class of product.

Meanwhile the series would be planned to lead up to a grand International Exhibition, where supreme competitions would be held.

It may be said, "this is no time for such ambitious schemes !" But what, in fact, is the lesson of the present crisis ? It is the result of an unfavourable trade balance. It has been our habit to export more than we imported and invest the surplus abroad, while neglecting the modernization of our plant and machinery, and the proper planning of our industrial areas. Is not the lesson, from every point of view, that we must cultivate our own garden ?

IN THAT CONTINGENCY

The following abstracts of inquiries represent a number of those recently submitted to the Building Research Station. The information given in the replies quoted is based on available knowledge. It has to be borne in mind that further scientific investigations may, in the course of time, indicate directions in which the replies might be supplemented or modified. Moreover, the replies relate to the specific subject of each inquiry, and are not necessarily suitable for application to all similar problems. Crown Copyright Reserved.

Construction of Concrete Silos

AN institution, engaged on the investigation of agricultural problems, reported deterioration of concrete silos under the action of acid juices and salts, formed or liberated during the fermentation of the green stuffs used in making ensilage.

Information was required on two points: (a) How to arrest deterioration in existing silos by surface treatment or other means; (b) What special precautions to take in erecting new silos.

It is understood that agricultural silos are usually constructed of precast concrete blocks or, occasionally, some form of reinforced concrete construction. In either case it is common practice to depend upon an internal layer of dense cement rendering to provide an impermeable lining which will confine the liquid products of fermentation. A silo was examined some time ago, which was built of precast concrete blocks, cement-rendered internally, and in which some trouble was experienced due to leakage of the liquor from the base. It was ascertained that the liquor had very little effect on the dense cement mortar rendering, but that where it had been possible for it to penetrate to the less dense concrete behind the rendering there was evidence of some deterioration. The penetration was found to be due to a limited number of faults in the rendering, some caused by defective consolidation under the trowel in application, and others by crazing or shrinkage. The problem is therefore considered to lie essentially in providing a sound, uncracked lining to prevent the penetration of the liquor to the more vulnerable material used in the body of the walls. The liquor is understood to be normally of low acidity, but is liable to attain a high temperature, approaching the boiling point of water, which will tend to increase the likelihood of the formation of cracks in the lining.

In order to minimize the risk of cracking of the cement-rendered lining, considerable care should be exercised. On account of the high shrinkage of rich cement mixes on drying out, it is advisable to use a mix not richer than 3 : 1. Density can be obtained by the use of a well-graded sand. Special precautions should be taken to wet the backing thoroughly before applying the rendering, and the work should be kept damp after application, preferably for about a fortnight.

Accounts have been published of experiments which have been carried out on slightly acid moorland waters, and these indicate that aluminous cement is likely to be more resistant than Portland cement to the deleterious action of acid liquors of the kind produced by ensilage.

Where deterioration of the linings of existing silos has occurred, the only treatment likely to be satisfactory is to strip the old rendering on the inside and to apply fresh material, taking the precautions already indicated. In view of the very severe conditions which the lining is called upon to withstand, it is open to doubt whether any practical treatment which can be suggested will provide a lining which will be completely free from all defects, but it may be mentioned that the defective silo previously referred to was treated on the lines of the foregoing recommendations, and is now reported to be satisfactory after two years in service.

Roughening Slippery Concrete Floors

A correspondent desired information of a treatment suitable for roughening the surfaces of concrete floors which had become very smooth and slippery as the result of traffic and wax carried from adjoining waxed linoleum.

In attempting to reduce the slipperiness of the floor, it will first be necessary to remove as much of the wax as is possible. This can be done by washing the surface with petrol or white spirit, taking the obvious precautions against fire.

After the wax has been removed, the smooth surface of the concrete, which usually consists of a film of neat cement, can sometimes be roughened by etching it with hydrochloric acid. If the cement film is thin, it will be removed by this means and the rougher aggregate exposed. In any case some reduction of slipperiness may be expected, although the surface may become smooth again under further traffic.

For the treatment, it is suggested that one volume of commercial hydrochloric acid be diluted with two volumes of water, the mixture applied copiously to the floor with a broom or mop, and well-brushed over the surface for ten or fifteen minutes. At the end of this time the acid should be washed off with plenty of clean water. Owing to the strongly corrosive nature of the mixture, it will be necessary to take care to prevent it from coming into contact with the skin or clothing. The dilution of the strong acid should be done out of doors, using earthenware or wooden vessels.

It is obviously desirable to ensure that any excess of acid is mopped up and to prevent its penetration through the concrete to the reinforcement. For this reason, it is well to treat limited areas at one operation, to exercise considerable care in the distribution of the acid, and to take special precautions where cracks have formed in the floor.

Corrosion of Metals by Magnesite Flooring

Contractors reported that they had recently experienced trouble on account of the corrosion of iron pipes, both water and gas, when laid in contact with magnesite floors, and asked for any information which could be supplied as to the best way of protecting pipes from such corrosion, and whether copper pipes are likely to be similarly affected.

It is generally found that magnesium oxychloride flooring contains an excess of magnesium chloride, and this exerts a very strongly corrosive action on iron and steel. An example of this in the case of a large office building was examined some time ago. Within a period of three years from the completion of the building, extensive leakage and corrosion of the piping of the heating system had occurred. On investigation, it was found that the corrosion had commenced at points where pipes passed through the magnesium oxychloride flooring, and it appeared that the corrosion had spread rapidly along the pipes as soon as small perforations allowed water to escape. The highly-corrosive nature of the magnesium chloride was shown very clearly where a large pipe had corroded under a concrete floor on which the magnesium oxychloride materials had originally been mixed, although, actually, the pipe was embedded in concrete and out of contact with the magnesite.

The action of magnesium oxychloride mixes on copper has not been studied in detail at this station, but it is known that slight corrosion occurs when copper is exposed to these mixes for a short time. It is not possible to state whether deterioration will be rapid, but, in view of the fact that copper is attacked, and that the walls of copper pipes are usually much thinner than those of steel or iron pipes, it is considered that the same precautions are desirable with copper as should be adopted for steel or iron pipes.

Corrosion of this kind may be easily avoided by inserting sleeves in the flooring where pipes pass through the corrosive materials. The use of sleeves of this kind has become a common practice, and they prevent the corrosive material coming in contact with the metal of the pipes. As an alternative, the pipes might be protected with a

thick coating of bitumen. It should be noted, however, that in experiments on the protection of metal pipes in soils, it has been shown that thin films of bitumen paint do not afford efficient protection against corrosion. Probably a more satisfactory method would be to apply a coat of bitumen, and then to wrap a piece of bitumen felt round the pipes, in order to obtain additional protection.

Use of Seashore Sand and Gravel in Concrete

Information was desired on the suitability of sand and gravel from the seashore as aggregates in mass concrete and reinforced concrete, for use in bridge work.

In mass concrete work, providing the concrete is well proportioned and carefully placed, the only trouble likely to be experienced from the use of unwashed sand and gravel from the seashore is that of an unsightly efflorescence on the face of the work.

The corrosion of the metal in reinforced concrete work is, of course, due primarily to the action of air and moisture on the metal, and is permitted either by the use of a badly-compacted concrete, or by the cracking of the concrete. If unwashed seashore sand and gravel are used in the work, and moisture has access to the reinforcement, the presence of the chlorides will tend to accelerate corrosion of the metal.

The removal of the whole of the salts in such aggregates by washing is difficult, but it is considered reasonably good practice to use washed seashore sand and gravel for the class of work mentioned, bearing in mind that any corrosion due to access of air and moisture, on account of poor workmanship in placing the concrete, may be somewhat accelerated by the traces of chlorides likely to be still present in the aggregates.

LITERATURE

ULSTER ARCHITECTS' YEAR BOOK

THE Year Book of the Ulster Society of Architects, 1931–32, which has reached its fourth year of publication, has recently been issued. It has been edited by Mr. J. L. Stevenson, L.R.I.B.A., the hon. secretary of the Society.

In the annual report of the Council for the year 1930–31 it is stated that the membership of the Society now totals 129—comprising 50 members, 17 hon. members, 40 associates and 22 students—showing an increase over that for the preceding year of 6 members.

The Council also state that it has placed for consideration with the Town Planning Committee a scheme for co-operation with speculative builders by the formation of a panel of architects to prepare plans in the hope that an improvement may be effected in suburban houses erected by private builders. This scheme was initiated in Staffordshire; under it assessors are appointed to consider the merits of plans sent in by members, and a special scale of charges is arranged for accepted designs. The consensus of opinion is that the younger members of the profession would be specially interested, and the Council of the Society hope to adopt a similar scheme.

The year book contains photographs of the president, Mr. R. H. Gibson, F.R.I.B.A.; and the immediate past president, Mr. J. A. Davidson, F.R.I.B.A.; the Society's memorandum of association and articles of association; suggestions governing the professional conduct and practice of architects; regulations for international architectural competitions; and a complete list of books on architecture and allied subjects in the Central and branch libraries of Belfast. A calendar covering the period July, 1931, to June, 1932, has also been incorporated.

The Year Book of the Ulster Society of Architects, 1930-31. Edited by J. C. Stevenson, L.R.I.B.A. *Belfast:* W. W. Clelland, Ltd.

THE ENGLISH SCENE

FIVE of the twelve studies in this book appeared originally in *The Times*, and the anonymous author has done well to rescue them from the old files of that newspaper, for all of them have more than ephemeral interest. The style is quiet and dignified, and a vast amount of useful information is conveyed without a hint of pedantry, whether the subject be windmills, canals, tithebarns, sports or punishments.

The beauty of England is a beauty of everyday things, of windmills and cider presses and lock gates. We admire afar off the grandeur of Durham or Chatsworth, but unless we are born to the purple it is the smell of a Kentish oast house or the swoop of a Downland windmill sail that really moves us. The village stocks were made for the legs of our grandsires, and the village pound for their strayed cattle. The author does not dissemble his preference for the leisurely life of the past before "the hour of noon" became "twelve sharp," but at the same time he holds the balance fairly. The pictures of Constable and Morland only tell half the story; old cottages and villages were seldom sanitary, and the picturesque was only a euphuism for rustic squalor.

If progress has uprooted us from the soil, it has made us at the same time more humane. Bull baiting, cock fighting, the ducking stool and the pillory are the darker side of the English Scene. The book is well produced, and the illustrations both well chosen and well reproduced.

METAL PLATE LITHOGRAPHY

THE use of the lithographic process as a means of securing multiple copies of original drawings, whether for pictorial prints or for architectural renderings, is not new. Artists and draftsmen have been making lithographs for years and have found that the medium possesses many advantages. Most of the literature on this subject, however, has been addressed to the professional lithographic printer; the

[*From* The English Scene.

Tithe Barn and Dovecote, Hurley, Berkshire.

volume under review, therefore, is claimed to be the first to present the subject of metal plate lithography from the standpoint of the artist using this medium.

The text, illustrated by thumb-nail sketches by numerous artists, explains each step in the process, from the graining and preparation of plates to receive the drawing, to the miscellaneous points concerning manipulation. Formulas for the various solutions required, and a complete list of the necessary materials are also given.

The author, in his foreword, states that "Lithography is the simplest and most wonderful of all the graphic arts, and probably the most abused. That it is not understood clearly by present-day artists is evidenced by their proneness to remember the 'Chromo Days' whenever lithography is mentioned. If they but knew it, not only as the simplest and the most versatile, but also as the most autographic, of all the graphic arts, the lithograph would be restored to its rightful position in the print world."

The book should serve a twofold purpose, not only in providing a practical guide for the novice, but also in supplying a handy reference book containing the necessary technical information, formulas and methods of procedure in compact form for the sophisticated worker. K.

LAW REPORTS

LIABILITY FOR FORECOURT—DISPUTED OWNERSHIP

Marston v. *Regent's Park Development Co., Ltd. Court of Appeal. Before Lords Justices Scrutton, Greer and Slesser*

THE dispute in this appeal was as to the ownership of a forecourt, which Mr. Wm. Marston, who met with an accident, said the defendants owned, and whom he sued for negligence before Lord Darling and a common jury, and recovered £810.

The defendants, the Regent's Park Development Co., Ltd., now appealed from that judgment, and asked for judgment or a new trial, saying that they did not own the strip of land in question, and in the alternative said, if they owned it, it had been dedicated to the public along with the rest of the other highway, and therefore they were not liable for the lack of repair into which it had fallen.

Mr. Macaskie, K.C., appeared for the appellants, and said his clients owned land at Regent's Park, and, amongst other property, 40 Frederick Street, Marylebone. This house had a forecourt, and it appeared that the plaintiff, in August of last year, fell into a small depression outside the house, and fractured his leg in two places.

Although the forecourt was open to the public to walk upon, it had never been conveyed to the appellants when they acquired this house and other property from Lord Howard de Walden. Some of the houses in the street had forecourts, but this house had not one, and in support of this statement counsel produced a layout plan. Counsel further argued that the damages which the jury had awarded the plaintiff were excessive, and that the judgment should be set aside and a new trial ordered.

Mr. G. T. Paull, for Mr. Marston, argued that the verdict of the jury was a conclusive one—they had found that there was no dedication of the forecourt to the public. It had not been suggested that his client was a trespasser, and it was for the appellants to prove that they had dedicated the forecourt to the public. Counsel contended that his client had ample cause of action. He alleged he met with an accident upon land which the appellants owned, that they had neglected to keep the forecourt in repair, which was a breach of their duty to an invitee, and that there here existed a hidden trap through which plaintiff had suffered as an invitee. Counsel further submitted that appellants, as owners of property alongside a highway, had permitted it to be a nuisance, whereby his client had suffered severe personal injury. Under these circumstances, he contended that the appellants had shown no ground for the Court to interfere with the verdict of the jury and the judgment of Lord Darling.

The Court dismissed the appeal with costs. By consent the damages were reduced to £550, the £260 claimed for treatment at a voluntary hospital being reduced from £810 awarded, as the hospital had no power to make charges to anybody.

Lord Justice Scrutton, in the course of his judgment, said the questions the Court had to determine were, whether there was any evidence on which the jury could have answered the questions left them by the Judge in the way they did, or whether there had been any misdirection by the Judge. With regard to the first point, the presumption was that the strip of land was owned by the defendants, and this was the result at which the Judge and jury arrived. The Court could not interfere with that finding unless the appellants got rid of that ownership by the plea that the land had been dedicated to the public. In his opinion there was here evidence upon which the jury could find that the land had never been dedicated. There was no misdirection by the Judge, and the appeal would be dismissed.

Lords Justices Greer and Slesser agreed.

MOTIONS BY THE CHARTERED SURVEYORS' INSTITUTE AND THE R.I.B.A.

Vacation Court. High Court of Justice. Before Mr. Justice Langton

In the Vacation Court, High Court of Justice, on Wednesday, September 9, Mr. Justice Langton had before him motions by the Chartered Surveyors' Institution and the Royal Institute of British Architects, to restrain Mr. Harry Geo. Leslie from using certain letters relating to his connection with the respective institutes.

The defendant, Mr. H. G. Leslie, appeared in person, and agreed to treat the motions as the trial of the action, and submit to a perpetual injunction in the first case, and to give an undertaking satisfactory to the plaintiffs in the second case. He also agreed to pay the costs in both actions.

His lordship made an order accordingly.

SCHOOL COURSES

BRIXTON SCHOOL OF BUILDING

The evening departments of the L.C.C. School of Building, Ferndale Road, Brixton, S.W., which commences on September 28, provide organized courses of training and individual classes for the purpose of instruction in the work of the building industry and of allied vocations and professions.

Although the courses of study and the scope of the instruction have been arranged primarily with a view to fitting the student for the practical duties of the various branches of the building industry, special consideration is given to the requirements of the recognized examinations held by independent bodies. Amongst these examining bodies the following receive special attention: The Institute of Builders, the R.I.B.A., the Chartered Surveyors' Institution, the Institution of Structural Engineers and the Institution of Sanitary Engineers.

The classes of the architecture department are planned to meet all the requirements of the student of architecture as regards design,

history of architecture and building, and drawing. The scheme of instruction is so arranged that an architectural course includes certain building subjects which are necessary to an architect's training.

A close co-ordination of the instruction in architecture and building construction is designed to ensure that the student shall obtain an intelligent grasp of the interdependence of the structural and æsthetic elements of his work. The grouping and scope of all the subjects are adapted to the requirements of the R.I.B.A.

The Principal of the School is Mr. F. E. Drury, M.I.STRUCT.E., M.SC.TECH.; the vice-principal Mr. A. Everett, B.SC., M.I.STRUCT.E.

NORTHERN POLYTECHNIC

The Northern Polytechnic School of Architecture, Holloway, N.7, the 1931–32 session of which commenced on September 21, is officially recognized by the R.I.B.A., and students who complete satisfactorily the first three years' course of study in the school and pass the school examinations, are exempted from the intermediate examination of that body.

The teaching staff consists of qualified practising architects, assisted by specialists in building science, acoustics, structural engineering, heating, ventilating, and other subjects relating to architectural practice. The department with which the school is associated also provides training for all branches of the building industry, and architectural students are thereby offered excellent opportunities of studying in the workshops and laboratories the many practical processes which they will ultimately be required to supervise.

The curriculum is arranged to provide the fullest possible training, and every aspect of architectural practice is dealt with by means of lectures, demonstrations, visits to buildings in course of erection and studio work.

The Head of the Department is Mr. T. E. Scott, F.R.I.B.A., and the Headmaster of the School of Architecture, Mr. F. E. Green, A.R.I.B.A.

L.C.C. SCHOOL OF ARTS AND CRAFTS

The new session of the L.C.C. School of Arts and Crafts, Southampton Row, W.C.1, will begin on Monday, September 28. The evening classes provide the following instruction for students of architecture: Architectural design, testimonies of study for the R.I.B.A., and town planning, given by Messrs. S. B. Caulfield, F.R.I.B.A., Basil Oliver, F.R.I.B.A., and E. Frazer Tomlins, F.R.I.B.A.; building construction, by Mr. F. H. Mansford, F.R.I.B.A.; structural mechanics, by Mr. Ewart S. Andrews, B.SC.; modelling and stone cutting, by Mr. Alfred Turner, A.R.A.; and general drawing, by Mr. F. W. Farleigh.

Other classes of interest to architectural students include life drawing, wood carving, metalwork, etc.

A series of visits and illustrated lectures dealing with recent developments in the manufacture and uses of various building materials has also been arranged. Architects, other than students in the school, may attend the lectures.

The Principal of the School is Mr. P. H. Jowett, A.R.C.A.

COMPETITIONS OPEN

September 30.—Sending-in day. New Central Library, Birkenhead. Limited to architects who have been resident or have had an office within twenty miles of the Birkenhead Town Hall during the whole period subsequent to January 1, 1930. Assessor: Andrew N. Prentice, F.R.I.B.A. Premiums: £250, £175 and £100. Conditions were obtainable from E. W. Tame, Town Clerk, Town Clerk's Office, Birkenhead. (Deposit £2 2s.)

October 1.—Sending-in day. Proposed New Municipal Technical College and School of Art, for the County Borough of Southport. Limited to architects practising in Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £200, £100 and £75. The first prize will be merged into the commission if the appointed architect executes the work. Full particulars were obtainable from the Director of Education, Municipal Buildings, Southport. (Deposit £1 1s.)

October 1.—Sending-in day. (Last day for conditions was June 3.) Pictorial Map of the Area of the West Yorkshire Society of Architects. Premium, 10 guineas. Particulars were obtainable from the Secretary, 62 Woodhouse Lane, Leeds.

October 31.—Sending-in day. Proposed Tuberculosis Hospital, Sully, near Cardiff, for the Welsh National Memorial Hospital. Assessors: C. E. Elcock, F.R.I.B.A., and T. Alwyn Lloyd, F.R.I.B.A. Premiums: £400, £300, £175 and £100. Conditions were obtainable from F. J. Alban, Memorial Hospital, Cardiff. (Deposit £2 2s.)

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor: Sydney Tatchell, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from F. L. Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius of Liverpool Town Hall. Assessor: A. H. Moberly, F.R.I.B.A. Premiums: £200, £100, and £50. Conditions, etc., obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

December 31.—Sending-in day. Latest date for conditions: September 31. Proposed New Town Hall and Municipal Building, for the Walthamstow Corporation. Assessor: H. Austen Hall, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Conditions, etc., obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors: Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium: £500; also a further amount of £750 will be awarded to other designs according to merit.

THE ARCHITECTS' DIARY

WEDNESDAY, SEPTEMBER 23

R.I.B.A., 9 Conduit Street, W.1. Exhibition of work submitted for the R.I.B.A. (Archibald Dawnay) Scholarships. 10 a.m. to 7 p.m. (Saturdays, 10 a.m. to 2 p.m.) Until September 25. Latest date for submission of applications for examination for the office of district surveyor. (Fee £3 3s.) **10 a.m.**

INTERNATIONAL ILLUMINATION CONGRESS. Faraday Exhibition Private View, Albert Hall. 10 a.m. to 4 p.m. British Association Centenary meeting. Delegates' Reception, Albert Hall. 3 p.m. Gen. Smuts (President, British Association) opens the Exhibition, Albert Hall. 4.30 p.m. Presidential Address to the British Association by Gen. Smuts, at the Central Hall, Westminster, S.W.1. 9 p.m. **10 a.m.**

INSTITUTE OF FUEL. At the Chemical Society's Premises, Burlington House, W. "The Reactivity of Coke. A Report to the Blast Furnace Committee, Iron and Steel Industrial Research Council." By J. G. King and J. H. Jones. **6 p.m.**

ROYAL PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN, 35 Russell Square, W.C.1. **Annual Exhibition.** Until Saturday, October 10.

THURSDAY, SEPTEMBER 24

INTERNATIONAL ILLUMINATION CONGRESS. Garden Party at the National Physical Laboratory, Teddington. 3 to 6 p.m. Soirée at the Royal Society, Burlington House, W. 8.30 p.m. **3 p.m.**

INCORPORATED INSTITUTE OF BRITISH DECORATORS. At Newcastle. "Modern Decoration." By John Gloag and Mrs. Grace Lovat Fraser, F.I.B.D.

FRIDAY, SEPTEMBER 25

INTERNATIONAL ILLUMINATION CONGRESS. At the Dorchester Hotel, Park Lane, W. Dinner given by H.M. Government to representative delegates and guests. Chairman: The Rt. Hon. Ramsay MacDonald, P.C.

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS. At the City Literary Institute, Goldsmith Street, E.C.2. "Architecture and the Art of the Machine." By R. A. Duncan, A.R.I.B.A.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS. At Canterbury. Visits and papers.

SATURDAY, SEPTEMBER 26

Sunrise, 6.50 a.m. Sunset, 6.53 p.m.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS. At Herne Bay. Visits and papers.

MONDAY, SEPTEMBER 28

L.C.C. SCHOOL OF BUILDING, Ferndale Road, Brixton, S.W.4. Commencement of New Session.

BRITISH COMMERCIAL GAS ASSOCIATION. Annual Conference to be held at Exeter. Until September 30.

TUESDAY, SEPTEMBER 29

R.I.B.A., 9 Conduit Street, W.1. Exhibition of drawings, including the whole of the British Section of the recent exhibition held in Berlin during the, Congress of the International Federation of Housing and Town Planning 10 a.m. to 7 p.m. (Saturday 10 a.m. to 5 p.m.) Until October 3.

WEDNESDAY, SEPTEMBER 30

SCOTTISH IDEAL HOME EXHIBITION. At Kelvin Hall, Glasgow.

SATURDAY, OCTOBER 3

Sunrise, 7.2 a.m. Sunset, 6.37 p.m.

MONDAY, OCTOBER 5

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. First General Meeting of the Session.

BARTLETT SCHOOL OF ARCHITECTURE, University College, Gower Street, W.C.1. Commencement of New Session.

TUESDAY, OCTOBER 6

INCORPORATED INSTITUTE OF BRITISH DECORATORS, Painters' Hall, Little Trinity Lane, E.C.4. Council Meeting, followed by "The Great Decorative Artists —Past and Present." By Major A. A. Longden, D.S.O.

FRIDAY, OCTOBER 9

TOWN PLANNING INSTITUTE. Annual Country Meeting to be held at Bristol. Until October 11.

SATURDAY, OCTOBER 10

Sunrise, 6.14 a.m. Sunset, 5.22 p.m.

THURSDAY, OCTOBER 15

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. First of six lectures on "The History of English Architecture—XIIth Century." By Herbert Mansford. **7.30 p.m.**

FRIDAY, OCTOBER 16

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION. At the Castle, Winchester. Council Meeting, 3 p.m. General Meeting, President's Address, 6.15 p.m. **3 p.m.**

SATURDAY, OCTOBER 17

Sunrise, 6.24 a.m. Sunset, 5.6 p.m.

INCORPORATED INSTITUTE OF BRITISH DECORATORS. At Manchester. "Modern Interior Decoration." By John M. Holmes.

TUESDAY, OCTOBER 20

INCORPORATED INSTITUTE OF BRITISH DECORATORS. Annual Dinner, to be held in the Empire Rooms, Trocadero Restaurant, Piccadilly Circus, W.1.

WEDNESDAY, OCTOBER 21

GARDEN CITIES AND TOWN PLANNING ASSOCIATION. Housing and town planning tour to Manchester and Liverpool. Departure to Manchester from Euston at 6.5 p.m.

TRADE NOTES

The twentieth annual conference of the British Commercial Gas Association will be held at Exeter from September 28 to 30. The President of the Conference is Mr. John E.. Daw, J.P., Chairman of the Exeter Gaslight and Coke Co.

At the annual general meeting, which precedes the Conference, the year's report and accounts will be presented by Sir Francis Goodenough, C.B.E., executive chairman. Among the principal speakers will be Sir Banister Fletcher, P.P.R.I.B.A., who will deliver an address on "Architecture as a Democratic Art"; Sir Leonard Hill, M.B., LL.D., who will give details of experiments with gas for the treatment of disease; Dr. L. Meredith Davies, M.D., B.CH., who will read a paper on "Public Health and the Gas Industry"; and Mr. Stephen Lacey, B.SC., who will explain how much time, thought and money are expended in research in order to provide first-class public service for gas consumers.

A booklet entitled *A Thousand and One Uses for Gas* has recently been published by the British Commercial Gas Association, in which are illustrated several types of gas fires and their surrounds, incorporated in rooms designed by prominent architects, including Messrs. Walter J. Tapper, F.R.I.B.A., T. S. Tait, F.R.I.B.A., and Charles W. Clarke, A.R.I.B.A. Each photograph is accompanied by a short description. The booklet may be obtained, free of charge, on application to the British Commercial Gas Association, 28 Grosvenor Gardens, London, S.W.1.

*

The main low-tension power, lighting and heating switchboard in Broadcasting House, Portland Place, W.1, a photograph of which is reproduced on this page, was manufactured by Messrs. Erskine Heap & Co., Ltd., at Lancashire Switchgear Works, Manchester. It consists of seventeen panels and a main 1,500 ampère incoming cubicle. The seventeen-panel board comprises drop-down oil switches (of which Erskine Heap were the original patentees), mounted on sheet-iron stands, complete with bus-bar chamber and change-over switches. In addition to this board, there are also several distribution boards and a main battery panel.

*

Messrs. Electrolux, Ltd., have recently received an order from Messrs. J. Lyons & Co., Ltd., the well-known caterers, for the supply of 1,000 Electrolux refrigerators for the conserving of ice-cream. These refrigerators, which, it is stated, will give employment to a large number of British workers during the winter, will be manufactured in the company's factories at Luton, Bedfordshire. It is interesting to record that less than twelve months ago Messrs. Electrolux received a similar contract from the same firm for the supply of 700 refrigerators. Thus, when the present contract is completed, Messrs. Lyons will have no less than 2,200 Electrolux refrigerators in use.

*

In extension of their new policy of running their own branches in place of local agencies, Messrs. Dorman Long & Co., Ltd., opened an office at Royal Insurance Building, Grey Street, Newcastle-on-Tyne, on September 1.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Broadcasting House, Portland Place, W.1 (pages 395-400 and supplement). General contractors, Ford and Walton, Ltd. Sculpture groups by Eric Gill. Sub-contractors : Anselm Odling and Sons, Ltd., Hopton-Wood stone; Aerocrete, Ltd., soundproof partitions; W. Aumonier and Sons, carving; Carrier Engineering Co., Ltd., heating and ventilating; Carter & Co. (London), Ltd., wall and floor tiling; Central Joinery Co. (1927), Ltd., doors; Crittall Manufacturing Co., Ltd., windows, roof lights and metal doors; Comyn Ching & Co., Ltd., metalwork; Dent and Hellyer, Ltd., sanitary installation; Haywards, Ltd., pavement lights and iron staircases; Independent Sprinklers, Ltd., fire protection; G. Jackson and Sons, Ltd., fibrous plastering; Korkoid Decorative Floors, floor finishings; Leeds Fireclay Co., Ltd., sanitary fittings; Marley Bros., Ltd., main bronze entrance doors; Moreland, Hayne & Co., Ltd., structural steelwork; E. Parkinson (London), Ltd., slating; Trussed Concrete Steel Co., Ltd., Reinforced Concrete Engineers, floors and soundproof ceilings; Troughton and Young, Ltd., electrical installation; J. Whitehead and Sons, Ltd., marble floors; Waygood-Otis, Ltd., lifts; Birmingham Guild, bronze doors (internal); Carron Co., fireplaces; J. W. Gray and Sons, Ltd., lightning conductors; Jenson and Nicholson, Ltd., anti-corrosive paint; A. H. Davis, Ltd., expandable paint; Goodlass, Wall & Co., Ltd., paint generally; Eric Munday, Ltd., lettering; Midhurst Bricks, Ltd., white bricks; Burn Bros. (London), Ltd., drainage goods; Cement Marketing Co., Ltd., cement; Eastwoods, Ltd., blue bricks; Huntley and Sparks, Ltd., Cabot's quilting; Hollis Bros. & Co., Ltd., wood flooring; Le Grand, Sutcliffe and Gell, artesian well; Erskine, Heap & Co., Ltd., and Whipp and Bourne, Ltd., switchgears; Tudor Accumulator Co., Ltd., and Hart Accumulator Co., Ltd., storage batteries; Siemens Bros. & Co., Ltd., engineering telephone system; English Electric Co., Ltd., motors for ventilation, heating, etc.; Sturtevant Engineering Co., Ltd., vacuum cleaning; Patent Impermeable Millboard Co., Ltd., Insulwood insulation board; Merchant Trading Co., Ltd., Celotex; Anglo-Colonial Trading Co., Ltd., Donnaconna insulating and building board; Smith and Hammond, Ltd., broadcasting wiring.

New Central School, Windy Harbour, Birkdale (pages 401-403). General contractors, Duxfield Bros. (Southport), Ltd., who were also responsible for the joinery. Sub-contractors : The Penmaenmawr and Trinidad Lake Asphalte Co., asphalt; W. T. Lamb and Sons, bricks; Christie Patent Stone Co., artificial stone; T. Blackburn and Son, Ltd., structural steel; Trussed Concrete Steel Co., Ltd., Reinforced Concrete Engineers, fireproof construction; Wm. Small & Co., tiles; Mitchell Bros., wood-block flooring; G. N. Haden and Sons, Ltd., central heating and boiler; Eagle Range Co., range; E. A. Clark, Ltd., grates; Butterworth and Robinson, electric wiring and electric light fixtures; Graham and Caddick, plumbing; Rowe Bros. & Co., Ltd., sanitary fittings; W. and R. Leggott, Ltd., door furniture; Samuel Parkes, swivel friction hinges; T. Southworth and Sons, plaster and decorative plaster; W. Calland and Sons, stonework; James Gibbons, Ltd., cloakroom fittings.

The main low-tension power, lighting and heating switchboard in Broadcasting House.

On page 232 of THE ARCHITECTS' JOURNAL for August 19 the name of Dr. Fritz Schumacher was inadvertently omitted as architect for the Cold Store for Herrings in Hamburg.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Messrs. Wm. Downs, Ltd., are to erect a new church for St. Mildred's, Addiscombe, CROYDON, from plans prepared by Mr. Cecil Hare.

The Middlesex Education Committee is considering the acquisition of Berkeley House and grounds for extensions at the HAMPTON grammar school.

The HESTON and ISLEWORTH U.D.C. is seeking sanction to borrow £12,500 for the layout of the Redless estate.

The LEWISHAM B.C. has passed plans, submitted by Mr. W. E. Trent, for the erection of a cinema and theatre in Loampit Vale.

Messrs. G. E. Marshall and Partners have submitted plans to the LEWISHAM B.C. for the erection of a stadium in Station Road, Catford.

Plans passed by the WOODFORD U.D.C. : Fifteen houses, Knighton Drive; fifty-four houses, Hillside estate; eighteen houses, Danbury Way.

SOUTHERN COUNTIES

The Ministry of Health is to hold an inquiry into six clearance schemes proposed by the BRIGHTON Corporation.

The BURGESS HILL, SUSSEX, U.D.C. is to erect another twenty houses.

The LEWES Corporation is to erect twelve houses on the Neville estate.

The NORTHFLEET U.D.C. is to erect eighty houses on the Wombwell Park estate.

The NORTHFLEET U.D.C. has sold a site on the Wombwell Park estate to the South Suburban Gas Co., for the erection of a gas compressor station.

Plans passed by NORTHFLEET U.D.C. : House, Wrotham Road, for Mr. F. Flateher; two bungalows, Southfleet Road, for Messrs. Bevan; houses, Singlewell Lane, for Mr. C. F. McInnes; two houses, Gouge Avenue, for Messrs. R. Hopkins and Sons; bungalow, Lewis Road, for Mr. N. Waterman; seven houses, Nelson Road, for Messrs. Barton and Burles.

The Godstone R.D.C. is to erect twenty-four houses at OXTED.

The SOUTHAMPTON Corporation has passed plans for the erection of a cinema, by Mr. A. C. Palmer, on the Regent site, Shirley.

MIDLAND COUNTIES

The Warwickshire Education Committee is to borrow £12,000 for extensions at ARLEY central school.

The Wesleyan Reform Union trustees are to erect a school at CHILVERS COTON, Warwickshire, at a cost of £3,000.

The COVENTRY Education Committee is to erect an elementary school in Moseley Avenue.

Mr. H. S. Scott has prepared plans for the erection of a cinema in Tamworth Street, LICHFIELD.

Plans passed at OXFORD :—Extensions, 108 Hurst Street, for Mr. R. Moss; additions, Arlosh Hall, for the trustees of the Manchester College; business premises, 11 New Road, for Messrs. Davey's, Ltd.; conversion into business premises, 8 Worcester Place, for Mrs. Walklett.

The Staffordshire Education Committee is to extend the elementary schools in Clarance Street and Biltson Street, SEDGLEY.

The Midland Electric Corporation is to erect a sub-station at Spring Head, SEDGLEY.

Plans passed by the SEDGLEY U.D.C. : Two houses, Wolverhampton Road, for Mr. F. B. Waterhouse; house, Vale Street, for Mr. J. Rollason; house, Eve Lane, for Mr. W. Hale; seven houses, Claremont Road, for Mr. F. H. Roberts; two houses, Gospel End Road, for Mr. S. Brookes; rope works, Burton Road, for Messrs. W. S. Jewell; rebuilding showrooms, Mumbles Road, for Mr. Chas. Williams; two houses, Carmarthen Road, for Mr. W. Evans; store, Swansea Castle, for Swansea Press, Ltd.; shop and two houses, Gelligrafog Road, for Mr. John Pye.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

BROADCASTING HOUSE

THE ARCHITECT'S DETAIL DRAWING OF THE SOUTHERN END

[G. Val Myer, Architect.

THE ENTRANCE TO THE MAIN RECEPTION HALL

ABOVE is a photograph of the main entrance to the new building now nearing completion for the British Broadcasting Corporation on a corner site at the southern end of Portland Place, W. It should be compared with the architect's working drawing of this apex of the structure reproduced overleaf, and with the exterior view which appears elsewhere in this issue.

The building will have a dual purpose, namely, to serve as a broadcasting station and to house the administrative offices of the B.B.C.

The studios are placed in a tower occupying the centre of the site, and are encircled by the offices. This type of plan has been adopted, in conjunction with special constructional methods, to eliminate street noises and the risk of sound-transmission from one studio to another.

The whole of the exterior of the building is faced with Portland stone. A sculptured figure by Eric Gill is to occupy the niche over the main entrance, indicated above.

BROADCASTING HOUSE
PORTLAND PLACE W
DETAILS OF FACADES

NOTE ALL DIMENSIONS MUST BE TAKEN FROM THE ACTUAL BUILDING AND ANY DIMENSIONS SHOWN ON THE DRAWINGS ARE TO BE CAREFULLY CHECKED. STONE BEDS GENERALLY ARE TO BE 45° WITH A BED TO EVERY 4 1/2" COURSE. SETTING OUT DRAWINGS IN ALL CASES TO BE SUBMITTED TO THE ARCHITECT & HIS APPROVAL OBTAINED BEFORE WORK IS PUT IN HAND

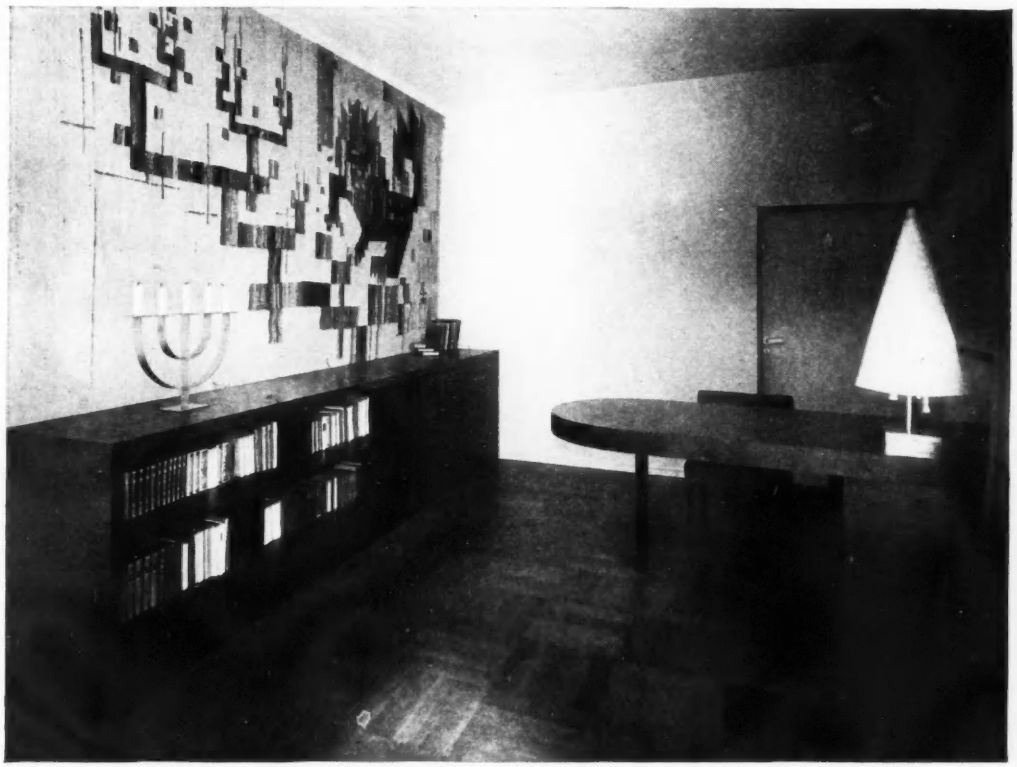
IN A VILLA AT INNSBRUCK

AN AUSTRIAN ARCHITECT'S FITTINGS FOR LIBRARY, BOUDOIR AND KITCHEN



[Lois Welzenbacher, Architect.

THE WRITING DESK, WITH CUPBOARD, IN THE LIBRARY

ONE of the articles in this issue illustrates and describes a villa at Innsbruck, in which all the interior fittings and furniture have been designed and disposed by the architect. The present supplement gives details of some of these.

Above and on the following page are a photograph and scale drawings of the library cupboard-table. The table-top, 4 ins. deep, is supported against the wall by the cupboard, and at its semicircular end by a 2-in. square leg, placed centrally to give ample knee-room all round. The cupboard is divided down the centre to form two compartments, each of which has a single-panel, flush door of laminated wood, which conceals a suite of four drawers with shelves below—a neat and dust-proof arrangement adopted throughout the house, and giving to the furniture its appearance of simplicity.

The circular mirror of $\frac{1}{4}$-in. silvered polished plate-glass, pictured on the last page and in drawings overleaf, is contained in a chromium-plated metal frame, and is adjustable. The main upright member is a $1\frac{1}{4}$-in. diam. hollow plated tube; and on it runs a length of $1\frac{1}{2}$-in. diam. tube, with an adjustment screw. To this larger tube the mirror is attached by jointed brackets, so that both its height and inclination can be governed. The base is weighted to counteract any tendency to overbalance, but it is not fixed to the floor. A tray of $\frac{1}{2}$-in. polished plate-glass forms a dressing-table, and is supported on a grid of plated steel.

The kitchen-scullery, of which drawings will also be found within, is particularly well and compactly planned. The isometric drawing and plan clearly show its features and their arrangement.

SELECTED PRECEDENTS:

TYPES OF TRIPLE-SPAN ROAD BRIDGES IN CONCRETE FROM THE CONTINENT

1. *THE SKURU BRIDGE, NEAR STOCKHOLM.*

THE triple-arched bridge satisfies our æsthetic sense even more completely, perhaps, than the single span. It seems a just and proper distribution: one for the river itself, and one for each of its banks. Moreover, three is notoriously both a lucky and a magic number, and not the least part of its magic lies in the way it has of providing a central focus between two bodies identical with itself. When we look at a triple bridge, it is always the centre arch which first arrests our attention.

The triple "bowstring" is a particularly airy and graceful type of design in concrete. Figures 3 and 5, the one in Sweden and the other in France, are of very similar design. It will be noticed that in both the vertical supports are not, as is usually the case, also made of concrete, but consist of very slender iron rods. The object of this variation is to help to counteract the occasionally excessive rigidity of the concrete bow, which is apt to cause cracks during spells of very cold weather. The first of these two bridges, built in 1928, which traverses the Fax River, near Stamsele, consists of three equal spans of 55 metres. The spans of the second, which was built in 1924, are all 55 metres long; while the platform is 5·30 metres wide.

Figure 1 is a view of the famous Skuru Bridge over an arm of the sea near Stockholm, which is now too well known to call for any comment except that few bridges yet built in any material are more serenely beautiful and inspiring.

Figure 2, a very imposing design, shows a new bridge over the River Neckar at Cannstadt, a suburb of Stuttgart, which is rather reminiscent of some of Mr. Maxwell Ayrton's earlier bridges. What looks like Modernist decorative motifs are really rows of brackets supporting the pavements, which are cantilevered out from the road platform. The same device is used in the example shown in Figure 4, a semi-hexagonal, flat-arch bridge spanning the Spree at Alt-Schadow, not far from Berlin. In this case, however, the pavement brackets are much shallower. This bridge, which was built in 1927, and has a length of 76 metres, rests on massive concrete girders of 5·20 by 1·25 metres section.

WAYSIDE BOXES

WE reproduce in the "Letters from Readers" pages of this issue a photograph of a police roadside box designed for the Leicestershire Constabulary.

The object of these boxes in country districts is to enable a police officer who is provided with a quick means of transport, usually a motor cycle, to use them as a call on his beat, which will cover a much wider area than at present. If the experiment is a success, several hundred such boxes will be required, and, as with telephone boxes, the choice is offered of either leaving their design to be a matter of local taste or of employing one design for general adaptation throughout the country—of mass-producing, in fact.

As opinion is divided over the merits of mass-production, let us examine its bearing upon this particular case.

The normal, though not necessarily the sensible procedure, regards the design of the box as the job of the authorities controlling the various police forces. There is no unified police force, although the same law is administered everywhere; therefore, as it became necessary to provide boxes, architectural departments here, there and everywhere, would be stirred to produce each a little building after its kind—each for the same set of conditions.

Once upon a time it would have fallen out that in stone counties little stone huts would have appeared by the wayside, in brick counties, brick, in wood-bearing counties, wood; and traditions of building, founded inevitably upon economic conditions, would have added another layer to the strata of unconscious local expression. Such variety of handling can no longer exist. Architectural assistants called upon to design cannot think naturally of local materials because locality plays only a minor part in the provision of building materials. If local materials are used, it is for effect, meretriciously, and with added expense.

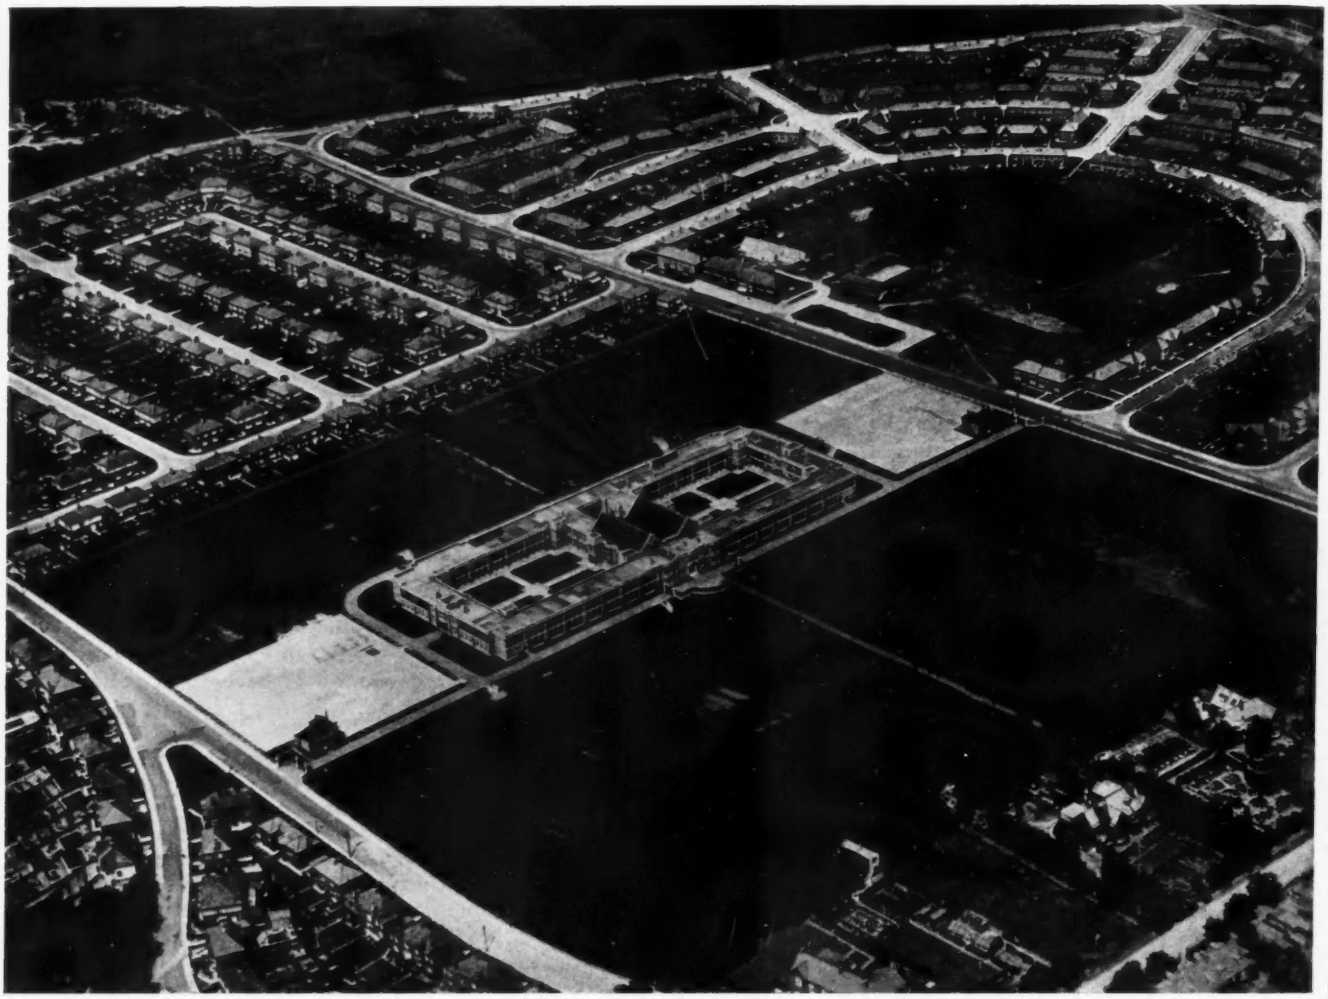
In point of fact, the normal result serves only to exhibit the varying degrees of personal competence and incompetence in materials that come from the four corners of the country, and even from overseas.

If, therefore, these boxes call for the use of non-local materials and the fulfilment of one and not many varying conditions, true economy is best served by employing one design used many times, the more so in that a travelling public must recognize the box for what it is before it can use it, whether it be in Devon or Norfolk. Now mass-production is useless if it means the incessant reproduction of anything, and we have only to look at motor cars and refrigerators to know that fine mass-production must be preceded by fine, exact thinking, the services of many second-rate brains being displaced by first-rate intelligence.

We do not properly understand the system as yet. Even the telephone boxes which so delight us could be finer in conception as mass-productions, and less expensive thereby. As it is, mass-production has enabled us to replace the clumsy efforts of many unthinking designers with the studied elegance of one trained mind.

The whole point of mass-production, if it is to be a blessing and not a curse, rests upon the conscious selection of the best models for reproduction in the most fitting materials. It is a process of what le Corbusier calls "high selection," and entails the employment of designers naturally sensitive to design, trained in the system of manufacture. The latter is very important, because freedom of manipulation is the outcome of understanding, and architects who don't understand the casting of concrete and iron, to take but two instances, cannot hope to use these materials to full advantage. It is largely because of this divorce of architect and manufacturer that we have suffered from the excesses of nineteenth-century mass-production: Birmingham and all its horrible progeny.

Birmingham was right when it recognized the system as part of modern economy, and we were wrong to look down upon it. The missing link was intelligent design, and this we can supply by conscious control of the design. To obtain this control, we must understand, and if necessary, evolve new methods of construction. Any other part we undertake to play will be as amateurs, unpaid.



A ZONED RESIDENTIAL AREA IN NORTHUMBERLAND

An aerial photograph of a housing estate in Northumberland. In *The North Tyneside Regional Report for 1931*, reviewed elsewhere in this issue, and from which the above illustration has been reproduced, it is rightly emphasized that zoning, or the allocation of particular areas to particular purposes, is one of the most important objects of town planning. The Committee dealing with this *Report* state that public open spaces have been proposed so as to provide areas for recreation in the proportion of one acre to every thousand of estimated population. An attempt has been made to site these open spaces so that no residential area is more than half a mile from an open space, and wherever possible advantage has been taken of natural parks and beauty spots, and places where, on account of the configuration of the ground, or for other reasons, the area is not likely to be used for building purposes.

NEWS & TOPICS

FARADAY'S LEGACY TO ARCHITECTURE

THE Faraday celebrations ended, it is time to wonder to what extent that great man's discoveries have influenced the forms of architecture. It is apparent at once that the researches which he and others of his day were about marked the first signs of a structural and mechanical revolution that has moved almost too quickly for us.

★

And if there is a moral to seek, it is this : that the practice of architecture is a variable thing, though the principles upon which it is founded are constant. The practice of architecture split into two, of which one was called engineering. But both were concerned with building, and both, in so far as either could be accounted beautiful, followed constant laws of harmony and proportion. The divorce which came about from the use of steel for building has beggared us doubly, leaving architects without the proper understanding of part of the structure of their building, and creating a profession of engineers with whom it has been no shame to disregard openly the clear call of proportion and beauty.

★

There are obvious signs today that the gap between these two is closing—engineers are less satisfied to be manipulators of metal; architects less sure that architecture is a matter of making buildings that look like those their grandfathers made. When this gap is closed we will realize the true value of Faraday's discoveries.

THE A.A. IN VIENNA

Members of the A.A. who formed the party visiting Austria this year have just returned after a fortnight spent partly in Vienna and partly in a motor tour through some of the finest mountain scenery in Austria. In Vienna the great burst of building activity for the housing of the people, inaugurated by the socialist Burgomaster Seitz, has to a certain extent quieted down, though numerous great housing blocks are still going up. Illustrations of the Karl Marx Hof, the latest to be completed, have appeared in English papers, but no photographs can really do justice to its impressive scale. When it is considered that this great block of buildings is about a quarter of a mile long, it will be realized that the architects were faced with a great opportunity and a great responsibility, but throughout the whole scheme they have succeeded in making it look big without being oppressive; there is plenty of interest in the long façades of the wings and the central court, backed by six great arches, holding the whole thing together.

★

This feeling for scale occurs generally in all the modern work of Austria, and with it goes a love of refinement and a wise selection of ornament and colour, which relieves the big masses of any feeling of overpowering weight. One can be shown these schemes one after another till one gets slightly dizzy, but one only has to wander for an hour in the outskirts of the city through street after street of dull stucco, sham baroque façades of the nineteenth century, to have it brought home forcibly that the modern Austrian architect in this particular knows his job. Fortunately the housing blocks are typical.

★

When will the influence of Fischer von Erlach crop up again ? Not in our time, possibly, but when Europe settles down once more and money has a steady value the mantle of that great contemporary of Wren will surely descend upon someone, and architecture will become expressive of something more than sheer necessity.

THE PROGRESS OF LONDON HOUSE

It is encouraging to hear of the progress of London House, the projected hostel for students, especially Dominion students, studying at the University and hospitals of London. The site is to be in Bloomsbury, near the Foundling Hospital, and will eventually include the full appurtenances of a residential college—hall, library, common rooms, etc., and accommodation for 300 students. Many students in the past must have gone home with mixed feelings, having met too few English people of their own inclination of mind and too many landladies of a type produced only by large cities of shifting population.

ON A PEDESTAL

The grievances which are aired in the correspondence columns of the Press are not without their humour, but they constitute the section of a paper to which the curious-minded and reflective turn with expectation of instruction. I make no apology, therefore, for diverting my readers' attention to a matter that has agitated the columns of the JOURNAL for several weeks—the matter of a Pedestal Basin. The subject is prosaic, but it has a wider significance.

★

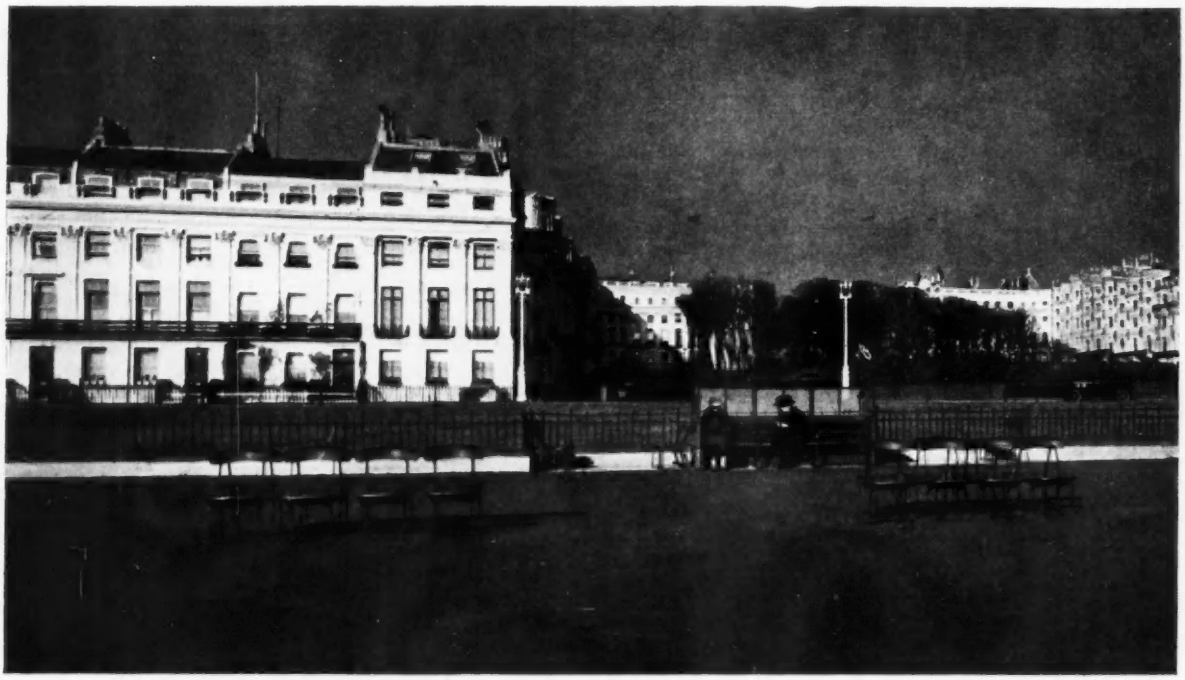
A correspondent chose, on his builder's advice, a certain lavatory basin supported on an earthenware pillar. He chose it expressly because he disliked the sight of pipes. On inspecting his house he was dismayed to find all the pipes boldly regimented outside the pillar, only to be informed that it was by no means practicable to carry them inside. On seeking the authoritative opinion of readers, he is no less surprised to find that the profession is very evenly divided on this question, the half supporting the recalcitrant plumber, the other half declaring categorically that any self-respecting pedestal would take the pipes and to spare. Thus, both he and his builder can retire from the battle with flags flying, even though I detect in his reply a certain apprehension as to the sanity of the building trade.

★

Now, which school of pedestal philosophy is in the right I need not here determine, but I will confess that this correspondent (who may be taken as any member of the public) has all my sympathy. I go farther. I say flatly that it is high time the sanitary engineers and manufacturers made up their minds once and for all on this very elementary question. The Prince of Wales, who takes an intelligent, as apart from a Royal, interest in the fortunes of our national industry, has made so bold as to say recently that it needs more than quality to sell our goods abroad. There is the question of appearance. As one might say in this case—we have got to come off our pedestal. It is not only the appearance of the thing; it is the most essential part of design which is here in question, —the fitness of the article for its purpose.

★

There was a time when the Englishman abroad was accustomed to use English sanitary fittings. There may be several reasons why such is no longer the case. The D.I.A. keeps reiterating that one reason at least is the lack of design, and in the matter of the Pedestal Basin it looks as if the D.I.A. were not far out. ASTRAGAL



A general view of the Square and Terrace, which has now stood unchanged for over a century, its destiny still regulated by the

BRUNSWICK SQUARE AND

How its Harmonious Design

IT is difficult to achieve a good layout, still harder to get your composition made visible by buildings which complete the harmony, and most difficult of all to ensure the continuance of such harmony, should you be fortunate enough to achieve it.

It is useful, therefore, to study examples of achievement in this last respect, and find out how it has been done. What has been done can be repeated, although in this matter we have almost to recapture a lost art of manners, if not of town planning.

Any visitor to Brighton and Hove is at once attracted by the well-mannered Georgian compositions, and astounded that a later age did not have the sense to complete the whole front in the same manner. That Brunswick Square and Terrace have retained their looks for over a century is due to the Brunswick Square and Terrace Act, 1830; which Act is now administered by the Hove Corporation. Portions of the preamble of the Act are interesting :

"Whereas a Square called Brunswick Square, and a Terrace and Place respectively called Brunswick Terrace and Brunswick Place, and Roads, Streets, and public Ways have been lately formed, and other Squares, Places, Roads, Streets, and public Ways are respectively in progress, and intended to be formed on Grounds late Parts of a Farm and Lands called the Wick Farm, situate in the Parish of Hove in the County of Sussex. . . . And whereas it is expedient that effectual Provision should be made for repairing and keeping in repair, improving, managing, and regulating the said Squares, Terrace, Places, Streets, and other public Ways so already formed and to be formed upon the said Grounds included and comprised within the Boundaries herein-after specified : And whereas it would contribute to the Benefit and Safety of the Persons now residing in Brunswick Square and on Brunswick Terrace respectively aforesaid, and the several Persons now being or who shall hereafter become Inhabitants of the several other Squares, Places, Streets, and other public Ways, or intended Squares, Streets, and other public Ways, comprised within the Boundaries aforesaid, and of the Persons who shall or may have Occasion to pass along the same Places, if Provisions were made for making paving, and keeping in repair the Footways before the said Houses, and for forming, making, stoning, gravelling, repairing, and keeping in repair the Carriageways, and also for lighting, watching, draining, watering and cleansing the same, and for removing and preventing Nuisances, Annoyances, and Encroachments thereon, and for other the Purposes herein-after mentioned. . . ."

Commissioners were appointed to carry out the purposes of the Act and were entitled to raise rates on the property to defray their expenses; the maximum rate in one year not to exceed 4s. in the £. The Commissioners were allowed to exonerate and release any poor householder or householders, or occupier or occupiers of any land, tenement, building or apartment, from the payment of all or any of the rate or rates to be assessed or imposed by virtue of this Act, for and during such time or times, and in such proportion or proportions, as the Commissioners shall think him, her, or them incapable of paying.

Section CXII is particularly interesting and is worth quoting in full :

"CXII. And for preserving an Uniformity of Appearance in the respective Fronts of the several Houses respectively erected and to be erected in Brunswick Square and Brunswick Place and on Brunswick Terrace respectively aforesaid, be it further enacted. That the several Areas in front of the several Houses respectively erected and to be erected in Brunswick Square and Brunswick Place and on Brunswick Terrace respectively aforesaid, shall at all Times hereafter, at the Costs and Charges of the several Proprietors of the said Houses respectively, be and remain inclosed with open Iron Palisadoes Four Feet high, let into a Stone Curb of Eight Inches by Six Inches, of the now existing Pattern, or of some other Pattern to be approved by the said Commissioners; and, at the like Costs and Charges,

original Act of Parliament, now administered by the Hove Corporation. Non-compliance involves a weekly fine of £2.

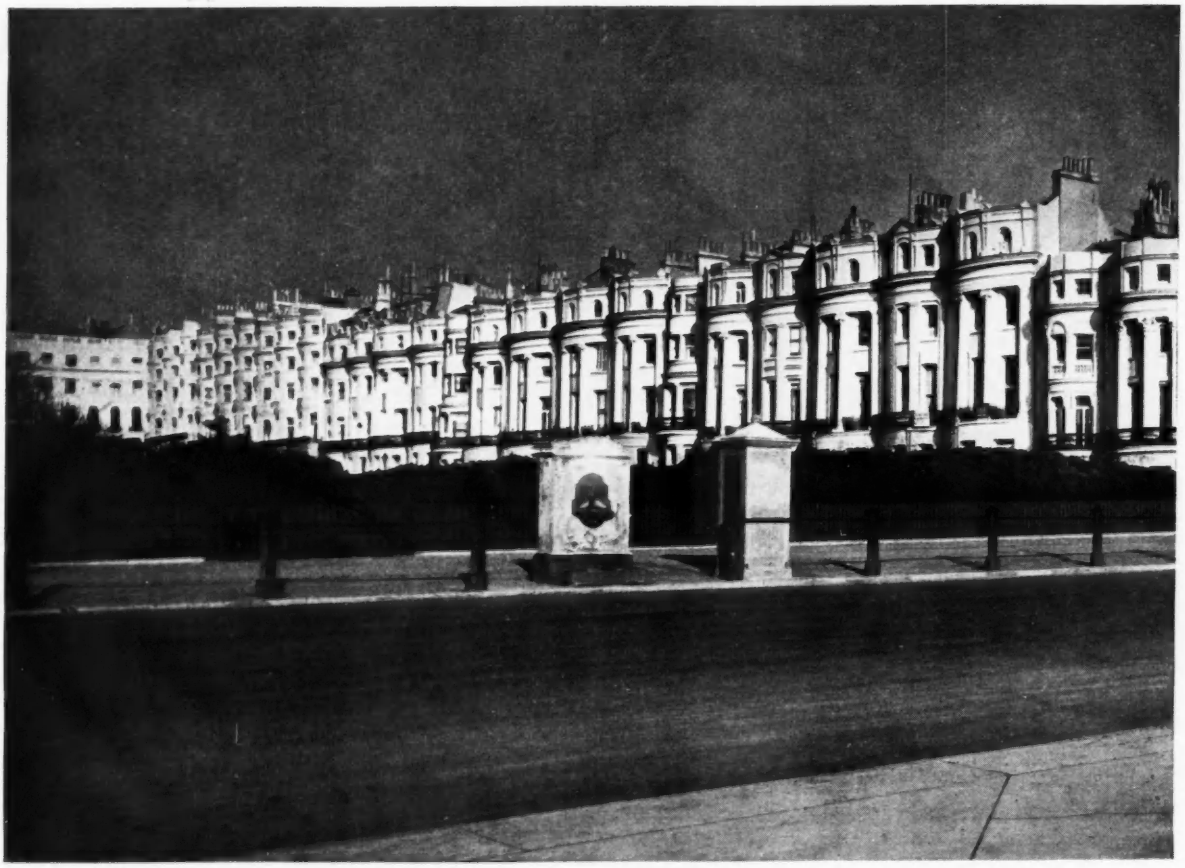
TERRACE, HOVE, SUSSEX

was Obtained and is Retained

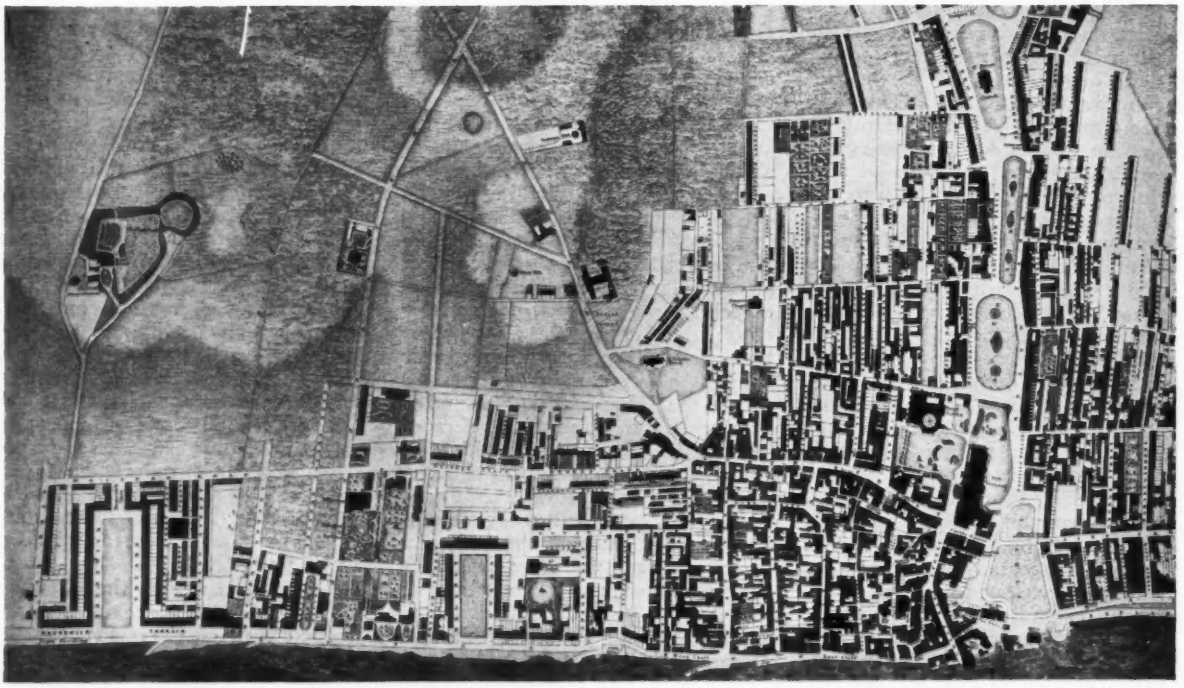
a Balcony shall be and remain erected and maintained at all Times hereafter in front of each Window on the Drawing-room Floor of the same several Houses, which said Balcony shall project not exceeding Two Feet from the Front of the said several Houses, and shall be surmounted by an Iron Railing of the now existing Pattern, or of some other Pattern to be approved by the said Commissioners; and no Viranda or other Projection (except such Balconies as aforesaid) shall at any Time be set up in front of any of the said respective Houses; but the present Front Elevations of the said several Houses shall at all Times hereafter be in all things maintained unaltered, and without Variation, and the Fronts of the same Houses, and the Chimney Shafts thereof respectively, be and remain covered with Parker's or Roman Cement, of one uniform Stone Colour; and in case any of the said Houses shall at any Time or Times hereafter be burnt down, destroyed, or damaged by Fire, the same shall, as soon as may be afterwards, at the like Costs and Charges, be rebuilt, or well and substantially repaired and amended, according to the original Plan and Elevation thereof, and the Front thereof be and remain covered with Parker's or Roman Cement, of one uniform Colour as aforesaid; and also that the respective Proprietors or Occupiers for the Time being of the said several Houses shall and do, at their respective proper Costs and Charges, at the End of every Three Years, to be computed from the Twenty-fifth Day of March One thousand eight hundred and twenty-nine, paint or cause to be painted the outside Woodwork and Ironwork in front of the said several and respective Houses and Premises with Two Coats of Paint in Oil at the least, and of such Colour or Colours as shall be ordered and directed by the said Commissioners; and that no Shop Window shall be made or set up, or any Sign Board, or other Notification of Trade, Business, or Calling whatsoever, shall be set up or affixed to or in any of the said Houses; and no Trade or Business whatsoever shall at any Time or Times hereafter be exercised or carried on in or upon any of the said Houses or Premises, or any Part thereof (except the Trade or Business of an Hotel Keeper in or upon the House being Number Forty-two on Brunswick Terrace aforesaid) or any other Calling or Employment be carried on or exercised to the Annoyance or Injury of any of the Houses or Premises adjoining; and further, that the Chimnies of any domestic Office or Offices, or other Buildings, now already built or hereafter to be built behind any of the said several Houses within the Distance of Ninety Feet, to be computed from the respective Fronts of the said Houses respectively, shall be carried up against the respective Bodies of the said Houses to the full Height of the respective Chimnies of the same Houses respectively; and every Person who shall act contrary to or in anywise deviate from or neglect to comply with any of the aforesaid Particulars or Provisions, and shall not, within Two Calendar Months after he shall be required so to do by the said Commissioners, remove, alter, amend, or otherwise supply such Contrariety, Deviation, or Neglect to the Satisfaction of the said Commissioners, shall forfeit the Sum of Two Pounds for every Week after the Expiration of the said Two Calendar Months during which such Offence shall continue; and it shall be lawful for the said Commissioners to order every such Contrariety, Deviation, or Neglect to be in all things removed, altered, amended, supplied, or otherwise, as the Case shall require, for the complete Observance of the said several Particulars and Provisions, at the Costs and Charges of the Proprietor or Proprietors of the House or Houses in respect of which such Contrariety, Deviation, or Neglect shall happen, to be recovered by Action of Debt in any of His Majesty's Courts of Record at Westminster."

Under this Section the Borough Surveyor of Hove still triennially issues a notice calling on the owners to paint the outside of their premises, according to the pattern prepared for the purpose, which may be inspected at the Town Hall.

G. L. P.



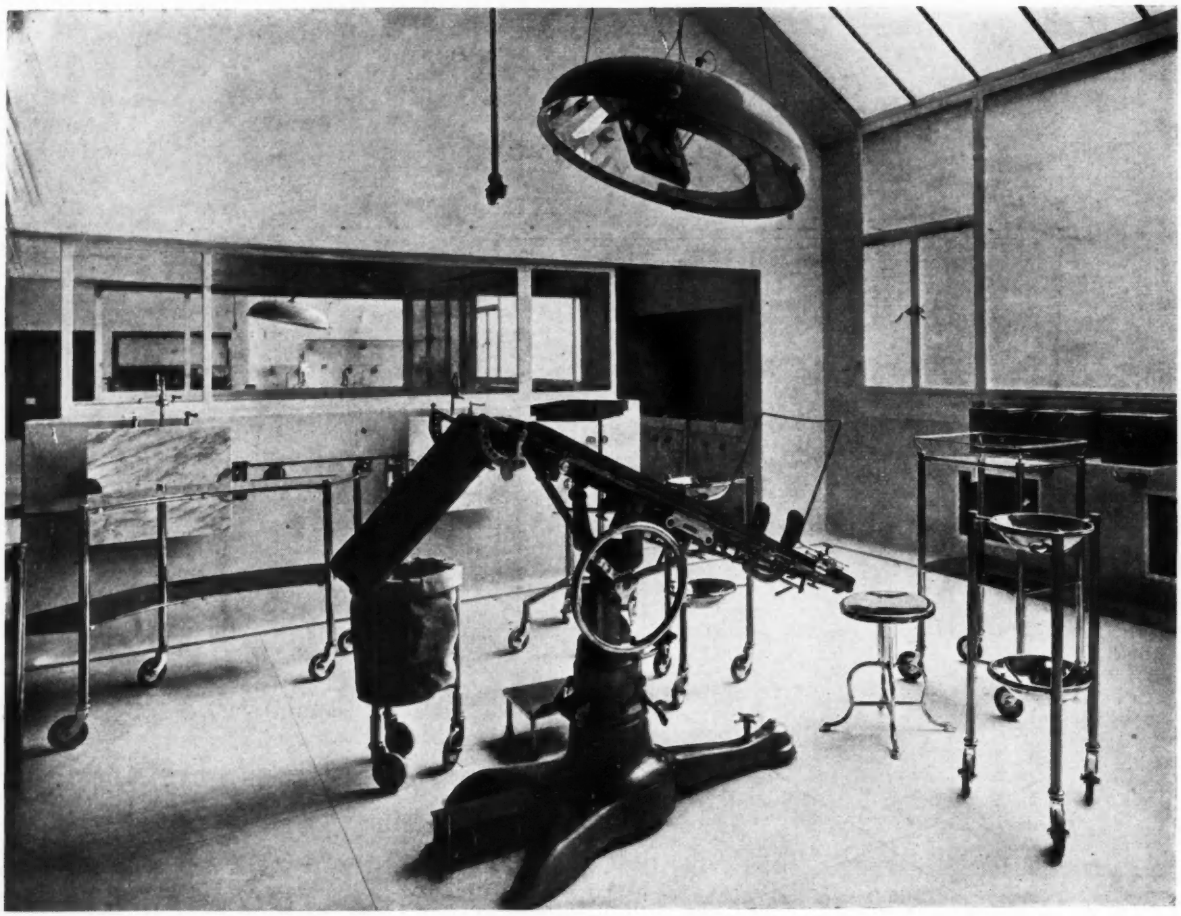
A nearer view of the Square, showing the "iron palisadoes" and the balcony, the design and proportions of which are very strictly defined in the section of the Act quoted in the accompanying article: "A Balcony shall be and remain erected and main-



Reproduction of a portion of a map of Hove and Brighton in Pre-Victorian days, when good manners in architecture, as in other matters, were valued. The plan of Brunswick Square and Terrace is seen on the left.

tained at all Times hereafter in front of each Window on the Drawing-room Floor of the same several Houses." "No Viranda," it is further provided, "or other Projection . . . . . shall at any time be set up in front of any of the said respective Houses."

The elevation of the west wing of the Terrace to the road and sea-front. "The present Front Elevations of the said several Houses," says the Act, "shall at all times hereafter be in all things maintained unaltered and without variation."



Looking from one operating theatre through the sink and sterilizing rooms into the other theatre. The equipment in each theatre includes an X-ray film-viewing box, Scialytic shadowless lamp with emergency lighting system, and power and lighting plugs.

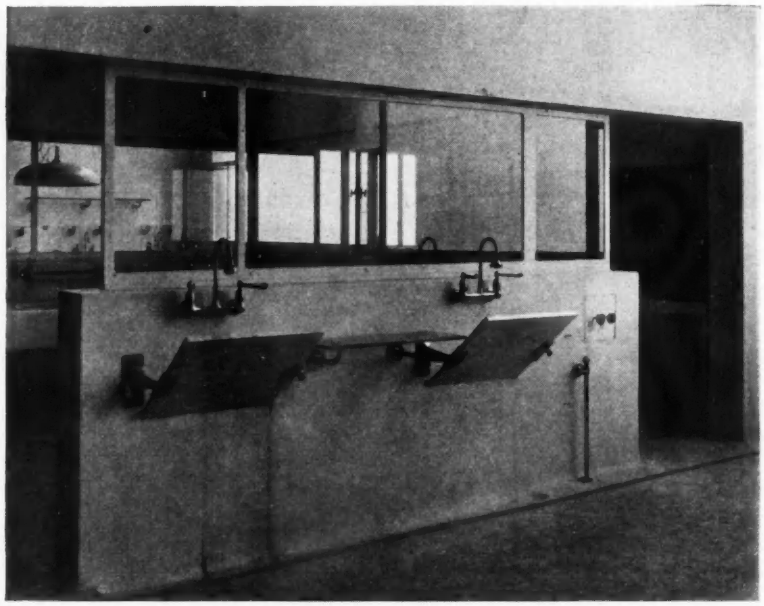
DUAL OPERATIONS UNIT AT A BARNET HOSPITAL

DESIGNED BY A. SAXON SNELL AND PHILLIPS

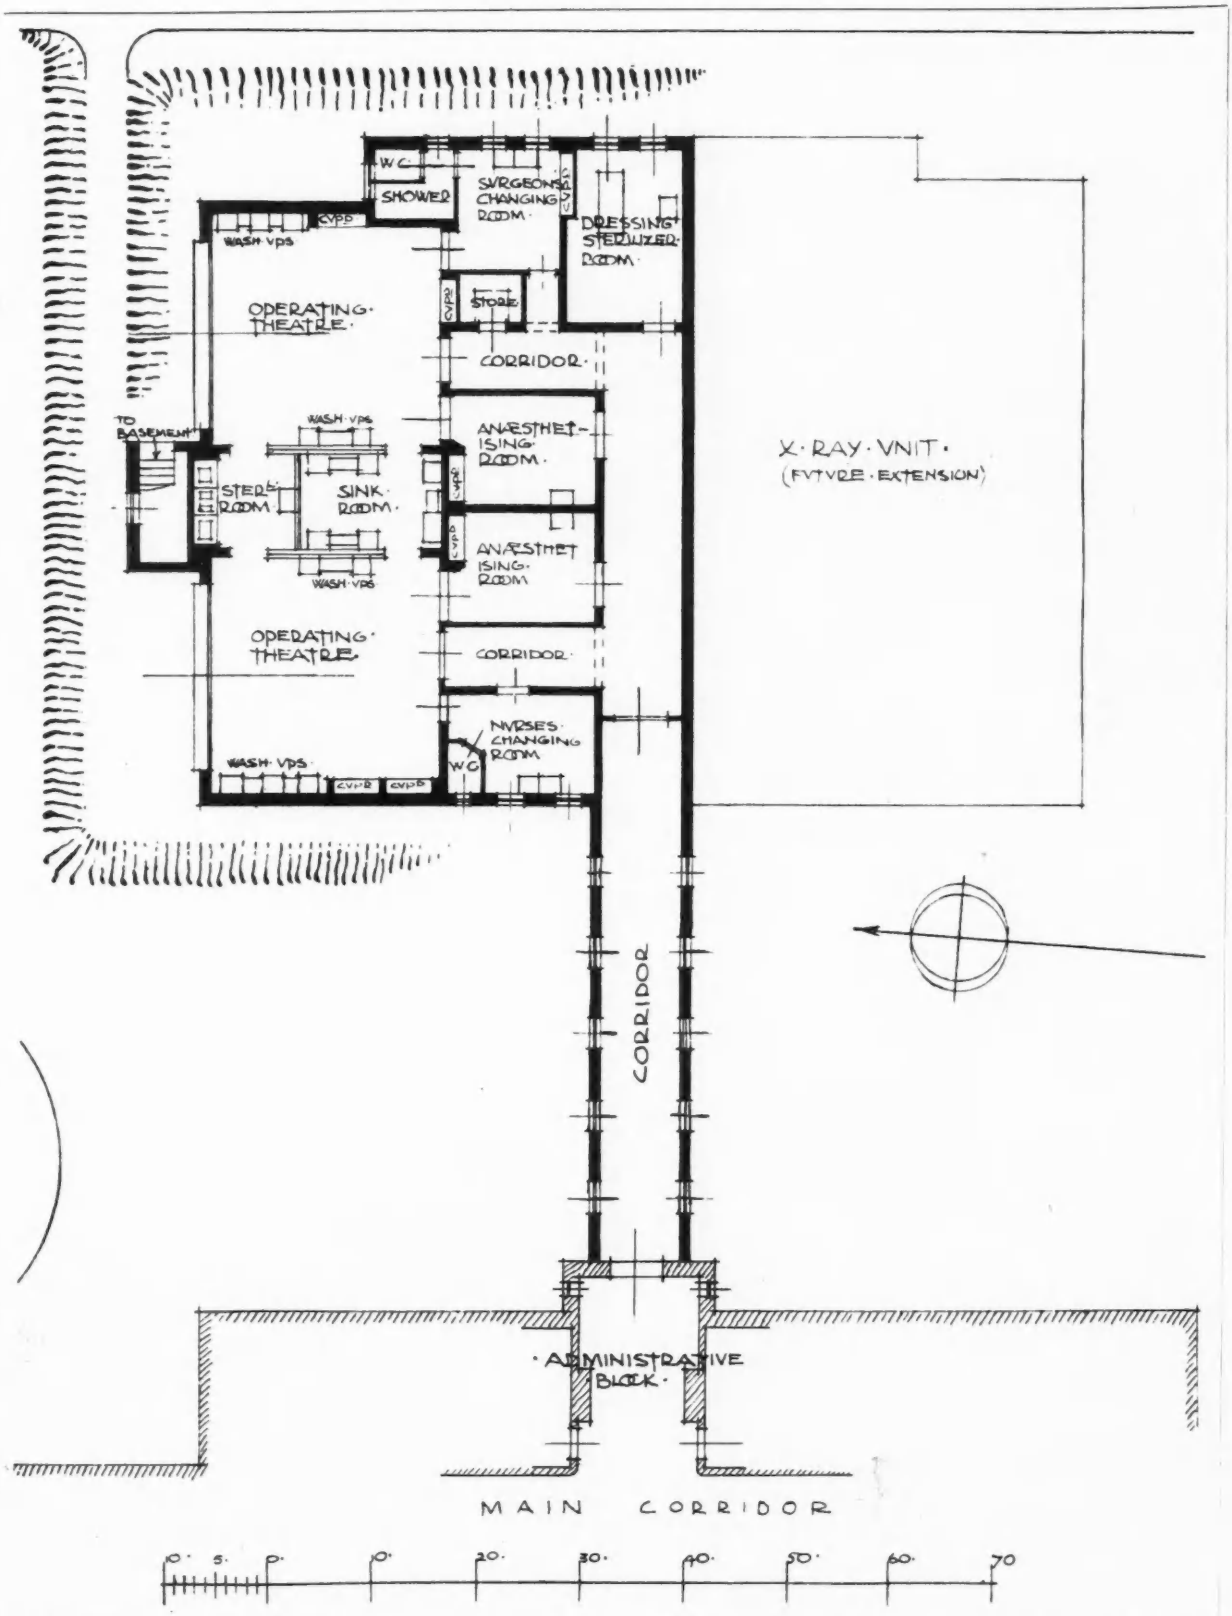
THE new operating department at Wellhouse Hospital, Barnet, is designed as part of a complete unit to incorporate operating, X-ray and electrical departments. At present only the operating department has been erected. The unit is in a central position. It is approached from the main corridor of the hospital and is one story in height, except for a small basement containing the heating and electrical apparatus.

Several new features are incorporated in the planning and equipment of the unit. A case in point is the design of the operating theatres and anæsthetising room. These are in duplicate, with the sink and sterilizing rooms for the common use of both, placed between the two theatres. The walls between the theatres and these rooms, and between the rooms themselves, have glass screens for ease of supervision.

The sink-room is fitted with various-sized sinks and has a chute for the discharge of soiled dressings, etc., over a bin in the basement, and there is a hatchway into the sterilizing room



Among the cleaning-up facilities for the surgeons and nurses in each operating theatre is an ingenious fitting, which ensures the hands being washed in running water.



Operations Unit: Wellhouse Hospital, Barnet.] [*By A. Saxon Snell & Phillips.*

Ground-floor plan. The unit has an operating theatre and anæsthetizing room planned in duplicate. Between the theatres and for their common use are the sink and sterilizing rooms. The corridors, anæsthetizing, sink and sterilizing rooms are top-lighted.

In the sterilizing equipment, the invention of Mr. E. W. Johnston, the chief engineer of King's College Hospital, London, the sterile water supply is automatic and sealed from contact with the air.

containing built-in bowl and instrument sterilizers. These are operated from inside, but the working parts are accessible only from the basement.

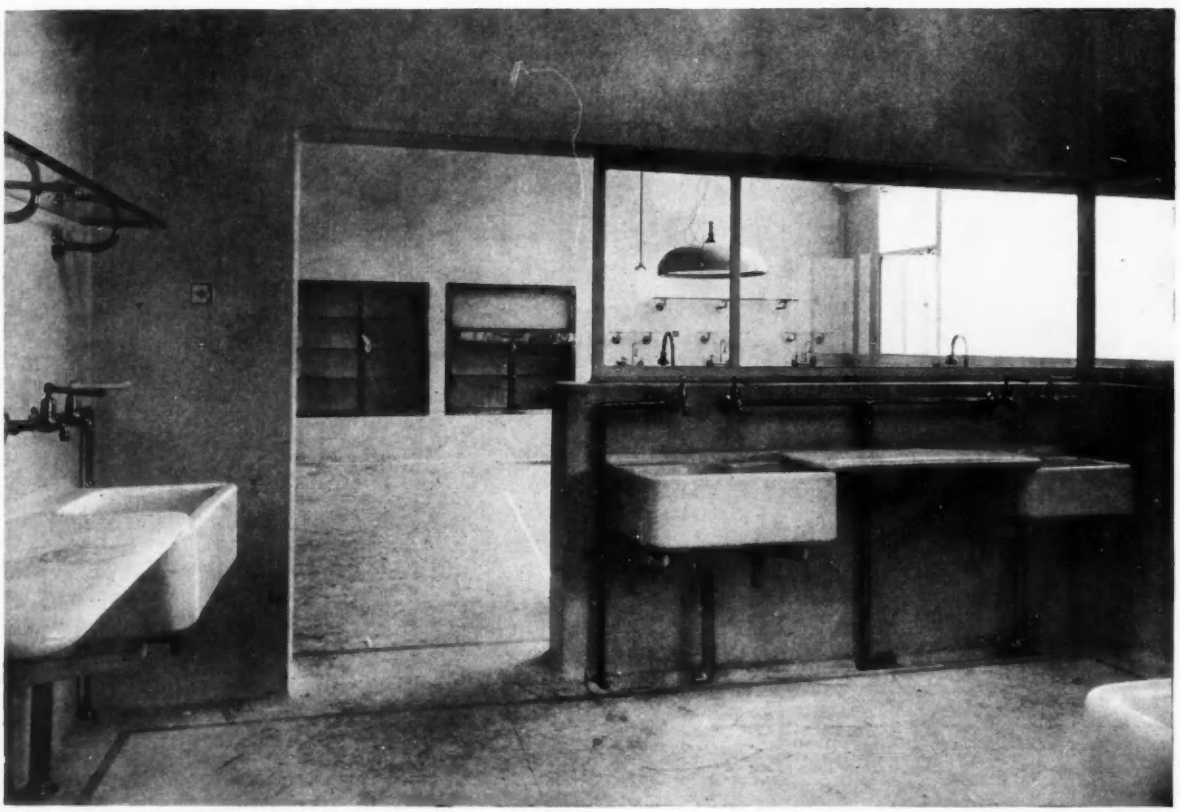
The dressings-sterilizer room, containing dressings and glove sterilizers, is at the end of the approach corridor, so that the sterilizer is available for ward as well as theatre purposes. A small store adjoins this room.

The sanitary and other equipment is of a very high standard both in appearance and efficiency, and includes some ingenious appliances such as the surgeons' hand "basins" and the sterilizing apparatus.

The latter embodies several original features which make it safe and convenient even for installation in the operating theatre itself. It provides an automatic supply of hot and cold sterile water, condensed from steam under pressure. It is the solution, long overdue, of the problem of extracting the steam vapour which is unavoidably present with all sterilizing equipments for operating theatres.

The corridors and changing rooms of the department are heated by radiators, and the theatres and remaining rooms, by panel heating.

Fresh-air ducts, to deliver air at any desired temperature, are provided in the theatres, and extract ventilation ducts are connected to openings in the ceilings of the theatres, sink and sterilizing rooms.



Operations Unit : Wellhouse Hospital, Barnet.] [*By A. Saxon Snell and Phillips.*

The sink room, like the sterilizing room, is planned between the two theatres and has glass screens for ease of supervision. It is fitted with various-sized sinks and a chute for the discharge of soiled dressings into the basement.

Bernard Whistlow, F.R.I.B.A.: An Autobiography: xix

FORGING AHEAD

BY KARSHISH

(H. B. CRESWELL)

I HAD not long set up an office in Nollingborough, where I slogged away at Garston's competition designs in the back room, while the big room cavernously yawned for the draughtsmen that were soon to occupy it, and Binger sat surreptitiously learning hymns in the front, when the heaven-sent bazaar began working its miracles. I had propitiated the fates by writing privately to my friends and acquaintances, telling them of my establishment in practice in the place, but the way commissions tumbled into my lap seemed to me then, as now, no less than miraculous; and I have, naturally, a vivid memory of the first miracle, particularly as it offered me the first chance I ever had of exercising to the full such architectural capacities as I possessed, for—as will have been noticed—my activities, up to this time, had been almost entirely limited to satisfying utilitarian needs of the crudest kind, and also because I have never since had a more embarrassing experience than on that sunny February morning in 1903, when a total stranger walked into my office and asked me to measure him for a house, as he might have asked a tailor to measure him for a suit of clothes.

I have to explain that Garston regarded his office in London as a studio rather than as a place of business, and, as he had no business, this was not so fantastic a notion as may appear. It was all in the picture, as we saw it, that, when at work in Charles Street, we wore French peasant's blouses which Garston had bought in some village in the Landes district, south of Bordeaux. They were of a dull, cherry-coloured canvas, delightfully smocked, and when we had taken off collars, coats and waistcoats, slipped our braces off our shoulders, and donned our blouses, we felt ready to slog till further orders—which was sometimes till two in the morning. I never felt keyed up for real work unless I was fully bloused, and I carried the custom to Nollingborough. Behold me, then, on that February morning, looking like a clown out of a circus, collarless, my braces looped like kicking-straps about my thighs, palettes of carefully rubbed-up colours before me, washing in a winter sky to a large perspective for Garston's current competition, when Binger, startled from his hymns into loss of all presence of mind, flung open the door and announced: "Sir Watkin Bennsan," in a voice like an orderly ushering the General.

I know no concentration more tense than that called for by the work I was then doing. I held a dozen things in my mind; the paper was damped exactly to my liking, and all was going well. To leave the drawing was impossible; I dared not even turn my head.

Bennsan, whose name I knew as that of the owner of a big estate in the neighbourhood, charged into the room like a bull into the arena, and the drawing, now hung in my office, records to this day my consternation at that moment. I blurted apologies and asked my visitor to find himself a chair. A vast, musical, bass voice behind me said pleasantly, in a tone that put me at ease: "Don't disturb yourself; I can wait." The speaker did not, however, seat himself but, as I was aware, amused himself with the drawings on the walls, and afterwards by looking on over my shoulder; but I took my time, and finished the job at leisure before I got off my stool to see a tall, grizzled, military-looking man, in riding cords and grey canvas leggings, and, had I known it, one of the best friends I was ever to have.

We sat to business. Bennsan explained that he called on the introduction of a Mrs. Robarts, who was a social acquaintance of mine. He was a little stiff in his manner, and tentative and hesitating in his talk. He led me, with perfect courtesy, but somewhat with the air of an elder man addressing a younger, to speak of myself and my doings; so that I began to wonder what he had come to see me for. Then, something cropped up in our conversation; there was an interchange of sallies of some sort, and suddenly his manner changed.

"The fact of the matter is," he said, "that I want an architect at once. I thought I should have to go to London for him, but our friend, Mrs. Robarts, told me of you—she has some of your sketches—and your name was known to me through another channel. I would, of course, much rather have a man on the spot. I know you won't let it go any farther, but I hardly myself knew I was going to build before I was besieged by persons recommending one or other of your rivals, here; even my gardener put in a word for someone or other, and two of your fraternity actually wrote and tendered for the work."

He went on to tell me that the building he had in view was a hunting-box for his sister, who had lately lost her husband, and who wanted to live in the neighbourhood. He then said that the "box" would have eight or ten bedrooms, besides servants' quarters and stables, and the question was: could the buildings be finished in time for the coming season, so that Mrs. Tavener, who had gone to Australia, could move in before the end of November?

It was a big undertaking, but I knew Farrar and Oldport would see me through, and I said, yes, that it could be done if he could instruct me, but that there would be no time to send sketches for approval to Australia.

"*That's* all right, then," said he. "Everything is left in my hands. There is one other question I have to ask. You must know that my sister is taking a lease of the house at a rent which is agreed, but which, it is also agreed, shall not be more than seven-and-a-half per cent. of the cost of the work; so, you see, I am tied pretty closely, both ways. Can you tell me what such a house will cost and what your own fees will amount to?"

"I can give you the approximate cost," I said, "when I have full particulars of what is wanted, and have made a sketch design. My own fees are five per cent. on the cost of the work."

He looked down his nose at this, and traced the carpet pattern with the point of his stick.

"Another architect in the place offered for three per cent.," he said.

I told him I had heard of an architect, in another town, who had publicly offered to work for nothing.

"How could he afford to do that?" Bennsan asked.

We looked at one another for a moment before my visitor again became attentive to the point of his stick.

"You say five per cent. is the customary charge?"

"Yes. It is generally recognized and is fixed by our representative body."

"How about extras—expenses?"

"I will give you a copy of the scale of charges; in such a case as this there need be no expenses."

He still did not seem satisfied.

"My fees must not stand between us," I said. "If, when all is done, you think I am being overpaid, I will accept a less sum."

"Fees not to exceed five per cent.—is that what you mean?"

"Yes."

"You will confirm it, of course?"

"Certainly."

My friend (as he was to become) never questioned my fees, which included an extra charge for surveying the site, but, instead, told me that he had formerly been at a loss to understand what architects did to earn their fees; but after seeing how I earned mine, he wondered how they got a living.

Since those days I have found an effective answer to clients who want to know what the exact amount of my fees will be, by telling them I shall be glad to do what they ask if they will say exactly what services they wish me to include for in my charge. When, as is usual, they cannot do this, I myself describe the services covered by the stated fee "for work not costing more than" so much; if they say what they require of me, they commonly make those requirements as small as possible, so that in either case I can name a fee which is as low as may be, and yet I cannot be called upon to do extraneous work without liberty to charge for it.

It is a satisfaction to be rigid in exacting due payment from people who try to avoid their obligations or are distrustful; just as it is unpleasant to be obliged to make extra charges to clients who are fair-minded. I may add, as a small contribution to the study of human nature, that the only trouble I have ever had in getting my fees paid has been with clients who, at the outset, were precise in fixing the amount of them beforehand.

One other indigestible fact Bennsan had to swallow; and I did not—as one is so much tempted to do—withhold the dose until after the sketch plans were approved, nor until the settlement of account, nor even altogether—on the assumption that he was aware of quantity surveyors' fees.

I reconciled him to the payment by explaining that the preparation of bills of quantities was part of the cost of the building; that the work had to be done by someone and paid for, and that building costs were reduced by the system of making one set of measurements serve all firms tendering, and had other advantages; and that the arrangement under which the architect supplied the bills, and was paid therefor by the builder, was usual in the provinces.

These preliminaries having been settled, Bennsan gave me exact particulars of "Quarle Paddox," as the youngest child of my T-square and dividers was to be called. I never built under happier conditions of getting instructions when I wanted them, and being allowed to do my work unimpeded; for, as the buildings were to meet, not Bennsan's own needs, but those of someone who was in the Antipodes, I had no prejudices or predilections to combat, and none of the obstructions which the natural anxieties and indecisions of clients throw in his architect's path. Bennsan was accustomed to look after his own estate, and was a clear-headed, experienced man of affairs; he was amenable to reason. I overflowed with reasons. Accordingly, I had things my own way, and everything progressed famously. It was, however, lucky for me that the plans of the house were settled before I tackled the stables, or Bennsan might not have accepted my judgment so readily. The stables were bigger than the house, and cost nearly as much: boxes for sixteen horses; stalls for four; with most complete and luxurious accessories, and quarters for a married head groom, and a kitchen, mess-room and dormitories for stablemen.

It was the first stable I had ever had to build. I arranged the buildings round a yard with a drive-in under the living quarters; and I was elated by the ingenuity of my contrivance—but I reckoned without my horse. When I was showing Bennsan the sketches, and was pointing out the glaring merits of my arrangements, he broke in:

"Yes, you know, but this won't do at all. If there was a fire it might be impossible to get the horses out; they, and men, too, perhaps, would be trapped. The doors of the stalls are wrong, also. A horse is always approached from the near side: you've got your doors on the off—that would never do; and the half-doors must be barred on the sunny side."

One memorable and joyous circumstance for which this house has always been endeared to me, is that in building it I was able to use a stone and a craft of building which belonged to the village—Earls Lawring—but which had long fallen into disuse. I have never seen similar stone nor similar ways of using it. The church was built of it, with imported dressings of Chilmark, and the older cottages in the village also; but otherwise the quarry, which was close to the site of the new house, had been drawn on only for metalling farm roads or building fence walls, for hundreds of years.

The stone was a hard, compact, white, crystalline lime-stone, and lay two feet below the surface in a bed composed of narrow, superimposed, uniform strata from two to five inches thick, separated by a film of shale, so that the face of the quarry itself looked like walling. The stone could be readily got with a pick, and dressed to a fair face with little waste, with a mason's cavil.

The traditional way of building with it was as coursed rubble laid dry—that is, with the mortar kept back from the face, as is the common usage in Westmorland. There was one old master of the craft in the village, and two proficient wallers whom Farrar and Oldport employed; and by various economies—using oak window-frames and mullions and doing without stone dressings, except at entrances and in chimney copings—I was able to get a tender for the whole—not including roads and fencing, but including terrace, entrance lodge and stables—within the limit of £17,000, which was the mark Bennsan set me.

With its weather-silvered oak, grey-milky walls, and mottled umber stone slates—which were like those seen in Oxfordshire and were to be got ten miles away—"Quarle Paddox" overlooks, from high ground, the valley of the Weddow, and it would be affectation if I did not confess that it is a source of pleasure to me whenever I see it, for such pleasures are the architect's reward when the disparity between his achievement and his aims allows.

I think my own satisfaction in the house is largely due to my having had to discard—for reasons of cost—a much more pretentious design; and to my realizing how much more happily the humbler traditional form fits the site and its surroundings. There was, I always felt, something repulsive in the arrogance of "Lawring Court," Bennsan's seat, which, with its Palladian frontage, stared the countryside out of countenance, from an eminence a mile distant, with cold, aloof grandeur.

All went smoothly till Farrar and Oldport were pressing on with the foundations of both stable and house, and copies of the drawings had been received in Australia; then the cables began to arrive, of which the saving grace (for me) was that it was impossible to make head or tail of them. The only news they conveyed was that, twelve thousand miles away, there was a brain-storm.

These cables—there were three of them in a week—were shown to me by Bennsan with gravity, but no signs of reciprocal consternation. Nothing could, however, be done until the promised — or threatened — letter arrived; and to stop the work, as one cable directed, would have stultified what we were all straining to accomplish. The letter duly arrived, and Bennsan brought it to my office. It was voluminous in disapproval, but scanty in defining any matters for objection; and close scrutiny made it seem that the lady had in part misread the plans and otherwise clearly overlooked consequences which necessarily flowed from the interferences she appeared to desire.

One change, to meet her ideas, was practicable; but when the question whether she wanted it made or not was set forth with great lucidity in a cable to her, the reply suggested either that we had misunderstood her letter

or Mrs. Tavener our cable, and as she had probably kept no copy of her letter, and could scarcely have remembered its contents, no other result was to be expected.

The position was hopeless; there was nothing to be done but press on with the work; and, though Bennsan showed me no more letters, I knew by the close way he questioned me, from time to time, that they continued to reach him, and that he was concerned to dispel his sister's apprehensions and sooth her distresses.

Thus, things went on right up to the time when the lady sailed for England. What would happen when she arrived I could not imagine! Bennsan warned me of the day of her arrival.

"You had better be on the spot," he said; and early on a certain Thursday afternoon, when the buildings had been finished and stove-dried, and nothing but the completion of the roads and certain fencing remained to be done, I dressed myself with care and, with terrible misgivings lest I should have to begin pulling the place down, cycled out to await the event.

Shortly before three, Bennsan, accompanied by a tall, graceful, beautiful and youthful woman, approached from Lawring Court through the strewn beech-leaves of the home park.

Mrs. Tavener was so radiant with enthusiasm that she scarcely looked at the house. She was delighted with everything before she had time to see it, and so grateful to me and anxious that I should know she was, that she could not wait while I explained that the dining-room was not the drawing-room, and that the butler's bedroom was not the game larder.

She was perfectly charming in her wish to show her pleasure in all that had been done; in fact this is the only occasion when the gratification of a client has been even more than I could wish.

The house, which was beautifully built, must have fitted her like a glove, for I never heard that anything was wrong with it; and though I sometimes met her socially, and was in after-years her guest, on occasions, she always spoke admiringly of Quarle Paddox, and never offered any criticism of its arrangements.

Before this house was finished I was busy with five other domestic jobs, none of which was, however, of the size or importance of Quarle Paddox, and the whole of them came to me directly, or indirectly, through that blessed old bazaar—that is to say, if it had not been for the bazaar they could scarcely have come my way. It is true that, profiting by the lesson of the bazaar, I had clapped a bit of ginger under the tail of destiny, and was rewarded no doubt by thus enlivening the jade. Of these devices, and of a great event which, again, grew out of the bazaar, I have next to tell.

NEXT WEEK—XX : AN ARCHITECT'S WIFE

The previous instalments appeared as follows :

May 27.	i :	I am Articled.

LETTERS FROM READERS

A Standard Police Box

SIR,—I have recently been asked to design a police box for the general use in Leicestershire, and enclose a photograph of one of the boxes.

Such boxes are, of course, well known in the various cities and towns of this county, but, so far, are in the experimental stage in the villages.

The object of the boxes in the county districts is to enable a police officer who is provided with quick means of transport, usually a motor cycle, to use them as a place of call on his beat, which will cover a much wider area than on the present system. Each box is provided with a telephone for public use, and first-aid appliances.

If the experiment is a success, several hundreds of such boxes will be required, and my object in writing to you is to

A police box, designed by W. Keay, for the Leicester C.C. (See letter above.)

suggest that the "powers that be" should employ a first-rate man to design a box for general adaptation throughout the country, somewhat on the lines of those designed by Sir Giles Gilbert Scott.

This would seem to be preferable to every county adopting a design of its own, which might be good, bad or indifferent.

It would also be advantageous to the public to be able to recognize the boxes when passing from one county to another. WILLIAM KEAY

Art and Industry

SIR,—In raising the question of an international exhibition as a project for the consideration of Lord Gorrell's Committee, I clearly ran the risk of saying too much and yet not enough. The interest shown by your readers, both architects and laymen, tempts me to trespass again on your space in order to define the suggestion more clearly.

In the first place, I am well aware (as Mr. Gloag must know) of our present shortcomings. At the same time I hold with Mr. Basil Oliver and others that there is already rather more worth showing than is generally supposed, and that there is a great fund of insufficiently used talent to draw on. For instance, our motor-coaches are for the most part admirably designed, and the English easy chair is surely unsurpassed for comfort. Even in backward trades, such as pottery or lighting, here and there excellent work is to be found.

The point, however, I most wish to make is that none of us who have been discussing the scheme during the last year imagines that a worth-while exhibition can take place tomorrow. We cannot dispense with a careful step-by-step policy, in which we can feel our way, profit by mistakes, and give encouragement where it is needed. It is for that reason that I would recommend more use be made of the British Industries Fair, Building Exhibition and similar popular occasions, the Government giving the lead by selecting a "Quality" or "Design" exhibit, which would be an education both to consumer and producer.

I have no room to stress here the importance of having a competent and independent selective committee, nor to enlarge on the possibility of such exhibits forming the nucleus of travelling exhibitions. The main thing is to make a start and in ways that do not involve great expense.

The international exhibition would be a goal for all to aim at, making effort for the more immediate aims worth while, and an objective surely more inspiring than that of "tiding over bad times" or "making every economy." Nor, of course, is any exhibition really a goal in itself. Its purpose would be to inaugurate a finer standard of civilization in every way—in our homes and our clothes, in our cities and our countryside—and to assist in restoring our prosperity as a manufacturing nation by enhancing the prestige of our products.

In conclusion, I would emphasize that in exhibitions two qualities count most for success: boldness of vision and attention to detail. Then for a site I would say Hyde Park and not the derelict corpse of the White City; and for time, I would say, Begin to organize at once. NOEL CARRINGTON

The Pedestal Basin

SIR,—With reference to the letters from "N. C." in your issues for August 19 and September 16, I should like to point out that a fitting is on the market which has a loose base pedestal, the back being left out. This can be placed over the pipes after the basin is fixed, the latter being supported on concealed brackets. H. E. B.

Cavity Walls

SIR,—As you have not so far barred this subject, I would like to reply to "G. E. D.'s" letter which appeared in the JOURNAL for August 26.

There was no faulty construction in the house I instanced, but it was admittedly in a very exposed position. As to whether further precautions may have been needed in the case, I assume that "G. E. D." would not necessarily bar the use of bare sandfaced bricks if they were strongly preferred, nor insist upon the use of rough-cast, which many people abominate.

I do not understand why properly-built hollow walls, if a "sound form of construction," should be taboo on Dartmoor or elsewhere. Some of the cliffland on the south coast is probably fully as inclement as Dartmoor. Some years ago a really eminent architect—now dead—was greatly disillusioned when his 14-in. solid walls, built in cement and coated with rough-cast, on a cliff site, near Dover, failed to keep out driving rain, the rough-cast, by the way, being the best I have ever seen.

In my opinion, an ordinary hollow wall, if built properly under supervision, will stop driving rains, even on Dartmoor. For walls of unusual height the thickness of the work will naturally be increased. It is not generally known that the inner face of the outer skin of a hollow wall will *stream* with wet when it has reached the limit of saturation in a driving rain of long continuance. I, at any rate, am quite satisfied that the safest way of treating the base of the wall is to start the cavity from the foundation concrete, always provided the concrete is thoroughly good. Water can then disperse harmlessly, well below the floor level. It is hard to see anything but harm in raising by 1 ft. 6 ins. or 2 ft. the bottom of a cavity where water can and does accumulate. After all, the quantity of concrete introduced into a narrow cavity for that height makes no great difference either in the bearing of the wall or its substantiality.

W. BEESTON

Birmingham Bank Competition

SIR,—Living a great distance from London, I have just seen the JOURNAL for June 24. I read with great interest the letter of the Rev. E. Benson Perkins on the Birmingham Bank Competition, whose sentiments I wish to endorse most heartily. In mitigation, it must be considered that bank directors are not always most easily amenable to novel ideas in architecture. I can speak with feeling as the architect of several banks.

I would, however, draw the attention of Mr. Perkins to a much more serious case of the adherence to Classic tradition, approved by the R.I.B.A., and figuring in the same number of THE ARCHITECTS' JOURNAL on page 876.

The R.I.B.A. has published an admirably drawn-up programme for the competition for their new premises in Portland Place, and we all look forward to seeing the winning design an outstanding example of European architecture. It is to be hoped that the same criterion which governed the award of this year's medal for street architecture in Wales will not influence the elimination of designs which show originality and a modern conception of architecture, and the selection of a scheme compounded of seventeenth- and eighteenth-century models. Should this happen, I fear we will see public opinion bracketing the R.I.B.A. with the R.A. as the hidebound enemies of artistic progress. "EXILE"

Popular Lectures

SIR,—Although I am glad to hear that the R.I.B.A. and the Architectural Association are running a series of Saturday afternoon popular lectures, to be given by many prominent architects, I do feel it is a pity some of them coincide. For instance, on October 10, at the R.I.B.A., Mr. Clough Williams-Ellis is to speak on "Architecture—What's the Use?" and on the same afternoon Mr. Eric Jarrett, at the A.A., is to explain "The Building of a House." Again, on October 24, "Tendencies in very Modern Buildings" will be Mr. A. S. G. Butler's contribution to the R.I.B.A. series; and, at the A.A., Mr. Edward Maufe will discuss "The Furnishing and Decorating of a House." I do hope that in the future both institutions will collaborate when arranging lectures. K. W.

NEW FLATS IN CHELSEA

DESIGNED BY ELMS AND JUPP

A view of the Paultons Square front, looking towards King's Road. The left-hand entrance gives access to ten flats over the lock-up shops; the right to fourteen flats.

KING'S Road, Chelsea, a long and populous thoroughfare not far from the banks of the Thames, has suffered much rebuilding during the last few years. To an old inhabitant very little of the older property now seems to remain, and this apparently is doomed for early demolition. Chiefly the rebuilding has consisted of new shops and stores, housed in buildings of a more pretentious character than those they have displaced.

One of the latest newcomers is Paultons House, which stands at the eastern corner of Paultons Square, at its junction with King's Road. This building takes the form of two blocks of flats, planned under one roof and each having its own entrance staircase and lift from the square.

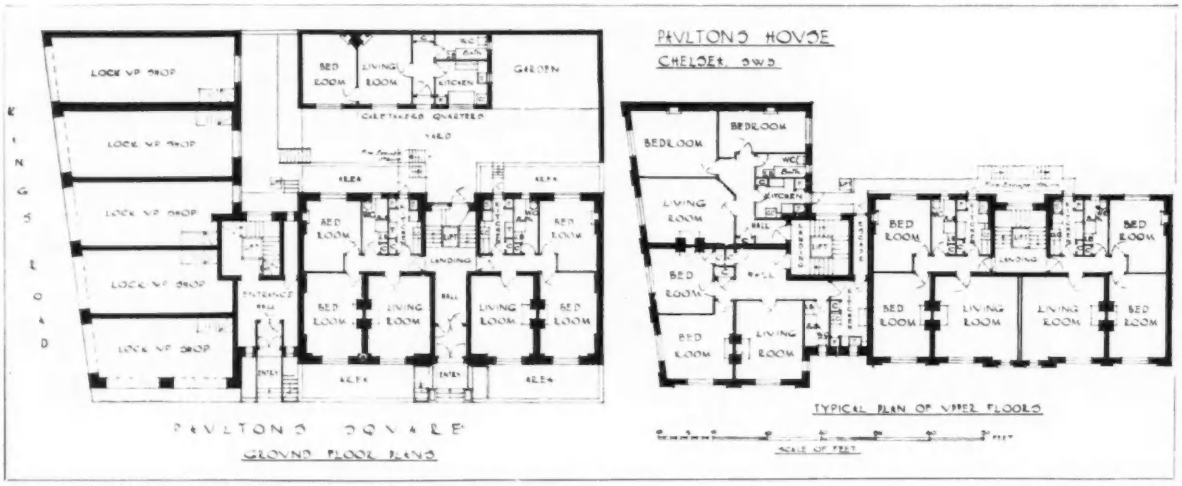
One block, beneath which are five lock-up shops with show-windows facing King's Road, accommodates ten flats; the other block fourteen flats. On every landing are two self-contained flats, each having a living-room, two bedrooms, kitchen and bathroom. Coal fires are installed in the living-rooms, the remainder of the rooms being fitted with gas fires. All the principal rooms are planned to overlook the main façades.

The flats in each block offer the same accommodation, but those in the King's Road end have rooms of a slightly larger area. At the rear of the building are the caretaker's quarters, providing a living-room, bedroom, kitchen and bathroom. Each block of flats is provided with means of escape in case of fire.

The exterior is faced with stock bricks of a pleasing texture, and has dressings of artificial stone. Metal windows, painted a royal blue, are fitted. The roof is of asphalt.

C

The King's Road (left) and the Paultons Square façades. The elevations are faced with stock bricks and have artificial stone dressings. The roof is of asphalt. Metal windows, painted a royal blue, are fitted.



Paultons House, Chelsea, S.W.] [*By Elms and Jupp.*

Plans of the ground floor and a typical upper floor. The building provides two blocks of flats and five lock-up shops. Two self-contained flats are provided on each landing, consisting of living-room, two bedrooms, kitchen and bathroom.

INTERIOR DECORATION

BY JOHN GLOAG

On this and the following page is printed the paper on "The Modern Movement in Design and its Effect on Home Decoration in the Future," read by Mr. John Gloag at the annual conference of the National Federation of Master Painters and Decorators of England and Wales, held at Newcastle-on-Tyne last week.

DECORATION cannot escape a close association with architecture. Before the attempt to consider in what direction interior decoration and furnishing are likely to develop, we must be familiar with contemporary developments in architecture and particularly with the new ideas of design that are changing the approach of the younger generation of architects to the problem of building houses that are fit to live in.

Two things have happened since the year 1880. First, there has been a structural revolution; this has changed the whole traditional method of putting up a building. Secondly, there has been a war; this has changed the whole traditional attitude towards the cost of building.

The structural revolution has made it possible to hang thin curtains of fabric over a steel skeleton. The wall which formerly enclosed and supported the building is no longer the dominating part of the structure. Buildings used to be like shell-fish, with all the hard, resisting structure carried externally. Now buildings are like vertebrates with an internal skeleton, which is the really important structural part of them, over which is stretched a skin, which is the wall.

The structural revolution has also made it possible to erect buildings very quickly. It has also helped to alter the point of view about the desirability of permanence: this is where the structural revolution begins to be associated with the new economic attitude towards the cost of building.

Counting-house Patronage

Today a site in a city or a suburb is acquired. So much money is to be invested in that site. Building upon it becomes a matter of investing so much money that will return so much interest in rent, and if it represents an adequate return on capital over a period of, say, fifty years, nobody has much interest in the building after that time as a building, and its replacement by something more profitable may be desirable from the economic point of view.

What may be termed the counting-house patronage of architecture favours impermanence in building, and the structural revolution has helped to make impermanence a safe reality. Hitherto, an impermanent building meant something blatantly temporary: something of wood, something uncomfortable, something that was often unsafe. Now a modern building, that is paying good interest on the capital invested in it—maybe an immense hotel or a huge block of flats—represents the architecture of the moment rather than the architecture of the future.

"Fitness for Purpose"

The economic situation following a prolonged period of organized destruction and waste, such as the war represented, has created an interest in functional fitness and has focussed a lot of attention on dealing very simply with architectural problems and with problems of house equipment. Before post-war stringency put a cutting edge on it, the cult of simplicity in furnishing and decoration and in domestic architecture had been rather self-conscious, not to say precious. When there was no money available for ornamental trimmings, a good many people, including a number of ardent young architects, discovered a virtue in simplicity.

"Fitness for purpose" was originally invented as a sort of antidote to ornamental congestion and design that had existed solely for the sake of decoration. In the hands of the modernist architects of Europe, who were compelled to practise austerities of design as a result of money shortage, and who were also experimenting with all kinds of new materials, "fitness for purpose" became in itself an end. Thereafter began the rise of what has been called functionalism. The results, among the bright young modernists, are very interesting. Here are some of them.

At the moment, functionalism is still in its noisy babyhood. It is making a tremendous lot of noise about something that is very obvious. It has dramatized the fact that anything that is made, or any room that is designed and equipped, must be fit for its job. Childlike, the more enthusiastic advocates of functionalism insist on scrapping everything that has been done before in the way of interior decoration and furnishing, and the logical development of their ideas is a little startling.

A Flat of 1960

One can visualize a flat of 1960 (always supposing that functionalism has not suffered a decline and fall); and in this flat one would expect to find two or three rooms, pleasant, airy, well-lit and efficient rather than comfortable. In the living-room, for example, I should expect to find a column about four feet in diameter ascending from the floor to the ceiling. Round this column at a convenient height would be a circular table. Above the table would be a little collar with different coloured buttons in it. A little bit higher, about the level of a man's eyes if he were sitting at the table, would be a series of dials. There would be a clock, a thermometer, a radio dial, a telephone dial and other dials concerned with the services with which this flat of the future would be connected. The whole of this fitting would be in polished rustless metal. The walls of the room would be of smooth glass, and by pressing any of the little coloured studs of the central column, the colour of the walls could be changed at will by concealed lighting, which would flood their glazed surface with the tone appropriate to the mood of the occupier. There would be an enormous range of these tones varying from a rich rosy hue, suitable for the young man or woman who had just fallen in love, to a deep dull blue reserved for quarter-days.

The advantages of being able to change the decoration of any room merely by light and by having glass walls is obvious and may conceivably be exploited in the future. Daylight would come into this room through a huge unbroken expanse of window which would occupy one wall completely. The window would, of course, be filled with glass that admitted a very high percentage of natural ultra-violet radiation. Heat would radiate from the lower part of the central column, the services column that has already been described.

Independent furniture would be confined to combinations of metal framework and flexible fabric; the finished humanized descendants of the early experimental steel chairs.

The bedroom would have a hammock-like apparatus in place of the old-fashioned bedstead, something that could be rolled up like a blind in the daytime and fitted into a slot in the wall. Everything would be standardized.

Austere Tidiness and Disciplined Home-life

Bathrooms would be all alike: convenient, luxurious, incapable of being rendered untidy by the splashing of even the most wilful wallower. In every apartment—and most people would probably have three rooms, bedroom, bathroom and living-room, for everybody would feed in restaurants—there would be a perfect adaptation of means to an end. Perfect tidiness: concealed well-ordered cupboards, where one's possessions were card-indexed. It is to this appalling condition of austere tidiness and disciplined

home-life that the functionalists, the bright young people of mod ernist architecture, are directing us. Fortunately, human beings insist on retaining their human likeness in spite of the mechanical conveniences that are periodically invented for them. The harsh doctrines of the present-day inhumanists will be softened when their application becomes general, when they are brought into contact with real life. All the violent experimental work that is being done today is very good for design, both in architecture and in decoration. It is shaking people out of that long, stuffy sleep in which they dreamed of nothing but styles.

It took the Greeks many centuries to humanize their structural ideas. They were working with stone. We are working with steel and with an infinite number of extremely tractable and intensely interesting materials.

The humanizing process should not take us so long : although one may be forgiven for believing that the functionalist flat of 1950 or 1960, which has been lightly sketched a few minutes ago, may become a horrible possibility. " Fitness for purpose " in itself is a negative creed. It is not enough. The homes of the future, like the homes of the past, must be made fit for humans to live in. They will be.

ARCHITECTURE AS A DEMOCRATIC ART

SIR BANISTER FLETCHER, PP.R.I.B.A., in a paper on the above subject, read at the twentieth annual conference of the British Commercial Gas Association, at Exeter, on Monday last, said : Architecture, of all the arts, was the most sensitive to the changing influences of time, place and material. It demanded the co-operation of the public in a greater degree than painting, or sculpture, or music. A genuine artist, if he was inwardly convinced of his genius, might produce masterpieces which, though they were derided in his own generation, would be admired in the next. A musician might compose symphonies which only he recognized as divine. But an architect could not build churches for which there were no worshippers, or houses which no one would live in. It was for this reason that architecture provided a visual history of the shifting fancies and ideals of mankind. The comparison between a Roman amphitheatre and a Gothic cathedral, between a Renaissance palace and an American skyscraper of steel and concrete, revealed, as nothing else could do, a revolution in the social habits of Western man. All successful architecture, whether it took the form of a mediæval fortress or a modern railway station, was an expression of the ideas and aspirations of its time and country for everyone to see. That was why Bishop Creighton said that " architecture is the most democratic of the arts : it goes literally into the market-place, it is for everybody, and rich and poor alike may enjoy it."

He agreed with that saying, but he thought there was another sense in which architecture today might be regarded as a democratic art. It was true that any labourer of æsthetic inclinations could look on St. Paul's without stint; but if he was forced to live in a squalid slum, he would probably reflect that the pleasures of architecture were strictly limited.

He thought that architecture, as an expression of true democracy, must be found in the homes of the people, and especially of the townspeople, as the spread of education and the improvement of material conditions made them discontented with the ugliness of our meaner streets. It was the concern of the architect today to see that not only " the stately homes of England," but her cottages and tenements as well, should show the influence of the English tradition in domestic architecture.

The Opportunities of Today

As in the past ten years, there would for some time to come be great opportunities for the domestic architect to erect houses which, whilst they were thoroughly modern in point of labour-saving and hygiene, did not detract from the pleasantness of the region in which they were set, but add something to its natural beauty.

The post-war housing shortage, the general demand for small and easily-managed homes, and the southward movement of industry which was a feature of our times, had led to immense schemes of town-planning, which would have been inconceivable before the war. Two months ago the King and Queen visited a thriving town in Essex which ten years ago was an expanse of green fields without a single cottage. The Great Fire, which left half of London in ruins, gave Sir Christopher Wren the opportunity of putting his designs into practice. The housing needs of the present day, if the parallel was not too exaggerated, afforded us a similar chance of profiting by the mistakes of the past. They put a responsibility on the whole community.

The Mistakes of the Past

Some years ago, in speaking before the International Congress of Architects, he pleaded that architecture should be given a more prominent place in general education. For the public at large were the patrons of architecture; and as an English statesman said after the passing of the Reform Bill : " We must educate our masters." Unless there was a genuine widespread desire for better architecture in the new homes that were now being built, we should repeat the mistakes of the past. " With a knowledge of architecture," he once said, " each street is a picture gallery which everyone may enter." Yet some of the poorer streets of English towns were only rogues' galleries.

In nineteenth-century England, when the " Battle of Styles " was being fought among revivalist architects, the grim streets of our industrial towns, built without regard to comfort, durability, or grace, were spreading on every side without proper guidance as the need arose and as builders began to realize the commercial possibilities of the results of mass production. The dwellers in these houses, though they might complain bitterly of the inconvenience to which they were exposed, were gradually inured to ugliness and even came to regard it as natural.

There was much truth in the saying that if you could not get what you liked, you would be forced to like what you got. Fortunately, with the undeniable improvement in general social conditions, a new spirit had grown up of intolerance towards unsightliness, discomfort and cheap pretence in domestic architecture.

Artists and Town Planning

For such developments were fraught with obvious dangers. The new opportunities for economy, convenience and beauty brought with them new opportunities for their opposites. Parliament had proposed to confer upon all councils the power to control the " elevations " of buildings as well as their material, without any evidence that those bodies were competent to decide upon such matters. It was therefore encouraging to see such proof of strong public feeling as Sir William Llewellyn's letter to the Prime Minister, which suggested that " men of artistic vision and experience " should be consulted by the local authorities, not only on the elevation of buildings, but on all matters on which planning would affect the looks of the region.

He was glad to say that many of the most important town-planning committees referred all their building plans to the joint advisory panels of the C.P.R.E. and the R.I.B.A. It was a healthy sign of the times that the expansion of our towns should be controlled in this way. Architecture could be considered a democratic art only when the desire for pleasant surroundings was satisfied in the homes of the poor as well as of the rich, and when the convenience of the cottager was studied in relation to the appliances which modern invention had made possible in every house, large or small.

Sir Banister then discussed the question of how far the use of gas met the needs of today as regards labour saving in the house and how it might best be applied.

THE SPECIFICATION WRITER

Electric Light in Architecture

BY R. W. MAITLAND AND HOWARD ROBERTSON[1]

THE architect today is conscious of the importance of artificial light as a contribution to the final effect of the interior, also of the fact that the light source is effectively controlled when housed in the structure; and as a consequence he is finding that considerable forethought is required in considering the lighting at an early stage in his design.

In the past, little consideration was given to lighting during the design and in the process of construction; the electrical contractors were generally called in after completion to instal the various fittings, with the result that little or no effect was produced other than the provision of so many footcandles. The aim of modern lighting is to eliminate the excessive use of small suspended light sources, and to distribute the light over comparatively large areas, with a resultant low surface brightness. To this new viewpoint the 1925 Exhibition at Paris made a substantial contribution. It marked the final breakaway from the converted gas candelabra and suspended fittings which were found by the artist to be inadequate to meet his requirements; and, due to the efficiency and flexibility of the modern gas-filled lamp, the arrangement of light sources with safety and convenience in any position in the interior became a practical possibility.

The engineer, as a result, has found himself faced with the task of setting aside his ideas of lighting in terms of footcandles only, and is now obliged to consider quality of light at least as much as quantity. He must be in a position to inform the architect of the different qualities of the diffusing and reflecting media available, of the position of the various light sources, also of the size and position of the reflecting equipment, so that the architect may leave sufficient space in his structure to house them.

During the past few years many architectural lighting designs have been executed in Europe. One is conscious that lighting is also being introduced into buildings as a novelty, with a resultant tendency to create unrest in interiors and exteriors; but this is a passing phase inseparable from experiment.

[1] Extracts from a paper read at a recent session of the International Illumination Congress.

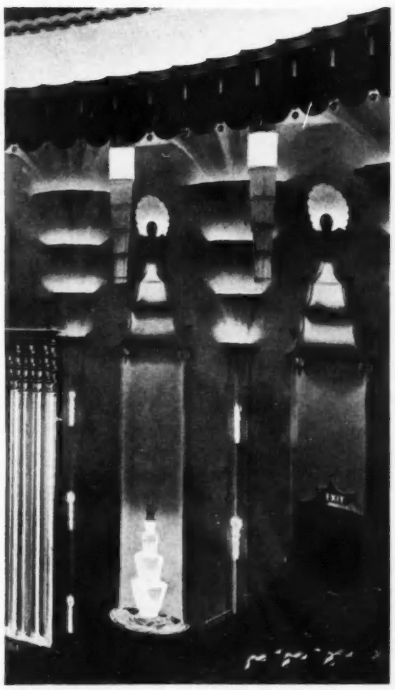
We are concerned with two definite principles in lighting :

1 : Light as an illuminant.

2 : Light as a combined illuminant and element of decoration.

In the former case, the utmost simplicity is desirable, an intimate and discreet incorporation in the architectural form. This branch of lighting demands the greatest technique, and is the most difficult to handle. The best examples of this kind are perhaps found in the employment of indirect lighting.

The second form of lighting, where the elements are in themselves decorative, and stressed as such, gives infinite scope to the designer. The old-fashioned crystal chandelier was an important architectural element in the eighteenth century, and it is possible that modern fittings of today will play a similar function; but danger lies in confusion of thought as regards the precise purpose of the fitting. Frequently fittings of this type used for purposes of illumination are inefficient through too great a fantasy and extravagance of form and design, and fittings primarily designed for decoration are not given a suitable architectural setting. The solution is for the architect to visualise his lighting elements in the initial stages of his design.



New Victoria Cinema, London. [*By W. E. Trent and E. Walmsley Lewis.*

"One is conscious that lighting is being introduced into buildings as a novelty."

We have yet to reach satisfaction in respect of well-designed and practical fittings for domestic rooms, offices, shops, etc., and it is easier to find amusing decorative fittings than simple and functional fittings.

INDIRECT LIGHTING

The question of placing the light sources in relation to other parts of an interior is naturally one involving many factors. It is often held that where indirect light covers the whole surface of the ceiling it tends to produce a dull effect and makes interiors appear flat, and that additional direct light sources could well be introduced to give more vitality. This is perfectly true, but, if indirect light is correctly applied, it is suggested that this phenomenon could be overcome. For instance, if the unit be so localised that the area of light is confined to a definite area, this being a good deal less than the total ceiling area, the light source assumes a more directional character; at the same time the soft and pleasing quality of the indirect lighting system is retained, and greater scope is also given in the designing of the ceiling itself.

Another method of lighting with the indirect system is that of introducing floor standards incorporating the necessary reflecting equipment, and arranged to harmonize with interior design. This method has not, until recently, been extensively used in this country, but Sweden, Denmark, France and the United States of America offer examples. It has the advantage of a good wide distribution and general diffusion, but is apt to suffer from monotony and requires local assistance. It is felt that, if the design of the interior were more definitely designed for diffused light, this phenomenon would be overcome, and this system has interesting possibilities in the incorporation of the lighting source in wall recesses, in furniture, etc., particularly in hotel and domestic interiors.

SEMI-INDIRECT LIGHTING

This system offers endless possibilities, and is well illustrated by the glass cornice. Here, again, the lighting should be controlled and confined as regards the lighting area. The glass should be of a good diffusing quality, and may well provide interest in its design. Certain makes of Italian, French and English glass are interesting from this point of view; they are dense and not too opaque, and have good diffusing properties. It is suggested that the best effect is obtained in this case when the direct light is of less intensity than the light contributed by the indirect lighting. In a continuous cornice the points of light are sometimes covered with darker glass.

Strand Palace Hotel, London, W.C.] [*By Oliver P. Bernard.*

"The field of combined direct and indirect lighting has, up to the present, only been partially explored ; one point is clear, however, namely, that wherever indirect lighting is employed it should have an intimate connection with the architectural form."

DIRECT LIGHTING

This system may be divided into two types :

1 : *Shielded Lamp.*

Laylight, or suspended glass panels. (Lamps behind diffused glass.)

2 : *Exposed Lamp.*

a : Pear-shaped lamp.

b : Tubular lamp.

Shielded Lamp.

A criticism of large numbers of the fittings at present available under the first heading is that they are either æsthetically unsatisfactory or else too fragile and complicated in their construction; improvement on this score is, however, gradually being effected.

One of the most recent departures in modern fittings design, which is being followed to a considerable extent in this country, comprises the use of glass tubes in the form of suspended glass panels, as used at the Trocadero Restaurant. The effect is similar to that of prismatic glass, which diffuses the light source over the glass area and has comparatively good efficiency. A similar effect is obtained from an Italian glass which is made in sheet form or in the form of a drum, and with which it is possible to obtain a uniform brightness over the glass surface without a great loss of efficiency.

Exposed Lamp.

a : Ordinary bare lamps, arranged in clusters to form fittings, are sometimes used, but such a method requires the lamps to be placed well out of the line of vision so as to avoid the excessive brightness of the exposed lamp. The inability to control the light effectively gives a limited scope of application to this method.

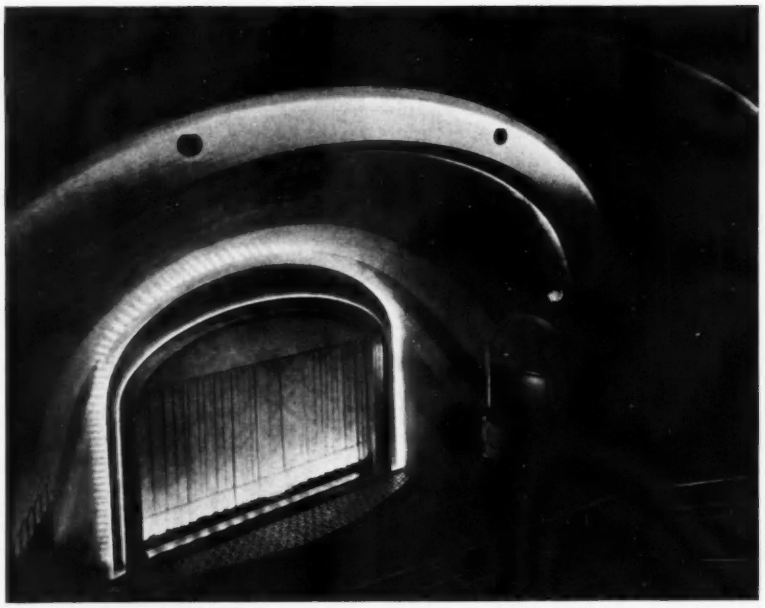
b : The tubular incandescent lamp can be used, the most successful examples being found in the opalescent type, since their brightness is not excessive. The possibility of grouping a number of these lamps in the form of a decorative design or making use of them for vertical and horizontal lines of light is extensive, and the increase in their use in this country is noticeable.

DIRECT AND INDIRECT

This method of lighting has many advantages, one of which is that it enables the two systems to be separately controlled. An excellent example of this was found in the original Salle Pleyel, Paris, where the ceiling was lit by powerful flood lights from the floor. The ceiling itself has star-shaped openings, and lights are projected through these apertures to the floor. Further, the effect of arranging these two systems side by side makes it possible to produce an interesting change in the quality of light.

The field of combined direct and indirect lighting has, up to the present, only been partially explored; one point is clear, however, namely, that wherever indirect lighting is employed it should have an intimate connection with the architectural form.

We have yet much to study in respect of the question of indirect lighting from an economic and utilitarian standpoint, for this system has the advantage of possessing a quality of light that is both pleasing and restful. There are also many other possibilities, one of which is the architectural importance of arranging the lighting between one room and another so that an effect of continuity is obtained. This question has, up to the present day, received little consideration. Climaxes, contrasts and harmonies are all possible; and to this end it will be necessary for the architect to collaborate with the engineer and to prepare ensemble-illumination-studies of his design on the



Cambridge Theatre, London, W.1.] [*By Wimperis, Simpson, and Guthrie.*

"Another important consideration, not yet fully explored, is the effect of acoustic forms necessary for theatres . . . . these do not necessarily result in shapes well adapted to successful lighting, to achieve which it may be reasonable to break up the ceiling in such a manner that the whole surface may be lit through successive steppings."

Berkeley Hotel, London, W.1] [*By Stanley Hall, and Easton and Robertson.*

"The possibility of grouping a number of tubular lamps in the form of a decorative design or making use of them for vertical and horizontal lines of light is extensive, and the increase in their use in this country is noticeable."

same basis as ensemble-studies for decoration. These studies are rarely made by the architect today, who is lacking in the necessary technique and data.

Another point in modern lighting which has not yet been fully explored is that of procuring a sense of separation between one room and another.

The simplest form of separation is found where different intensities of light are used between one room and another, or by the difference in colour, an example of which is to be found at the Mayfair Hotel in the adjoining ballroom and reception room.

In every case of this kind it is important to consider the approaches and connections so that, on leaving one apartment, there is a sense of adequate preparation for what is to come. The effect is primarily a psychological one and constitutes an architectural aim in itself.

Another important consideration, not yet fully explored, is the effect of acoustic forms necessary for theatres, cinemas, concert halls and buildings of a similar type; these do not necessarily result in shapes well adapted to successful lighting, to achieve which it may be reasonable to break up the ceiling in such a manner that the whole surface may be lit through successive steppings. The various materials employed for the purpose of sound reflection and absorption are also important factors to the architect and lighting engineer.

EXTERIOR LIGHTING

Exterior lighting may be considered under three headings :

1 : Floodlighting.

2 : Illuminated windows, lighting from the inside.

3 : Applied lighting in the form of applied boxes or screens.

1 : Floodlighting.

Floodlighting is generally applied to buildings in two ways; either the façade is totally floodlighted to present a daylight appearance, or else only portions of the façade are floodlighted. Up to the present day, only the actual question of securing the necessary illumination has been considered, and many installations suffer from careless placing of the units. They are frequently insufficiently concealed, or provided for, and for this reason the daylight appearance of the installation is often unsightly.

When floodlighting is considered as part of the general scheme of the building, it will be found that two methods are generally adopted, one where the floods are concealed in a portion of the building itself, as at Olympia, the other where each unit is housed in a specially designed decorative sconce on the building face, similar to that at Drages, in Oxford Street. It is, however, very necessary that the elements and modelling of the building front should be designed in such a manner that the necessary light and shade will produce an effect, and this effect must be visualized and should not be an after-thought.

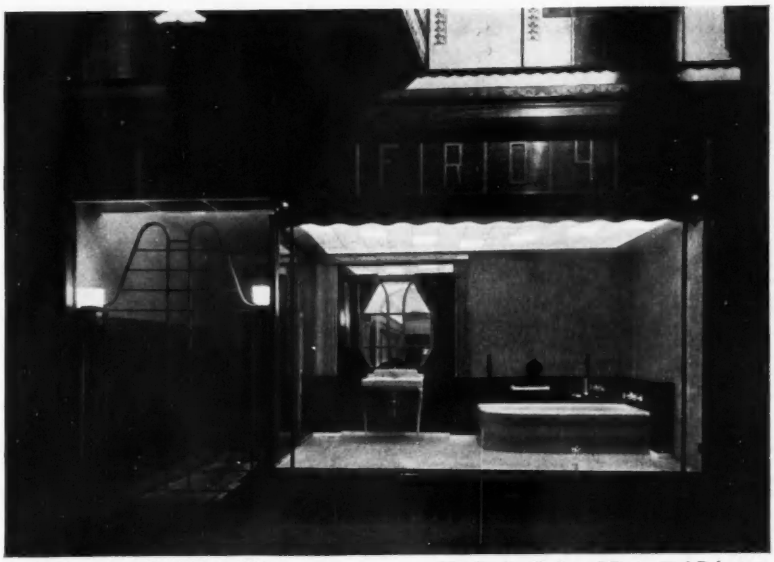
It is suggested that the concentration of floodlighting on the upper attics of a building, etc., where architectural interest is not justified as a general rule, does not show the possibilities of floodlighting to the best advantage.

2 : Illuminated Windows

The use of light projected from the inside to illuminate the windows or walls of the building has extensive possibilities. They have an advertising value to the cinema owner, the shop-keeper and restaurant proprietor, etc.

3 : Applied Lighting in the Form of Boxes

In this method, boxes in the form of panels are introduced on the building face forming part of the general design of the façade. They require careful designing if the daylight appearance is not to be unsatisfactory.



Froy's Showrooms, Bond Street, W.] [*By Stanley Hall, and Easton and Robertson.*

"The use of light projected from the inside to illuminate the windows or walls of the building has extensive possibilities. Examples of this kind are to be seen in England, and have an advertising value to the cinema owner, the shop-keeper, etc."

LITERATURE

THREE PLANNING REPORTS

THE passing of the Town Planning Act on April 9, 1925, imposed the duty on the Council of every borough or urban district with a population of over 20,000 of preparing a town-planning scheme. This scheme was to be submitted to the Ministry of Health before January 1, 1929. The Local Government Act of 1929, however, extended the time until January, 1934, and in certain cases a still further extension up to December 31, 1938, was allowed for.

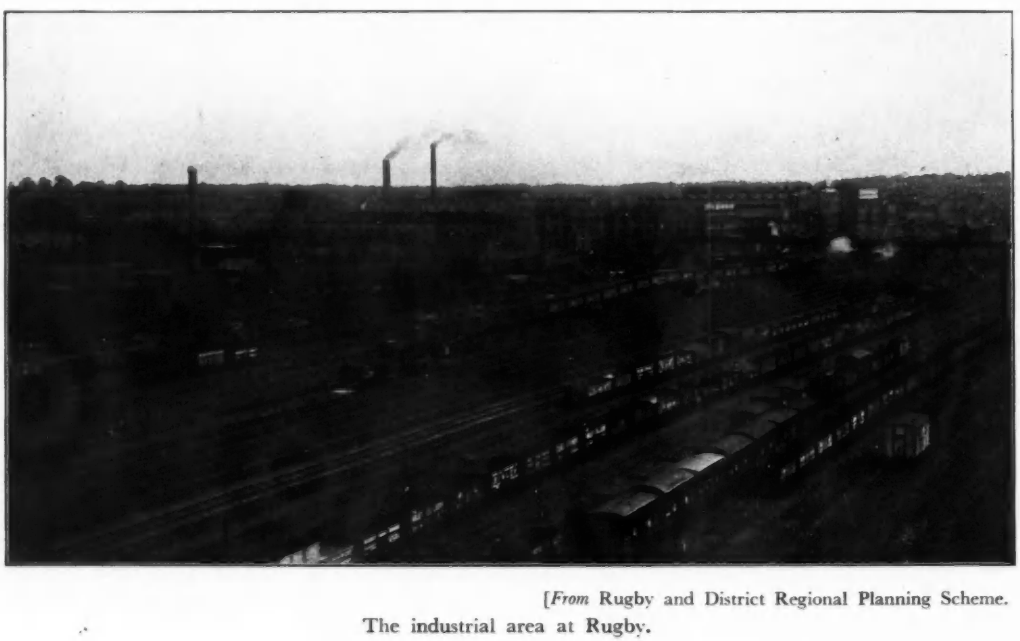
One of the worst features of post-war land development has been the uncontrolled exploitation of small estates by speculators whose only aim is to develop their holding intensively, and then to disappear with the profits. Regional planning and zoning seeks to control such haphazard methods, and by taking long views to reserve areas for garden cities and satellite towns which shall become, in time, assets rather than liabilities to the present town.

These three reports are typical of three different aspects of regional planning. One is a seaside borough, one a highly industrialized area, and one a typical provincial town. Each has its own particular problem to work out and its own special evils to guard against.

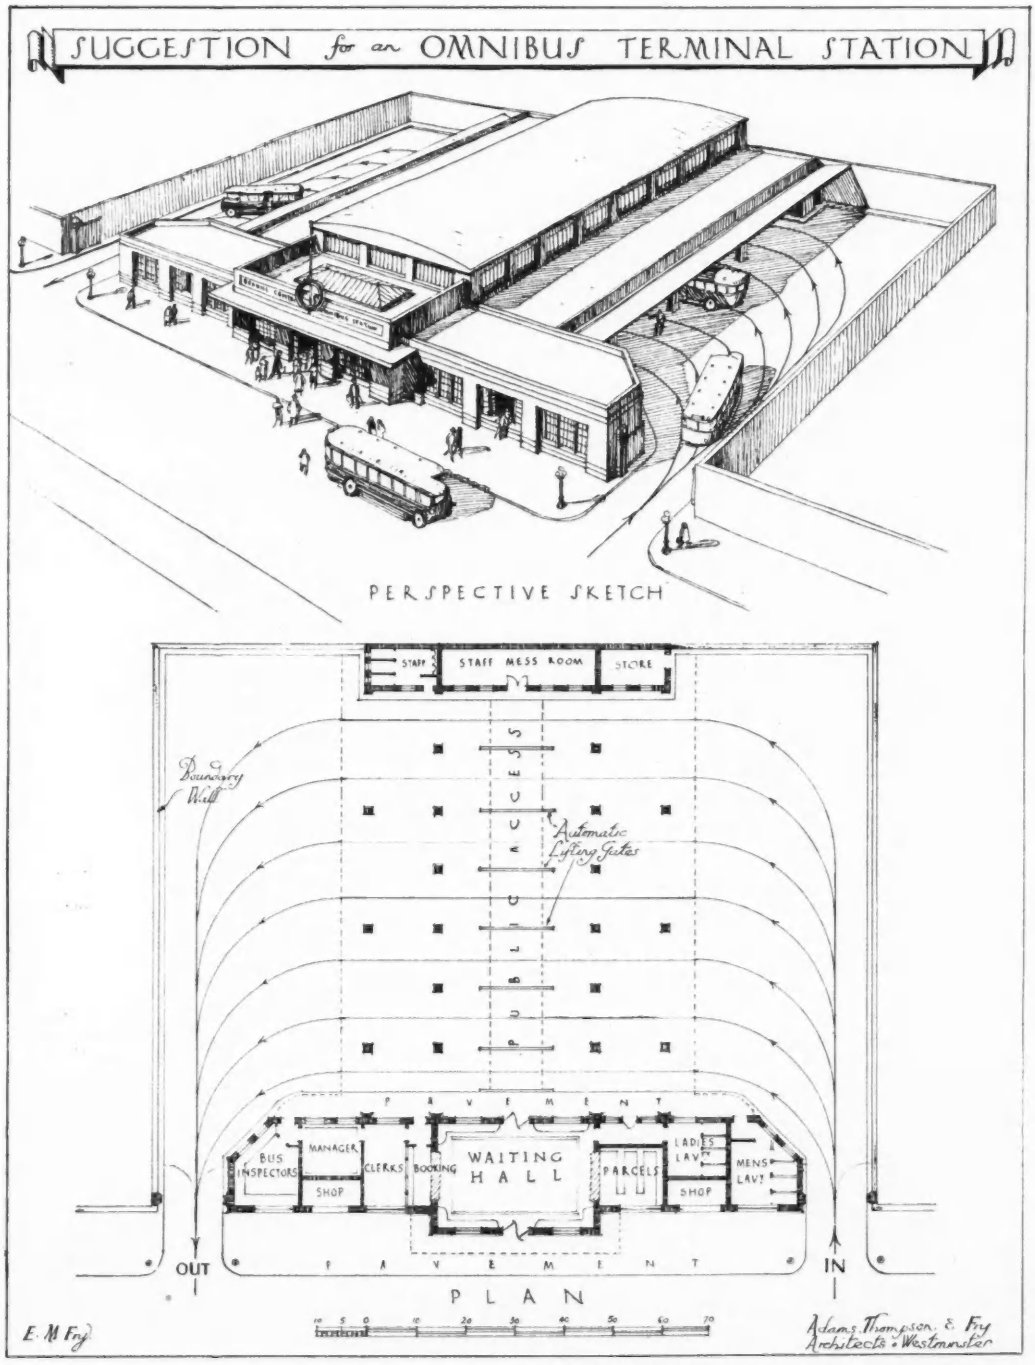
The Borough of Bexhill has laid down a programme for the development of a town whose main source of prosperity depends upon the attraction and entertainment of visitors. The focal point of the scheme is the sea front, with a swimming pool, bandstand, and concert hall. The immediate area behind these is reserved exclusively for hotels, boarding and apartment houses; the residential district is still further removed from the sea behind the railway, a peculiarly awkward feature which cuts the town in half from east to west. All this residential area has been zoned, the density of the houses being regulated by the style already existing in different districts. It is proposed to combine the railway stations, and group in the neighbourhood the civic and main shopping centre. The road proposals are excellent, the aim of the report being to provide easy access to the town, at the same time avoiding unnecessary through traffic, and to this end the main Southampton–Dover road by-passes the town. The importance of the motor coach traffic is not overlooked, and a proper coach station is included, though one trusts that regulations will be made to keep both these and the local motor-bus services away from the sea front. The Committee have reserved large tracts of "sea levels" to east and west as agricultural land and have provided for the extension of the esplanade up to the golf course. The amenities are thus, it seems, adequately secured. Some of the designs of proposed seats, shelters and ornamental features could be improved, and one hopes never to see in being the lamp-posts here illustrated.

To leave the "Sunny South Coast" for the North Tyneside Regional Planning Scheme is to enter a sterner world. The area under consideration comprises the city of Newcastle, three boroughs, nine urban districts and one large rural district, in all, nearly two hundred square miles of the most highly industrialized district of Northumberland. The Tyne forms the southern boundary, and it is clear that here the question of paramount importance is one of communications. The report sets out a very comprehensive list of recommendations for new arterial roads, and the widening of those existing to cope with heavy commercial vehicles. The crossings of the river have been carefully considered, for the south Tyneside is also an industrial area. The cost of great bridges is enormous, and suggestions on this head are not lightly made. The new bridge proposed to be thrown across the river at St. Anthony's will cost nearly one million pounds to complete. The area under consideration being so large, it has not been thought advisable to do more than indicate the various zoned areas allocated to residential and industrial districts, but the Committee wisely recommends that the proportion of open spaces shall be one acre to every 1,000 inhabitants, and has so placed these open spaces that no residential area is more than half-a-mile from a recreational space.

The Rugby Report comprises the Rugby Urban District and two rural districts, including some 113 square miles of typical English countryside. The population is largely agricultural, the only industries of any size being in Rugby itself. The town-planning has,



[*From* Rugby and District Regional Planning Scheme.
The industrial area at Rugby.



[*From* Borough of Bexhill General Development Plan, 1930.

An indispensable feature of a modern seaside resort: the omnibus terminal station.

therefore, been confined to the immediate neighbourhood of the town, where a density of twelve houses to the acre is the highest allowed. The proposal to treat the whole rural district as an agricultural zone is a bold step, but undoubtedly a right one, for this will prevent the exploitation of bungalows and shacks. The only large road in the district is from Coventry to Daventry, but as road traffic may increase, the road proposals are chiefly concerned with safeguarding routes which, in the future, may become important.

One of the best sections of this excellent report deals with the preservation of amenities. A learned judge has defined amenities as "pleasant circumstances or features," and the photographs show that this part of Warwickshire is rich in such features. The report urges local authorities to make full use of their powers in controlling advertisements and filling stations, to preserve existing trees and to carry out the no less necessary duty of planting new trees by the sides of the arterial roads. A sense of humour enlivens this book and some of the

photographs might be used for a "Cautionary Guide to Rugby" if the Joint Town Planning Committee had not already shown themselves awake to these horrors in issuing this report.

The Rugby authorities suggest a standard of open spaces of at least five acres per 1,000 of the population, as compared with the one acre per 1,000 of the Tyneside report. Coombe Abbey Park, lying on the extreme western boundary of the region, is recommended to be retained as an open space. If such a spot, so near to the town of Coventry, were allowed to be exploited for building, it would be a disaster, and it is to be hoped that the Coventry scheme for town-planning will be pushed on, for the park is nearer to that city than to Rugby.

All the reports are illustrated with good maps, plans and photographs.

SOUTH WALES ARCHITECTS' YEAR BOOK

THE *Annual Report of the South Wales Institute of Architects for the Year 1931–32*, recently issued, marks the forty-first year of its publication. It has been edited by Mr. Ivor P. Jones, A.R.I.B.A., the hon. secretary. The membership of the Institute now totals 282, made up of the following: Central branch, 165 members; Western branch, 80 members; Eastern branch, 37 members.

Mr. T. Alwyn Lloyd, F.R.I.B.A., the Past President, in an address given at the conclusion of his year of office (1930–1931), printed in the *Report*, states that it had for some time been his hope that means might be found for establishing a travelling studentship for competition, annually or biennially, among their younger members. It seemed to him to be the one thing lacking in their training of young architects. Speaking from his own experience, he knew of nothing that would be of greater benefit to the student at the end of his course, or to the assistant recently started on his office career, than the opportunity of three or four weeks' sojourn abroad for the purpose of architectural study. He suggested that they should consider utilizing some of their funds, or make an appeal to members and friends of the Institute, to enable a travelling studentship of a modest sum to be awarded.

The book also contains an article on the R.I.B.A. South Wales Architecture Medal and a photograph of the building, selected by the jury as the best in South Wales for the years 1928–30; annual reports of the three branches and a complete list of their members; suggestions governing professional conduct and practice; scale of professional charges; quantities for small jobs; and a photograph of the President, Mr. J. Herbert Jones, F.R.I.B.A., accompanied by a brief description of his career.

Forty-first Annual Report of the South Wales Institute of Architects, 1931–32. Edited by Ivor P. Jones, A.R.I.B.A. Cardiff: Western Mail and Echo, Ltd.

QUESTIONS THAT ARISE

French Polishing

W. H. writes: "*I should be pleased to have your expert's advice regarding the best treatment for the oak-work of a shop-front. My experience in the past has been to have such work french polished and then given a coat of best quality copal varnish. I was strongly advised by a shopfitter, however, not to cover with varnish as it would be necessary, at some future date, to scrape off the varnish and repolish, whereas polishing every year would be a better and more economical treatment. The polished work, after less than three months, is becoming bare and discoloured in places, where subject to friction when washing windows, etc. Building operations have been going on, and dust, etc., may possibly have played a large part in impairing the condition of the polished oak, but I am of the opinion that varnishing after polishing would at least be the best treatment for the lower part of the oak front.*"

There is no question but that a good hard varnish finish is much more durable than french polish: but the latter would last much longer than is generally the case today if it were done in several operations, and well bodied up to provide a good hard film of shellac (the objection of too brilliant a gloss can always be overcome by cutting down to wax polish finish).

French polish, however, is bound to succumb to heat and damp, and a better, though rather more costly, method is to varnish on open grain. Several coats must be applied, each well rubbed down when hard. French polishing every year keeps a front smart, but it is seldom that the surfaces are properly prepared, which is essential to durability; then, again, the best shellac is no longer obtainable for polishes, and that means the quality is not what it was.

J. C. R.

Defects in a House

F. F. C. writes: "*A client of mine recently purchased a house which now shows defects, and is anxious to know whether he has sufficient grounds for legal action against the seller or builder, or both. Briefly, the case is as follows: My client purchased his house about two years ago (immediately after the building had been completed) from a utility building society.*

The house is semi-detached, and contains six bedrooms, with bathroom and w.c. My client recently found a persistent smell of dampness around the entrance hall, and on removing the linoleum he found the flooring boards in a partly-decayed condition. He investigated further and lifted one of the flooring boards, when he discovered that no concrete had been laid over the site, and that the soil under the floor was saturated with water. He attributes the saturation to a down pipe on the wall just outside, which had not been connected to the drains, but discharges into a sump at the base of the wall. The building society had no employed architect, and my client would, therefore, like to know if he can legally compel the society or the builder to make good the defects. Personally, I consider that he has no case for action; but I would be glad to have your expert's opinion on the matter."

It does not appear from the facts that the purchaser inspected the house before he entered into the contract.

A purchaser is not bound to inspect the property before entering into a contract, but if he does not do so he purchases the property at his peril and he cannot rescind the contract upon discovering defects that he might have found if he had inspected the property.

The principle of law as expressed by the words *caveat emptor*—let the buyer beware—applies to the sale of land.

The terms expressed in the contract might throw valuable light as to the rights of the purchaser to obtain compensation if the defects could not have been ascertained by inspection, but as the contract is not before me it is impossible to express a final opinion on the rights of the purchaser, although *prima facie* it appears that the purchaser has no remedy.

The purchaser would be well advised to consult his solicitor with regard to the construction of the contract and upon the other matters set forth in this answer.

COMPETITIONS OPEN

September 30.—Sending-in day. New Central Library, Birkenhead. Limited to architects who have been resident or have had an office within twenty miles of the Birkenhead Town Hall during the whole period subsequent to January 1, 1930. Assessor: Andrew N. Prentice, F.R.I.B.A. Premiums: £250, £175 and £100. Conditions were obtainable from E. W. Tame, Town Clerk, Town Clerk's Office, Birkenhead. (Deposit £2 2s.)

October 1.—Sending-in day. Proposed New Municipal Technical College and School of Art, for the County Borough of Southport. Limited to architects practising in Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £200, £100 and £75. The first prize will be merged into the commission if the appointed architect executes the work. Full particulars were obtainable from the Director of Education, Municipal Buildings, Southport. (Deposit £1 1s.)

October 1.—Sending-in day. (Last day for conditions was June 3.) Pictorial Map of the Area of the West Yorkshire Society of Architects. Premium, 10 guineas. Particulars were obtainable from the Secretary, 62 Woodhouse Lane, Leeds.

October 31.—Sending-in day. Proposed Tuberculosis Hospital, Sully, near Cardiff, for the Welsh National Memorial Hospital. Assessors: C. E. Elcock, F.R.I.B.A., and T. Alwyn Lloyd, F.R.I.B.A. Premiums: £400, £300, £175 and £100. Conditions were obtainable from F. J. Alban, Memorial Hospital, Cardiff. (Deposit £2 2s.)

November 23.—Sending-in day. New Junior and Infants' School, Farnborough Road, Birkdale, for the Southport Corporation. Limited to architects practising or residing in the County of Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £100, £75 and £50. Conditions, etc., obtainable from the Director of Education, 1 Eastbank Street, Southport. (Deposit £1 1s.)

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor: Sydney Tatchell, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from F. L. Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius of Liverpool Town Hall. Assessor: A. H. Moberly, F.R.I.B.A. Premiums: £200, £100, and £50. Conditions, etc., obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

December 31.—Sending-in day. Latest date for conditions: September 31. Proposed New Town Hall and Municipal Building, for the Walthamstow Corporation. Assessor: H. Austen Hall, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Conditions, etc., obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors: Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium: £500; also a further amount of £750 will be awarded to other designs according to merit.

SOCIETIES AND INSTITUTIONS

EXHIBITION OF TOWN-PLANNING DRAWINGS

AN exhibition of town-planning drawings is now being held in the R.I.B.A. Galleries. They include the whole of the British section of the recent exhibition held in Berlin during the Congress of the International Federation of Housing and Town Planning.

In addition to the British section, there are a few examples of work now being done in other countries.

The exhibition is open daily between the hours of 10 a.m. and 7 p.m., until Saturday, October 3, on which day the hours will be 10 a.m. to 5 p.m.

ARCHIBALD DAWNAY SCHOLARSHIPS

In accordance with the terms of the will of the late Sir Archibald Dawnay, the R.I.B.A. have awarded one scholarship of £75 for the academical year 1931–1932 to Mr. J. R. Baxter, of the Liverpool School of Architecture, University of Liverpool, and one scholarship of £50 for the academical year 1931–1932 to Mr. D. L. Couves, of the School of Architecture, Armstrong College (University of Durham), Newcastle-upon-Tyne. The work submitted by Mr. R. L. Banks, of the School of Architecture, the Architectural Association, London, and Mr. R. A. Smeeton, of the Birmingham School of Architecture, was highly commended.

Mr. J. A. Pinckheard, of the Department of Architecture, Surveying and Building of the Northern Polytechnic, London, N., who was awarded a scholarship of £75, and Mr. Arthur Roberts, of the Liverpool School of Architecture, University of Liverpool, who was awarded a scholarship of £50, both for the academical year 1930–1931, have been granted renewals of their scholarships for the year 1931–1932.

The scholarships are intended to foster the advanced study of construction and the improvement generally of constructional methods and materials and their influence on design.

MANCHESTER ARCHITECTS' VISIT

The Manchester Society of Architects paid an evening visit on Wednesday, September 16, to St. Paul's Church and Rectory, Blackley, Manchester. The church, which is designed by Messrs. Taylor and Young, members of the Society, is one of many required by the huge new housing estates around Manchester. It is still unfinished, but in a state most interesting to the professional visitor.

THE ARCHITECTS' DIARY

WEDNESDAY, SEPTEMBER 30

R.I.B.A., 9 Conduit Street, W.1. Exhibition of drawings, including the whole of the British Section of the recent exhibition held in Berlin during the Congress of the International Federation of Housing and Town Planning 10 a.m. to 7 p.m. (Saturday 10 a.m. to 5 p.m.) Until October 3.

BRITISH COMMERCIAL GAS ASSOCIATION. Annual Conference to be held at Exeter. (Last Day.)

ROYAL PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN, 35 Russell Square, W.C.1. Annual Exhibition. Until Saturday, October 10.

Luncheon at Childwall. 1 p.m. Visit to housing estates. 2.30 p.m. **10.30 a.m.**

LAW REPORT

DRAINAGE WHICH AFFECTED AN ESTATE

Hatton v. *Barclays Bank, Ltd. Chancery Division. Before Mr. Justice Farwell*

THIS was an action by Mrs. Marjorie E. Hatton, for rescission of a contract to purchase from the defendants, the trustees under the marriage settlement of Captain and Mrs. Lubbock, certain property known as Mere House, Hamble, near Southampton, for the sum of £8,000.

Captain and Mrs. Lubbock were the owners of the property, and the plaintiff alleged that she was induced by the misrepresentations of Captain Lubbock as to the local drainage scheme to pay a deposit of £800 on the purchase price of the property for £8,000. Mrs. Hatton's case was that the misrepresentations were made in a personal interview. She now alleged that the drainage system, which the local authority had installed, affected the amenities of the property.

Defendants, in their defence, denied misrepresentations, or if made, that they in any way influenced Mrs. Hatton's decision to purchase the property. They claimed specific performance of the contract which the plaintiff had entered into. In the alternative, they asked for a declaration that they had a lien on the property.

His lordship, after hearing the evidence, granted Mrs. Hatton a rescission of the contract with costs, and ordered the return of her deposit. The defendants' counter-claim he dismissed with costs.

In giving judgment, his lordship said the dispute was an unfortunate one, as it apparently arose through a perfectly honest mistake between the parties. It was a regrettable misunderstanding, and he was satisfied that the parties were truthful persons, though it might be that their memories were at fault. Judging by the evidence, it appeared that Captain Lubbock told the plaintiff that the new drainage scheme would not affect the property, and she agreed to purchase. As a matter of fact, part of the system came right up to the boundary of the property. This was no doubt quite an innocent misrepresentation, but it entitled plaintiff to succeed in the action.

Mr. Gavin Simonds, K.C., and Mr. Roxburgh appeared for the plaintiff, and Mr. Archer, K.C., and Mr. W. Hunt for the defendants.

TRADE NOTES

The Patent Impermeable Millboard Co., Ltd., of Sunbury Common, Middlesex, have recently issued a booklet containing general information and fixing instructions re Insulwood insulation boards, and illustrations of some of the buildings in which this material has been used, including the City of Antwerp Pavilion, erected at the Antwerp International Exhibition, a photograph of which is reproduced on this page. Insulwood, it is stated, is made from real wood fibres, scientifically and chemically treated and waterproofed to prevent, it is claimed, bacterial action, rot, deterioration, disintegration of the fibres through lapse of time, condensation and dampness. It is also claimed to give maximum thermal and sound insulation consistent with structural strength, long life and durability, and to harden with age. It is made in standard thicknesses of ½ in. and ¾ in. in sizes ranging from 12 ft. by 6 ft. to 4 ft. by 2 ft.

*

The main entrance to the new headquarters of the London Coastal Coaches, in Buckingham Palace Road, S.W.1, is faced with a mixture of broken glass and "Snowcrete," supplied by the British Portland Cement Association, Ltd. The glass was first crushed and mixed with the cement, and the mixture poured between the shuttering. When the cement had set, the boards were removed and the surface rubbed down. By this means the small pieces of glass were exposed on the surface, giving it a scintillating effect. This form of concrete has, it is claimed, unlimited possibilities. Glass of any colour can be used, and, since it is a waste product, its cost is comparatively small. The architects for the building are Messrs. Wallis Gilbert and Partners.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Operating Department, Wellhouse Hospital, Barnet (pages 430–432). General contractor, H. E. Winskell. Sub-contractors : Salter, Edwards & Co., Ltd., asphalt ; Diespeker & Co., Ltd., reinforced concrete ; Rosser and Russell, Ltd., central heating; Locke and Soares, electric wiring, electric light fixtures and bells ; Kite & Co., ventilation ; J. Bolding and Sons, Ltd., and Leeds Fireclay Co., Ltd., sanitary fittings; James Slater & Co., Ltd., and Leeds Fireclay Co., Ltd., sterilizing apparatus ; J. Gibbons, Ltd., instrument cupboards, glazed fixed screens and lantern lights; Ericsson, Ltd., telephones; Avery & Co., dark blinds; J. P. White and Sons, hospital doors; W. B. Simpson and Sons, Ltd., terrazzo, murazzo and tiling; Camerer Cuss & Co., clocks.

Paultons House, Chelsea (pages 437–438). General contractors, R. Dixon and Sons. Sub-contractors : Smith, Walker, Ltd., steelwork; Welstead, Ltd., metal windows; Speedy and Eynon, electric light wiring; Speirs & Co., sanitary fittings and fireplaces; Marryat and Scott, Ltd., lifts; Potter Rax Gate Co., Ltd., enclosures and railings; Huntley and Sparks, Ltd., Cabot's quilting; A. R. H. Maxted, Ltd., fire escape stairs; J. W. Gray and Son, Ltd., lightning conductor system; John Wallis, facing bricks.

The City of Antwerp Pavilion, erected at the Antwerp International Exhibition, 1930. Some hundreds of thousands of square feet of Insulwood were used for the walls and partitions, and applied to timber framing, on the internal and external surfaces of the building.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The BERMONDSEY B.C. has decided to erect twelve three-room and sixteen two-room flats on the Grange Walk site.

Messrs. Thomas and Son have varied the plans for the development of the Purley Downs estate to meet the wishes of the COULSDON U.D.C.

The BRIGHTON Corporation has obtained sanction to borrow £17,000 for the erection of stables at the racecourse.

The BRIGHTON Corporation Electricity Committee has obtained sanction to borrow £27,000 for the erection of a building for the purposes of electricity showrooms, offices, etc., in Castle Square.

The BRIGHTON Education Committee has obtained sanction to borrow £33,569 for the erection of a public elementary school at Whitehawk.

Plans passed by the BRIGHTON Corporation: Alterations, 106 Western Road, for Mr. A. Woods: house, Tivoli Crescent, for Mr. S. H. Griffiths: five houses, Widdicombe Way, for Messrs. Brabons, Ltd.; four houses, Warmdene Road, Patcham, for Mr. J. A. Yetman; alterations and additions, Race Hill Inn, Lewes Road, Beaufort Hotel, Queen's Park Road, and "Elephant and Castle" public-house, London Road, for Tamplin and Son's Brewery (Brighton), Ltd.; setting back premises, 20 West Street, for Ocean Accident and Guarantee Corporation, Ltd.; alterations, 63–6 North Street, for Messrs. Joseph Smith (Brighton), Ltd.; extensions, Reneta Hotel, Montpelier Road, for Messrs. I. and R. Cohen; meeting-room, St. Matthias Church, Ditchling Road, for Churchwardens; Free Church, King Charles's Avenue, Woodingdean, for Mr. S. Etheridge; four houses, Vernon Avenue, for Mr. H. King Jones; two shops and two houses, Widdicombe Way, for Messrs. Braybons, Ltd.; alterations, 94 London Road, for Brighton Equitable Co-operative Society, Ltd.; alterations, 89 Western Road, for Messrs. Cave, Austin & Co., Ltd.; five houses, Hollingbury Rise, for Messrs. Robert Newman and Son; four houses, Stanmer Park Road, for Mr. C. Munday; alterations. 7 Buckingham Road, for Brighton and Hove Dental Hospital; licensed premises and flats, Marine Parade and Charles Street, for Messrs. Edlins, Ltd.; three flats, 91–5 May Road, for Mr. G. Ayling; extensions, Northend House, High Street, Rottingdean, for Sir Frederick Jones, K.B.E.; two houses, Warren Road, Woodingdean, for Mr. W. H. Clark; two houses, Carden Avenue, for Mr. E. H. Riwe; fourteen houses, off Warren Road, Woodingdean, for Mr. W. H. Clark: three almshouses, Carden Avenue, for Mrs. S. C. Turner.

Plans passed by the HERNE BAY U.D.C.: Five bungalows, Carlton Hill and elsewhere, for Messrs. Goodwin and Russell, Ltd.; two bungalows, The Broadway, for Mr. E. J. Line; six houses, Southsea Drive, for Mr. C. J. Jordan; house, Western Esplanade, for Messrs. Woolf Bros.; bungalow, The Broadway, for Mr. A. P. Bennett: bungalow, Ivanhoe Road, for Herne Bay Estates, Ltd.

The East Sussex Education Committee is to erect a secondary school for girls in Old Shoreham Road, HOVE.

Plans have been lodged with the Brighton Corporation, by Mr. S. Milsom, for the erection of a village hall at OVINGDEAN.

The Brighton Corporation has obtained sanction to borrow £3,000 for the purchase of land as a housing site at ROTTINGDEAN.

SOUTH-WESTERN COUNTIES

The DORCHESTER Corporation is to have plans prepared for the erection of twenty houses on the Victoria Park estate.

The DORCHESTER Corporation is considering the provision of an isolation hospital, in association with the neighbouring authorities of Cerne, Wareham, and Purbeck.

Plans passed by the DORCHESTER Corporation: House, Edward Road, for Mr. W. M. Sercombe; improvements. "Royal Oak" Hotel, High West Street, for Messrs. Eldridge Pope & Co., Ltd.; bungalow, East Parade, for Mr. A. J. Perry; three bungalows, Louise Road, for Messrs. Watts Bros.

The PAIGNTON U.D.C. is seeking sanction to borrow £4,100 for the erection of another ten houses on the Collaton estate.

Plans passed by the PAIGNTON U.D.C.: Twelve houses, Laura Grove, for Mr. C. Williams; house, Dartmouth Road, for Mr. F. G. Stockman: six houses, Colley End Road, for Messrs. Coombe and Sons; house, Winsu Avenue, for Mr. A. Chippendale; alterations, 14 Victoria Street, for Messrs. Brock & Co., Ltd.; house, Osney Crescent, for Mr. G. C. Verry: two houses, Shirton Lane, for Mr. A. Chippindale: bungalow, Blatchcombe Road, for Messrs. E. and A. Diggines.

The PORTLAND U.D.C. is negotiating for a site for the erection of about fifty houses.

The WEYMOUTH Corporation is to erect sixty-two houses on the Westham estate.

MIDLAND COUNTIES

The BEDFORD Corporation proposes to erect 204 houses on the new London Road estate.

Plans passed by the BEDFORD Corporation: House, Kimbolton Road, for Mr. G. Smith: extensions, Elstow Road depot, for Redline Motor Spirit Co., Ltd.; extensions, Handicraft centre, Harpur central school, for Mr. G. P. Allen; workshop, Houghton Road, for the Bedford Engineering Co.; two houses, Southville Road, for Messrs. E. Two and Son; alterations and additions, Burnaby House, Burnaby Road, for Bedford School governors; two houses, Elstow Road, for Mr. C. A. White.

The BIRMINGHAM Corporation proposes to undertake various clearance schemes, and has investigated the question of rehousing accommodation, in the cheapest manner, for seven thousand families, and ascertained that the costs would be £3,704,000 for all flats: £3,624,000 for flats and maisonnettes, and £3,465,000 for all maisonnettes. The housing sub-committee recommends the erection of a modern colony of flats or tenement buildings.

Mr. H. E. Farmer, architect, has prepared plans for the erection of shops in Bridge Street, WALSALL.

The WALSALL Corporation is seeking sanction to borrow £22,000 for the erection of shops and offices at the Leicester Square corner.

The WALSALL Corporation has obtained another housing site in West Bromwich Road.

The trustees of the Blakenall Congregational Church have obtained a site on the Field estate, WALSALL, for the erection of a church.

NORTHERN COUNTIES

The BLYTH Corporation is to undertake clearance schemes in Old White Row and Hodgsons Mill, involving some fifty houses.

The BLYTH Education Committee is to utilize a recreation ground site in Princess Louise Road for the erection of an infants' school.

Plans passed by the BLYTH Corporation: Four houses, Barrass Avenue, for Messrs. Pattison and Hush; two bungalows, Fourteenth Avenue, for L.N.E.R., Cottage Homes Committee; house, Delavel Avenue, for Mr. Andrew Best.

The Durham County Council recommends a site in Hedgley Road, HEBBURN, for the erection of relief offices.

The SALE U.D.C. is to erect another fifteen houses in Doveston Road and Chapel Road.

Mr. J. H. Hinchliff has prepared plans for the erection of thirty-four houses for the STAINCROSS U.D.C.

The WIGAN Corporation is to erect ninety houses on the Wigan Road estate.

WALES

The SWANSEA Corporation has obtained twenty-five acres of land at Mayhill for a housing scheme.

SCOTLAND

The GLASGOW Education Committee is considering the erection of an elementary school for Roman Catholic children in Anworth Street, Tollcross.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

FROM THE NEW WORLD: 4

MEASURED DRAWINGS OF AN AMERICAN COLONIAL RAILING

RAILING IN CAST IRON, FROM WASHINGTON, D.C.

THE example of old Colonial cast iron, of which a photograph is given above, while drawings by R. Keith Harris occupy the remaining pages of this supplement, will bear comparison with anything of its date and kind to be found in the older countries.

Its exquisite design and proportion, its ingenious setting-out, are matched by the craftsmanship displayed in its casting.

The top member is missing. It possibly consisted of a plain wooden rail, but more probably of simple wrought iron, as suggested in the drawing. Inspection of the casting at close quarters confirms the first impression of its delicacy and perfection—qualities that pay significant tribute to the art and skill of the founder.

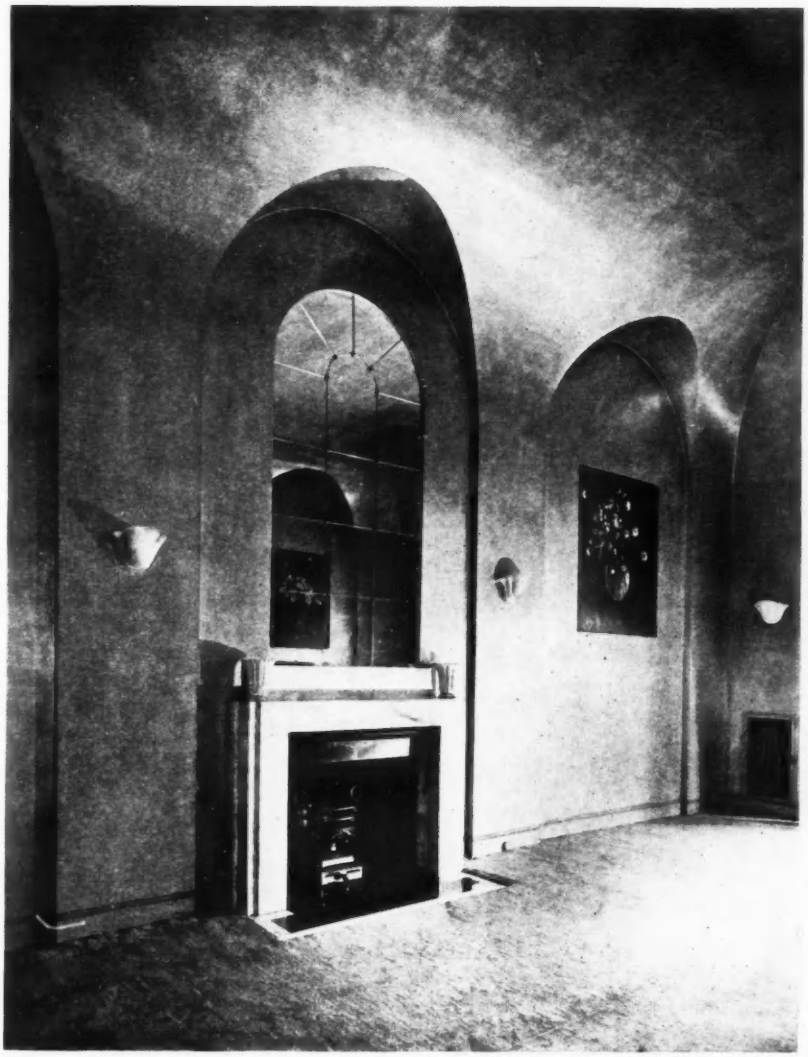
DETAILS OF A MODERN ROOM IN A REGENCY HOUSE



[*Lord Gerald Wellesley and Trenwith Wills, Architects.*

STIPPLED SILVER-LEAF WALLS AND EGYPTIAN ALABASTER FIREPLACE

WALL features of the room in a Regency house in London, recently reconstructed and redecorated in accordance with the designs recorded, to scale, overleaf, are the fireplace, seen in the view reproduced above, a sunk mirror in the side opposite to it, a mirror door in one of the ends, and a bronze window the full height of the room in the other, all of similar character.

The ceiling is coved, and its entire surface, in common with that of the walls, is finished in silver leaf, stippled biscuit colour. The subdued glow thus attained makes a becoming background for four flower studies by Mrs. Payne Thompson, for whom the room was designed; these are sunk into the wall in shallow recesses provided for that purpose.

The chimney-piece is carried out in Egyptian alabaster, with a border of the same to a black marble hearthstone. A golden harmony of colour thus runs through the walls and the white and yellow markings of the alabaster —and, it may be added, through the furniture, which is upholstered in pale gold and black, with splashes of crimson. It is a modern room of refined elegance.

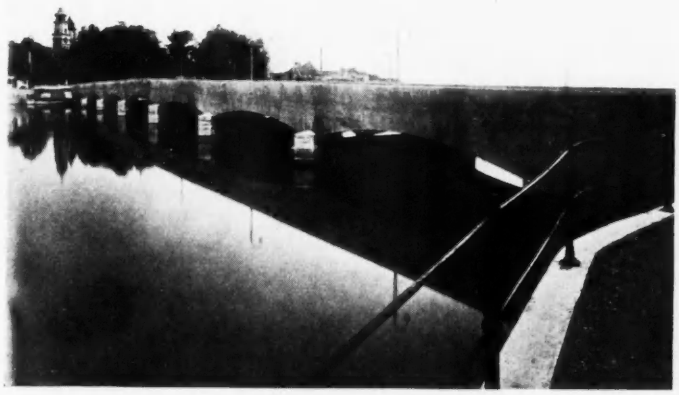
SELECTED PRECEDENTS:

MULTIPLE-SPAN CONCRETE BRIDGES ABROAD

APART from such important considerations as monolithic homogeneity and almost non-existent maintenance costs, the chief advantage of reinforced concrete over fabricated steel bridges is the greater simplicity of design resulting from reduction in the number of structural elements and the absence of ubiquitous ends and edges and angles—to say nothing of the often heinously "ungrammatical" punctuations of rivet-heads. The five road bridges reproduced, all of which were built during the last decade, are intended to illustrate not progress in concrete design, but different types of concrete construction. From the purely æsthetic point of view the tidy flush surfaces of this material are perhaps its greatest asset.

The "bowstring" bridge (one of the commonest types of steel bridge for wider spans) is a form of rigidly suspended structure in which the parabolic arch of the "bow" supports the taut "string" of the platform. When steel is used the "bow" needs to be cross-braced between the vertical supports. With concrete construction this necessity does not arise. Owing to our superannuated bylaws, the concrete bowstring bridge, long familiar abroad, is almost unknown in England. In France it was adopted by the "Ponts et Chaussées" after the war as the standard type for the routes nationales. Figure **2** *shows a bowstring bridge in Brazil, each of the six spans of which measures 29.30 metres.*



[By courtesy of Wayss and Freytag, Frankfort-on-Main.

1. *SEVEN-SPAN ARCHED BRIDGE LINKING THE TOWN AND ISLAND OF LINDAU IN LAKE CONSTANCE WITH THE WURTEMBERG MAINLAND.*

The graceful design of the elongated arches in figures **3** *and* **5** *might make it appear that they were stone structures. In reality, their arch curves are too flat, and their arch crowns too thin for this to be possible. In both cases local amenities influenced design. The former crosses the Neckar, a tributary of the Rhine, at one of the most famous beauty-spots in Germany; while the five spans of the latter (two of 47 and three of 57 metres) vault lightly across a particularly lovely reach of the Loire.*

Figure **1** *is an example of clean, monolithic dignity, with massive, almost monumental, proportions. Its seven equal spans join the island in Lake Constance, on which the town of Lindau is built, to the mainland of Wurtemberg.*

Figure **4** *illustrates a flat, half-hexagon type of arch, impossible in steel or masonry, which permits of an even gentler rise in gradient than that adopted for figure* **1**. *The pavements are cantilevered out continuously over the four arches.*

In figures **2** *and* **5** *the parapets are of slotted concrete slabs; figures* **1** *and* **4** *have solid balustrades; while in figure* **3** *iron railings are employed.*

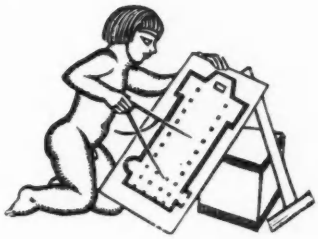
THE ARCHITECTS' JOURNAL



WEDNESDAY, OCTOBER 7, 1931

THE FUTURE IN THE PRESENT

THE scheme for a municipal bathing station at Wannsee, near Berlin, of which there are illustrations in a supplement to this issue, has a social and economic as well as an architectural significance. Appearing at a juncture when Germany's financial affairs and our own are of international concern, this project, only a portion of which is executed, immediately provokes the question—Ought a country to indulge in grandiose schemes when it is hard up? Is it a legitimate tonic, as a new hat is to a depressed woman; or an inexcusable extravagance?

The answer is one about which economists may and do differ, but the question may be at least illuminated by regarding the present less as the tail-end of the past and more as the first stage of the future.

That we have arrived there is plain. For the first time in the history of the earth there is superfluity on a grand scale of most of the things that the civilized world requires. Mass-production has already achieved this result. Plant has been laid down sufficient to supply more goods than can be absorbed, and food is more abundant than mouths that can afford to eat it. In times past a conquered nation was required to work for its conquerors. Nowadays it is desired to abstain from working or else it will upset its conquerors' business.

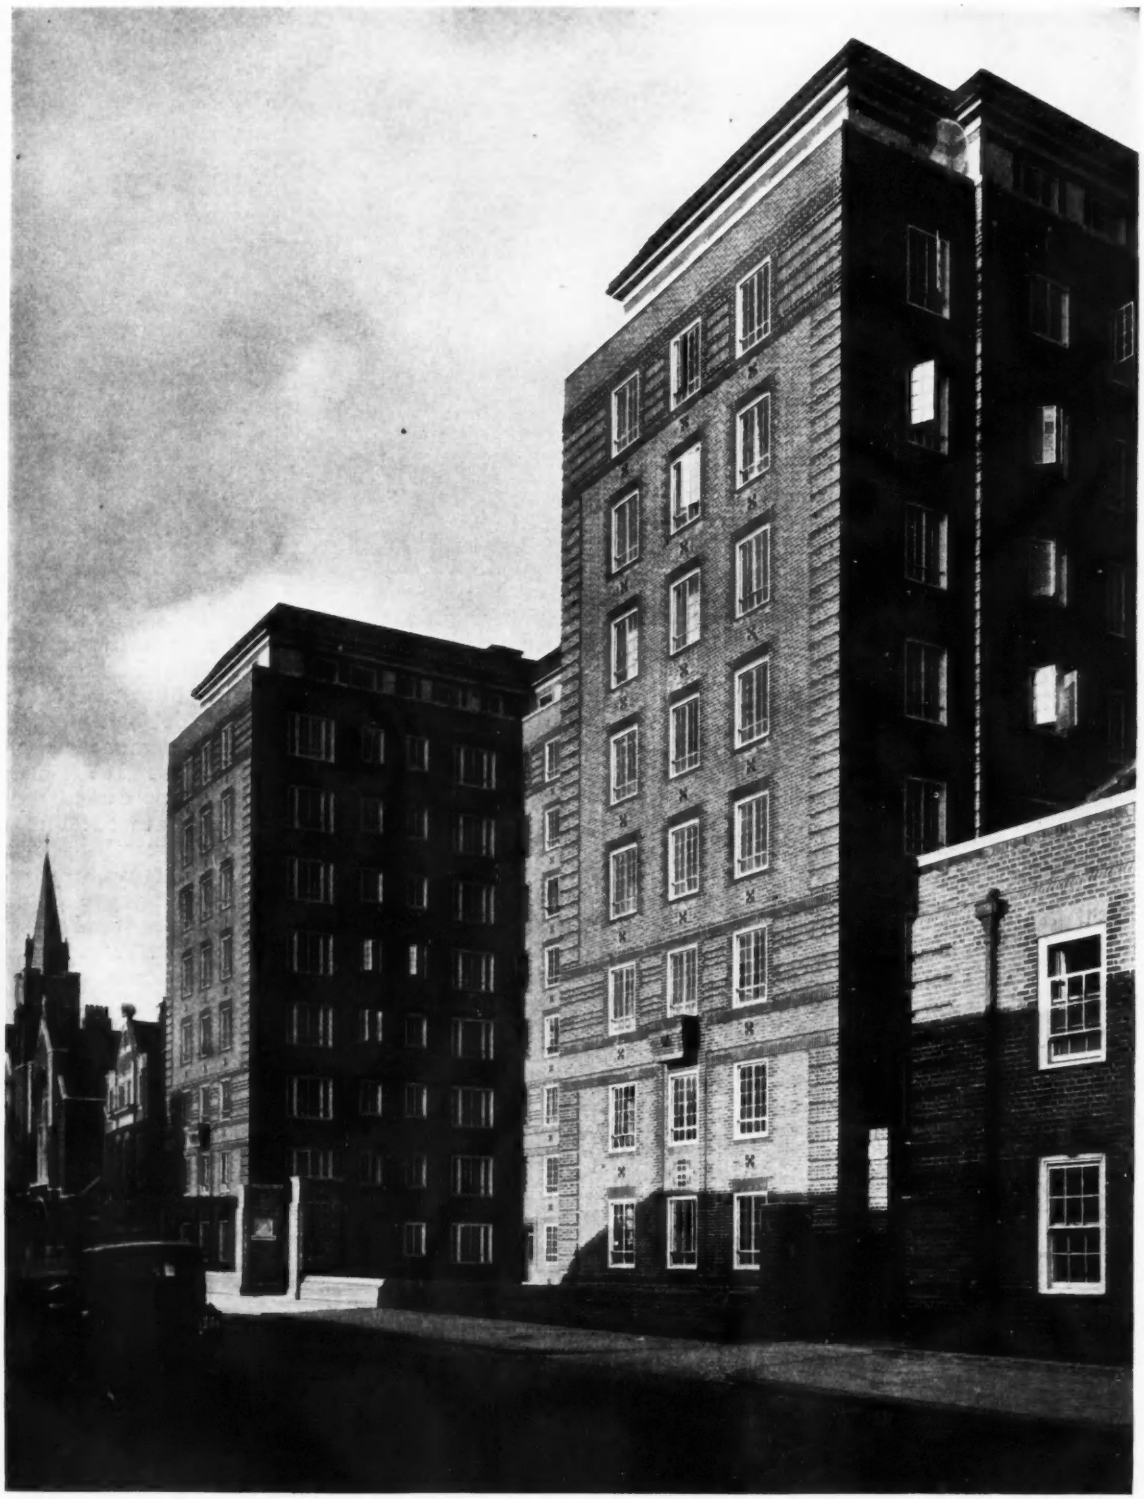
Such a state of affairs is clearly absurd. Either the intelligence of mankind will prevail or else catastrophe will consume this actual and potential plenitude. In the former case there will be such a liberation of energy as has not hitherto been dreamt of, and that energy, we believe, must be absorbed largely in the provision of buildings adequate to the private and public needs of the community. The scope remains ample, and the next two or three generations need not worry about the purely contemplative life. Housing, transport and facilities for public health and enjoyment will provide sufficient outlet for creative energy. It would be a pity if too much of it had to be wasted in obliterating the more futile and unpleasant-looking works of the present day and conversely it would be gratifying if we could believe that some of these works were designed with such fitness for their purpose and position that in the future they would seem perhaps a little old-fashioned yet worthy of a permanent place in that better-conceived scheme of things.

The open-air bathing station at Wannsee seems to us very clearly to be of the latter kind. It fits into the landscape with singular felicity. Its curved terraces shelve down to the beach in a way that Nature, with more precise instruments at her disposal, might have attempted. Just so Chinese artists were wont to clarify and humanize the somewhat vague intentions of natural landscape. Up to the present only a section of the scheme has been carried out. This comprises the open-air café and some of the terraces with their dressing-boxes. The complete project, with its fan shape, seems designed to collect the visitors from the land and dissipate them outwards along the shore or propel them out on to the pier. It has the appearance of a living, organic entity, and the working-out of the project in detail does no more (and no less) than materialize, in a clean, cheerful and permanent fashion, the idea behind the whole.

This concentration of riparian pleasures and recreations is not to everyone's liking, and many English gorges would rise at such organized health and recreation. But the alternative in this crowded island is that almost continuous "development" that extends from the mouth of the Thames to Bournemouth, and those who seek isolation must work all the harder to make concentration agreeable.

The Wannsee project stands out as an early example of those spacious and orderly structures that the future—we hope, the near future—will see.

Such things are in every true sense of the word the reverse of extravagant. They represent comely and efficient plant for the production of public health and efficiency, and countries which use them in such a way will reap their reward. If the present clash of national rivalries and the present monetary system hinders such developments it is those that must be amended.



[*Buckland and Haywood, Architects.*

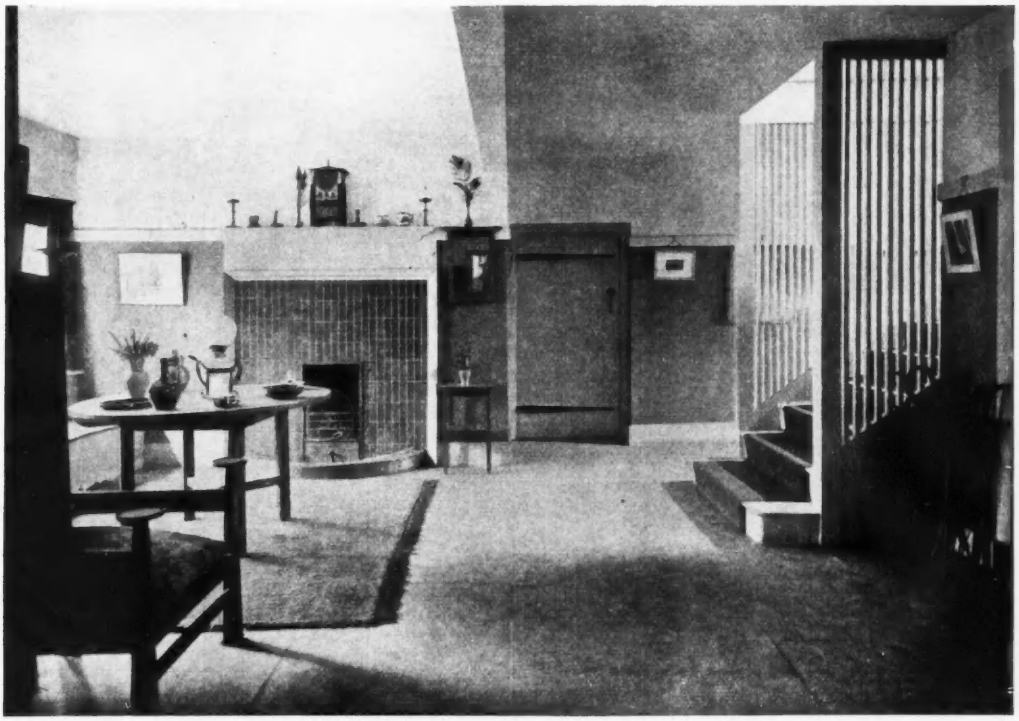
A MODERN ESSAY IN BRICKWORK

A view of Swan Court, Chelsea, taken from Manor Street. With the exception of the top story, which is treated with white cement, and a small artificial stone coping, the whole of the building is faced with, and has external features of, plum-coloured brickwork. Between the two projecting wings is a forecourt, a photograph of which appears on page 465.

NEWS & TOPICS

THE VOYSEY EXHIBITION

SIR EDWIN LUTYENS, in this month's *Architectural Review*, says of C. F. A. Voysey : " He was building—it was evident—what he liked. Fresh and serene, he created that with which you could laugh—a very different thing from much of the moribund building then prevailing which one laughed at. . . . The *hearted* shutters, the client's profile on the bracket, the absence of accepted forms, the long sloping slate-clad roofs, the green frames, the black bases and the black chimney pots contrasting with the white walls, clear and clean." The exhibition at Messrs. Batsford's Galleries, this week and next, contains photographs of a representative selection of every craft in Mr. Voysey's work. Most impressive, however, to young architects today will be his designs for houses, gaily-coloured and well proportioned. Voysey was building in 1890 in a manner far more simplified than most modern architects. As he writes himself, in an article, " 1874 and After," also in the current *Architectural Review :* " The 1851 Exhibition originated the idea of Utility as the basis of Art. All that was necessary for daily life could be and ought to be made beautiful." Visitors to the exhibition will find that Mr. Voysey has thoroughly carried out his principles by designing every detail and fitting of his buildings.



The dining-room of " The Orchards," Chorley Wood, Herts, designed by C. F. A. Voysey, in 1899, for his own occupation. An exhibition of his work is now being held at the Batsford Galleries.

BRIDGE-BUILDING IN DENMARK

Of late, several examples of the bridge-building art abroad have figured in this JOURNAL. In Denmark a beginning has been made on one of the most difficult bridging schemes ever attempted. The endeavour is to bridge the Little Belt in the Baltic, and thus connect Jutland, the Danish mainland, with the island of Funen, the second largest island in the Danish group. The bridge is planned to carry a double-track railway and two roads, and is scheduled for completion in 1935. The cost of the work is estimated at £2,000,000. Rapid currents are causing great difficulties in fixing the foundations of the first of the four stone buttresses, and the pressure of closely packed ice is expected to cause further trouble during the winter. This bridge will displace the train-ferries across the Little Belt, and is the first of extensive works planned by the Danish Ministry of Communications and Public Works to speed up traffic on the main routes between England and the Continent.

" THIS MOTORING " AND ITS CONCOMITANTS

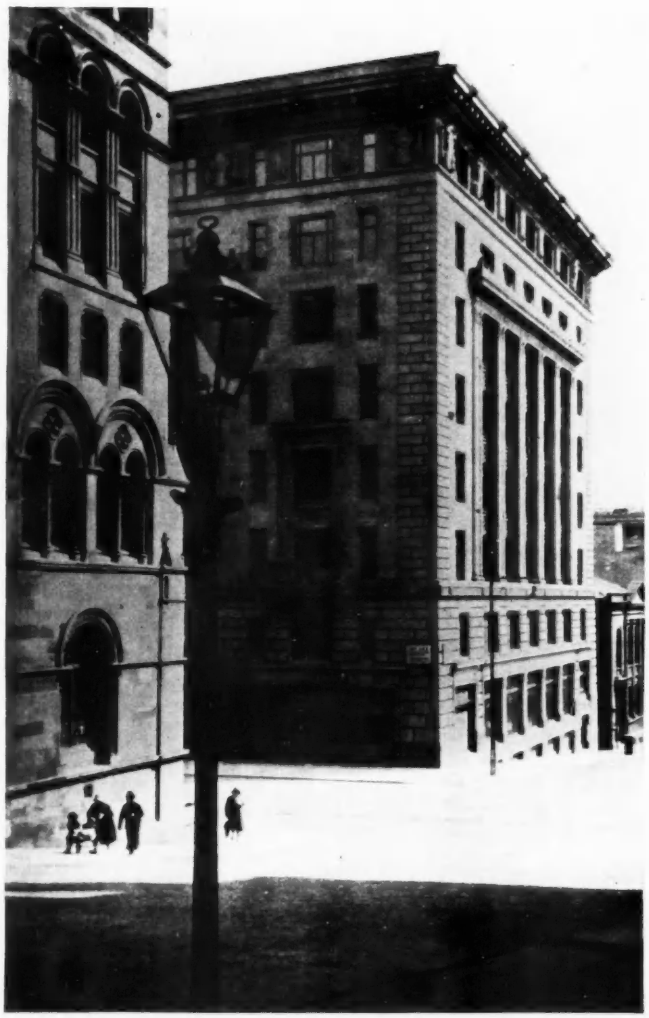
The scene is the Great North Road. " Within five or a few more years, roadside petrol pumps were even as the lilies of the field, albeit not quite so pretty. . . ." Thus Mr. Stenson Cooke, of the Automobile Association, in his book, recently published under the title " This Motoring." And he goes on to make the Honorary Treasurer of that ubiquitous organization boast : " Look at 'em ! Twenty-five pumps between Newark and Stamford. I've counted them, and the A.A. did it ! " True. The A.A., to whom I owe many kindnesses upon the road, is indeed a power in the land; I only hope that it will extend still farther that powerful influence, diligently seeing to it that the type of roadside pump and garage erected is likely to be inoffensive in appearance alike to the wayfaring motorist and the local inhabitant. The A.A. have shown their willingness to help the aims of the C.P.R.E. and similar organizations in numerous practical ways : this would be the most practical of all.

ASTRAGAL

THE SCOTTISH LEGAL BUILDING, GLASGOW

DESIGNED BY WYLIE, WRIGHT AND WYLIE

THE Scottish Legal Building, the new headquarters of the Scottish Legal Life Assurance Society, at 95 Bothwell Street, Glasgow, as it now stands completed, follows very closely the lines of the original design submitted in the public competition held four years ago.



This view of the end of the building fronting to Blythswood Street gives an impression of its size. It occupies an oblong island site that slopes steeply, and contains two basement and seven floors above the ground level, which is largely devoted to shops for separate letting.

The site is approximately rectangular, measuring 247 ft. by 108 ft., and the height of the building varies from 120 ft. high at the south-east corner to 100 ft. high at the north-west corner, owing to the difference in levels of the streets.

Large shops and saloons occupy all the ground floor, except for the main entrance hall and staircases. Above this are seven floors of offices; a main block 60 ft. deep, extending along Bothwell Street, and end wings 37 ft. wide, fronting the side streets. This leaves an open area 150 ft. by 43 ft. at the back, so that all the offices and shops receive the maximum amount of daylight and fresh air. The Society occupy the whole of the top floor and half of the sixth floor as offices, and a large area in the basement as storage for filing; the remainder of the building is let to tenants.

In the basement, in addition, there are a garage and motor showroom. A sub-basement, stretching along the lane at the back and the whole length of the site, is divided up into safe deposit vaults for tenants, with the heating chamber, Corporation Electricity Department sub-station, vacuum cleaning plant room, and electricity main switch room at the west end. On the roof are situated the caretaker's house, lift machinery rooms, automatic telephone battery room, and water supply tank rooms.

In order to comply with the Glasgow building regulations, fireproof division walls divide the building into compartments of approximately 350,000 cub. ft., with double fireproof sliding doors at all openings through these walls.

Owing to the nature of the subsoil, a piled foundation was found necessary. Some 150 precast reinforced concrete piles, averaging 13 ft. deep, were used over the larger northern area, and about 200 reinforced concrete pressure piles, averaging 40 to 50 ft. deep, over the southern area, where running sand was encountered. The foundations consist of a combination of reinforced concrete rafts connected to the pile caps and steel grillages at the column bases. The raft supporting the outside walls and columns also acts as the base of a reinforced concrete retaining wall which surrounds the site.

The structural system consists of a steel frame which supports all floors, fireproof partitions and outer walls, necessitating compound girders of large sections due to the wide spans, internal columns being reduced to a minimum.

The outer walls to street fronts are of Blaxter stone, a cream-coloured sandstone from Northumberland, with a base of polished Inverawe (dark grey) granite, and the shopfronts of honed Kemnay (light-grey) granite. The infillings surrounding the windows at the main order from second to fifth floors are of cast iron. The back elevations have cream-coloured facing brick, with patterns at window breasts formed with brown-glazed brick to give relief.

The exterior ornamentation makes extensive use of symbolical motives representative of the Society's activities. There are four sculptured stone panels on the first floor of the Bothwell Street elevation. They represent, respectively, Industry, Prudence, Thrift and Courage: the motto of the undertaking is "Prudence and Thrift." Similar emblems appear as pilaster caps; in the design of the rising gates to the main entrance; and in the panelled and carved board room.

The floors are of reinforced concrete, with patent lathing to support the plaster ceilings. The inside face of the outer walls is lined with 2-in. composition blocks, and all internal office partitions are of the same material, 3 ins. thick. The finished surface of all inside walls and partitions in the offices is plaster.

The windows, which have been kept as big as possible, are generally of bronze with plate glass.

A portion of the large bronze windows and cast-iron panels extending from second to sixth floor levels of the Bothwell Street front. Similar windows are central features of the two ends of the building.

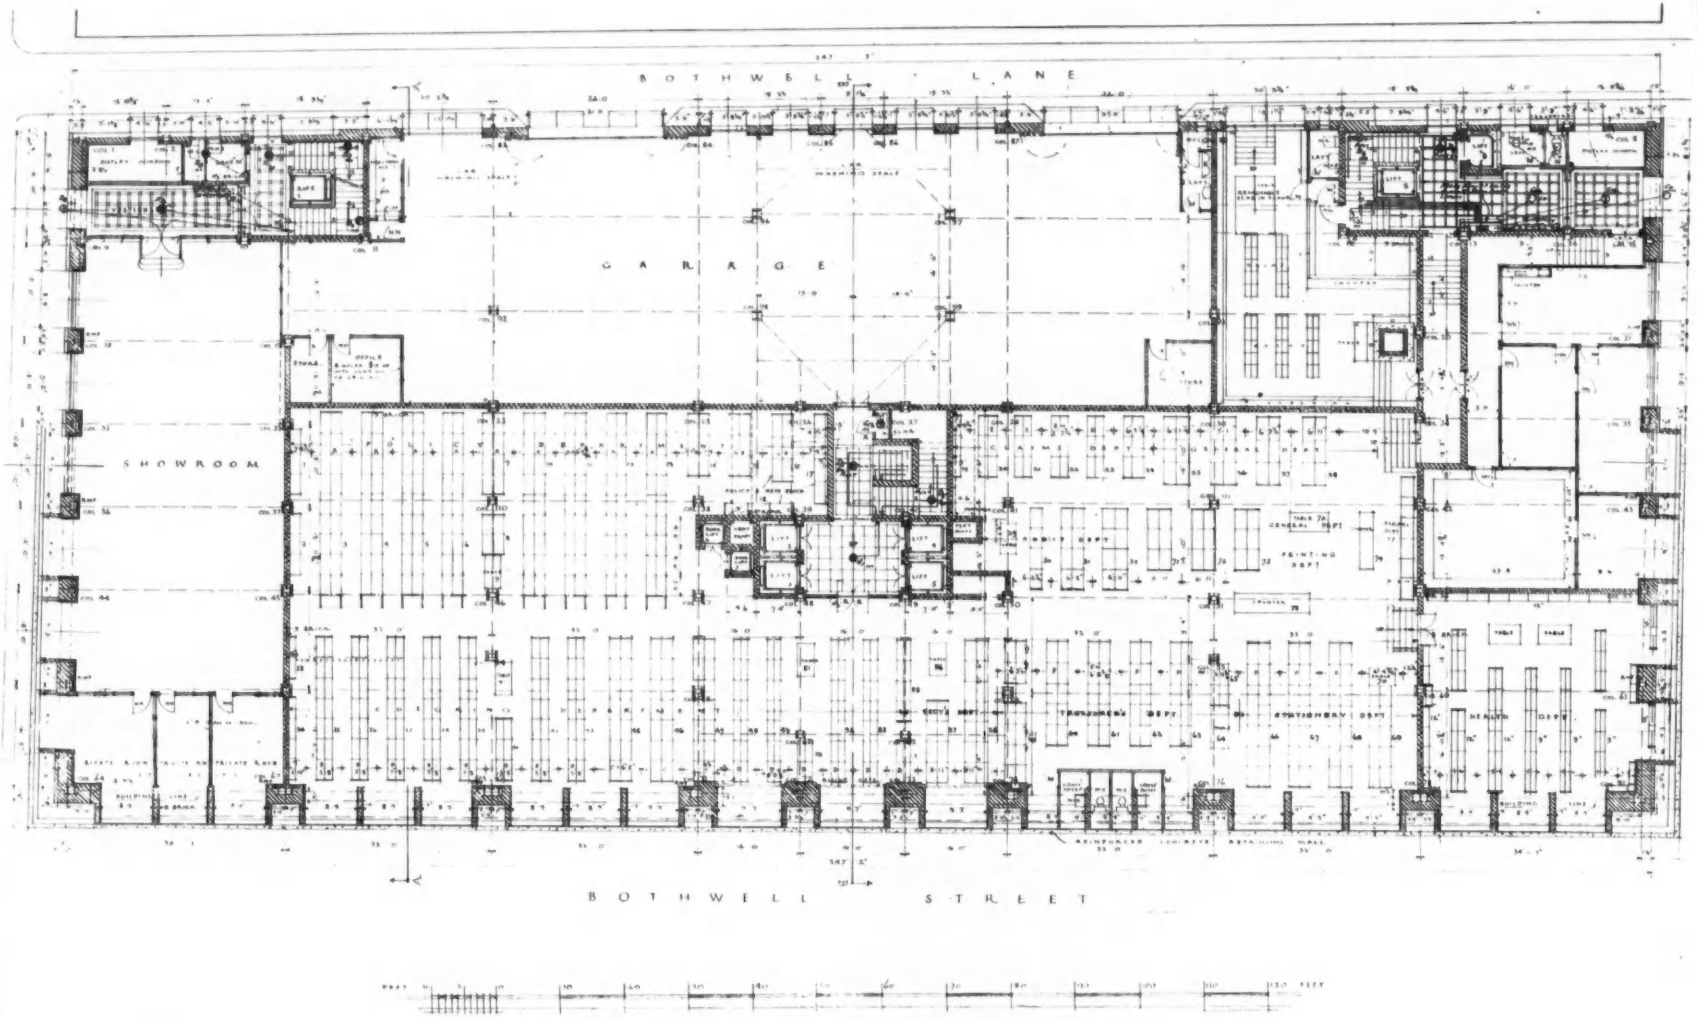
Scottish Legal Building, Glasgow.] [*By Wylie, Wright and Wylie.*

The main entrance, with its triple arches, is in the centre of the principal façade to Bothwell Street. Above it is the coat of arms of the Assurance Society, based on emblems of Rampant Lion, Unicorn, Visor, and Mantling.

For the office floors karri wood from Australia has been laid, nailed to bearers set in bituminous concrete.

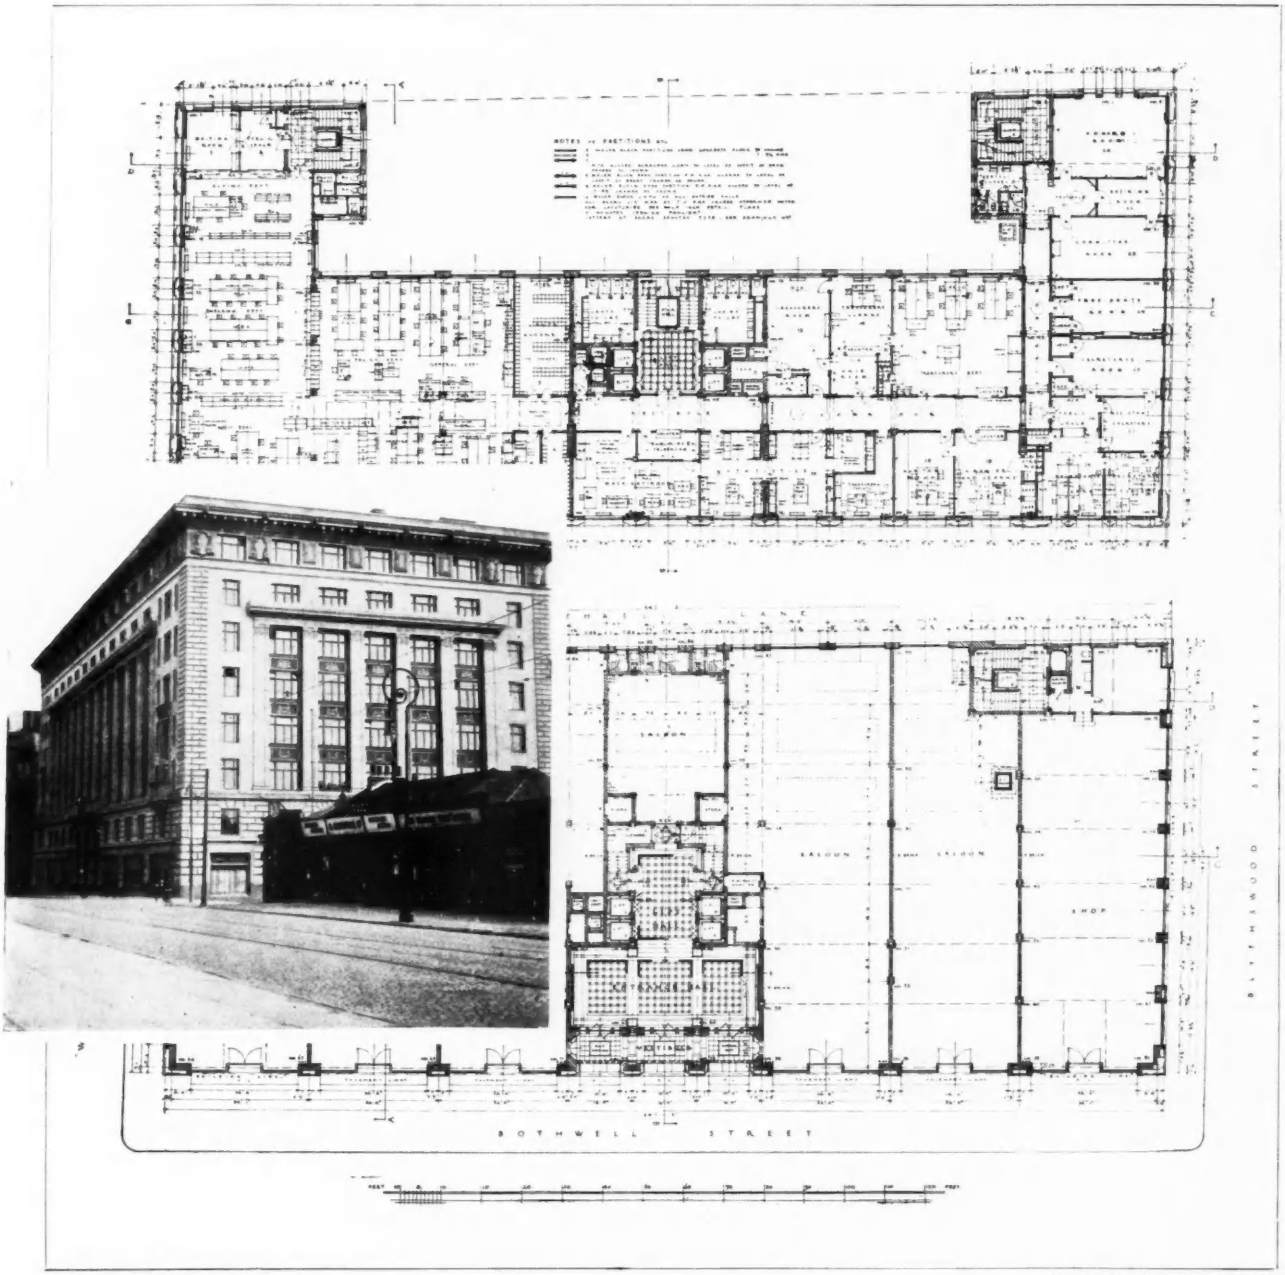
The main staircase is finished in marble — Forêt de Brousse treads and risers, Blanc Clair margins and stringers, and a dado lining on the walls of Lunel Rubane (purplish veined, grey-buff) with bands of Pacilo (dark green). The side staircases have Hopton Wood treads, risers and paved landings, with terrazzo margins, stringers, and dado on walls in various shades of green with black lines. The main entrance hall and lift halls at each floor have Forêt de Brousse paving and Lunel Rubane lined walls, with bands of Pacilo.

The woodwork throughout the offices generally is Borneo cedar, stained and varnished to tone with the doors, which are of African mahogany. In the Society's own offices the Borneo cedar finishings are french-polished, with very satisfactory results. For the private rooms, which are all panelled, a variety of hardwoods were used.



Scottish Legal Building, Glasgow.] [*By Wylie, Wright and Wylie.*

The basement plan. The slope of the site is downwards from Bothwell Street to Bothwell Lane at the back of the building; West Campbell Street bounds it on the left, Blythswood Street on the right. The showroom space shown is thus entered from the lower street level, like the garage adjacent, above which there is a recessed lighting area. The bulk of the space nearest the main front is devoted to office space for the Assurance Society; there is also a sub-basement, utilized by them for storage purposes, etc.



Scottish Legal Building, Glasgow.] [*By Wylie, Wright and Wylie.*

Plans of the ground and seventh floors; and a view from Bothwell Street. Apart from the main entrance, halls and staircases, the ground floor is planned to be let off as shops. Much of the Society's office space is provided on the seventh floor, which contains, in addition, board, committee, president's and secretary's rooms; the intermediate floors are also to be let off.

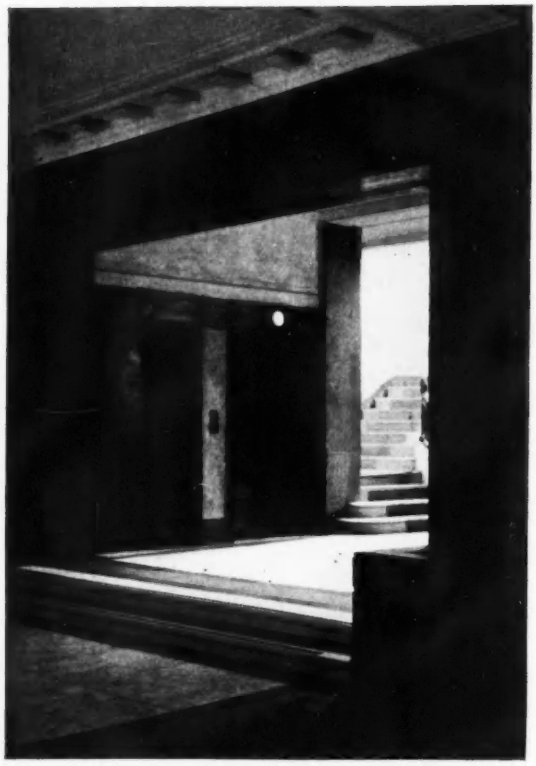
The board room is in English walnut, finely figured ; the committee room, corridor, and ante-room to board room in Indian laurel ; the retiring room in brown pollard oak, with a distressed finish; the treasurer's and secretary's rooms are in Cuban mahogany; and the assistant secretary's room is in Austrian wainscot oak.

Special furniture in the same woods, to harmonize with the rooms, was designed by the architects. Elements of the society's coat of arms, namely, Rampant Lion, Unicorn, Visor, and Mantling, have been used in the cast-iron panels of the windows at the third, fourth and fifth floor levels on all the streets. The coat of arms appears in its entirety over the central doorway in Bothwell Street.

There are seven high-speed, self-levelling lifts, all having solid bronze cars, and two-speed entrance doors, operating automatically by pneumatic action.

The heating installation is on the differential vacuum steam principle. The steam is pumped through piping to radiators with condense return to the boilers, which are oil-fired. The temperature is thermostatically controlled. An independent boiler, also oil-fired, supplies an adequate flow of hot water to all the lavatory basins throughout the building.

C



A view in the main hall, looking across towards one of the ground-floor lift and stair units.

The marble-lined staircase of the adjacent photograph, running up from the lift hall.

Scottish Legal Building, Glasgow.]

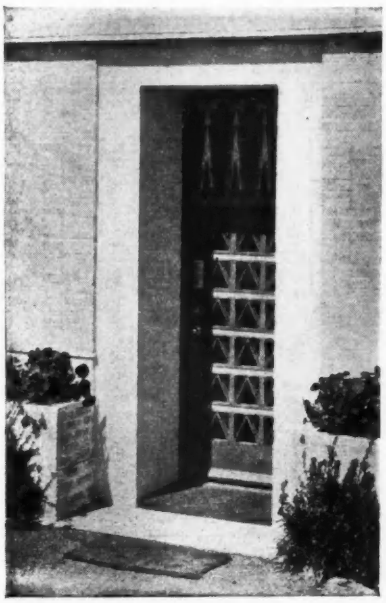
In the board-room on the seventh floor, showing the chairman's seat, with the carved coat of arms above it.

[*By Wylie, Wright and Wylie.*

A typical lift hall on one of the upper floors. Marble is extensively employed for lining and decorative purposes.

HOUSE AT CHORLEY WOOD, HERTFORDSHIRE

DESIGNED BY WELCH, CACHEMAILLE-DAY AND LANDER

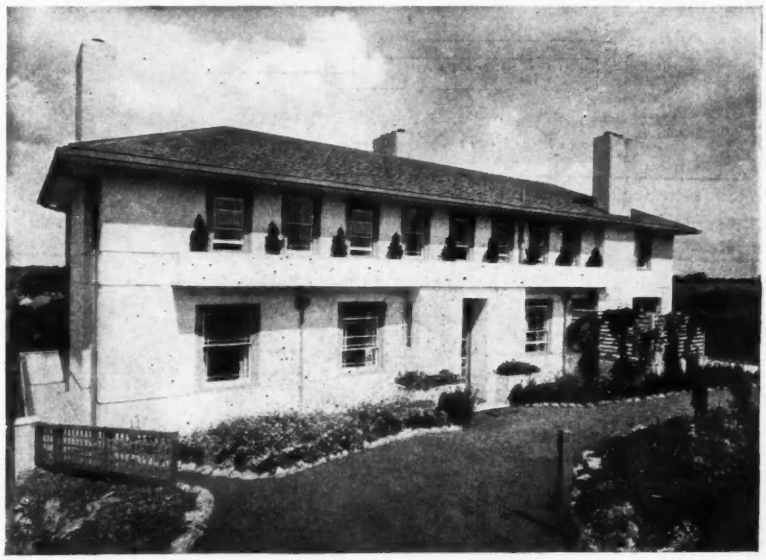


The main entrance leading to the hall.

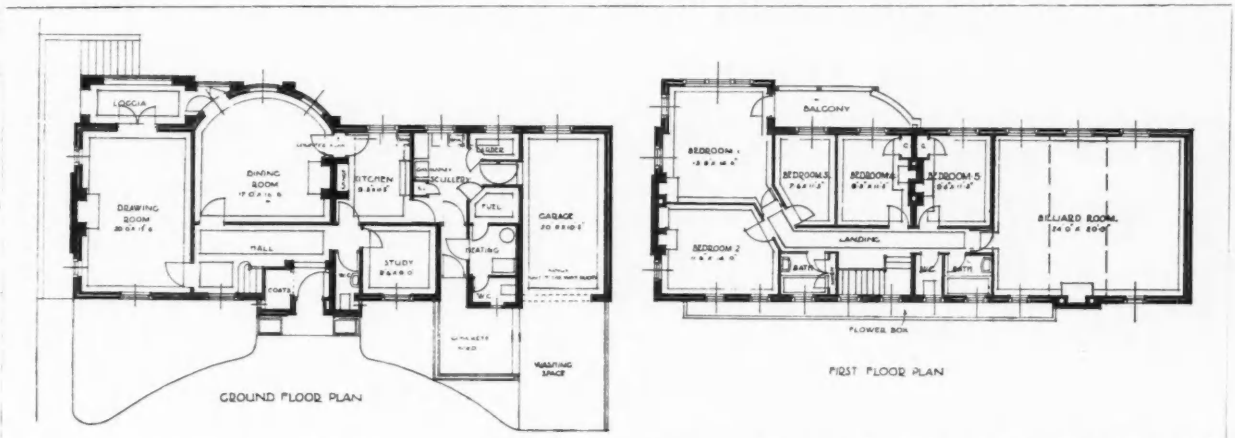
THIS house is situated on a steeply sloping site overlooking Chorley Wood Common. The main front faces almost due south, and the back, which enjoys the better view, has a northerly aspect, the site sloping from south to north.

There were several particular points which had to be considered in the planning. One, of course, the usual question of economy and obtaining the maximum amount of accommodation in the smallest possible cube; another, the ever-present labour-saving question. But perhaps the most important of all was that of arranging the rooms so that as many as possible obtained the view over Chorley Wood Common and yet received a certain amount of sunshine.

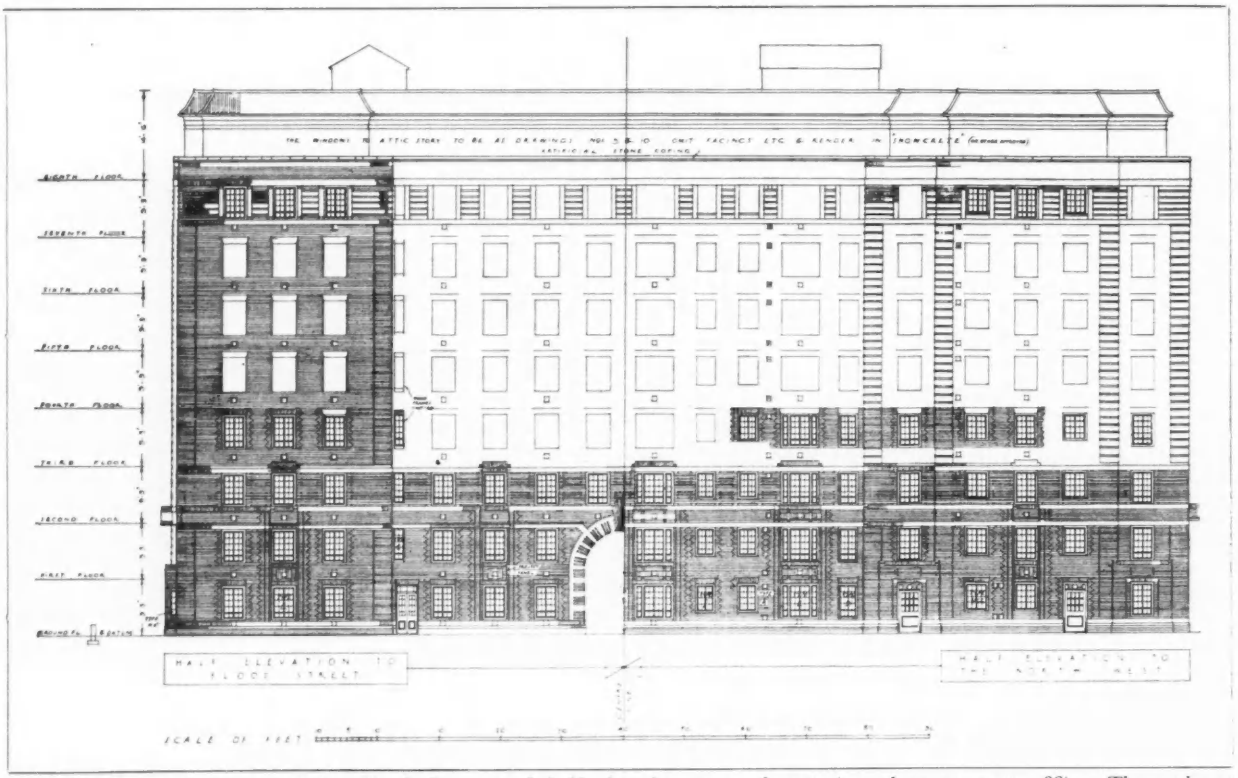
The north front. The steps shown lead down to the garden, which is laid out in a series of terraces. Access to the house is by stairs behind the wall on the right.



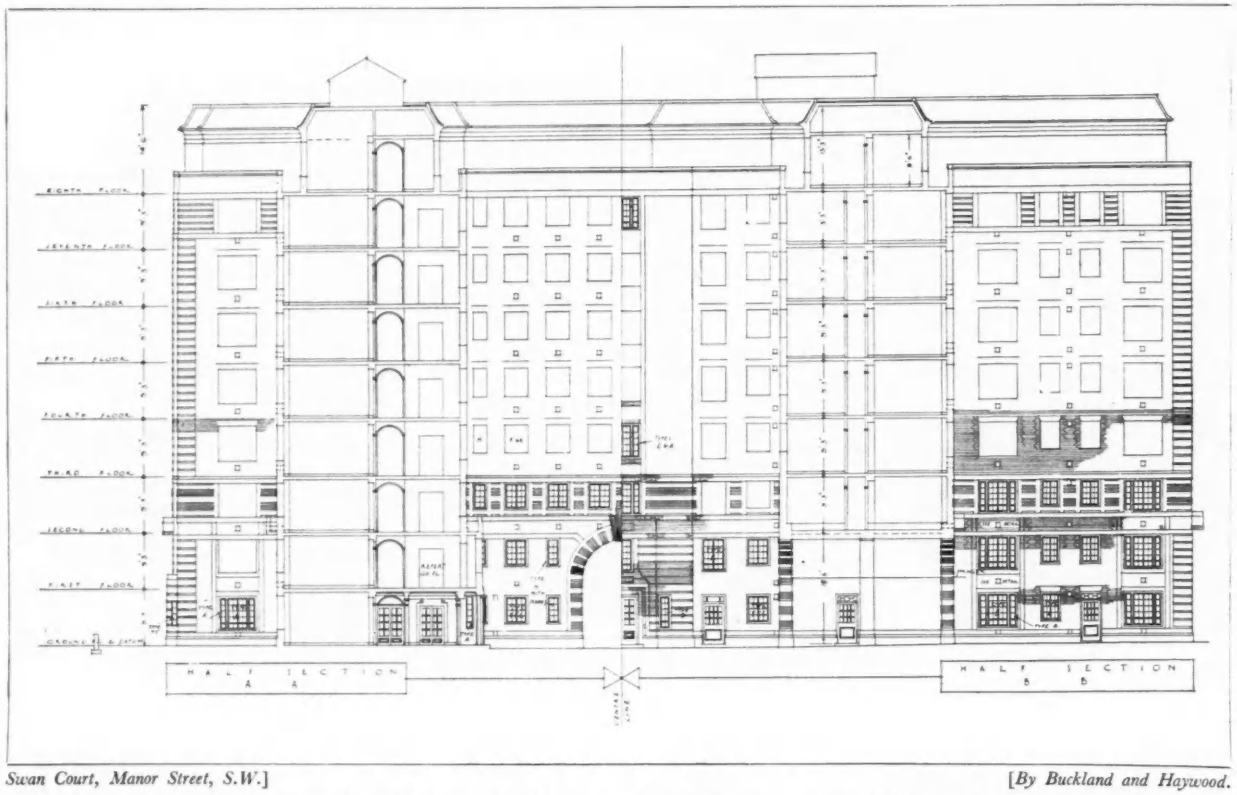
Looking along the main front. The walls are of rustic Fletton bricks, lime-whitened; and the roof is covered with Westmorland slates. The garage is on the extreme right.



Ground- and first-floor plans. The dining-room and kitchen are so planned that meals can be served comfortably with, or without, a servant in attendance. The house is centrally heated; the bedrooms and billiard room are also fitted with gas fires and radiators.



Half elevation to north-east, facing Flood Street, and half elevation to north-west (see plans on page 466). The archway leads to a central courtyard containing the two entrances to the flats and studios. The doorways shown lead to the maisonnettes.



Swan Court, Manor Street, S.W.] [*By Buckland and Haywood.*

Half sections taken from the same points of view as the elevations reproduced above. The architects' detail drawings of the archway and the main entrances to the flats in the courtyard appear on one of the special supplements accompanying this issue.

FLATS WITH ARTISTS' STUDIOS

DESIGNED BY BUCKLAND AND HAYWOOD

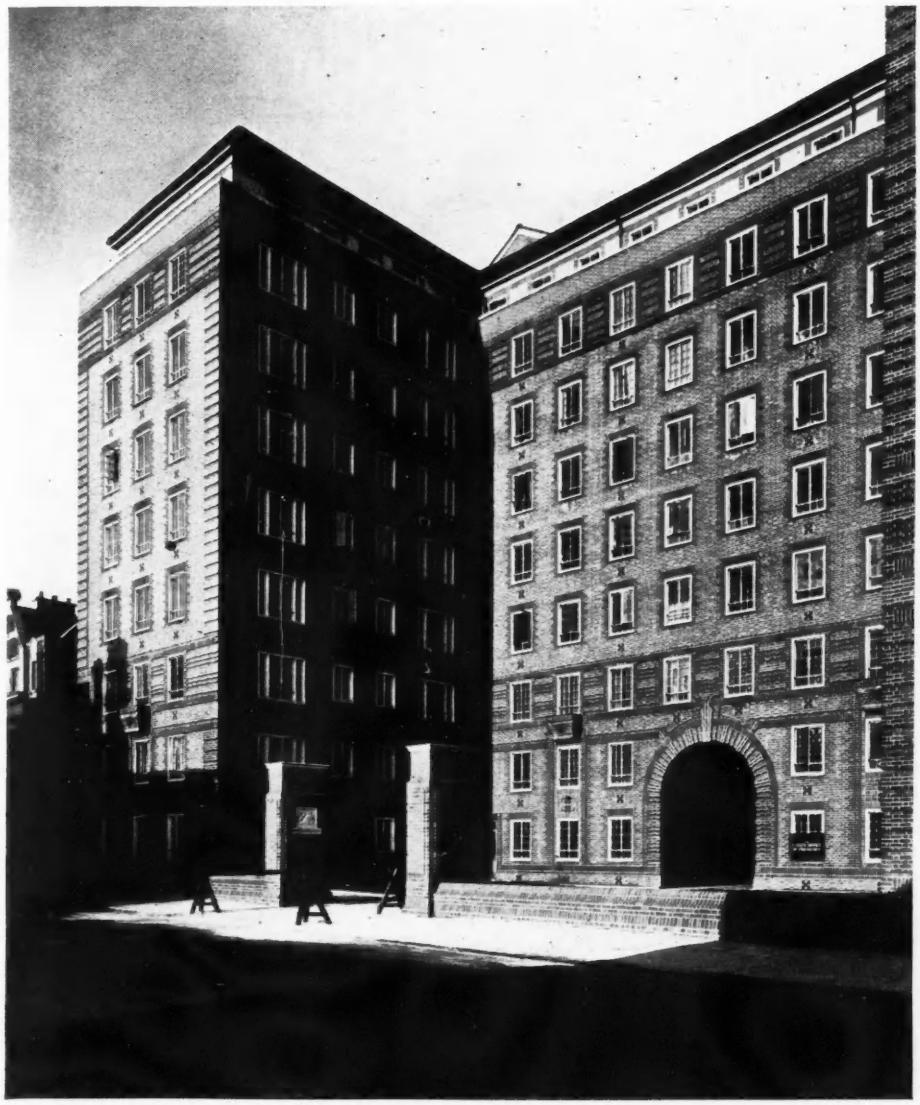
SWAN COURT undoubtedly is one of the most interesting blocks of flats erected in London for some considerable time. With the exception of the upper story of white cement and a small artificial stone coping, the elevations are built entirely of brick of a pleasant plum colour, bricks with bold rusticated being used for the quoins, and bricks with a dragged face for the window surrounds. Notable features of the exterior include the arched heads of the main entrances, the porches and window boxes—all in brick of the same plum colour.

In planning, the building is unusual, if not unique, and even a most cursory examination of the accompanying drawings shows the intensity with which the architects have investigated the needs of the town dweller, and particularly those peculiar to an artistic quarter, such as Chelsea. Thus, there are flats for the bachelor; flats and maisonnettes for the family man; and studio flats for the artist.

The building stands on a site covering a considerable area between Manor Street and Flood Street, close to Chelsea Town Hall, and a few minutes' walk from Chelsea Embankment. It is planned as a quadrangle about an inner courtyard, and the central part of each of the two street façades is deeply recessed to form a projecting block at each corner. This type of plan has enabled the architects to include a forecourt on each street frontage, beyond which is an archway leading to the courtyard.

In the building itself are 104 mansion flats, 24 maisonnettes, and 16 studio flats.

The maisonnettes are the most interesting feature of the plan. They are believed to be unique in London, and give the occupier all the delight



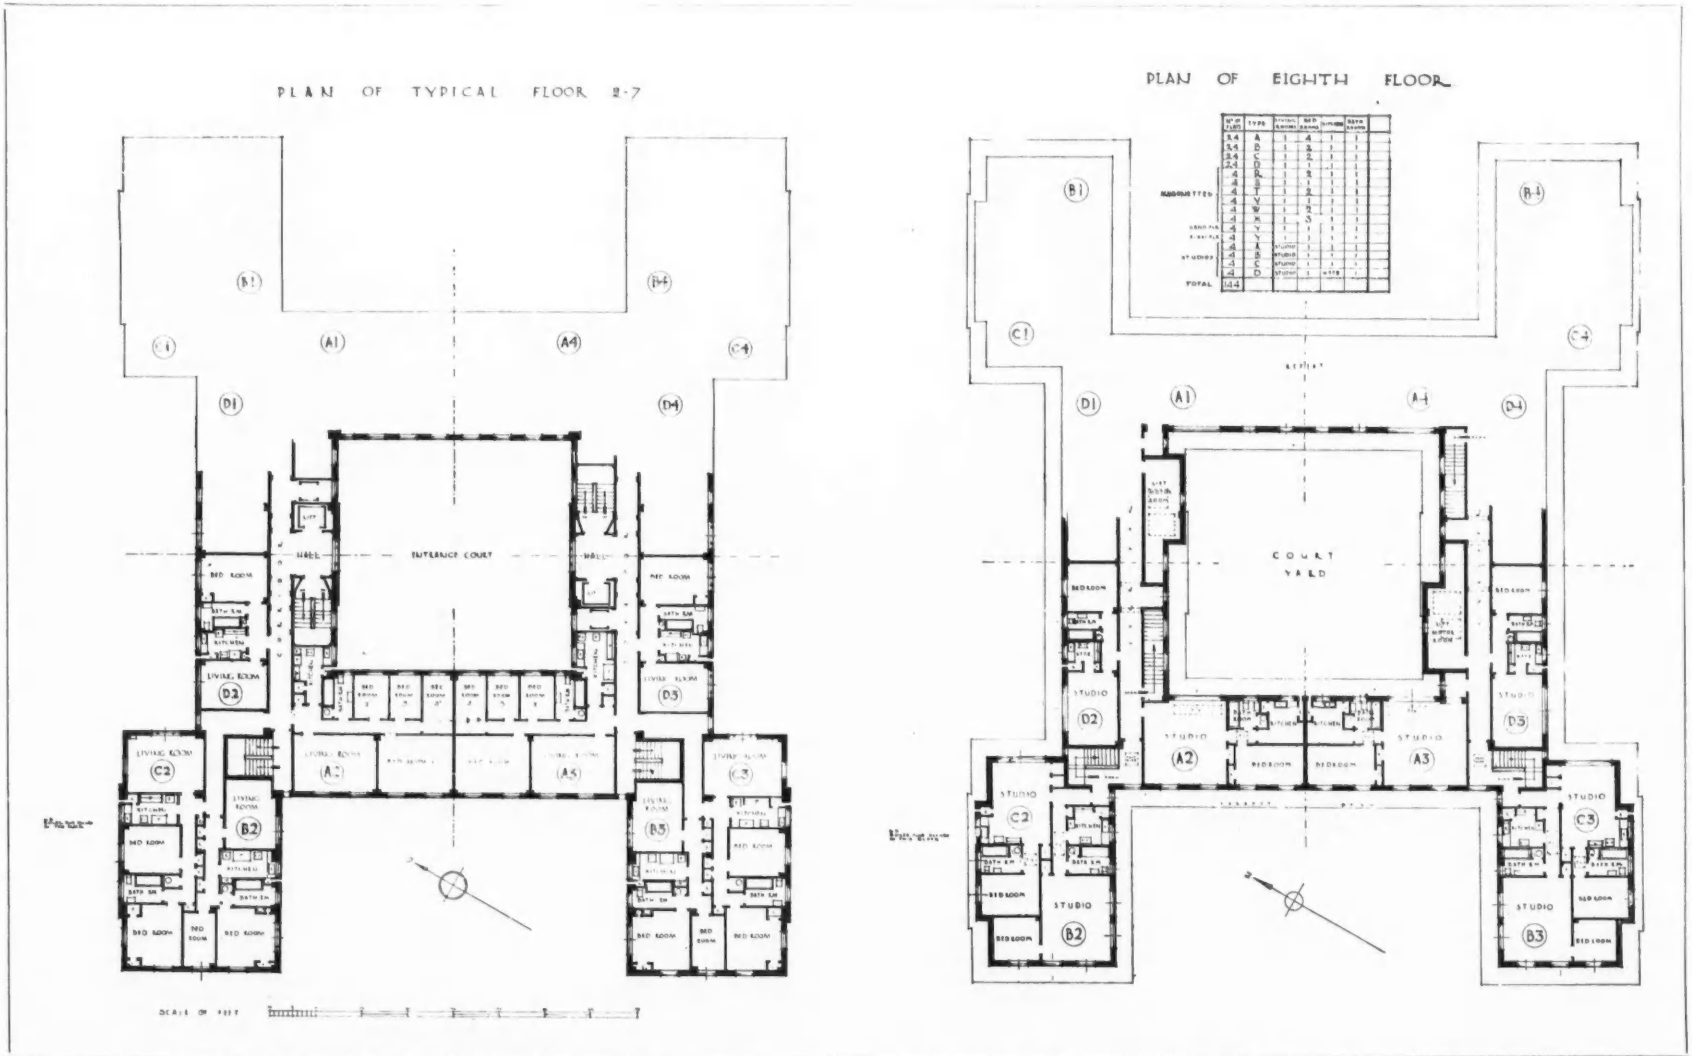
Looking from Manor Street into the forecourt and towards the archway leading to the central courtyard. The other main façade facing Flood Street is of similar design.

Plans of the ground and first floors. The maisonnettes are planned with the entrance hall, living-room and kitchen on the ground floor, and the bedrooms and bathroom on the first floor. The inclusion of maisonnettes is unique in London. On these two floors also are flats with one living-room, bedroom, kitchen and bathroom.

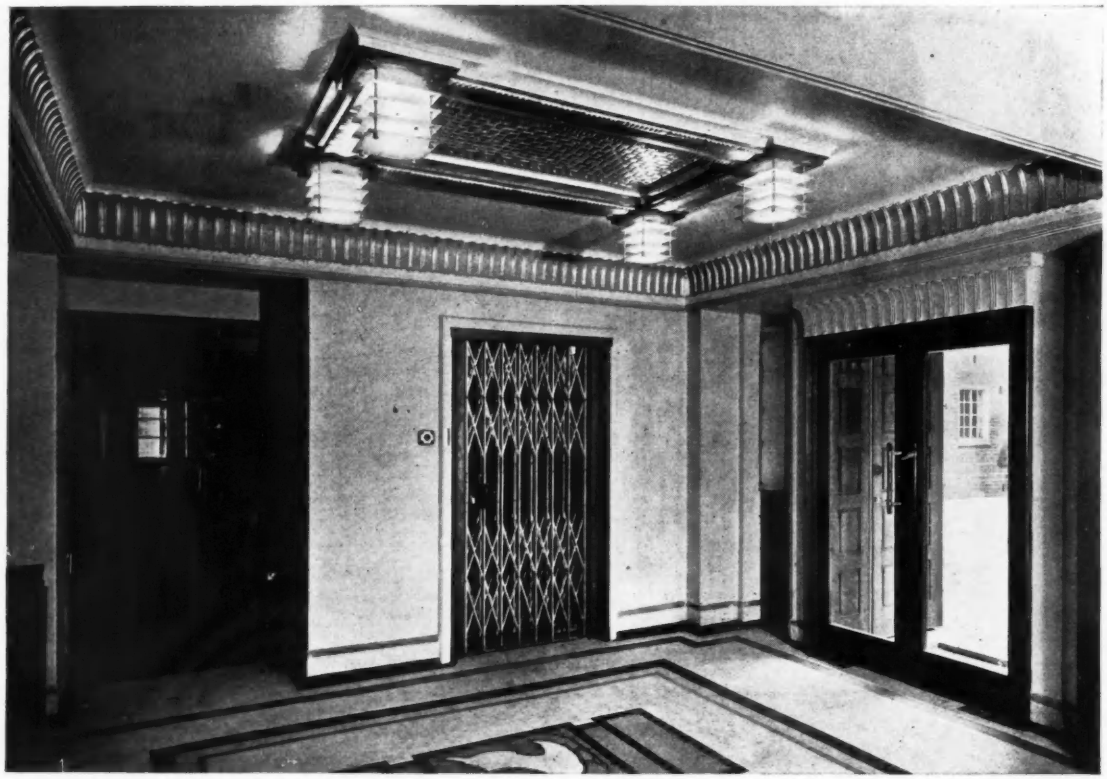
FLATS WITH ARTISTS' STUDIOS

DESIGNED BY BUCKLAND AND HAYWOOD

SWAN COURT, MANOR STREET, S.W.

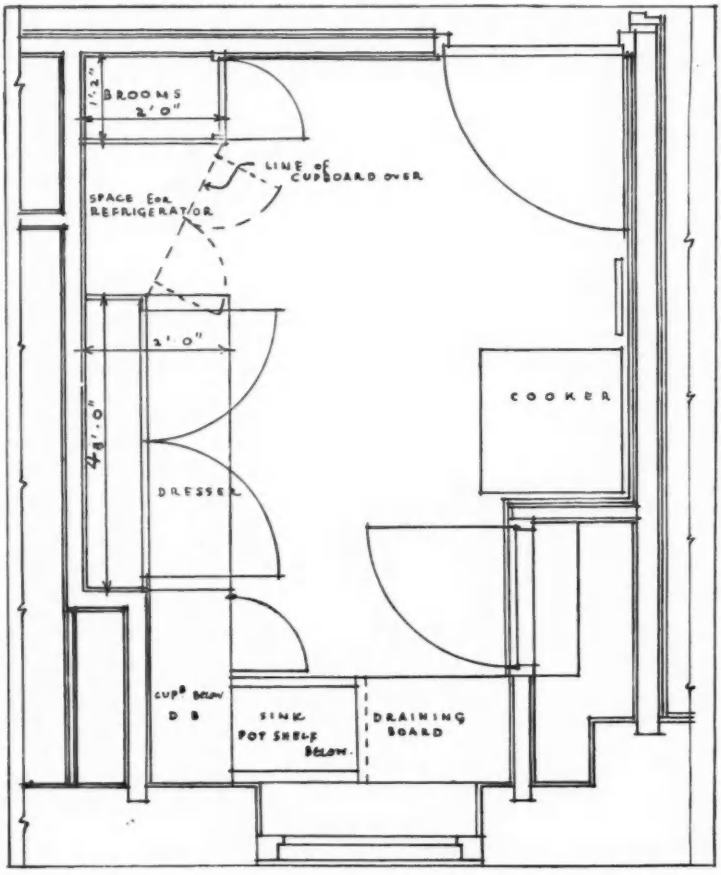


Plans of floors numbers two to seven, and number eight. There are flats of four different types from the second to the seventh floors inclusive. Each flat has an entrance hall, living-room, kitchen and bathroom, the numbers of bedrooms varying from one to four. On the eighth floor are one-bedroomed studio flats of four types.



Swan Court, Manor Street, S.W.] [*By Buckland and Haywood.*

The main entrance halls from the courtyard have light-green walls with a green and gold cornice. The ceiling decoration is in gold relieved with red and green, and has amber light fittings. On the floor, in cream and bright colours, is the figure of a swan.



Plan of the kitchen fitments in the one-bedroomed flats and studio flats.

of a small house with the advantages of a flat. Each maisonnette is planned on the ground and first floors, and has its own entrance and staircase. The maisonnettes are of six types: each has an entrance hall, living-room, and kitchen on the ground floor, but the number of bedrooms on the first floor, where also is the bathroom, varies from one to three.

Everything appears to have been done to make the flats economical to run and labour-saving. Among the more important blessings conferred upon the tenant are ample cupboard accommodation, refrigerators in the kitchens, in addition to larders, electric light, central heating, constant hot water, and electric power points for electric radiators, vacuum cleaners, etc.; gas cookers can also be fitted. The interior decorative finish of the flats is left to the reasonable choice of the tenant.

The rents range from £160 to £250 per annum, inclusive of rates and taxes, and there are no extra charges.

Bernard Whistlow, F.R.I.B.A.: An Autobiography: xx

AN ARCHITECT'S WIFE

BY KARSHISH

(H. B. CRESWELL)

THIS writing is an account of my career as an architect only; but I shall not deviate from that course by speaking of my marriage, for it was that, more than any intrinsic capacities in myself, that established me in practice, gave me an entrenched position in life, and found me fruitful opportunities to show what stuff might be in me. I do not know how it is with other architects, but although few can be so advantaged by their marriages as I was by mine, I am convinced that a certain kind of woman can be the making of a certain kind of man, if they are rightly assorted.

Mr. Bernard Shaw has said somewhere that no married man can write truthfully of women unless he has quarrelled with his wife; and Garston used to insist that no man had any right to speak of a woman except as he would of his sister. I think both these dicta, in a manner, true; and I am also aware of the nauseating flavour any taint of uxoriousness gives to the subject. These difficulties I must make the best of; and as Nancy died when we had been man and wife only eight years, I am able to look back on our past with the detachment of one who writes of others.

Nancy was the best pal a man ever had; but the circumstances of our marriage were somewhat unusual, and I must say something of them. I shall —at the risk of banality—go straight to the point if I recall that, after we were married, she one day said to me :

" It was on the afternoon at the Talbots', when the chimney caught fire, that I thought to myself—if that man asks me to marry him, I will."

" I believe you made up your mind that I *should* ask you," I said.

" But you're not sorry, are you, Pidge ? "

" Pidge " was short for " Pigeon," and this also is much to my point; for I discovered—after we were married—that even before we had struck up a friendship Nancy used to speak of me to her friends as " The Pigeon "; and I happen to know that she announced our engagement to one of them by : " I am going to marry the Pigeon; what do you think of that ! "

I was thirty-two, and she a year older, and a widow. Captain Gardriffen had been killed in the South African War. It sticks in my mind as most odd that I can exactly remember, to the smallest detail, the occasion when I first casually saw the woman who in such a queer way was to become my wife.

I was walking up Cow Street one sunny morning when a white-painted governess-cart, with a long-legged chestnut pony in the shafts, drove up to the curb thirty yards before me, and the lady in it reached across the path, beat on the window of a shop with her whip, and brought the grocer running to her like a dog from its kennel. This lady was small, with dark hair, blue-grey eyes, bright complexion and short oval face. She had rather a beaky, hard-bitten look, and thin lips that smiled in a curious self-satisfied way, and she did not strike me as in the least beautiful; but her air of vivacity attracted me, as I well remember, and her personality was strikingly expressed by the unconventional dark, tailored, tweed costume, and hunting stock, and cloth hat, with a black-cock feather in it, which she wore. This was Nancy—except that the smiling expression of the lips was not due to complacency, but to a mind that found nothing in life to abate cheerfulness and good humour.

We became acquainted that same summer at lawn-tennis parties. Nancy was extremely active, and had a system of scientific lobbing all her own; and I one day noticed that she was mischievously directing these tactics to my individual frustration. This broke the ice between us, and we met afterwards with the social intimacy that allowed—even in those days—banter and personal chaff. Looking back, I got the idea that Nancy first esteemed me for the ease with which she could pull my leg.

I had better say here that not only had I no intention of marrying, but that the idea of marriage never occupied my mind and, except that I did not formulate the thing, it even was my intention never to marry. This state of affairs was due to Frances. Frances' home was at Yaw. We fell in love—as it is called—when I was twenty-four, and she was seventeen. I could only see her when I went home —which explains my unexampled dutifulness to the parental roof; and I could not write to her, for such things were, in the circumstances, considered " unheard of " in those days—and, besides, our attachment was clandestine.

Then, one day, my father suddenly awoke to the fact—which I could have informed him of two years before—that Frances was not " safe." I was made aware of this by sudden obstacles to our meeting, and by my being plainly regarded at home as a delinquent who only escaped obloquy because he was also a fool. The unhappiness of nursing forlorn hopes was replaced by that of seeing them gradually dissipated. Frances grew, under pressure, thoroughly to know her own mind—which turned out to be also her mother's; and finally married very well indeed.

It would have been a disaster if Frances had waited for me, and I fancy I realized it; but for six years my energies had been dissipated, my powers of concentration diminished, my purposes made wayward, and my judgment, taste, and even my sanity, warped by extremes of feeling which ranged from ecstasies of elation to the darkest despair. That was what love had done for me, and I resolutely turned my back upon it as upon a delusion and a folly.

I believe now that it was a small episode at a subscription dance at Nollingborough Town Hall that settled my hash, though I was quite unaware of any change of heart at the time. I had never before seen Nancy in full fig, and I was so much astonished as to be even a little discomforted. She had the kind of presence without which the most beautiful woman fails of effect. It seemed to me she was the most distinguished-looking person in the room, and we only got back upon our accustomed footing of unreserve when, after our first dance, I was leading her out of the hall.

At one end of this hall there was a platform which had been set out with armchairs, where the chaperons, who encumbered such occasions thirty years ago, sat embowered in palms. Conspicuous among them was an old gentleman, the hereditary family solicitor of the neighbourhood's gentry; and as Nancy and I passed across the floor under his eye, we walked behind one of his daughters, who were conspicuous in the town for sporting the newest and naughtiest fashions, and for being, on all occasions, one notch up on every other girl in the place. My eye was caught by the pretty neck and shoulders before me, and my attention held by the extremely low-cut bodice, skimpy skirts, and other novel devices for man-slaying, when Nancy whispered :

" Poppa saw you ! "

I was at a loss until I met her mischievous glance. As I say, I fancy that the moment settled my hash; and the thing was so exactly characteristic of her, and I so delightedly receptive of it,

that I might well have then discerned a secure ground for devotion to her; but, as a fact, I believe I thought nothing more of her after I left the place that night.

It was some time later that I was even curious enough to ask our common friend, Mrs. Talbot, about her. She lived, I was to discover, in a tiny house hidden in the country, with a certain Miss Pauline Salsify of mature years, who sought, with only partial success, to dissipate virgin vinegar by horse exercise. She and Nancy shared one hunter, and although neither of the ladies got all the hunting she wanted, there is no doubt the horse did. That Nancy was able to keep house with "P. S." is proof of the enduring equanimity and sunny good-nature I was to know so well. I never became aware I was fond of her until after I had ceased to wonder at the startling parallelism of our minds, and when her humour and discernments had become a treasured possession for me, without my being aware of it. I found out how things were with me when she went abroad for three months after taking a heavy toss that destroyed her nerve.

She was the best pal a man ever had, and we were supremely happy. Of that I have nothing to say; I have given this account of her and of the circumstances under which we became life-partners for the purpose of introducing the subject of her education of me as a practising architect.

It was while we were still engaged that she said to me one day: "You know, Pidge, you can't afford to travel third-class."

I did not at once gather her meaning. It was ninety-one miles to London from Nollingborough. I went up more than once a week—on an average—and travelled third-class, and sometimes by the Wednesday cheap day excursion. Nancy realized that in doing this I grouped myself with persons of no account in the place, and that I ought to associate myself with the well-to-do, and adopt the outward signs of affluence and prosperity. I found she was perfectly right in this; for when I travelled first-class I was at once aware that I set a further distance between myself and the detestable associations of the town, and drew nearer to persons with whom I had social affinity. I also met agreeable acquaintances on the train and hob-nobbed with men whom it was useful to know, and I was even introduced, in railway carriages, to those who afterwards employed me and who otherwise might not have done so.

"You can't make money unless you spend it." "People will not readily pay money to those who are in need of it: to earn money easily you must make people think you don't want it." "You will find people much more anxious to employ you if they think you are so busy you cannot attend to them, than if they think you are in want of work": these are some of the things Nancy said to me—taught me, in fact, for I have found them to be true; but she did not get them from any writings—although she read much—but from her amused observation of life and her acute discernments.

When I was thinking of becoming a Mason she demurred until I had found out who the members of the Town Lodge were; and she then vetoed the idea.

"You may console yourself that if there was anything of the least moment or interest in Masons' secrets, everybody would know them," she concluded.

It was, however, her guidance in more intimate and personal matters that most benefited me. After the bazaar, I had made some pretentious water-colours of local scenes—picturesque farms and villages—and had two of them exhibited in the window of a seller of cheap prints who was also a frame-maker and glass-cutter, with a placard I wrote myself: "Sketches by Bernard Whistlow, Architect: £5 5s. each." The shop was to get 25 per cent. commission on sales; but I sold nothing, though I substituted new drawings from time to time, to disguise that humiliating fact. My purpose, however, was not to sell, but to keep my name to the fore and fan the flame lighted by the bazaar.

Nancy shook her head at all this, however; she also disapproved of my singing in the church choir of the village where I lodged and, where, afterwards, we rented a small house; and she dissuaded me from singing at village concerts in the country round about. The explanation she gave me for her objection was: "You must not be parochial until you are in a position to patronize."

This is perfectly clear to me now, but I had some difficulty in understanding her meaning then. I had thought it a great stroke when I was asked to become a member of the church choir, and was pleased to find myself fast becoming a standard turn at "penny readings," and I had, at the time Nancy intervened, prepared myself with "Songs of Araby" and "The Devout Lover" in expectation of being asked to help at the big Nollingborough concert in aid of the Organ Fund. Nancy, however, would not hear of this. "It is not that you do not sing well enough," she said; "it is your style of singing and the kinds of songs you sing. If you accompanied yourself and sang *comic* songs—I mean ironic and insolent songs, like Corney Grain; or even hoarse-sounding modern German songs that people would only pretend to like so as to appear more musical than they were, it might be a different matter; but the songs you sing are too sentimental, Pidge, and you sing them far too earnestly—as if you were actually having the experiences you enact. You solicit your audiences like a professional singer: you will lose caste if you sing like that, and it is the only way you *can* sing. You must give it up."

I did give it up, and I have no doubt Nancy was right, for a few years later the idea of standing up and singing such songs as "The Pilot" and "The Midshipmite" would have made me wince.

Garston, who was devoted to music, must have had much the same idea of my performance, for he once very much annoyed me by introducing me to a stranger, one hilarious night in his diggings, by shouting:

> He'll sing thee rot from Araby
> And drivel from Cashmere;
> Stuff that I think
> Will strike you pink
> And make you stop your ear.

All the same, I was a popular success with my songs on village platforms.

Nancy, however, did not merely disapprove of my attempts to advance myself; she was also quick to seize ideas to the same end. One day, for instance, when we were in the town, I was returning to the trap in which she was waiting with a roll of brown paper I had just bought under my arm, when I met an acquaintance, a solicitor in the town, who said with jealous curiosity: "*You* seem to be pretty busy." I allowed him to think what he liked; but I happened to mention the thing to Nancy when I joined her, and she at once said: "That's a hint to *you*, Pidge"; and I formed the habit, from that day, of going about with a roll of drawings under my arm.

Another idea of hers from which I had great advantage was the setting up of a portfolio in my office. She said I ought to have an array of designs for all sorts of buildings that I could show to people as evidence of my attainments. Accordingly I set about making designs, in plan, section and elevation, of houses, churches, a cricket pavilion and so forth, which I kept, with perspective drawings and some of my sketches, in a great standing portfolio of mahogany and brass. I found it, as a practical matter, impossible to design without having to satisfy fixed conditions; and almost impossible to observe requirements which had no other justification than my own caprice, and accordingly—at Nancy's suggestion again—I lifted plans out of the back numbers of architectural journals and altered them to suit my fancy in improving on their elevations. This

made the task easy enough, and the result was some striking designs; and as it amused me to exercise myself in neat draughtsmanship, I had a variety of interesting buildings, beautifully rendered, to display to clients or to acquaintances who came to the office or were brought there by Nancy, and who noticed the portfolio and were curious about it. I never, of course, said anything deliberately to lead anyone to suppose that the buildings had been carried out. Our purpose was to let it be known that I was competent to design and carry out such works, and I had plenty of evidence that Nancy's forethought and my industry was not wasted.

For a long time Nancy used to give me continual surprises. The lessons at our church were read by the chief engineer of the Eureka Plough Works, and when I heard, privately, that he was leaving the place to take up other work I found no difficulty in getting invited by our rector to fill his place at the lectern, and came in high spirits to Nancy with the news. She, however, laughed at me, burlesqued what she pretended to think my manner would be, and ridiculed the whole idea. When I could get a serious reason from her, all she said was : " No one, except a clergyman, can read in church without giving up all social pretensions, *unless* he is able to condescend to the Scriptures—which you could not do."

I could not make head or tail of this at the time, and though I agree that her decision was wise, I cannot even now perfectly understand the reason she gave for it.

Another thing that puzzled me was her increasing habit of making fun of my pretentions as an architect before acquaintances. " This husband of mine is crazy about church spires : I am always afraid he is going to begin climbing up one;" " Nothing will satisfy this architect of mine but to see the Royal Academy lined with his drawings;" " I am afraid to look at my husband's houses for fear they should wobble," and things of that sort.

I once expostulated when she had made me look particularly foolish.

" Why, you stupid man," she cried, laughingly, " how else can I call people's attention to you and your work a dozen times a day ! I should bore everybody if I spoke seriously of your doings, and they would also think I was trying to boost you. Don't you realize that the mere fact of my laughing at you carries conviction of your success ! Everyone will suppose that I could not make fun of you if you were not far above being damaged by it. You must be careful not to appear pipped; you must try to smile and be easy and tolerant of my nonsense."

It was, however, more by her intricate social manœuvrings that Nancy built up my fortune. This part of the story is closely linked to my work and my relations to my clients and the widening of my connection, and as the emulation Nancy inspired was the chief preoccupation of my life in those active years, and is an object-lesson—as I think—in the methods by which secure establishment in a general architectural practice is to be attained, I shall give some account of it.

NEXT WEEK—XXI : I QUARREL WITH MY PARTNER

LETTERS FROM READERS

Art and Industry

SIR,—I tried recently, in a town of about a million inhabitants, the experiment of holding an exhibition of examples of wallpapers, fabrics, carpets, electric fittings, and ironmongery designed by Professors Fahrenkamp, Wach, Breuhaus, Poetter, Harkop, Nany, Kleinhempel, Kaufmann, Gropius, and Mendelsohn; also Bruno Paul and that remarkable guild—the Wiener Werkstätte.

All the local architects, and 75 per cent. of the painters and decorators were circularized, as well as the general public. To my knowledge, no architects or decorators attended the exhibition, but only members of the general public and three students of the local art school. So much for the value of exhibitions. The people most concerned in the use of beautiful materials simply could not be bothered spending half an hour to visit it.

Nothing shows more clearly than these German, Austrian, and Swiss designs how immensely in advance Continental design is of our own, and the tremendously important position the architect holds in the eyes of the Continental manufacturer. The beauty of colour, and the sane simplicity of designs used by these architects, makes British wallpaper designs appear crude and dull in contrast, and the uninspired work of hack designers.

At present our designers, if working on modern lines at all, are guilty of copying the worst of crude French design. Original and creative minds seem to be absolutely divorced from our manufacturers' draughting-rooms. Undoubtedly, a start will have to be made at the source, which, I suppose, is the various art schools throughout the country. This will mean the introduction of new teaching methods by men who spend some weeks in every year visiting the various guild centres throughout Europe, and studying the methods of training and textile production which are employed abroad with such success.

At present the product of the art school has usually about as much idea of modern commercial design as the chief of the unenterprising firm whose staff he joins. W. A. R. STRINGFELLOW

Will the Robot Come?

SIR,—I was extremely interested in the report of Mr. John Gloag's lecture on " The Modern Movement in Design and its Effect on Home Decoration of the Future."

His visualization of a flat of 1960, with its " clock, thermometer, radio dial, telephone dial and other dials concerned with the services with which this flat of the future would be connected," is certainly a clever representation of what the future of functionalism may be like. To my mind, however, he seems to have omitted one vital point in his flat of the future—namely, the substitution of a Robot for the ordinary servant ! R. U. R.

Loamy Sand

SIR,—We have read with interest your article on loamy sand in the JOURNAL for September 9. We have for some years used a mixture for cement mortar of four parts sharp sand and two parts loamy sand to one part of cement, and we have found that this mixture makes a mortar as hard and tough and strong as any mortar could possibly be. In fact, we changed to this mixture some years ago because mortar made with sharp sand only, in addition to being very " short," and consequently difficult to manipulate, had a tendency to flake and rub off when set.

The chief objection of your authority " W. A. D." to loamy sand seems to be that it makes the mortar easier to manipulate and so saves the builder time and money. This cheapens the work for the client and therefore does not seem to us to be a sound objection.

H. C. LIST

FIRST PRIZE: PERCY BOWEN.] (Pencil: 8½″ × 13″)

Chepstow Castle and the River Wye, Monmouth.

SECOND PRIZE: E. B. MUSMAN.] (Pen and bistre: 12½″ × 8¾″)

Coltishall Mill, on the River Bure, Norfolk.

THE SEPTEMBER HOLIDAY SKETCHES COMPETITION RESULT

THE last of this year's three Holiday Sketches Competitions, which closed in September, was highly successful. It produced no fewer than 104 sketches, submitted by thirty-four entrants. The standard of execution in various media was well maintained; greater discrimination might, however, have been used in choice of subject. This consideration has carried weight in the adjudication.

The first prize of ten guineas has been awarded to "Charlton's" pencil drawing, reproduced on this page. He is:

PERCY BOWEN,
63 Westbourne Park Road, W.2.

For the second prize of five guineas choice has fallen on the pen-and-wash drawing also published here—one of a number, mainly in bistre, sent in by "Gaff," who proves to be:

E. B. MUSMAN,
7 Carteret Street, Westminster, S.W.1.

One competitor who was in the running had to be disqualified for not having used motto labels of the appropriate date.

A selection of the present competition drawings appears on the facing page, and it is proposed to publish others from time to time.

In again congratulating all competitors on their enthusiasm, the results of the two sets, of three competitions each, held this year and last, may be summarized. Last year weather conditions in England were anything but ideal; this year, unfortunately, they have been even worse. Yet the two years have produced not far short of 450 drawings from nearly 150 competitors, a state of affairs that is highly gratifying to all concerned.

THE SKETCH CLUB

THIRTY-NINTH SESSION

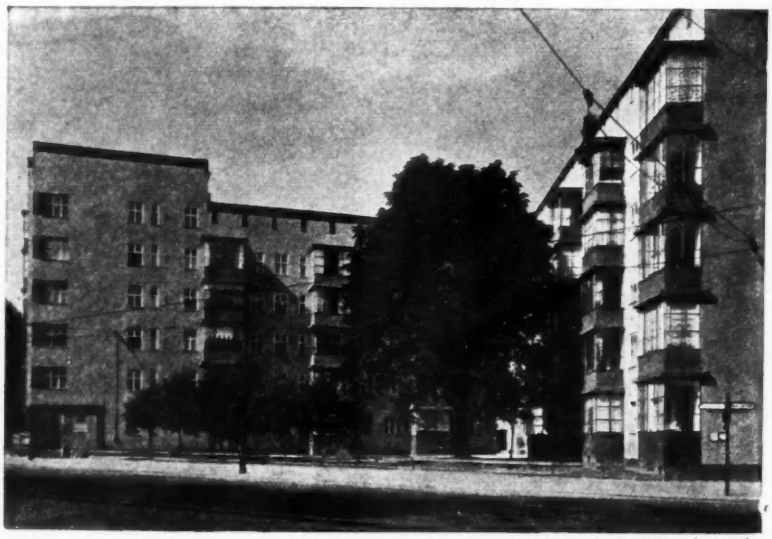
Waterloo Bridge and St. Paul's Cathedral.

LITERATURE

BERLIN HOUSING SCHEMES

ONE of the effects of the post-war troubles of Germany has been to elevate Berlin from a provincial capital — which happened to be the centre of the Reich Government and was a little looked-down on by such towns as Munich and Dresden—to a world-city. Its population increased enormously and the housing shortage became acute. As a consequence the post-war years, and particularly the years 1927–1930, witnessed a positive orgy of building and the creation of entire new suburbs composed of great flat-dwellings. This orgy has now spent itself and, indeed, over-reached itself, as the authors of this work complain, inasmuch as in large areas of pre-war Berlin living accommodation can be had at a very low rate, rendering the financial management of these huge new estates a very difficult problem.



[*Mebes and Emmerich, Architects.*

Block of dwellings in Schöneberg, Hauptstrasse.

[*Martin Wagner, Architect.*

The Britz housing scheme, Stavenhagener Strasse.

This period of feverish expansion is here described and analysed by Dr. Schallenburger, the director of one of the largest of the Berlin building societies, and Dr. Erwin Gutkind, one of his most distinguished colleagues and architects. The examples illustrated are taken from almost every suburb of the new Berlin and show a considerable variety, both in style and in quality.

In their preface the authors complain that enough attention has not been paid to a uniform

[*Bruno Taut, Architect.*

[*Erich Richter, Architect.*

The Tegel housing scheme, 38th and 39th streets.

style of building, but to English eyes there is a certain national similarity in most of the examples illustrated and greater uniformity would, from our point of view, lead to an almost intolerable monotony. The actual quality of the flat-buildings, too, varies very greatly.

Some of the examples in Prenzlauer Berg and Siedlung are extremely interesting, and should be very pleasant to occupy; others, such as some of the examples from Wedding and Köpenick, are regular "mietskaserne," tenement-like in the worst sense of the word, and would require a very strict municipal discipline to prevent them from developing into slums. It would

[*Walter Gropius, Architect.*

The "Siemens-stadt" industrial suburb, the Mäckeritz Strasse.

[*Erich Glas, Architect.*

An extensive block at Wedding, the Dubliner Strasse.

be interesting to know if the environment suggested the buildings, or if the buildings have created the mentality in, say, Wedding, which is one of the strongholds of the Berlin Communist party.

There is an article on the financing of these great flat-buildings by Kurt Rohloff, another director of the same building society—the Wohnungsfuersorge Gesellschaft. It goes into great detail on questions of upkeep and letting, and is illustrated by specimen balance-sheets. Another chapter discusses the question of whether the Berliner is housed above his means. It is decidedly pertinent today.

There are some interesting plans of the general arrangement of the buildings in the suburb showing the communal gardens, methods of approach, etc., and several plans of individual apartments. It is a pity that no plans are included of some single block to show the relative positions of the apartments within the main building. The photographic illustrations are good and include many buildings by architects well known in this country; to mention only a few, Bruno and Max Taut, Hans Poelzig and Walter Gropius.

It would be interesting to know for whom exactly this volume is intended. It is not produced in the style usually devoted to architectural works in Germany, and the price (Rm. 5,80) suggests that it is intended for a wider public. But surely the Berliner is not so sociologically-minded as to swallow all the statistics in the text as recreation?

L. F. E.

Berliner Wohnbauten der Letzten Jahre. By Jakob Schallenburger and Erwin Gutkind. Verlag W. & S. Loewenthal. Rm. 5.80.

ELECTRICAL DEVELOPMENT IN THE NORTH

THIS book, recently published by the Newcastle-upon-Tyne Electric Supply Co., Ltd., describes rural areas in Northumberland, Durham and the North Riding of Yorkshire, where agricultural prosperity and rural repopulation has followed electrification. The company supplies current to an extensive area on the North-East Coast, stretching from Alnwick to York. This book, therefore, contains a number of illustrations depicting electrified farms, dairies and villages, in addition to maps showing the distribution network.

The author refers to the early planning, in 1906, of the transmission network to which is connected today the largest industrial, domestic and rural load of any European power supply company. Difficulties which had to be surmounted are referred to, notably that of obtaining from British sources cables and switchgear suitable for the then unusually high pressure of 20,000 volts. Certain heavy power loads, such as those required for collieries, had to be provided for, and cables laid for those services by routes which would enable supplies to be given to intermediate areas where future demands were expected.

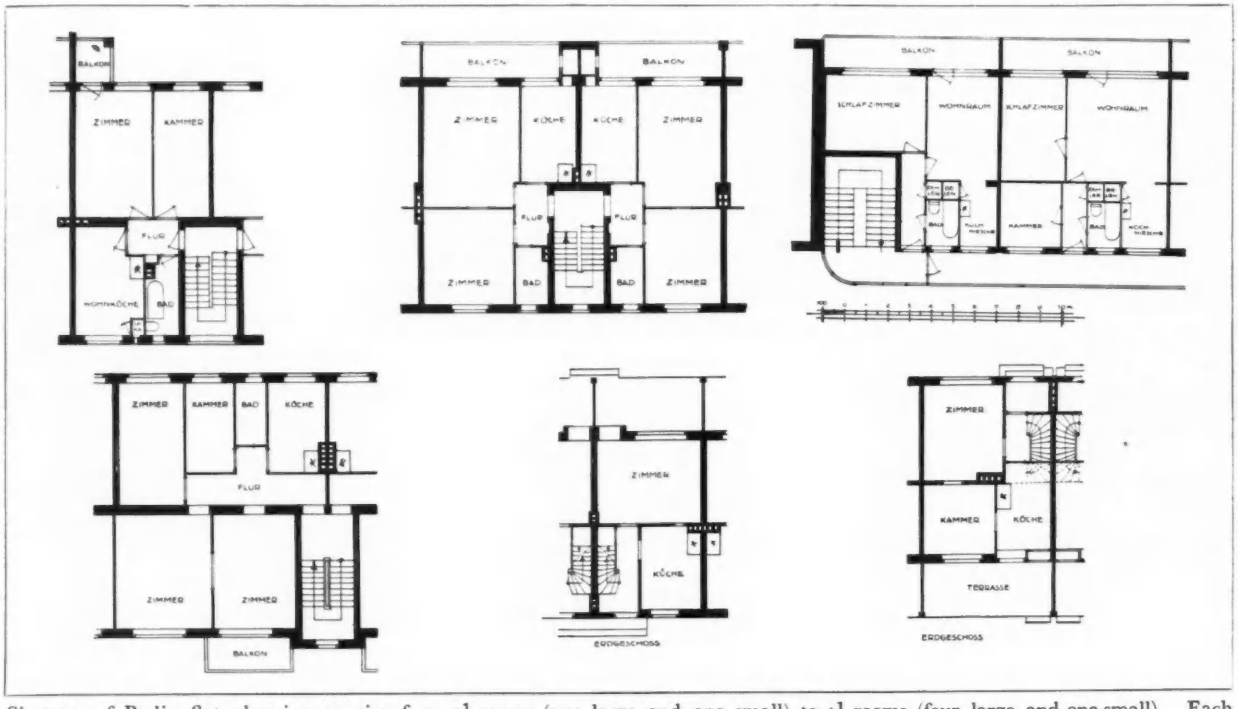
It is claimed that there are three factors which can bring new life and population to the country. The first of these is prosperous agriculture. Secondly, cheap and convenient transport to the business areas of cities and industrial districts. Thirdly, there must be belief that repopulation of the countryside, the revival of village industries, and the re-equipping of agriculture are vital things, and that it is a paying proposition to finance them.

A description is given of the travelling electric showroom which has been found particularly advantageous in districts where the population density did not justify the renting or erection of permanent premises. It visited over twenty villages last year. This showroom seats fifty people for lectures on housecraft and demonstrations of cooking by electricity, and contains nearly every kind of electrical apparatus used for domestic purposes, including cookers, fires, refrigerators and water-heaters.

The book is the first attempt to describe the early efforts in constructing transmission lines through sparsely populated districts. The national "grid" now being erected by the Central Electricity Board will help to develop other areas in the same way, and we may look forward to a revival of agriculture, based on an intelligent use of electrical power.

H. V. L.

The North-East Coast Countryside Electrical Development. By Holmes Waghorn. Newcastle-upon-Tyne Electric Supply Co., Ltd.



Six types of Berlin flat planning, ranging from 1½ rooms (one large and one small) to 4½ rooms (four large and one small). Each flat has a kitchen and bathroom.

QUESTIONS THAT ARISE

Profit on Metal Work

H. G. G. writes: "*I recently obtained an estimate for some metal work, and the following was included in the bill of quantities:*

	£	s.	d.
Provide the provisional sum of £300 for wrought-iron grilles, gates and railings which are to be supplied and fixed complete by a firm selected by the architect	300	0	0
Add for profit 5 per cent.	15	0	0
Allow for attendance upon specialist and for supplying scaffolding, ladders, and the usual facilities (cutting away and making good measured separately), 2½ per cent.	7	10	0

"*The percentages required for profit and attendance were priced by the builder. During the progress of the works the builder, who was a specialist for wrought-iron work, asked whether he could submit a price for this work. He did so and his price of £275 was accepted. In settlement of accounts I consider that I have a saving on the contract of £22 10s. i.e. on profit and attendance as well as the saving on the provisional sum. As the builder is getting a profit in his estimate of £275 for this work, surely he does not expect to make a second profit.*"

Unless in obtaining his price for the ironwork from the builder inquirer asked him to allow in his estimate for all profit, including scaffolding and attendance, incorporated in the three items in the bills, I consider that the builder is entitled to the benefit of all items.

It is reasonable that the builder will claim that his price of £275 was given in competition with the figure of £300, included as from the specialist to be appointed, but his profit was reduced in this figure to allow for the inclusion of profit gained by the other two items. Actually, his price is £275 plus 5 per cent. profit, i.e. £13 15s., and 2½ per cent. for scaffolding, etc., i.e. £6 17s. 6d., giving a grand total of £295 12s. 6d. G. E. D.

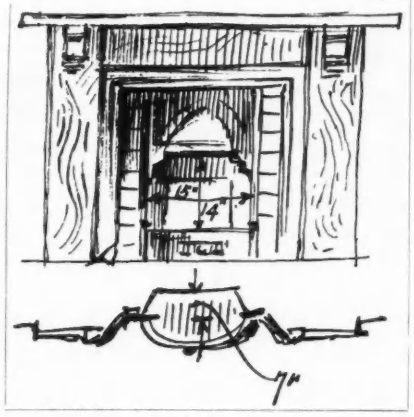
Smoky Chimney

E. I. writes: "*I should be glad of the opinion of your expert with regard to curing the smoky chimney in the following case: The fireplace (open coal fire) is on the first floor of a three-story house, and the flue is quite straight! The flue is carried up well above the ridge, and there are no neighbouring buildings of greater height. Every windy day the smoke is driven down (periodically) in gusts. The flue is almost vertical for its entire length, and is carried up from the fireplace opening for a total height of approximately 25 ft., where it is finished with an ordinary chimney-pot. Its width is presumably 9 ins. by 9 ins. The fireplace opening and dimensions can be seen from the accompanying rough sketch.*"

The possible causes of smoky chimneys are so various that it is always extremely difficult to pronounce a remedy, especially without seeing the actual circumstances.

From the information given, I should imagine that in this case the trouble is attributable to collections of cold or damp air somewhere in the flue. For this type of fireplace a slowly gathered flue is not desirable, as it leaves large pockets of cold air just above the fire, which stop the upward current of the warm smoke. Alternatively, it is possible that the chimney cap (as in many cases) is saturated, making an area of heavy damp air, which would assist any tendency to down draught. I should recommend the inquirer to look at these points.

It is possible that one of the patent anti-down-draught pots might give relief, but it would be better to diagnose the cause of the trouble and to remedy that. H. D.



See query on "Smoky Chimney."

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Road and Bridge Schemes Abandoned

THE economy programme of the National Government has resulted in the abandonment of certain road and bridge-building plans, including the Humber bridge scheme. This project has occupied a good deal of time in Committee, and was estimated to cost £1,750,000. The Ministry of Transport offered to contribute 75 per cent. of the cost. The promoters have agreed that some postponement is inevitable, and it is hoped that Parliament will agree to carrying the Bill over to another Session.

Damaged Supports of Waterloo Bridge

Mr. Mills asked the Minister of Transport if his attention had been called to the fact that the temporary wooden supports to the damaged arches of Waterloo Bridge were infected by death-watch beetles; and whether any inspection had been made of these supports since 1923.

Mr. Pybus said that the bridge and its supports were subject to constant inspection by the engineering staff of the L.C.C., and he was assured that Mr. Mills was misinformed.

Control of Rents

Mr. John Palin asked whether any and, if so, what proposals were under consideration to extend the control of rents and to effect a decrease in rents.

Mr. Perry asked whether, in view of the increasing prices of food and other commodities since September 21 and also the increased taxation falling heavily upon persons who had purchased their houses on the instalment or mortgage plan, it was the intention of the Government to introduce a new Rent and Mortgage Interest Restriction Bill.

Mr. E. D. Simon said that the action which the Government proposed was to extend the Rent Restriction Acts by means of the Expiring Laws Continuance Act.

Investigation of Basement Dwellings

Mr. Day asked the Minister of Health what investigations had been made into the number and description of occupants of basement dwellings in different parts of London; and would he make a statement of any such investigations and the conclusions and recommendations arrived at.

Mr. E. D. Simon said that the report of the County Medical Officer of the London County Council for the year 1929, and the report of the School Medical Officer of the Council for the year 1930, contained accounts of the investigations which had been carried out. The question of what further steps, if any, could usefully be taken to deal with unhealthy basements was engaging the active consideration of the London County Council and the Standing Joint Committee of the Metropolitan Borough Councils.

Housing Progress in Manchester

Sir Gerald Hurst asked how many subsidized houses were built in Manchester between May, 1929, and August, 1931, inclusive, and at what cost to the State.

Mr. E. D. Simon said that 5,807 subsidized houses were built in Manchester between the months named. The present value of the subsidies payable out of the Exchequer in respect of these houses was £472,390.

SOCIETIES AND INSTITUTIONS

"MODERN Tendencies in Decoration" was the title of a paper read by Mrs. Grace Lovat Fraser, F.I.B.D., at a meeting of the Incorporated Institute of British Decorators, held at Newcastle. Mr. Gloag's paper, printed in our last issue, was read at the same meeting. Mrs. Fraser analysed the problems of the modern home-maker and made a particular point of the considerable variety of jobs the modern house or flat had to perform.

Modern rooms, Mrs. Fraser said, had to accommodate quite different habits from those which the spacious, staid rooms of the nineteenth century were expected to accommodate. They had to be capable of making quick changes. They had to house gramophones and wireless sets, and at any moment preparations for a party might be thrust upon them, with a consequent demand for dancing space. Furniture had, under those demands, lost much of the solid air of permanence it once possessed. Things were lighter, simpler and fresher in colour. Plain walls to some extent compensated the eye for the restrictions of space. The modern, light, easy, informal method of furnishing had grown quite naturally out of real contemporary needs and tastes, as a style should grow.

On the subject of modernism, the lecturer pointed out that there were two kinds of modernism: the sort that broke with every tradition and was breathlessly revolutionary, and the sort that had links with the past. She divided the present modern movement in Europe into two main sections: the Latin section, represented mainly by France—as usual panting after the latest fashion—and the Nordic section, represented by Austria, Germany, Sweden and ourselves. The Nordic section was developing something in the true evolutionary sense; something that connected up easily and naturally with the best work of the early nineteenth century, and which bridged a gap in design instead of starting entirely afresh and forgetting every tradition, and incidentally every achievement, of previous periods. The furniture and interior decoration produced by the Nordic modernists could be comfortably associated with older work.

SOUTH WALES ARCHITECTS' VISIT

The South Wales Institute of Architects held their summer meeting on Saturday, September 25, when a visit was paid to London.

The party—comprising about twenty members and guests (including ladies)—on arrival in London, made a charabanc tour through the West End, Westminster and the City, to view some of the latest architectural work.

The party were then entertained to luncheon at the Architectural Association, by invitation of the Council. A speech of thanks was made, on behalf of the visitors, by Mr. J. Herbert Jones, F.R.I.B.A., President of the South Wales Institute of Architects, and replied to by Mr. C. H. James, F.R.I.B.A.

Later, the party proceeded to the Masonic Peace Memorial building in Great Queen Street, where they were met by the architects, Messrs. H. V. Ashley and Winton Newman, FF.R.I.B.A., and the Clerk of Works, Mr. Bennett, and conducted over the building. Great interest was shown by the members in the general planning of the building.

The following members of the South Wales Institute of Architects participated in the visit:

Messrs. J. Herbert Jones (President), C. S. Thomas and Ernest E. Morgan, of Swansea.

Messrs. T. Alwyn Lloyd, J. A. Hallam, Percy Thomas, C. J. Ward, J. W. Bishop, A. G. Robertson, J. R. J. Hallett, and Ivor P. Jones, of Cardiff.

Messrs. E. H. Fawckner and C. E. Compton, of Newport.

Mr. W. D. Thomas, of Porth, and Mr. W. T. Evans, of Haverfordwest.

VISIT TO ITALY

The Foreign Work Committee of Leplay House is arranging to take a group to Italy during the coming Christmas vacation.

Rome and Naples will be the centres from which Ostia, Tusculum, Herculaneum, Pompeii, Paestum and other places of interest from the archæological, historical and sociological points of view will be visited. Mr. W. M. Keesey, M.C., A.R.I.B.A., will direct the studies with the help of local specialists. Miss Margaret Tatton, F.R.G.S., will be hostess.

Full particulars are obtainable on application to Miss Tatton, Director, Foreign Work Committee, Leplay House, 65 Belgrave Road, Westminster, S.W.1.

LAW REPORTS

ALTERATIONS TO A SHOP

Balls Bros., Ltd., v. *Sinclair. Chancery Division. Before Mr. Justice Luxmoore*

THE issue in this action centred around the right of the defendant, Mr. L. D. Sinclair, a tailor, of 38a The Town, Enfield, to make certain alterations and additions to his shop.

The plaintiffs, a firm of wine and spirit merchants, with premises adjoining, and from whom the defendant held a lease of his shop for a term of twenty-one years from May, 1930, consisting of the ground and first floor, sought an injunction against the defendant to restrain him carrying out the alterations and additions, and further asked that defendant should be restrained from cutting, injuring or maiming the walls, in breach of a covenant in his lease.

Sir Gerald Hurst, K.C., for the plaintiffs, explained that the lease the defendant held contained covenants not to make any alterations or additions, except upon plans and specifications approved by the parties, or such as might have been authorized in writing by the landlord, and further he was not to cut, maim or injure the walls. It appeared, said counsel, that in January, 1931, the defendant's solicitor wrote the plaintiffs that the defendant, whether he received the plaintiffs' licence or not by a certain date, intended to carry out his project of turning the staircase round so as to face the shop door.

Counsel submitted that this was not an improvement, and the Landlord and Tenant Act, 1927, did not apply here. The covenant was not against improvement, but was against alterations and additions. Taking this view he submitted that the licence the defendant sought had not been unreasonably withheld.

Mr. Norman Daynes, K.C., for the defence, said his submission was that the licence had been unreasonably withheld, as in his view what the defendant desired to carry out was in the nature of an improvement. Under the circumstances, section 19 (subsection 2) of the Landlord and Tenant Act applied. In support of his contention, he cited a case decided by Mr. Justice Rowlatt.

His lordship, after hearing the evidence, said the case did not rest on the covenants of the lease alone, as Mr. Daynes had relied on subsection 2 of section 19 of the Act in question, which he had argued was applicable to all leases containing covenants which prevented improvements being made. In his lordship's view, the true construction of the subsection showed that it referred to covenants which would restrict the making of improvements. It might be that a covenant against alterations and additions would affect improvements, but he thought that if an alteration was made which effected an improvement, then that would be one of the matters which undoubtedly would come within the subsection.

In this case he had his opinion strengthened by a decision in the case of *Lilley and Skinner, Ltd.*, v. *Crump*, given by Mr. Justice Rowlatt, which decision was binding on his lordship. In his

opinion, he had to read into the covenant the provision that consent to an improvement or an addition must not be withheld unreasonably. He came to the conclusion that what was proposed to be done was an improvement within the Act. The defendant by his counsel had given an undertaking to reinstate the premises at the end of the term, and by this undertaking the landlord was amply protected. Being satisfied that the landlord's consent had been unreasonably withheld, his lordship dismissed the action with costs.

POSSESSION APPEAL ALLOWED

Green v. *Smith. King's Bench Divisional Court. Before Justices Swift and Charles*

A decision of the County Court judge at Westminster was reversed by the Court after hearing arguments in a case affecting the letting of rooms.

In the County Court, Miss Emily Green claimed possession of five rooms on the first and second floors at an address at Claverton Street, from William Thomas Smith, who was the tenant of the plaintiff. Miss Green sought possession on the ground of nuisance, but the judge found against her on the point and there was no appeal. The plaintiff, however, had an alternative claim for possession of two rooms on the second floor, as she alleged the defendant had sub-let them furnished, which brought them outside the protection of the Rent Restriction Act. The judge, however, decided against her.

Mr. Cairns, for the appellant, said the County Court judge found against his client, and she now appealed. The respondent had admitted the sub-letting, but put forward the contention that the sub-letting had not been continuous, and, further, that what sub-letting there had been was with the knowledge and consent of the plaintiff. Counsel's contention was that these two rooms were no longer protected, seeing that in December, 1927, the rooms were sub-let by the defendant to two ladies.

Mr. Sharp submitted that the occupants of the rooms were lodgers and not sub-tenants, and contended that as the plaintiff's main claim was for five rooms, she could not alter her claim to two rooms.

The Court allowed the appeal with costs, and sent the case back to the judge to decide when possession should be given.

Mr. Justice Swift, in the course of his judgment, said in his view of the law the Rent Restriction Act did not apply to protect the defendant, because he was not the tenant in occupation. He thought the Act only applied to a tenant in occupation, and could not be relied on by anyone who had sub-let to another person. Under these circumstances, he thought the County Court judge should have given judgment for possession. Here the defendant's counsel had submitted that, as plaintiff had claimed all five rooms let to the defendant, she could not now say, "I shall now claim two rooms." But the plaintiff had made her claim for the five rooms on the ground of nuisance, whilst as to the two rooms her claim was based on the contention that they were sub-let furnished. The defendant was out of possession of the rooms, and had sub-let them, and therefore the County Court judge should have entered judgment for possession.

Mr. Justice Charles agreed.

COMPETITIONS OPEN

October 31.—Sending-in day. Proposed Tuberculosis Hospital, Sully, near Cardiff, for the Welsh National Memorial Hospital. Assessors: C. E. Elcock, F.R.I.B.A., and T. Alwyn Lloyd, F.R.I.B.A. Premiums: £400, £300, £175 and £100. Conditions were obtainable from F. J. Alban, Memorial Hospital, Cardiff. (Deposit £2 2s.)

November 23.—Sending-in day. New Junior and Infants' School, Farnborough Road, Birkdale, for the Southport Corporation. Limited to architects practising or residing in the County of Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £100, £75 and £50. Conditions, etc., obtainable from the Director of Education, 1 Eastbank Street, Southport. (Deposit £1 1s.)

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor: Sydney Tatchell, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from F. L. Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius of Liverpool Town Hall. Assessor: A. H. Moberly, F.R.I.B.A. Premiums: £200, £100, and £50. Conditions, etc., obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

December 31.—Sending-in day. Latest date for conditions: September 31. Proposed New Town Hall and Municipal Building, for the Walthamstow Corporation. Assessor: H. Austen Hall, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Conditions, etc., obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors: Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium: £500; also a further amount of £750 will be awarded to other designs according to merit.

THE ARCHITECTS' DIARY

WEDNESDAY, OCTOBER 7

C. F. ANNESLEY VOYSEY: EXHIBITION OF WORK. At the Batsford Gallery, North Audley Street, W.1. 10 a.m. to 6 p.m. (Saturdays, 10 a.m. to 1 p.m.). Until October 17. **10 a.m.**

RENAISSANCE ARCHITECTURE

Sir Banister Fletcher, PP.R.I.B.A., on Wednesday last, gave the first of twenty-four University extension lectures on "Renaissance Architecture," to be delivered every Wednesday throughout the session, at the Central School of Arts and Crafts, Southampton Row, W.C.1.

To put the subject in its right setting, Sir Banister gave a rapid, but stimulating review of ancient and mediæval architecture that led to the Renaissance style. Coming to the latter, he dealt with some of its influences. He graphically illustrated Renaissance buildings in Italy, France, Germany, Belgium, Spain and England, and said that he would endeavour to introduce the atmosphere of the Renaissance and show the connection between architecture and history from the fifteenth century to the present day—for the street architecture of today was still largely based on the Renaissance tradition.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Scottish Legal Building, 95 Bothwell Street, Glasgow (pages 458-462). Masonwork contractors : Thaw and Campbell, Ltd., who were also responsible for the dampcourses, Moler blocks, bricks, and stone. Measurers : Andrew Stewart, Pringle and Lockerbie. Masonwork foreman, Thomas Taylor. Sub-contractors : Gray's Ferro Concrete Co., Ltd., demolition; Val de Travers Asphalte Paving Co., Ltd., asphalt; Wm. Taylor and Son (Glasgow), Ltd., reinforced concrete; J. and G. Mossman, and Wm. Edwards and Son, Kemnay granite; Hadden Muir & Co., Inverawe granite; Redpath, Brown & Co., Ltd., structural steel; Kean and Wardrop, tiles; Warren and Stuart, consultant engineers for foundations; Maclean & Co., pavement lights; Considère Constructions, Ltd., consultant engineers for concrete floors, etc.; Roneo, Ltd., steel partitions; Pennycook Patent Glazing and Engineering Co., Ltd., patent glazing; Walter Macfarlane & Co., cast iron; Henry J. Stewart and Brothers, Karri wood flooring; North British Rubber Co., Ltd., rubber flooring; Wardrop and McGibbon, waterproofing materials; James Boyd and Sons, Ltd., central heating and ventilation; Barr & Co., vacuum cleaning; Wm. Kemp & Co., Ltd., grates; Alexander Ramsay, consultant engineer for electrical work; Osborne and Hunter, electric wiring, electric heating, bells and telephones; General Electric Co., electric light fixtures; Craigpark Electric Cable Co., electric cables; Galloway Gibb & Co., Ltd., sanitary fittings; Wm. McGeoch & Co., Ltd., bronze door furniture; Crittall Mfg. Co., Ltd., bronze casements and window furniture; H. H. Martyn & Co., Ltd., bronze folding gates, wrought-iron lift enclosures, bronze lift and wrought-iron railings and bronze handrails; Chas. T. Henshaw, bronze shopfronts and rising gates; Donald Clark and Son, Ltd., fireproof doors; George Rome & Co. (Glasgow), Ltd., plaster and decorative plaster; Birmingham Guild, Ltd., bronze entrance doors; Wylie and Lochhead, Ltd., joinery; Toffolo, Jackson & Co., terrazzo; Galbraith and Winton, marble; Kean and Wardrop, tiling; Cosmos Decorators, painting and wallpapers; Archd. Stewart & Co. (House and Ship Furnishers), Ltd., furniture; Archd. Dawson and Young, sculpture, modelling and carving; Roneo, Ltd., steel office fittings and steel cloakroom fittings; Waygood-Otis, Ltd., lifts; Dykes Bros., synchronised electric clocks.

Swan Court, Manor Street, Chelsea (pages 456, 464–468 and supplement). General contractors : F. G. Minter, Ltd. Joint consulting engineers, Lt.-Col. J. D. K. Restler and Major J. K. Allsop. Rutherford & Co., linoleum; Burley and Sons, Ltd., and Constable Hart & Co., Ltd., garden layout.

TRADE NOTES

There has recently been erected on the outskirts of Watford, overlooking the Colne Valley, a model factory for the Universal Asbestos Manufacturing Co., Ltd. The executive of the Company, who are responsible for the erection of the building, firmly believe that the architectural effect which can be obtained from the scientific use of asbestos-cement has not been fully explored by the building and allied trades. They have accordingly laid down a modern plant and have organized a service for the supply of the following products : Spanish tiles; pantiles, Watford "Handcraft" tiles, valley tiles, and tiled sheets. In the search for improved architectural effects, however, the value of asbestos-cement from the general utility standpoint has, it is stated, not been overlooked. Improved methods of manufacture and originality in design will, it is claimed, be apparent in products such as super-six sheets, standard 3-in. corrugated sheets, flat sheets, slates, diagonal and straight cover patterns, and ridges, aprons, barge boards, louvres, etc. The firm has adopted the trade name of "Handcraft."

*

The British Steelwork Association announces that an order has been placed, on behalf of the Rt. Rev. the Abbot of Buckfast, for the steelwork for the nave of the new Buckfast Abbey Church at Buckfastleigh, Devon. The whole of the work at the abbey has been carried out by the monks themselves, who have been actively engaged on the erection of the structural steelwork. Messrs. John Booth and Sons of Bolton, who have received the order for the steelwork, have recently completed the installation of fireproof doors and an ornamental grille to safeguard the archives in the ancient cathedral of St. Magnus in the Orkney Islands, and have received instructions from H.M. Office of Works for the strengthening of the south-west corner of Goodrich Castle in Herefordshire, and also Monmouth Castle.

*

Some Products for Civil Engineers is the title of a booklet recently issued by Messrs. Thos. Butlin & Co., a branch of the United Steel Co., Ltd., of Wellingborough, Northants. The firm, which, it is stated, is concerned principally with the requirements of civil and municipal engineers, highway engineers and surveyors, has a modern well-equipped iron foundry, with pattern and machine shops attached, a coating plant, a works for the manufacture of concrete products, and a tarmacadam plant. The principal output of the iron foundry comprises heavy iron castings, such as tunnel and shaft segments, segments for well linings, gulley grates, manhole and inspection covers and similar products. General castings for the engineer and contractor are also undertaken. Where required, the pattern making and the machining of castings are also done. In the precast concrete works are made paving slabs, road kerbs of all sections, fencing posts, steps, etc., with or without reinforcement. Tarmacadam in all sizes is produced by the tar spray process, which, it is claimed, ensures thorough coating and uniformity of quality. The booklet gives, in further detail, the principal ranges of products.

*

Mr. A. K. Kirsop, of 4 Nuns Lane, Newcastle-on-Tyne, has been appointed the representative of Messrs. Helliwell & Co., Ltd., for the Newcastle district.

Rigby; estate development, Knowlys Avenue, for Strawberry Gardens (Heysham), Ltd.; two houses, Bare Lane, for Mr. H. Priestley; engineering works, Westgate, for Mr. R. H. Kay; fifty-six houses, Brentlia Crescent, for Mr. J. H. Atkinson; estate development, Homfray Avenue, for Mr. A. Heathcote; house, Longlands Crescent, for Mr. H. Wood; two houses, Twemlow Parade, for Messrs. Swithenbank and Ladell; two houses, Margaret Street, for Messrs. D. Hunt and Son; four houses, Morecambe Road, for Mr. R. Bigland; two houses, Burlington Avenue, for Messrs. Edmondson Bros.; house, Westgate, for Mr. A. Clough; ten bungalows, Hawksworth Crescent, for Mr. F. Obank.

The TYNEMOUTH Corporation has purchased a site of 135 acres of land at Howden Road, for housing purposes.

SCOTLAND

Plans passed by the GLASGOW Corporation: Office, dwelling-houses, etc., King Street, Pollokshaws, for Mr. Alexander M'Lellan; temporary shops, Boydstone Road, Carnwadric, for Pollokshaws Co-op. Society, Ltd.; store, Carntyne Road, for Parazone Co., Ltd.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

SWAN COURT, CHELSEA, S.W.

DETAIL DRAWINGS OF ARCHWAYS AND MAIN ENTRANCES

[*Buckland and Haywood, Architects.*

LOOKING THROUGH AN ARCHWAY INTO THE ENTRANCE COURTYARD

SWAN COURT, a block of flats, maisonnettes and studio flats in Chelsea, is planned as a quadrangle about a central courtyard, and is bounded on one side by Manor Street, and on the other by Flood Street, two thoroughfares running parallel to each other into the King's Road.

The courtyard, a glimpse of which is shown in the photograph reproduced above, is approached from either street through a forecourt and an archway, and contains the two main entrances and lifts to the flats and studio flats.

The architect's detail drawings of these archways and main entrances are reproduced on the following pages. The maisonnettes are entered from the forecourts and are situated on the ground and first floors of the building.

Further illustrations of Swan Court appear elsewhere in this issue.

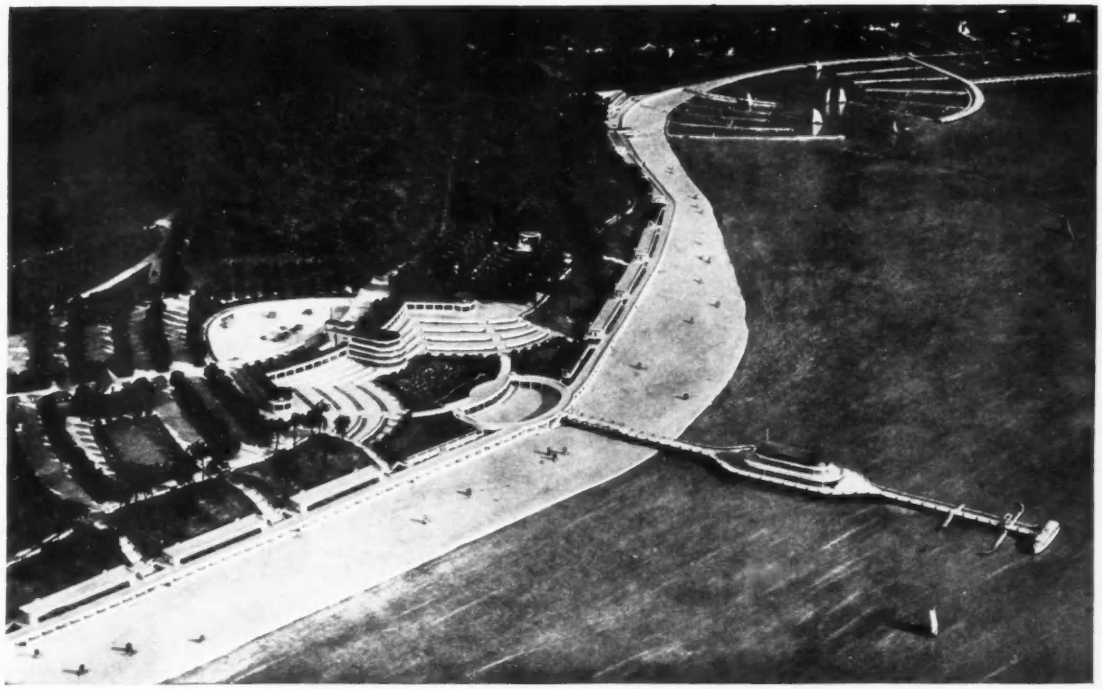
BATHING BEACH AT WANNSEE, BERLIN

PHOTOGRAPHS AND DRAWINGS ILLUSTRATING THE COMPLETED SCHEME



[*Martin Wagner and Richard Ermisch, Architects.*

THE MODEL FOR THE COMPLETED PROJECT, SHOWING THE BEACH AND BUILDINGS

WANNSEE, the lake-side site of the municipal project here outlined in photographs and drawings, is part of the Grunewald in the Dauerwald district, and is reached in about half an hour from the centre of Berlin by electric tram to Potsdam. It is situated among woods and fields which lie high above the water and fall down to the beach in a steep slope towards the south-west. The beach is some 60 yards broad, and, when completed, the bathing station will extend for about 1,300 yards.

The buildings are erected at the bottom of the slope, so that the view from above over the very beautiful water scenery is not obstructed, and they will fit in well with the landscape when seen from the water. In a hollow, approximately in the middle of the scheme, a large main restaurant is to be erected. This will be the centre of interest of the layout.

At present only the north wing of the scheme has been carried out. This comprises a row of buildings which consist of the essential changing-rooms (of several types) and lavatories. They are connected by a wide covered way and several random flights of steps.

This week's leading article debates the expediency of proceeding with such enterprises in relation to the current situation. A future supplement will be devoted to other details of the scheme.

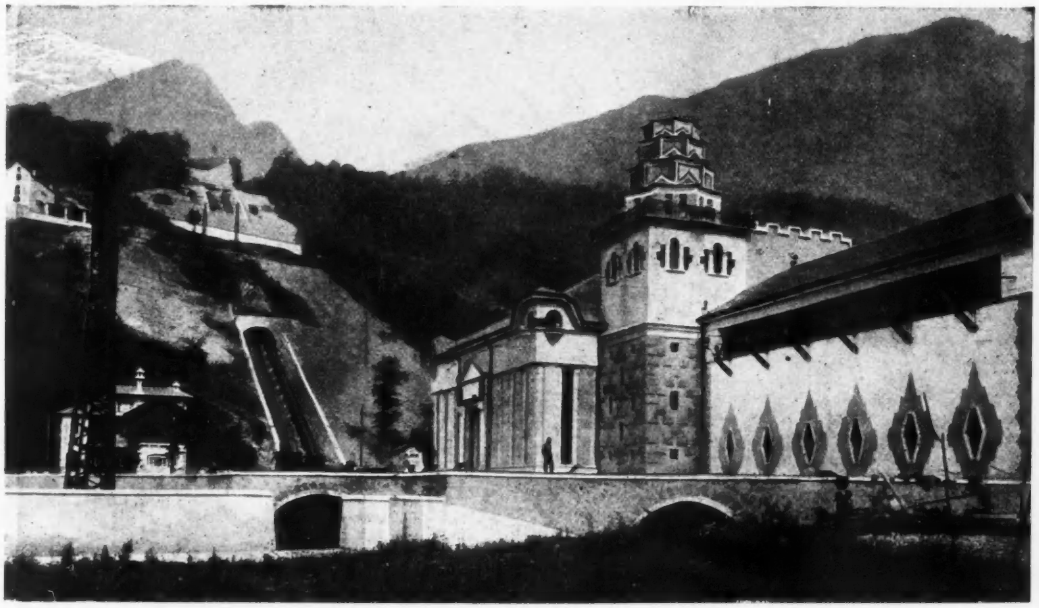
A DRESSING PAVILION WITH SINGLE CABINS

SELECTED PRECEDENTS:

INSIDE AND OUTSIDE THE POWER-HOUSE ABROAD



1. *HYDRO-ELECTRIC POWER STATION, CREVOLA, ITALY.*

NO type of building stands in greater need of that "tidying up" which is part of the architect's civic mission in a wilfully untidy world than the electric power station. It is to be hoped that the accompanying illustrations may help to dispel a still prevalent illusion that there are high technical reasons why it should be a higgledy-piggledy affair of broken levels and unco-ordinated parts externally, and a medley of disorderly piping and chaotically-arranged switches and meters within.

Figure **2**, *the switchboard of a city substation serving an underground railway, shows what can be done by calling in the architect. The way in which the dial faces of the various indicators and gauges have been arranged in symmetrical patterns is a sight for sore eyes. Further comment is superfluous.*

The remaining figures illustrate the exteriors of different types of electrical stations. Figure **1** *represents the hydro-electric generating station at Crevola, which is modern, individualistic, and in keeping with its locality.*

Figure **3** *solves the problem of introducing a substation into an ordinary urban street without making its presence either aggressively conspicuous or unduly self-effacing. Without diverging materially from the ordinary free-standing model of a railway substation, the architect of figure* **4** *has succeeded in evolving a rather more carefully-composed and sympathetic design than most of the examples to be found on the electrified suburban lines round Paris and London.*

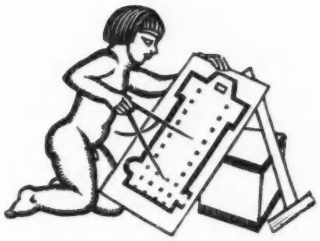
THE ARCHITECTS' JOURNAL



WEDNESDAY, OCTOBER 14, 1931

"THIS ACUTE CONFUSION"

AFTER what always seems to be an interminable period the answers to questions posed by competitors in the R.I.B.A. New Premises Competition have appeared. In the main they are not unlike the answers given to innumerable competitors in hundreds of architectural competitions; except that for the first time there is made the point-blank inquiry —Will you accept a modern design?

The answer is: "This is a problem for which the competitor must find his solution in accordance with his own architectural convictions. Clear thinking, and a strict sense of fitness for purpose will do much to clear away *the acute architectural confusion* of which the competitor complains."

Now this question could never be asked were it not for the fact that the history of architectural competitions in recent years provides us with a series of minor victories for tradition and acceptable dullness. This may be merely a reflection of an outlook common to competitors and assessors, but it is much more likely to be one common to many competitors and *all* assessors, leaving out of the reckoning a body of architects intent upon winning the job of designing a large building, but unable to contemplate a labour which could not be expected to lead to success in face of the known prejudices of so many assessors against anything that could by any chance be called modern.

One has only to look at the schools of Dr. Schumacher of Hamburg, which we profess to admire, and at the winning designs of several recent school competitions (many of which, as readers will recall, have appeared in supplements to the JOURNAL during recent months), to realize the hopelessness of the situation for a young man with the intense desire to work to the top of his bent, untrammelled by the necessity for wondering whether the assessor will look only at definitely "scholastic" designs or will cast such prejudices aside.

The answer which the R.I.B.A. assessors gave is fair enough. It contains advice which, followed, would produce designs of which no one could be ashamed.

But there still remains that element of risk which occasioned the question—the risk that in this year of grace a board of eminent assessors, leaders of the R.I.B.A., could not be trusted to *think clearly* and judge a design *with a strict sense of its fitness for purpose.*

Well, there is nothing we can say to a competitor who estimates the nature of this risk other than that he must cease to regard it as influencing his design, and take heart of grace from the answer returned him. We must realize that, if it is true that architecture in this country is still a thing of hidebound tradition, ruled over by the elders, it will continue in the same, unless younger men are prepared to sacrifice themselves for what they stand for, and decline to make compromises to the ruling gods.

It is most fervently to be hoped that nothing in the composition of the board of assessors or in the programme of this competition—not even the necessity to build in stone—will turn away any who feel that the state of "acute architectural confusion" can be clarified by whatever contribution they themselves may bring. There has never been before an occasion where the pressure of new ideas and clear thinking was capable of greater effect, and no architectural competition in this country has held out a promise of unbiassed judgment equal to that which we may expect in this case.

"This is a problem for which the competitor must find his solution in accordance with his own architectural convictions." Clear thinking and a strict sense of fitness for purpose will clear away architectural confusion.

ST. MICHEL D'AIGUILLE, LE PUY, HAUTE LOIRE, FRANCE

The word "Puy" is a geological term, used locally in Auvergne for the remarkable volcanic hills which occur in the vicinity, of which this is a typical example. The tradition of building a sacred edifice on the very summit of a peak is of great antiquity. Many authorities hold that Solomon built the Temple at Jerusalem on the site now occupied by the Dome of the Temple, or Mosque of Omar, within which, today, travellers marvel at the living rock thrusting up its mighty mass.

St. Michel d'Aiguille is similarly moulded to the summit of its Puy, which it entirely covers—a building with nothing straight or square or axial about its lines.

NEWS & TOPICS

PRICES OF BUILDING MATERIALS

I HEAR unfortunate rumours that certain people connected with the building industry are taking advantage of the present crisis to exploit the situation selfishly and in a manner contrary to the interests of the industry as a whole. Manufacturers of some of the most commonly used building materials have decided to raise prices to their customers in the home market. Yet it has been pointed out by our greatest authorities on economics that the de-valuation of the pound should have no such effect on the home market, and the only people who should suffer by it are importers of goods from abroad, who must pay more for these because the pound is worth less in foreign countries than it was a few weeks ago. British manufacturers using home-produced raw materials are thus enjoying the same immunity from foreign competition as would result from a tariff, and those who have the well-being of the building industry at heart hope that they will be content with such an advantage without taking this opportunity to penalize their fellow-countrymen. The tendency of such manufacturers to raise prices at this moment would undoubtedly have a most injurious effect on the prospects of the building industry. In fact, now is rather the time to cut prices and thus to encourage building owners to proceed with their enterprises. If the opposite happens, we are indeed all of us in for a very much worse time than the world situation warrants.

THE LATE SIR BERTRAM MACKENNAL

It was with deep regret that I heard of the death, during the week-end, of Sir Bertram Mackennal, R.A. Born in Melbourne, sixty-eight years ago, the son of a sculptor, he came to London at the age of eighteen, chiefly to study the Elgin Marbles in the British Museum, and entered the Royal Academy Schools. A short time later he went to Paris, where he worked in several studios. His first calls to fame were made in 1889, when he won the competition for the decoration of Government House, Melbourne, and in 1893, when his statue " Circe " achieved a sensational public success, particularly in this country and in France. From this time he was flooded with commissions and became one of the most versatile and prolific sculptors of the day.

★

I fancy that architects will chiefly remember him for his National Memorial to King Edward VII, executed in conjunction with Sir Edwin Lutyens as architect, and the public for his designs for the new coinage which superseded the Edwardian designs. Incidentally, he was the first Australian sculptor to become an Associate of the Royal Academy.

DECORATION OF THE NEW CUNARD LINER

The interesting announcement has been made that the design of the public passenger accommodation in the new giant liner now under construction at Clydebank for the Cunard Company is to be undertaken by Mr. Arthur Davis, of Mewès and Davis, in association with Mr. Benjamin Morris, of New York. No doubt their collaboration will produce that sense of co-ordination too often lacking in similar undertakings. Mr. Davis was, of course, the architect of the Cunard Company's new premises in London, and has been concerned with the decoration of many of their ships, including the *Aquitania*. Mr. Benjamin Morris is a member of the New York firm of architects, Morris and O'Connor, who designed the Cunard building in Broadway, New York.

OUR DYING [SIC] RURAL INDUSTRIES

Rural industries are a long time a-dying. They are not dying at all, as anyone who has followed this movement can tell you. Wherever the country is in fact rural, and not dependent upon the town, rural industries of centuries' growth continue to come naturally to countrymen and women, with the facility for direct expression and simple strong design that attend those who make independent use of hands and brain. If such industries as Welsh quilting were to perish the countryside would be badly lost to us, and it is wrong to think, as many do, that because we are asked to support a struggling home industry, an uneconomic and antediluvian activity is being needlessly bolstered up. I feel quite certain that every countryman whom we can teach the rudiments of an honest craft, be it iron-working or spray-painting, is a good man saved and made happy, productive where before he had been a problem for Westminster to squabble over.

THE CHAOS OF BUILDING REGULATIONS

Although we are assured by Mr. Shelley that we are all wrong, the chaos of building regulation continues to press heavily upon us. The Advisory Council of the Building Industry, set up by Mr. Arthur Greenwood, have adopted a resolution to be sent to the Ministry of Health, protesting once more against the lack of uniformity, the antiquity, and the state of chronic inco-ordination of building laws and bylaws, which make building in this country a hazardous undertaking. In London, for instance, seven consents are required for a theatre, and two distinct sets of officials have to be dealt with. Both sets give their decisions in their own particular spheres, and always without prejudice to the other set of officials.

★

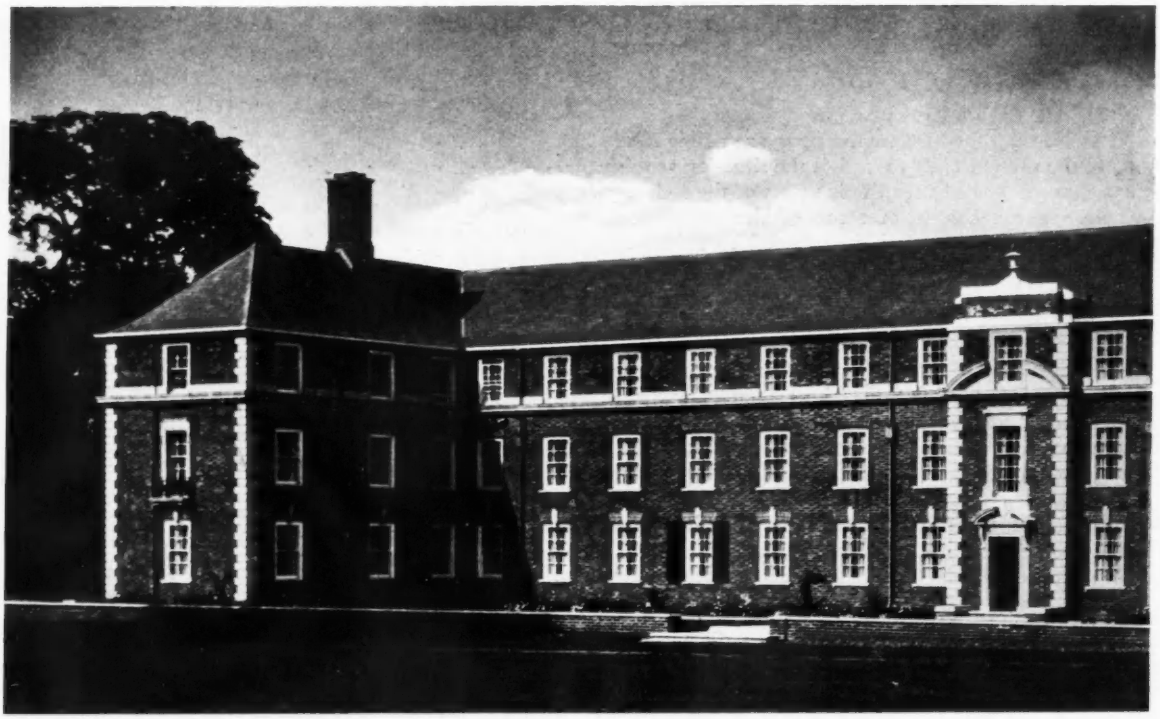
And so it goes on—rights of light, height, frontage, etc.—a long and terrifying list, stretched out and spread out before the prospective building-owner and his harassed architect. " Conditions such as these," comments the memorandum, " are not calculated to stimulate building or attract capital for similar enterprises."

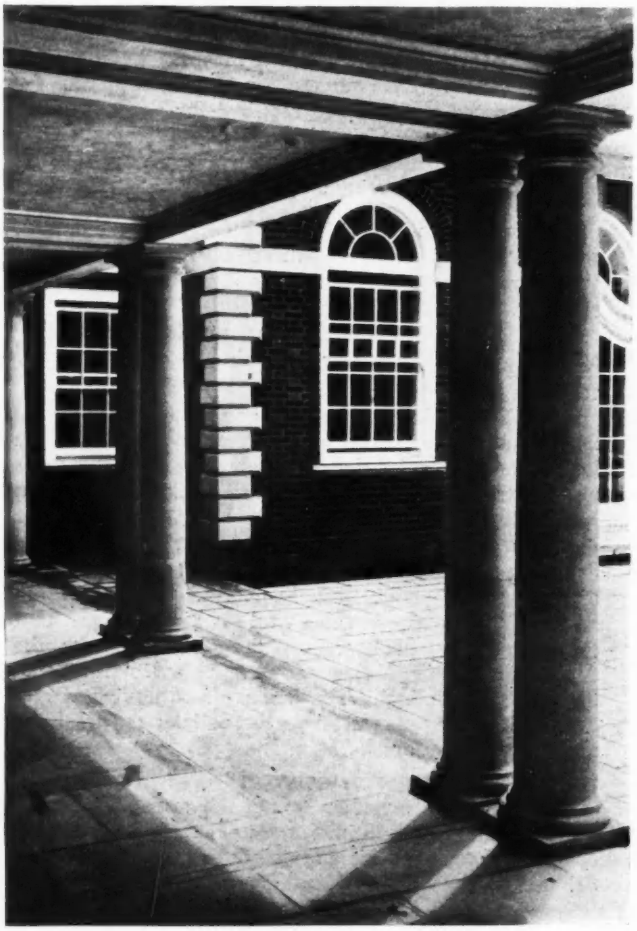
THE INDUSTRIAL SOUTH

Lord Londonderry, speaking at the opening of the new Aladdin factory at Greenford, Middlesex, on Thursday last, stressed the point that, at the present time, there was an industrial drift from the North of England to the area surrounding London. This made him wonder whether we were going to allow the new industrial area of the South to rival in bleakness and austerity the industrial areas of the Midlands and the North. There is, I am sure, only one answer to this vital question, namely, that the newcomers should follow the lead given by the Aladdin Industries and employ competent architects to design their buildings. The building was illustrated and described in the JOURNAL for August 12 last; the architects are Nicholas and Dixon-Spain.

THE SANITARY INSPECTOR-ARCHITECT !

The question of whether or not the sanitary inspector should assume the full-time duties of architect, or should combine these with his normal duties, has been hotly debated by the Llanelly Rural Council. The democratic system is at work before our eyes ! ASTRAGAL





The photograph running across the tops of this and the facing pages shows the main or garden entrance of the new hostel, which takes its place in the grounds of Wotton House, an eighteenth-century building. Over eighty study-bedrooms are

A corner of the cloisters which provide covered access from the main block, shown above, to the common and dining-room blocks.

WOTTON HOUSE,

New Hostel

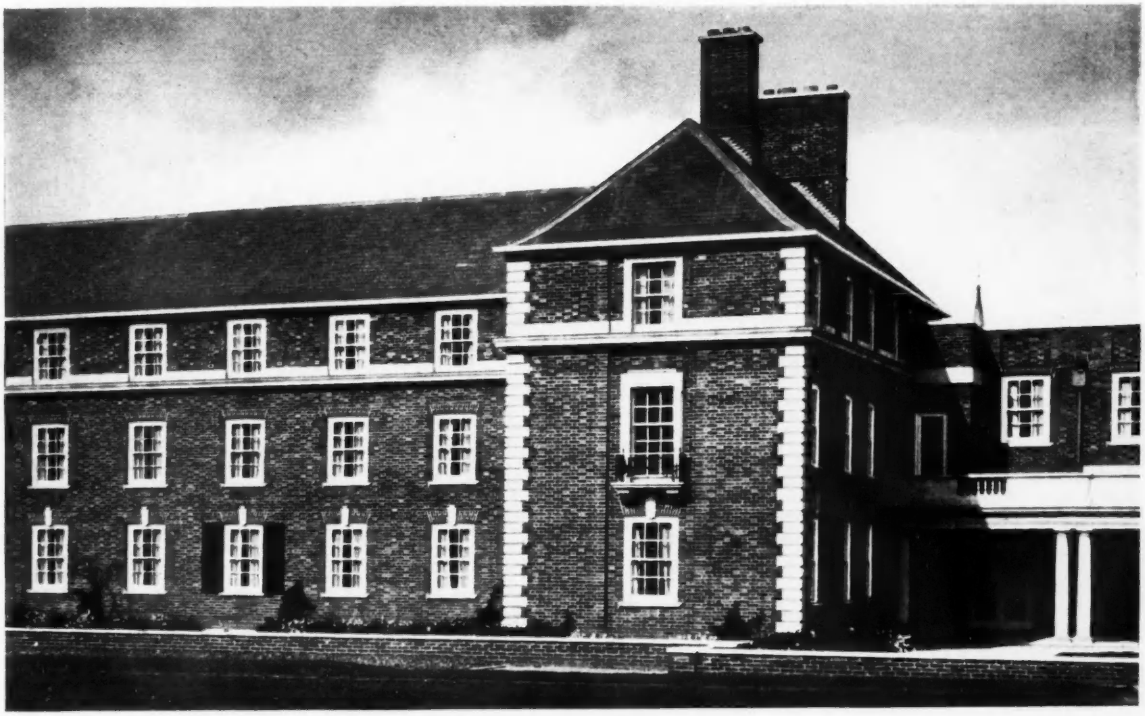
DESIGNED BY

THIS hostel has been erected by the Gloucestershire County Council to accommodate students attending the Gloucestershire Training College of Domestic Science. The building stands in the grounds of, and is attached to, Wotton House, a domestic building erected in the early part of the eighteenth century.

The hostel contains eighty-one study-bedrooms, most of which are single, and have a south aspect. The sanitary wings are placed on the north side of the building.

The plan is, in fact, logical, compact and hygienic, but it would have been impossible to give the boon of direct sunlight to so large a proportion of the rooms had the vogue of placing the communal rooms, required for dining and recreation purposes in an establishment of this kind, in a central position in the main block been followed.

The site conditions made it feasible to plot them elsewhere: accordingly the common room and its companion dining-room, with their adjuncts of ante-room and kitchen quarters respectively, occupy single-story wings. Access to them and, eventually, to the corridor connecting with the existing building is provided by means of covered cloisters, open to the terraces on one side.



GLOUCESTER

for Students

R. S. PHILLIPS

At the same time, the pretext for a pleasing central feature of the main elevation, which faces the garden, was supplied in the principal entrance. The entire design achieves unity from the consistent employment of the simple contrasts between two age-old structural materials : brick and stone.

The walls are of brickwork faced with 2½-in. multi-coloured rustic facing bricks with cream-coloured joints, and the cornice and dressings are of reconstructed Bath stone.

The floors above the kitchen, etc., and the floors of the corridors are of fireproof construction, laid with oak blocks. Other floors are laid with Columbian pine.

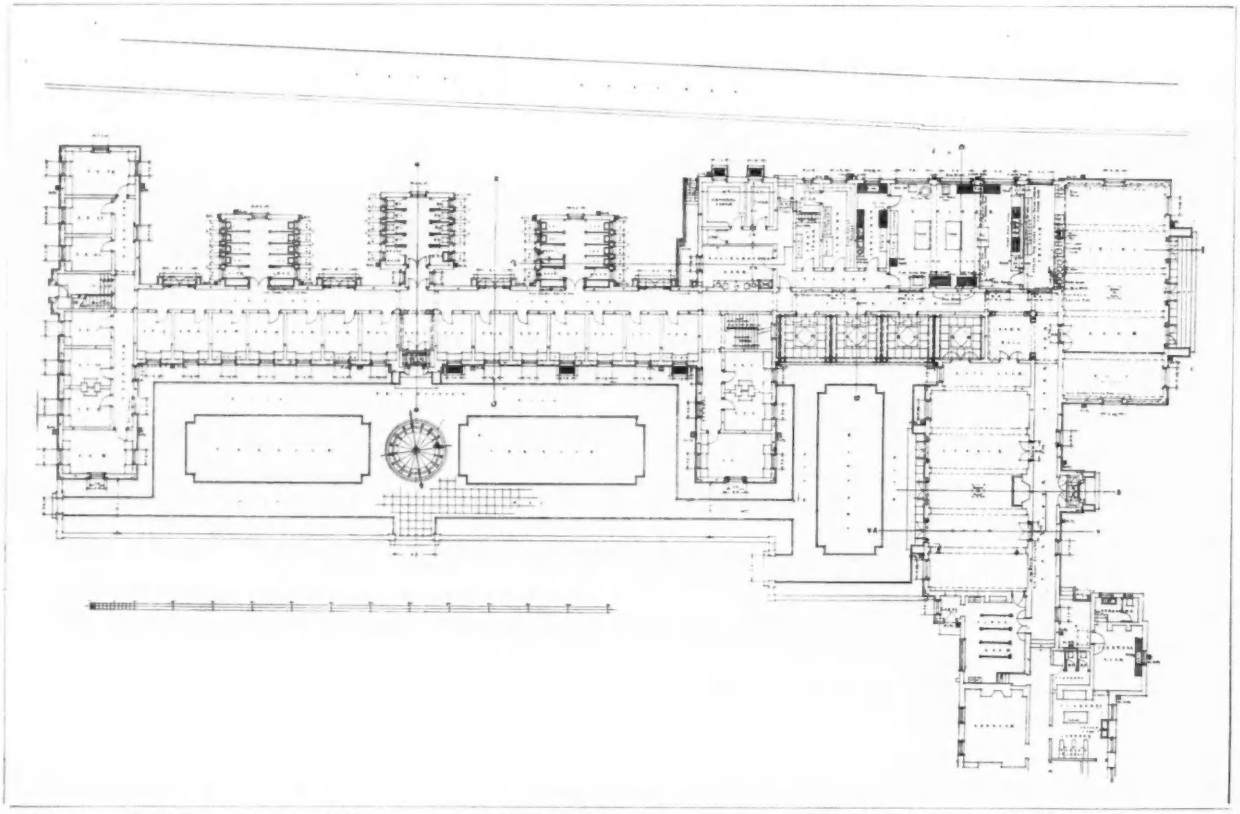
The staff of the college have applied the latest principles of time-and-motion studies to the kitchens, and all labour-saving items of equipment are so placed in relation to each other as to reach their maximum degree of efficiency.

In the offices, dining-room and sick-room, labour-making ornament has been avoided and the rooms depend for beauty on line, proportion and colour.

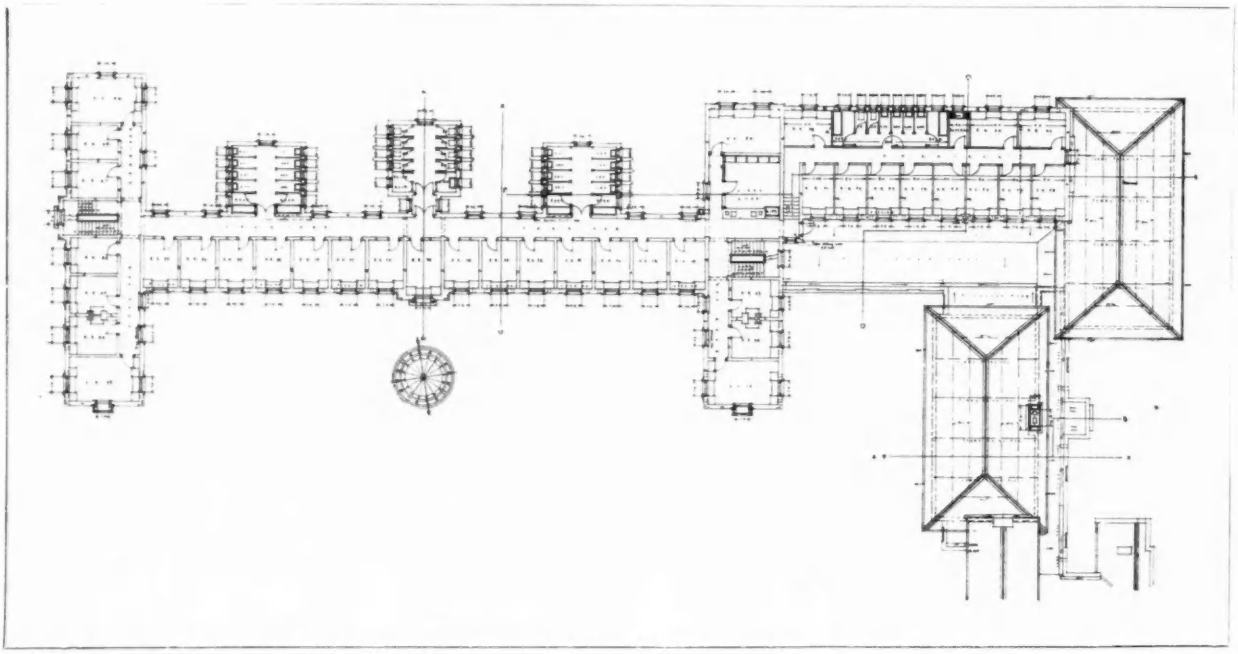
The cost of the building, including heating, lighting, work to site, kitchen equipment and the oak fittings in the study - bedrooms, has amounted to approximately £34,500.

provided on the ground and upper floors, most of which look south on to the terrace. The colonnaded veranda on the right connects with the common room and dining - room (see pages 493–4), and eventually provides a link with the old building.

The main (terrace) entrance. The walls are of small multi-coloured rustic bricks; and the dressings are of reconstructed Bath stone.

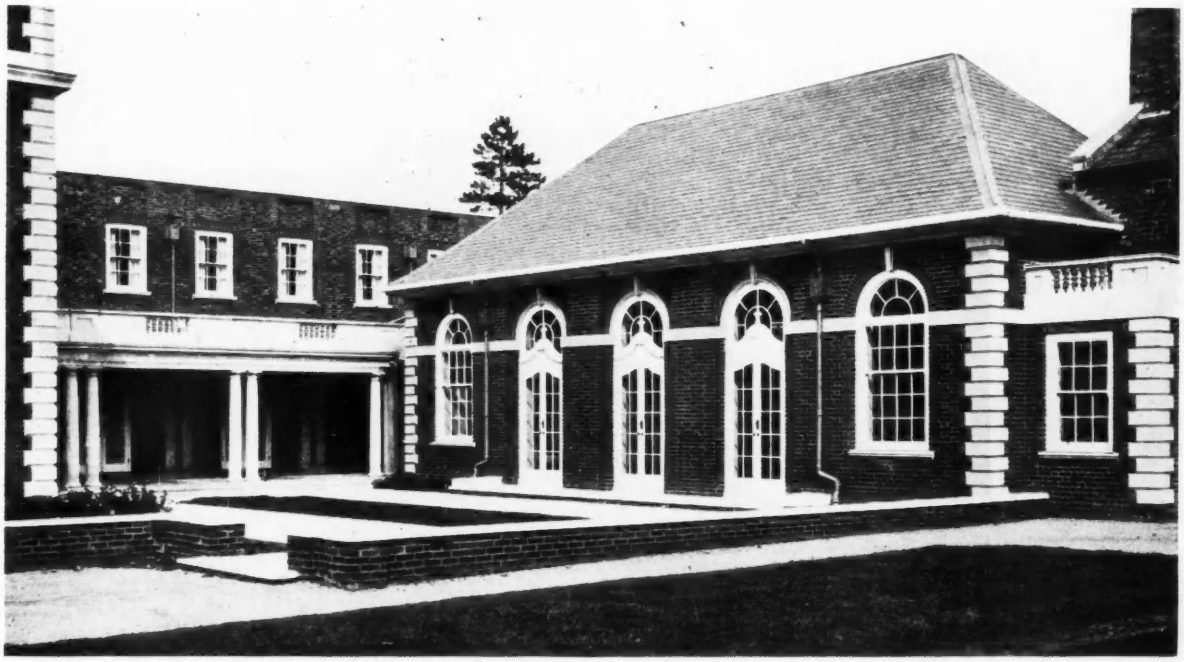


The ground plan is typical of all, in its concentration of the bedroom accommodation in the main block. On the right are seen the common room, and, behind it, the dining-room, both housed in a single story, and with kitchen quarters in proximity.

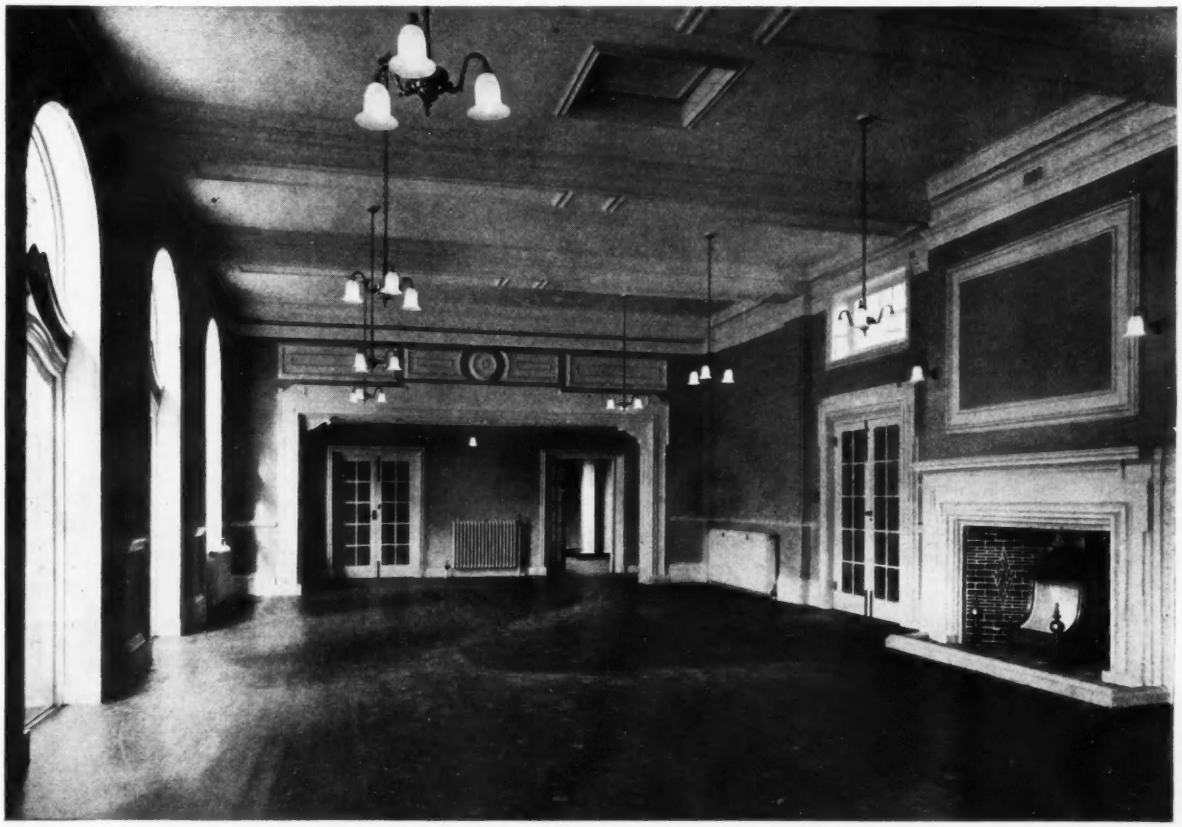


Wotton House Hostel, Gloucester.]

The main block first floor is devoted entirely to study-bedrooms and lavatory accommodation. The layout of the second floor is similar, except that, at the south-west corner, a small hospital ward, with observation and nurse's rooms, is included.

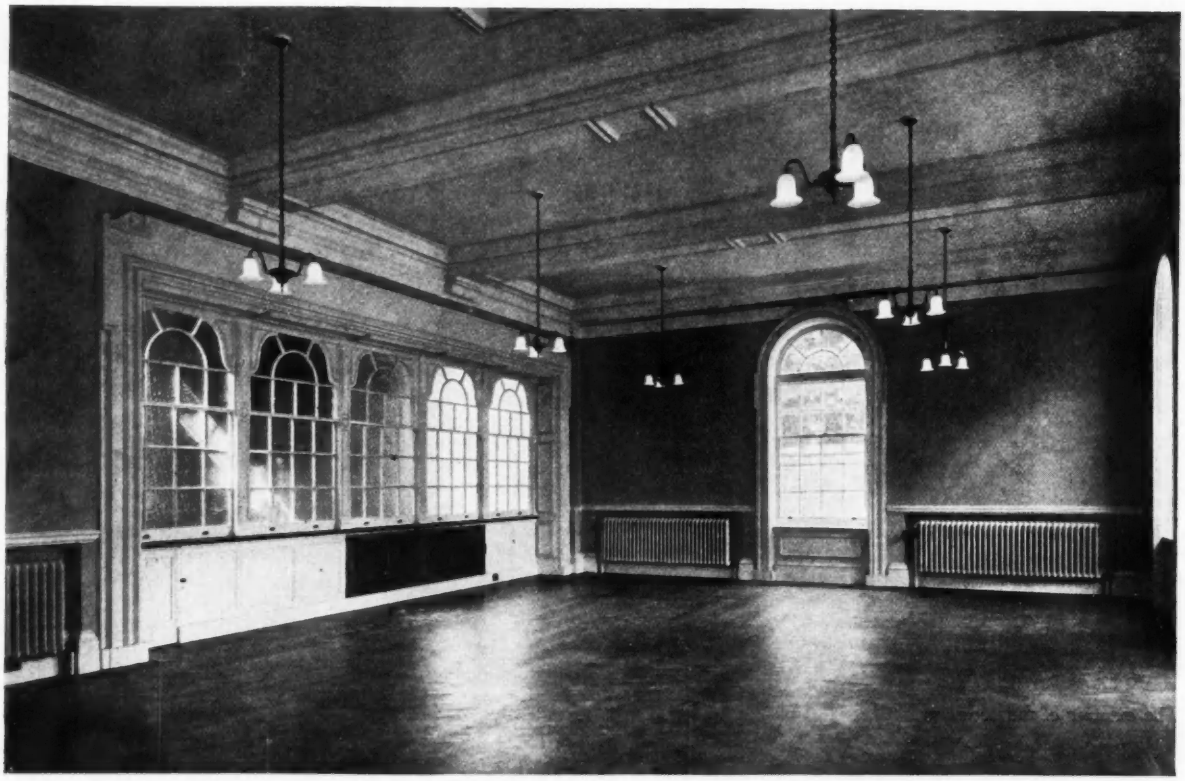


The exterior of the common room. This picture continues from the right of the photograph reproduced across the tops of pages 490–1, and the two together enable the main points of the entire scheme to be visualized.

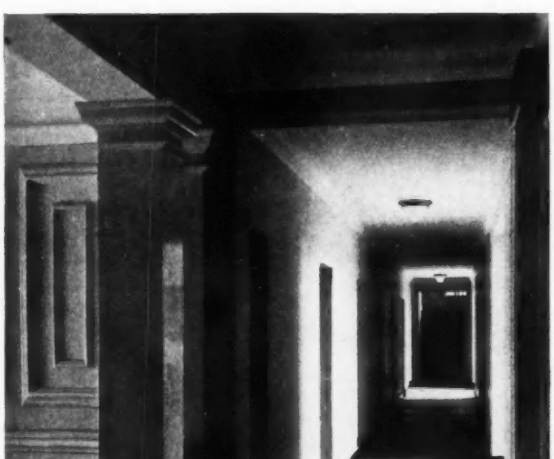


[*By R. S. Phillips.*

In the common room. Beyond the fireplace on the right are doors from a corridor leading to the dining-room; those seen in the farther wall lead (left) to the inner hall, approached by the covered cloisters, and (right) to the ante-room.

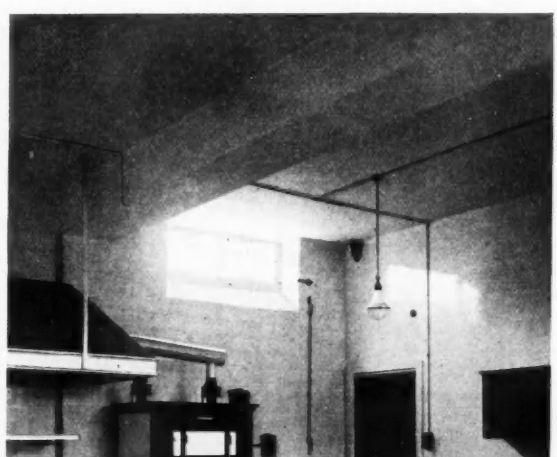


An interior view of the dining-room. It has been an object to eliminate dust-catching, and therefore labour-making, ornament, and the general effect relies on the lines and proportions of the design.



Wotton House Hostel, Gloucester.]

A typical corridor. All the corridor floors are of fireproof construction, and are laid with oak blocks.



[*By R. S. Phillips.*

A corner of the kitchen which faces the dining-room, but is divided from it by a corridor.

Bernard Whistlow, F.R.I.B.A.: An Autobiography: xxi

I QUARREL WITH MY PARTNER

BY KARSHISH

(H. B. CRESWELL)

IT was in the year after my marriage that Garston brought down the nuts from the tree into which, for seven years, he had been throwing sticks with such undeviating pertinacity and courage. During those years he had competed for eleven important public buildings at home or in the colonies, and for other smaller works, though he always said that the law of chances made it easier to win a big competition than a small one.

The year 1904 saw Philip Garston pass at one stride from the ranks of promising students to those of conspicuous architects—from impoverishment to affluence, from neglect to solicitude, from obscurity to fame; for in that year his design for the Bolchester Town Hall, costing £240,000 — or nearly half a million at present values —was chosen from among those of one hundred and seven competitors, including many of the leading architects in the Empire; and before he had had time to realize the magnitude of his success he received a totally unexpected telegram from Cambridge, signed " Clapcabbage," asking him to keep an appointment at Ashley College, where the Provost told him that his design in competition for the College Library and Chapel building, which had been for months shrouded in the mystery of wranglings behind closed doors, had been accepted. This commission, which resulted in Garston's best-admired work, conferred upon him the blue ribbon of professional attainment of those days. He was a made man.

As I have already said, there had never been any partnership arrangement between Garston and me. Before I was employed by the Eureka Plough Company at Nollingborough, I was giving all my available time to working on competitions with Garston; but the designs were always regarded as Garston's: it was he who initiated each adventure and bore the whole cost, and to whatever extent my suggestions may have been embodied in his schemes or my ideas in his elevations, all decisions were made by Garston and the drawings were sent in under his name. It was, however, clearly in our adventurous boyish minds, beyond any need for formulating the intention, that if success came I should give up the work by which I contrived to earn a living and join forces with him.

After I went to Nollingborough I gave my evenings to finishing up and printing on his drawings, and continued always to make any perspectives that were wanted. I also frequently tackled the Conditions independently of Garston and got out preliminary schemes which he might or might not make use of, but which, at least, tested possibilities and cleared the way for him. I also, in finishing drawings, often worked up his elevations, and, for months at a time, spent week-ends at Charles Street helping to push things along. But when I began to get busy in private practice I took less and less part in these speculations. I did, however, spend a good deal of time torturing a difficult corner of Garston's first Bolchester layout, which at least had the usefulness of convincing Garston that that scheme would not do, and inducing him to discard it in favour of that which brought him success. I also worked over his Library elevations on tracing paper, and two of my ideas are represented in the building as it now stands; and, as a matter of course, I made perspectives in both competitions.

Our financial arrangements were equally casual and happy-go-lucky. I never paid Garston anything for the use of his office as my headquarters, nor anything on account of office expenses, except that when, on two occasions when he was hard pressed, I made surveys and got out contract particulars for scraps of private work he had, and he helped me with three similar little worries of mine in London by representing me with clients and overlooking the work. We divided the plunder; but Garston never shared in any of my Nollingborough work. When Garston in 1901 won a second premium of a hundred and fifty pounds in the Padilloes Public Baths Competition, he insisted on my taking fifty of it; and when I pointed out that the design was his, that my work did not represent a sixth part of the labour of producing the drawings, and that I had met none of the cost, he told me he regarded the premium as the proceeds of the whole of the competition work in which I had lent a hand. It was Garston's generosity in this matter, as will be seen, that later made grounds for our quarrelling.

When Garston's fortunes suddenly soared to these undreamed-of heights he wrote in his frank, incisive way, leaving it for me to say whether I would throw in my lot with him or not; but he made it clear that if I did so I must move up to London. This meant that I should be obliged to give up my fast-growing Nollingborough connection—for to leave the place would have been to drop out of remembrance there completely—identify myself with Garston's fortunes, put aside my individual ambitions and adopt his. I was supremely happy in my brand-new country home amid surroundings beloved of Nancy; and was entirely devoted to my work, which provided a succession of delightful adventures in which I continually surprised unexpected capacities in myself which excited me by raising images of all kinds of wonderful achievements in the future. I had, in fact, tasted blood: I had acquired that insatiable appetite for self-expression which is the glory of the architect's calling and, as I believe, the supreme thing in life.

Garston's personality was so masterful, his decisions were so vigorous, his judgments so firm and his mind so active, that I felt that the more delicate plant I nurtured would be choked among his robuster growths; for, capable as he was, his taste differed from mine considerably. I accordingly replied to him that I could not break up my home and relinquish my practice at Nollingborough, but that this would be no obstacle to partnership, as I could be in town two days a week or more; could work as effectively in Nollingborough as in London; and that we should obviously prosper better if we joined fortunes than if I merely shared his. His reply was brief:

My Dear Twitters,

I must have you body and soul or not at all. You do not realize the immensity of the thing that has happened. The Universal Bank wants me! Life is a turmoil—*and* the eating and drinking! I shall have soon to wear a harness to support my belly. Choose, my dear fellow. I shall quite understand if you decide to go your own way. I move into the new offices on Wednesday.

Ever yours.

It was evident that Garston wanted more from me than he supposed I would be willing to give, so that even if I had previously decided to join him his letter would have made me change my mind. Nancy also had to be reckoned with. For some extraordinary reason she took a strong dislike to Garston before she ever saw him, so that I learnt to check myself when on the point of speaking of him, or quoting his sayings, to her; and even after Gar spent a week-end with us, when he was in his best form and most attentive to her, Nancy was grudging of any good word for him, and met my expostulations by shrugging her

shoulders and telling me I was an "infatuated old Pigeon." When I put the case of the partnership to her and showed her Garston's letters she said: "It would not suit you, Pidge—you ought to make your own career, not Mr. Garston's. Architecture is not all banks and town halls, and your gifts—your sympathies—lie in other directions; but do not answer Mr. Garston's letter for three days. Promise?"

I gave her the promise, and on the third day knew why she had exacted it when she showed me a letter from her solicitor who, in answer to questions she had referred to him, gave it as his opinion that my relations with Garston in the past constituted a partnership, and that a separation could only be on terms to be agreed between us, or settled by reference to arbitration, or by an action at law. That, at least, was the significance of his letter, which informed me for the first time of the trivial circumstances which the law will hold to set up a partnership, and the rigidity with which it enforces the obligations of partnership. Garston and I were, in fact, partners; and I was entitled to share in the "profits" that had accrued, though how those "profits" and my share in them were to be determined, I had no idea.

Nancy had started the hare and it was she who hunted it. I cannot recall all the reasons she urged why I should, in violence to all my instincts, claim my rights; but she insisted, among other things, not only that my ideas might have decided Garston's success, but that they must necessarily have been factors in it; that if the law decreed that Garston was liable to me it was not for him to settle that he was not; and that as he had met the whole cost of the competition in which he voluntarily paid me a one-third share of the proceeds, he had virtually acknowledged that I was entitled to share net profits with him, equally.

She pointed out that for years we had been partners in speculations with a view to mutually benefiting if any were successful; that if success had rewarded us three years earlier I should have shared that success as a matter of course, as, in his letter, Garston admitted I was still entitled to do; so that if I elected to forgo that right it would be no hardship to Garston to pay me a sum representing part of the gain to him of my relinquishing my share in the practice.

The matter was merely a business adjustment, she said; and a friendship that was unable to recognize the ordinary obligations of men was of so little account that it was not worth preserving.

Nancy said much more; and she also blamed me, as she often did, for my reluctance to "assert my rights"—as she termed it—and my hesitation to claim my dues when circumstances made it in the least embarrassing to do so. The result was that I wrote Garston a letter—the draft of which Nancy approved—which I have all my life since regretted. I presented the case to him as a statement of abstract principles, but said that as he would benefit financially from our separation I supposed he would wish to square the account so that there should be no grounds for discontent in the minds of either of us.

I am not going to reproduce that letter, for I am ashamed of it: it was not the sort of letter I could have written to Garston out of my free discretion. Neither am I going to give the letter I received by return of post from Garston, in reply; partly because it is false to his generous nature, and partly because of his searching comments on myself. He wrote, with his characteristic impulsiveness, on the spur of the moment, at a time when he was suffering from strain, and gave his extraordinary gift of pungent statement full rein. He concluded: "As you have evidently taken Counsel's opinion on the quality of the friendship which offered you a share in my fortunes, you had better take it again on the quality of the common sense which now withdraws the offer."

Nancy was indignant. She had always, she said, known exactly the sort of man Garston was, but had refrained from telling me so as to spare my feelings; but I could now see what he was for myself, and deal with him accordingly. I was so angered at some of Garston's cutting aspersions that I did not resist this view of him. Several bitter letters passed between us. We avoided meeting. Weeks went by. Nancy urged me to make a definite claim and had decided that Garston ought to pay me at least three thousand pounds; and when I hesitated to do this—for I felt unable to form any idea of what I was justly entitled to—she wanted me to put the matter in the hands of solicitors. I was actually contemplating taking this deplorable step when I received the following letter from Garston:

My Dear Old Twitters,

Burn all those damned letters of mine like a good fellow and forget all about them for old times' sake. I have been so strained and overburdened and worried for money to carry on with, that I have been half off my head. Yesterday I got out to West Wickham with Gwen for a long day in the beech woods, and came to my senses. The idea of dirty, idiotic, futile, squalid money coming between us is impossible. Think of it! I believe I owe more to your companionship than to anything in life. The idea of falling out with you on such a question as *money* is sheer insanity. Are we in Hell already?

What we must do is to ask some sordid brute to settle our account. I shall be perfectly satisfied to abide by what he says and I know you will be; but I would much rather you said what will meet your views and I will pay. If, however, I have the least feeling that you are opening your old mouth too widely I will tell you and we can then fall back on the first idea—I mean that there must be no grievance in the mind of either of us. I have none in making this proposal, for I realize that if our positions were reversed I should feel just as you do. It is, as you say, just a matter of business.

No doubt you will let the payment be over a term of years so that I can pay out of future earnings, for I am fearfully pushed to meet office expenses and Gwen and I hope to be married before the end of the year. In fact, I *can't* pay spot cash: technically, I am broke.

Ever yours, my dear T.,

GAR

I did not show this letter to Nancy; I did not even deliberate, but sent Garston my answer by return of post, which was that I accepted his second alternative and that the amount I named as acceptable to me in settlement was a sixpence to wear on my watch-chain as a memento of his success. When this letter had been posted my relief at being unburdened of the misery of the past weeks, and my joy in the re-establishment of our friendship, was unbounded.

From one extreme of feeling I went to the other, and it became inconceivable to me how I could ever have reconciled myself to taking toll of Garston's earnings after his long struggle to place himself in a position to earn anything. This was the sense of the matter that was natural to me; and I was so sure of myself that I would allow Nancy no more to influence me. Directly she saw me she expected to hear good news, and we had our first, real, fully-staged, almighty matrimonial row when she heard what that good news was.

She said that I thought more of Garston than I did of her; that he was a sly, boorish, self-centred man, who could twiddle me round his thumb; that his letter was a mere device to undermine my purpose; that anyone but I would have realized, years before, what a hypocrite the man was; that I thought of no one but myself and did not consider that she would suffer by the loss of three or four thousand pounds much more than I would, for I had my work to interest me and she nothing but whatever amusements she

could make for herself; that I was a most hopeless person to try and help; that my ambitions were trivial; that I did not take advantage of my opportunities; that being married to me was like being chained to a dead elephant; and that I did not care for her the least little bit. That is all I need report except that the tears in which our difference was forgotten were not mine.

My difference with Garston was, however, not so easily settled, for it became as difficult for us to agree that our account was all square as it had been to agree that it was not, and each of us was soon using for his new purpose the arguments that the other had advanced for the old one. I was finally compelled to agree to Garston's paying me two hundred pounds a year for five years, and as he was soon making four or five times as much as I was, I had little more compunction in cashing his cheques than he had reluctance in drawing them. In after years, when Garston and his wife came to stay with us from time to time, Nancy and Gar became friends. She said marriage had improved him. In this, however, she was entirely wrong. She never knew Garston in the old days when we used to bolt out of the office and dine on sandwiches and London stout at Pimm's, in Fleet Street, before settling down to a last session of T-square and dividers.

I have in my life observed many "dissolutions of partnership" among architects, but I do not remember any case where friendship has survived the rupture. My relations with Garston were unusual, but that unusualness was fruitful ground for misunderstandings and a bitter quarrel. I always regard it as one of the happiest events in my life that we escaped that calamity, and that the memory I have of Philip Garston is a continual happiness to me and not something very different.

NEXT WEEK: XXII—THE FUN OF THE FAIR

LETTERS FROM READERS

Quantities for the Smaller House

SIR,—I have been surprised of late by the number of architects who avoid the use of bills of quantities for the smaller house—the house, say, of a price in the region of £1,500.

There does not appear to be any semblance of a line which can be drawn between the really small type of house, which the average builder is supposed to price without difficulty, and the larger erection for which bills are considered absolutely necessary.

I have known architects place before builders schemes for work amounting to over £2,000, some including alterations, and expecting to get real competitive tenders. Possibly, sometimes, they greet the result with joy when some unfortunate builder, making a glorious guess, secures the contract at a low figure and finds himself well out of pocket on completion of the work.

By a guess I do not mean that a builder, if he really has any intention of trying to secure the work, will produce his price without paying any attention to figures.

I understand that some builders, although I am sure not many, base their estimates on the cube of a building, adding to their cubic figure lump sums for any special work such as an open fire with a briquette surround and hearth and such like.

A cubic figure is all very well for the provision by an architect to a client of an approximate estimate, but its value ends there, and the result is a very uncertain price.

Keen builders take out rough quantities when drawings and specification only are provided, and as they have no time, nor can they expend the money to produce anything approaching full quantities, the result is that they are forced to add a percentage upon the price their rough figures produce; a percentage which varies with the care which has been given to the production of their quantities.

The increase in the use of new materials in present-day building makes it necessary for the builder to estimate with much more care.

It is unfair to expect a builder to enter into competition for work without a sound basis upon which to start this work, and whereas the architect professes to save a client money if employed in preference to the acquisition of houses erected by a speculating builder, I consider that the inclusion of quantities is also a necessity to produce for the client a building which will give value for his money.

Architects seem to be very seldom seriously employed in connection with houses below £1,000, and although possibly many would treat with scorn any suggestion that quantities are of value for all work over that figure, I trust that others would not.

W. D.

Cavity Walls

SIR,—My quotation of Dartmoor, in a letter of mine on the above subject, published in the JOURNAL for August 26, was just an example of a weather-beaten area where hollow walling of ordinary construction, i.e. two 4½-in. thicknesses, would lead to failure, and there is a similar possibility on cliff sites.

I do not mean that hollow walling is of no value on sites such as these, but that more than a 4½-in. outer thickness of brickwork is necessary.

I have seen buildings on Dartmoor erected of local stone 12 ins. to 18 ins. in thickness with a cavity, and a 4½-in. inner brick skin.

I am in total disagreement with Mr. Beeston as regards the construction of the bottom of the cavity wall.

The filling of concrete not only strengthens the base of the wall, but provides an outlet above ground level for any moisture which may accumulate, by way of the open joints left in the brickwork.

By leaving the cavity open as far as the concrete, with, I presume, a number of weepholes below ground level, Mr. Beeston suggests (see issue for September 30) a badly constructed base, the possibility of an inadequate outlet for the dispersal of water (if water does really accumulate in the cavity) and an inlet for moisture and water by way of the earth.

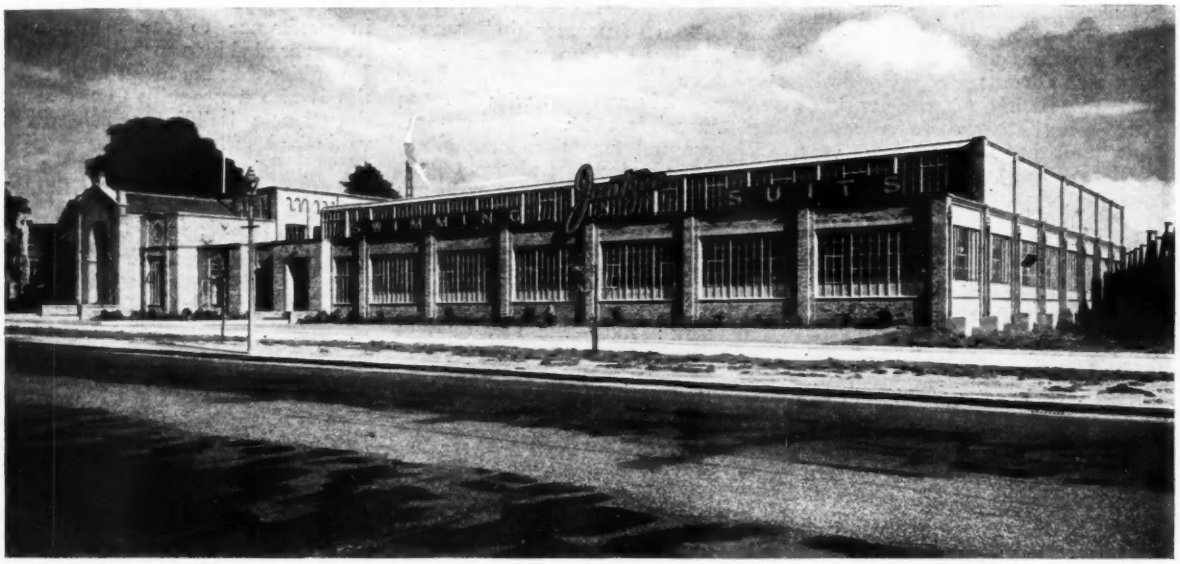
I do not like to doubt Mr. Beeston when he says that water will stream down the inner face of the outer skin of brickwork of a hollow wall, for I have never witnessed the result of driving rain upon the inner face, but then whilst I am wholly in favour of this type of construction I would not consider building the outer thickness in 4½-in. work in abnormal situations.

G. E. D.

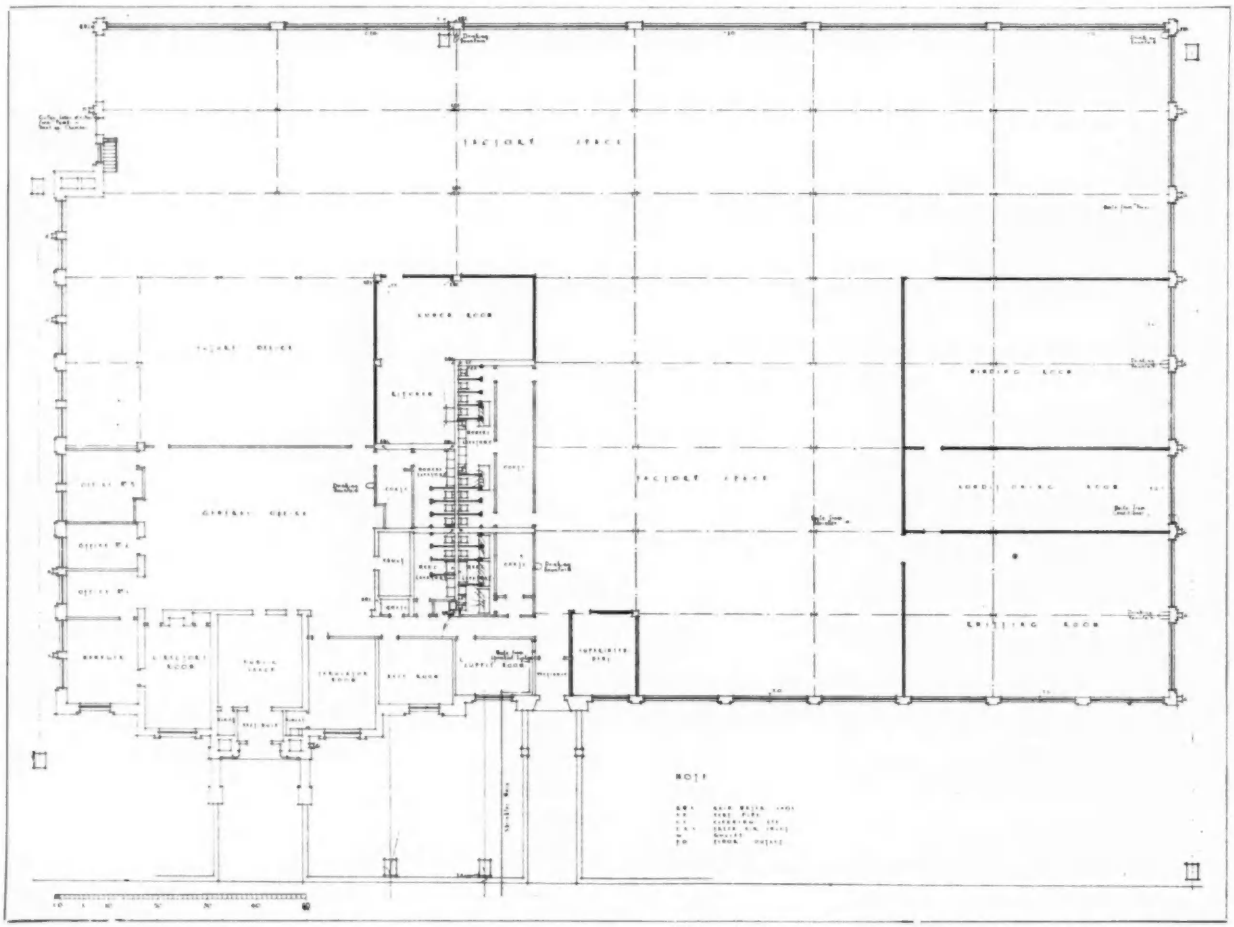
Copper as Damp-proof Coursing

SIR,—I am very much interested to know if any of your readers has experience of the use of sheet copper in strip form for damp-proof coursing.

F.R.I.B.A.



A general view of the front to the Great West Road, Brentford; the building is, as far as possible, a reproduction of the Jantzen headquarters in U.S.A., and was erected from the original plans of Richard Sundeleaf, of Portland, Oregon, U.S.A.



[*Constantine and Vernon, Supervising Architects.*

THE JANTZEN KNITTING MILLS

The layout has been designed expressly to accommodate the plant required in the various processes of manufacture of swimming suits from the yarn. It will be noted that all the lavatories are planned within the main body of the building, and have, therefore, to comply with English bylaws, to be mechanically ventilated.

THE JANTZEN KNITTING MILLS,

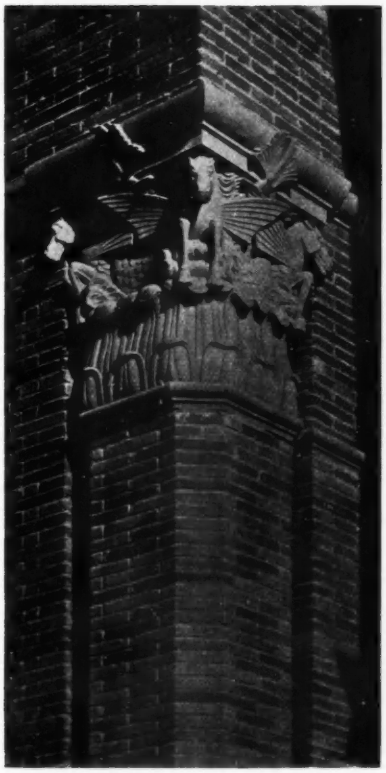
Great West Road, W.

CONSTANTINE AND VERNON, SUPERVISING ARCHITECTS

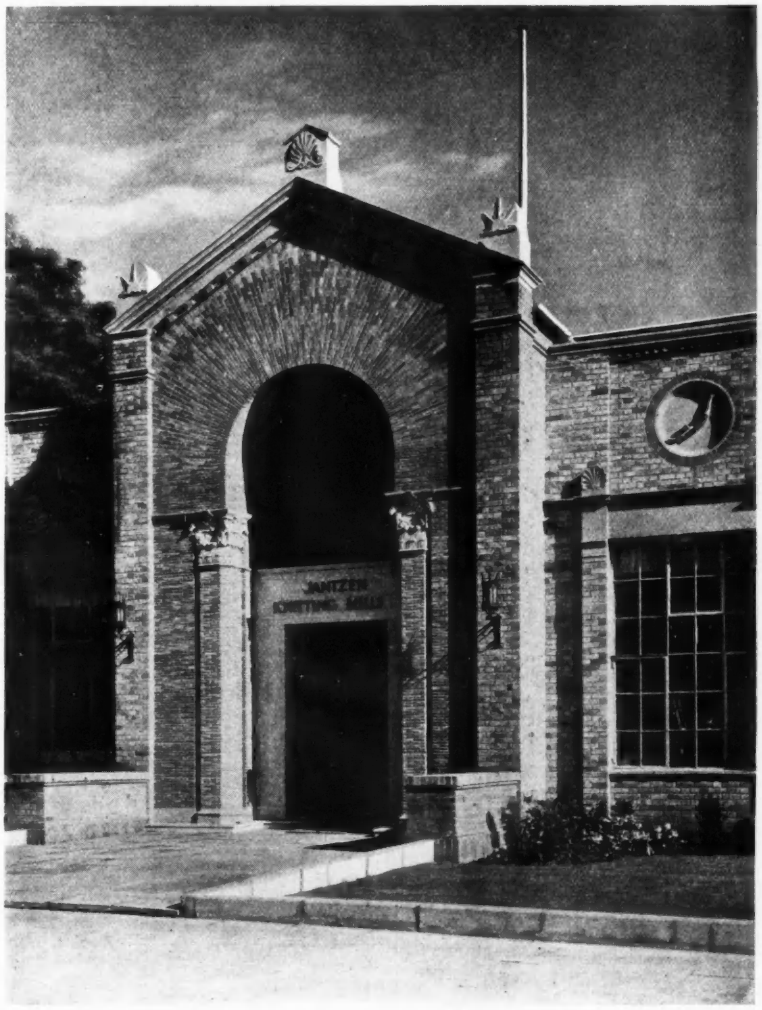
THE buildings here illustrated have been built from the original layout plans supplied by Mr. Richard Sundeleaf, of Portland, Oregon, U.S.A., and have been erected under the superintendence of Messrs. Constantine and Vernon. The plans provide for a factory building accommodating all the plant for the actual manufacture from the yarn of the well-known Jantzen Swimming Suit, with all its processes, which include conditioning of the yarn, pressing, cutting and sewing.

It was desired that this building should, as near as possible, match in tone, colour and details, Messrs. Jantzen's headquarters in America, and the brick and stonework is as near as possible a replica of the aforesaid building, special facing bricks of an orange-gold tint having been utilized.

Generally, the construction of the building, as erected, is upon orthodox lines of factory construction in this country, with the exception that the saw-tooth roofs of the factory section have vertical glazing, with opening lights, in place of the usual sloping patent glazing used in this type of building.



A detail of one of the carved stone capitals occurring at the main entrance, illustrated above.



The main entrance, in the front shown as a whole in the photograph reproduced on the facing page, owes a good deal to the orange tone of the facing bricks employed, and its contrast with the stonework.

The principal offices in the administration building are panelled in Austrian oak, and the general office, which is approximately 30 ft. high, is well lighted by clerestory windows. The heating installation, which is on the unit system, has been designed to give an internal temperature throughout of 70° when the outside temperature is 35°. The installation is on the low-pressure steam system, and the whole plant is under thermostatic control. Free steam is used in the various machines.

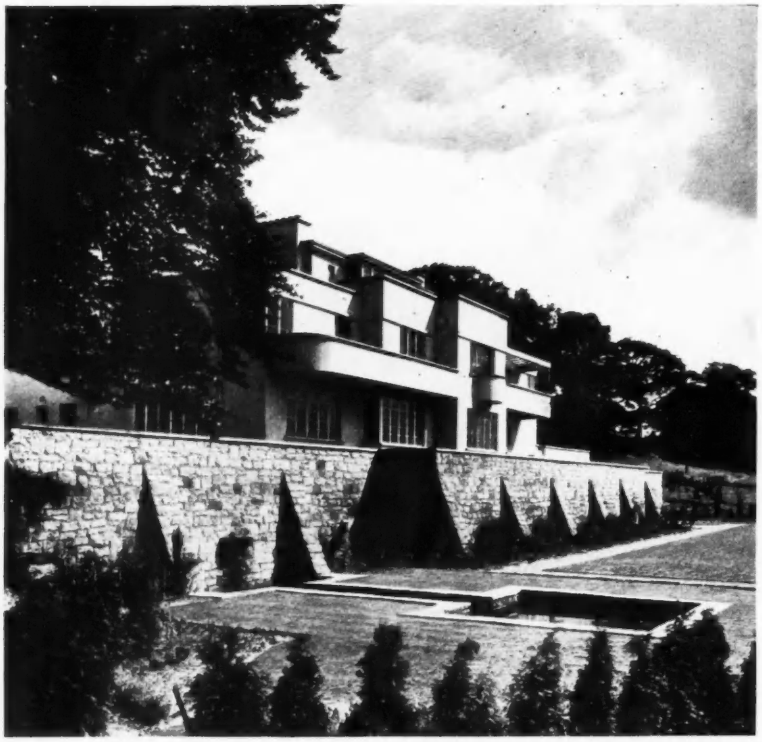
The interior planning is a little unusual, as the whole of the sanitary arrangements are within the building and, in order to accord with the local bylaws, are mechanically ventilated. The whole of the drainage is constructed in heavy iron, the manholes and gullies having access from a space specially provided under the main floor.

R.I.B.A. Surveyors' Examination

The R.I.B.A. Statutory Examination for the office of district surveyor under the London Building Acts, and the examination for the office of building surveyor under local authorities, will be held at the R.I.B.A., on May 4, 5 and 6, 1932.

The closing date for receiving applications for admission to the examinations, accompanied by the fee of £3 3s., is April 13, 1932.

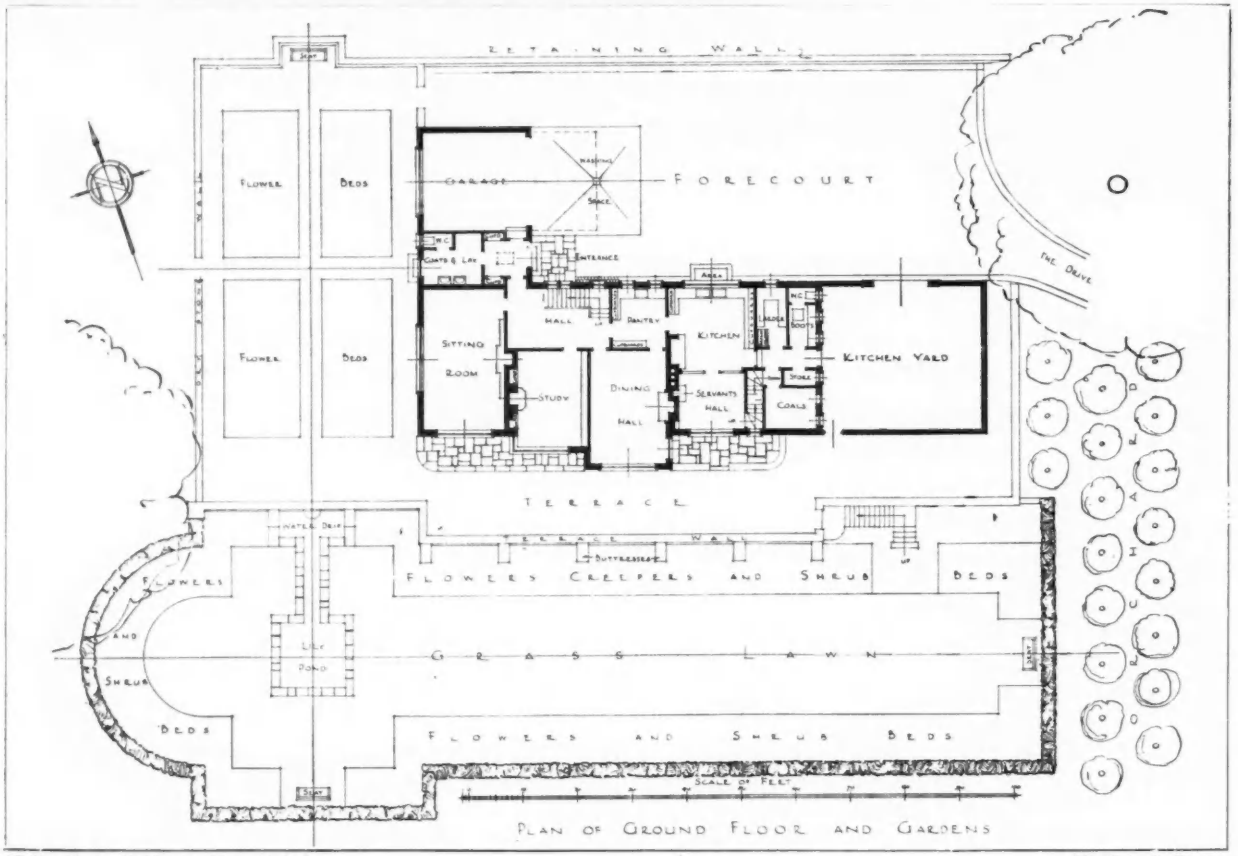
Full particulars of the examinations and application forms can be obtained from the Secretary of the R.I.B.A., 9 Conduit Street, W.1.



Looking along the garden front, with the lily pond in the foreground, towards the east. Steps at the farther end of the garden wall, which is of local stone, lead up to the terrace. (See layout plan below.)

FIRST FLOOR PLAN

The central feature of the first-floor plan is the owner's suite, comprising bedroom, dressing-room and bathroom, together with a glass-roofed balcony. This runs along the garden front, and can be seen in the adjoining photograph.

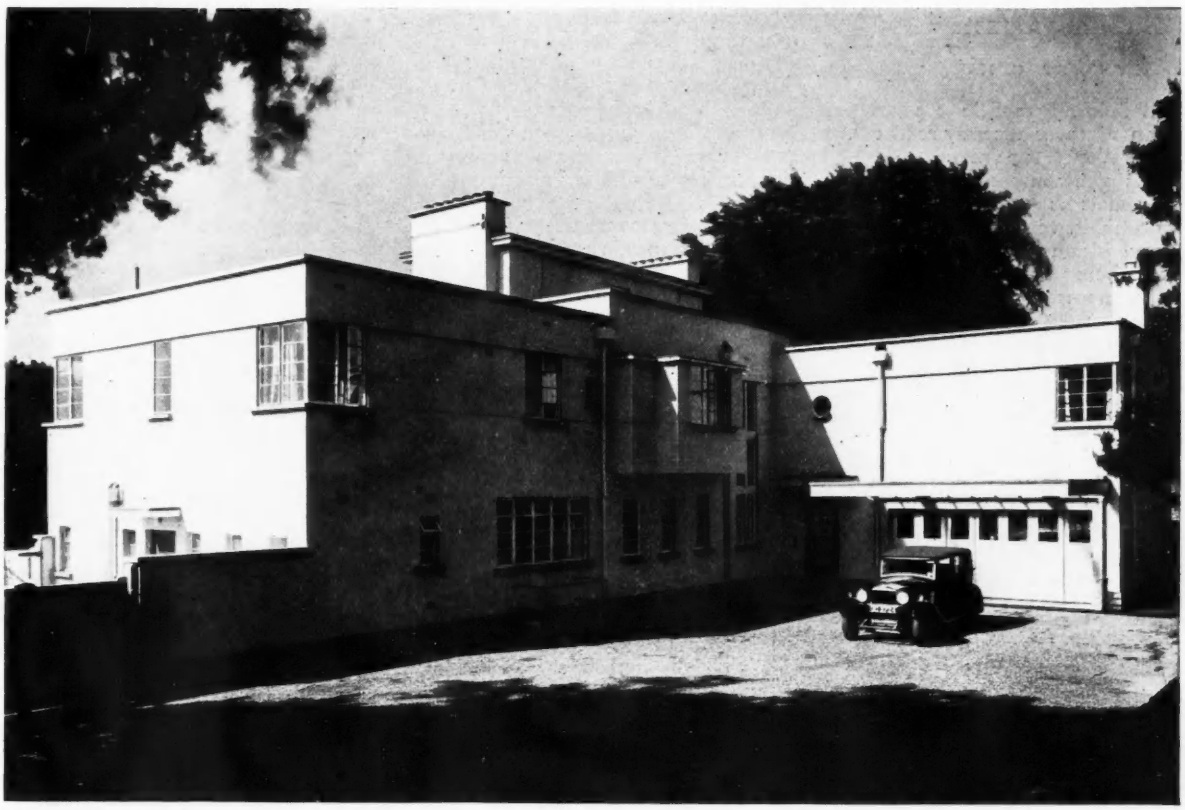


Kirkby House, Kirkby Overblow, Yorks.] [*By John C. Procter.*

The ground-floor plan and the layout of the gardens. The house is entered from a forecourt, partly dug into the hill on the north side. The entrance lobby, as will be seen, both connects and separates the staircase hall, garage, and cloakroom.

KIRKBY HOUSE, KIRKBY OVERBLOW, YORKSHIRE

DESIGNED BY JOHN C. PROCTER



The main entrance front, as seen from the east. The external walls are of cavity brickwork, covered with a slightly-textured stucco, finished a light buff colour. The low plinth is of local stone, and the roof is floored with asphalt. The garage is on the right of the entrance door, and the gateway on the left leads to the kitchen yard.

KIRKBY HOUSE, Kirkby, Yorkshire, illustrations and plans of which are reproduced on this and the facing page, is built on a site sloping steeply from north to south, overlooking a very beautiful stretch of Wharfedale, and towards the ruins of Harewood Castle across the valley.

The site is in the midst of park land, and is surrounded by many very fine trees, which dictated to some extent the placing of the house. The gardens had all to be made up, and in this respect there is still much to be done.

At the outset, the usual "Battle of the Styles" in its minor form was pleasantly fought, and, after a mild struggle, the Germanic prevailed over the locally-favoured Tudor and Queen Anne.

Light and sun were the principal requirements of the planning, and the house has been designed accordingly.

The fairly exposed site affected the planning in some measure, especially in regard to the sun room on the roof, which is buttressed by the two main stacks which take all but one of the flues in the house. This was made possible by the client's desire that all the principal rooms should have their fireplaces on the long walls, and that these should not be external walls.

On the ground floor the chief feature of the planning is that the house is entered from a forecourt partly dug into the hill on the north side, and that the entrance lobby both connects and separates the staircase hall, garage and cloakroom. Both on the ground and first floors the staff quarters are definitely cut off from the rest of the house.

The first-floor plan shows that the number of bathrooms have not been stinted for the size of the house, that the staff have separate small bedrooms, and that the staircase commits the "school" crime of crossing the hall window. The main interest on this floor, however, is the owner's suite, consisting of bedroom, dressing-room and bathroom, together with a spacious glass-roofed balcony, reached from a lobby between dressing-room and bathroom. The balcony cannot be overlooked, and this, together with the dining-room veranda below, are sheltered from the prevailing wind, and catch and amplify the sun.

On the roof, reached by an internal staircase, is the sun room, glazed from floor to ceiling on its south side, with folding doors on to the roof. Here also are placed the box and tank rooms.

Externally the walls are of cavity brickwork, covered with a slightly-textured stucco, finished a light buff. The house stands on a low plinth of local stone, and the terrace and garden walling are in the same material. The roof is covered with asphalt, laid on joists and boards.

At the time the photographs were taken, many of the windows were still lacking curtains, and this and other shortcomings made interior photographs impossible. As with the design of the exterior, the aim internally has been to eliminate "nonsense" as much as possible; as far as money would allow to use respectable materials; and not allow the "craftsman" to be too crafty, or to torture honest stuff by too much cutting and twisting.

A. B.

THE SPECIFICATION WRITER

Natural Rock Asphalt in Building Construction

BY COL. S. C. MARRIOTT

THE following article is condensed from a paper recently read to the Clerks of Works Association.

What is commonly known as natural rock asphalt is really natural rock mastic asphalt, a combination of natural rock and bitumen, so composed as to enable its being applied in a plastic state.

Briefly, natural rock asphalt is a limestone which in some prehistoric period has been impregnated with the oil vapours from the centre of the earth, and the actual amount of impregnation has depended upon the density of the limestone, the result being that some classes of rock are richer than others, but this does not necessarily mean that they are the better for it, because it indicates a softness in the limestone which is not conducive to good mastic asphalt. A percentage of from 6 to 8 per cent. has been found by experience to give the best results, as it facilitates regulation of the mastic by the addition of bitumen to bring the bitumen content up to 16 per cent. in order to make the mass into a plastic nature. By far the most important feature in the manufacture of mastic asphalt is the nature and origin of the added bitumen, owing to the fact that it has an important bearing upon the wearing and weathering qualities of the finished product.

There are two kinds of bitumen, one natural, and the other synthetic, and whilst there are many sources from which natural rock asphalt can be obtained, there is only one source from which natural bitumen is marketed—that is from Trinidad, a British island in the West Indies. I will not deal with the peculiar circumstances in which this unique material is found. Trinidad Lake bitumen has been endowed with certain qualities which cannot be reproduced by artificial methods, with the result that its use in connection with the production of mastic asphalt is specified by architects and engineers throughout the world. There are, however, synthetic bitumens—the residue of oil after the petrol and lubricating oils have been extracted, and whilst they may be termed pure bitumens, their consistency varies very considerably with the amount of distillation to which they have been subjected. On the other hand, the consistency of Trinidad Lake bitumen has never varied since the first analysis.

This peculiar stability in Trinidad bitumen therefore is of the greatest value in the manufacture of mastic asphalt, because if the natural rock aggregate contains 6 to 8 per cent. of naturally impregnated bitumen, and the percentage has to be brought up to 16 per cent. with added bitumen, this balance practically controls the situation and, knowing its consistency, the manufacturers are able to standardize the various grades of mastic asphalt produced.

We therefore come down to the fact that the best mastic asphalt is produced from natural rock asphalt and Trinidad Lake bitumen. The actual process of manufacture is as follows: The rock asphalt, having been reduced to powder, is fed into mechanically stirred boilers or cookers, together with sufficient bitumen or asphalt cement to bring the whole mass into a plastic state, when it is run off into ½ cwt. moulds ready for issue. This process will perhaps sound somewhat simple, but it is very much the reverse, owing to the numerous factors which operate against the manufacturer unless the greatest care is taken: the choice and grading of the rock itself, the characteristics of the added bitumen, its ductility, penetration, etc. These all vary according to the requirements of the grade of material being manufactured; there are something like fifty different standardized grades of mastic asphalt. Not the least important part of this process is the actual cooking in the boilers, after the mass has been properly mixed, and to all intents and purposes is ready to be run off. The whole process of preparation should take 6 to 8 hours.

There is still a further danger that the finished product may be spoilt in the reheating on the job. Care should be taken to avoid overheating, and frequent stirring is necessary to prevent the material from burning against the sides and bottoms of the pans.

It is only by taking every precaution and care in the manufacture at the works and preparation on the site of the contract that the mastic arrives at its final stage in the building in such a condition as to give its best service and longest service.

In application the best results are only obtainable when the architect, the builder and the asphalter co-operate.

In natural rock asphalt we have a material in which are combined more weather-resisting qualities than any other agent yet produced. It is used as a shield against the elements for the protection of the most vital points in building and engineering construction. The asphalt specialist should be consulted by the architect as to the best means of arriving at certain results.

In these days architects as a whole (although there are exceptions) seem apathetic in their attitude towards asphalt, and often unsympathetic towards those specialists whose long experience in the trade must be of value. Trinidad Lake asphalt, as a fluxing agent to rock asphalt, is frequently specified, but steps are rarely if ever taken to identify its presence in the asphalt blocks actually used on contracts. Investigation on the part of architects regarding this matter would be welcomed by the asphalt specialists, whose technical departments are always at their disposal whenever they wish to avail themselves of them.

Last, and by no means least, the finished work, especially in the "tanking" of basements, must be carefully protected against the thoughtless workman. To some people the strict Clerk of Works is a nuisance; to the asphalt contractor he is a blessing, because he knows that, in his absence from the job, he holds a watching brief for all exposed asphalt surfaces, in which a single fracture may cause many hundreds of pounds' worth of damage.

I propose to conclude this address by going straight to one or two of the latest developments in asphalt work, new applications which are mainly the result of research. I refer to the action of acids and oils. The former is, of course, of greater importance, but it is only possible to give a very general outline from the fact that hardly any two propositions are exactly alike.

The application of acid proof asphalt ranges from the flooring of accumulator rooms to that of glue houses, from sugar refineries to the lining of galvanizing tanks, and in each case different conditions of acid and temperature have to be countered. It is, therefore, impossible to have one standard material, and the most satisfactory method of dealing with this problem from the manufacturers' and the asphalters' point of view is to have several specifications, some of which cover propositions of medium severity and others are designed for work under the most stringent conditions.

Oil-proof asphalt, a recent invention, produced with the object of countering the conditions met with on garage floors, and oil-fuel ships' decks, is also available now, as is also coloured asphalt in red, green and brown shades. The latter material is not merely coloured on the surface, but combines permanent colouring, with all the wearing and waterproofing qualities of natural rock mastic asphalt.

Finally, Trinidad Lake asphalt is an all-Empire product.

RESEARCH into the mechanical properties of concrete is always in progress. For ten years such problems as its

susceptibility to corrosion and its behaviour under varying stresses and strains have been under investigation at the Karlsruhe Technical College. Using a carefully-adjusted composition of Portland cement, Rhine sand and gravel, it has been concluded that there exists a critical stress for concrete in compression and tension. Loadings below this stress strengthen the material and render it elastic. For this reason it is advisable to provide for a critical limit, as high as possible, in the case of structures subjected to high alternate stresses. This means a material of great strength and elasticity. In order to restrict the formation of the cracks as far as possible in structural parts subjected to bending moments, a reduction of the permanent and plastic compressive strains in the concrete is necessary. As the permanent strains include those caused by shrinkage, the age of the concrete plays an important part. After some time—about six months—the increase of these strains practically ceases and the moisture and the temperature of the air have a variable influence, but not as great a one as by shrinkage due to hardening during the first months. Thus it is necessary to counteract the strains due to hardening by keeping the structures wet as long as possible. The most essential result is that alternating loadings below the critical strains and stresses do not influence the load of rupture. Finally, the investigations have shown that in reinforced concrete beams subjected to bending moments the cracks breathe—i.e. they open by the loading and practically close by unloading—as long as the reinforcement is not stressed beyond the elastic limit of the steel. The knowledge obtained as the result of the investigations was given in detail in a paper read at the Institution of Structural Engineers by Dr. E. Probst, of the College, last week.

PUBLIC BUILDINGS COMPETITION, NORTHAMPTON

WINNING DESIGN: BY J. C. PRESTWICH AND SONS

ON this and the following two pages are illustrated the first premiated designs in the competition for the proposed public baths, police and fire stations, sessions court, etc., to be erected in Campbell Street and Upper Mounts, Northampton. The approximate cost of the scheme is £250,000. The assessor, Mr. Percy Thomas, O.B.E., F.R.I.B.A., made his award as follows :

First premium (£500) : Messrs. J. C. Prestwich and Sons, F. & LL.R.I.B.A., of Leigh, Lancs.

Second premium (£400) : Mr. H. J. Harding, A.R.I.B.A., of 46 Beauchamp Place, London.

Third premium (£300) : Messrs. Tolson and King, A.R.I.B.A., of 4 Hessle Mount, Leeds.

Fourth premium (£200) : Mr. E. P. Musman, A.R.I.B.A., of 7 Carteret Street, Westminster, London.

As will be seen from the ground-floor plan reproduced on page 505, the main entrances to the courts, fire station and baths are on the main front to Upper Mounts. The large bath has been specially designed for use as a public hall, therefore a separate entrance has been provided, set back about ten feet from the main building line, in order to allow for the arrival and departure of cars.

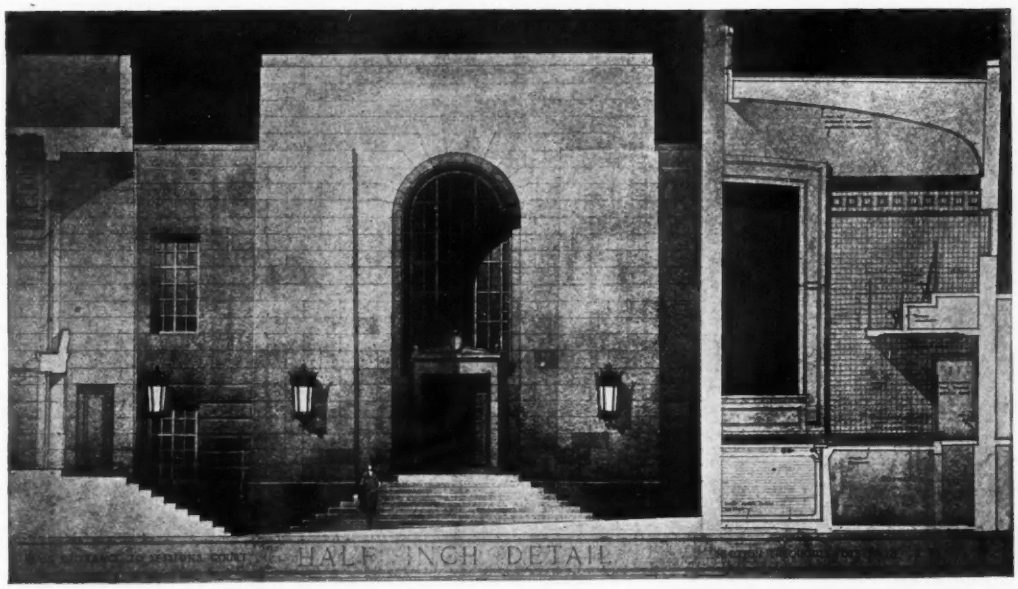
The baths building, one of the principal features of the scheme, contains, in addition to the large bath or public hall a smaller bath with a flat roof, for the purpose of sun-bathing, with direct access to both baths. This facility for sun bathers was requested in the conditions. The usual subsidiary slipper baths, etc., are planned at the rear of the building. The first floor is devoted to the superintendent's quarters and a committee room.

The fire station is situated between the courts and baths buildings. The engine space, running up through the mezzanine floor, has a maximum accommodation for five engines. The four upper floors are devoted to the firemen's quarters.

The police buildings and courts, on the left of the fire station, are planned on two floors.

A house for the chief constable has been placed on the south-western corner of the site, with its main front to Upper Mounts.

The designs are on exhibition in the Town Hall, Northampton, until Thursday, October 15.

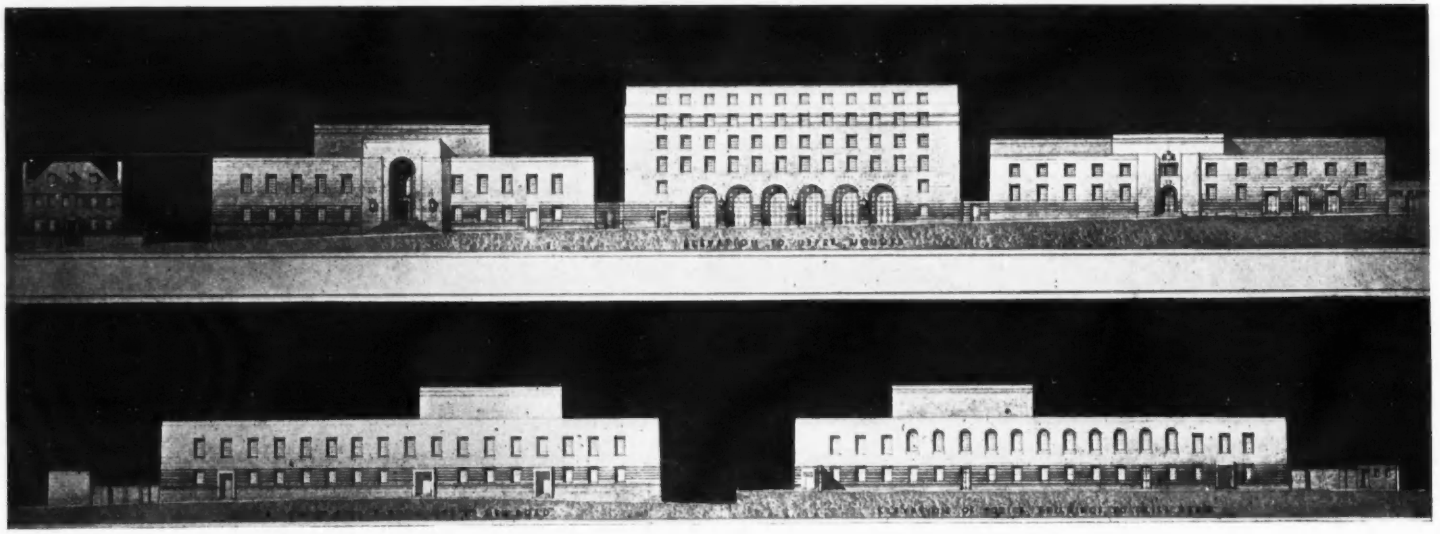


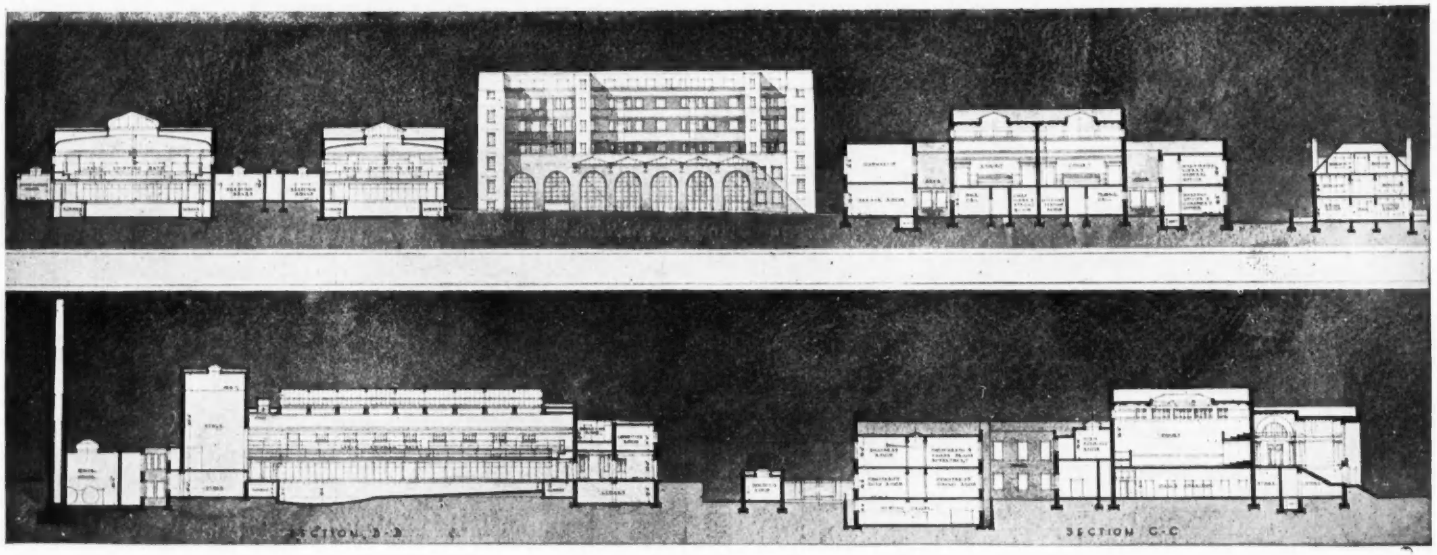
The architects' half-inch detail drawing of the main entrance to the sessions court on the front to Upper Mounts; and a section through the large bath.

Public Buildings Competition, Northampton

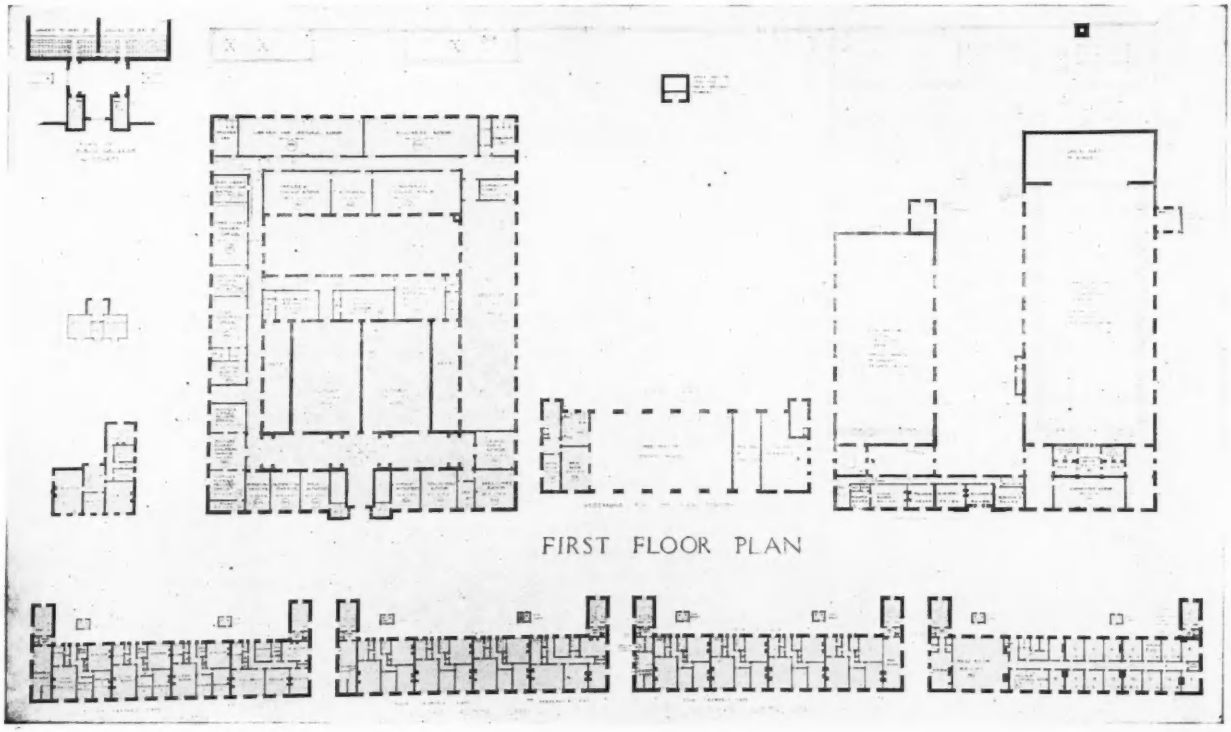
By J. C. Prestwich and Sons

Elevations of the buildings facing Upper Mounts, New Road and Drill Yard. In the conditions of the competition it was stated that "the general character of the buildings should rely for effect upon good proportion and grouping rather than upon elaborate detail." Portland stone is to be used for facings.



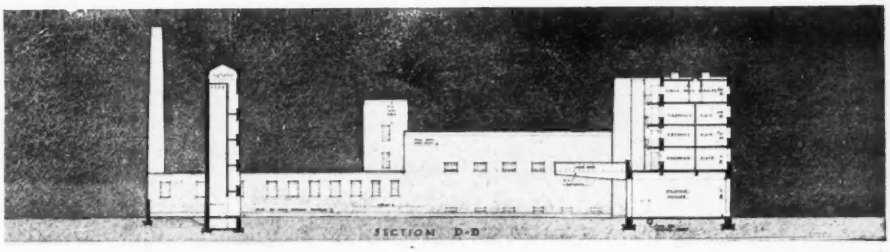


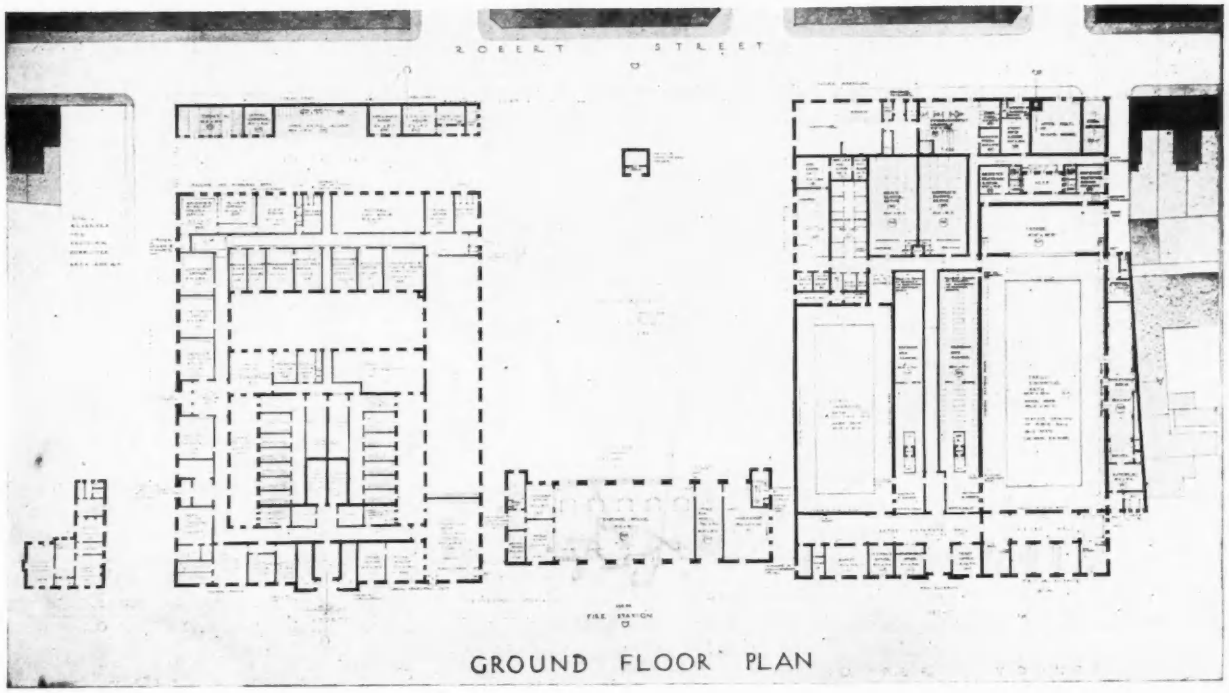
Sections A–A, B–B, and C–C; the fourth—D–D—is reproduced on the facing page. As will be seen on the section A–A, the smaller of the two swimming baths has a flat roof; this has been so designed for the purpose of sun-bathing, thus complying with one of the clauses in the conditions. Farther along are shown the fire station, the upper stories of which are devoted to the firemen's quarters; the police buildings and courts, with the two principal courts on the first floor; and the house for the Chief Constable.



Public Buildings Competition, Northampton: Winning Design.] [*By J. C. Prestwich and Sons.*

Ground and first-floor plans of the courts and baths buildings, the house for the Chief Constable, and the ground, mezzanine four upper floors; and section D–D of the fire station.





LITERATURE

EGYPTIAN SCULPTURE

THE modern sculptor says there is no such thing as static sculpture; for sculpture to be expressive it must indicate a moment of suspended dynamism. This is a very different thing from the expression of violent emotion in violent representational action. Between the two, however, there is only the matter of degree. All actualistic sculpture exhibits this degree; while abstract work is necessarily static.

So the demand of the modern sculptor for the non-static principle requires to be classified according to exemplary models furnished by the past plastic and glyptic schools. All schools of sculpture provide the extremes of vivid movement and perfect peace. The war and hunting scenes of the Assyrian reliefs provide that extreme dynamism which of necessity is the requirement of pictorial art. The portraits of the kings, queens, and priests of Egypt provide the extreme of quietism which we have usually denoted as static.

It is in this remarkable quietism of Egyptian sculpture, of carving especially, that the great excellence of it is possessed. It has virtues of material and technique; of portraiture, of history; but its great virtue is its sublime stillness. This may well be compared with the solitude of the desert in which some of it is found; just as the horizontality of Egyptian architecture may well be compared with the contour of the geological formation of the country. The two principles not only coalesce, they combine, for Egyptian sculpture is but a factor in Egyptian architecture.

If there is no static of form, however, there is in Egyptian sculpture an overwhelming static of history. However the form may be described, it has been the possession of the art from inception even to decay; a more overwhelming display of consistency than even the Greek affords. There are few elements, but they are paramount as well as unchanging and persistent. There were six great schools of Egyptian sculpture, but the minimum of development. The first dynasty produced the composite wood statue; the Old Kingdom added metal to this and produced the whole statue in stone; the Middle Kingdom maintained these things and it was not until the New Kingdom that some variation was achieved in the composite stone statue and the colossal figure began to dominate the art. Figure and relief offered themselves as architectural elements; the Old and Middle works affording examples in relief of scenes from daily life and funerary ceremonies; the New, the reliefs of the decorated temples and tombs.

Of all these things Miss Murray, the Assistant Professor of Egyptology in the University of London, gives an admirable account, to which are added detailed descriptions of many particular works and most useful sections on methods and materials.

There are 120 excellent illustrations in the volume. KINETON PARKES

MONUMENTAL ARCHITECTURE

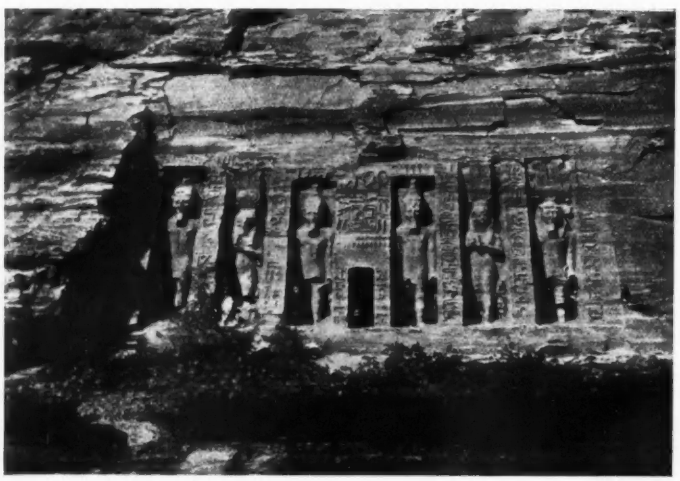
IT is necessary to say at once that this book is not so much a critical selection as a record of monumental and commercial architecture carried on from one volume to another and dealing in detail with different types. In this particular volume are included theatres, scholastic and commercial buildings; but in the main it is a record of modern bank architecture.

The production is excellent. Large photographs, clear plans, and a well-written introduction to the study of bank-planning by Mr. Grahame B. Tubbs, with good paper and modest black binding, make it in every way a book for the library.

Bank architecture in England is interesting within a well-defined and rather narrow ambit. The habit of banking has grown among the people gradually and without serious check. It has grown to enormous dimensions, and by a series of amalgamations nearly the entire banking business of the country has become concentrated in five great banks. These five banks carry on a gentlemanly war, vieing one with another in the erection of little branch banks wherever there is business to be had.

Generally speaking, the directors of the great banks saw very clearly in what their programme was to consist, and when they followed the doctor in choosing a seemly Georgian address it must be admitted that they gauged their public well : the English branch bank gives the impression of friendly security, and banking has become a pleasant habit. Nor can anybody really seriously complain that the banks have failed in their architectural duty, for in every country town you will find them upholding the amenities and taking their modest place, securely wedged into the direct line of gentlemanly tradition.

Even more particularly speaking, the banks cannot be accused of architectural reaction in a world of adventure. They are not, in fact, any worse than their neighbours the insurance companies, than the kings of commerce or than most of the great builders of today. The point at issue rests upon the fact that they have been responsible for an enormous amount of building all over the country, and upon a very grand scale in London. Yet there is no rush of foreigners to England, eager to see how we have solved the problems that must have confronted the directors and their architects. There is hardly one of these buildings, great or small, that offer themselves as models for future development. The chance must have been offered by more than one architect to evoke some fresher and directer expression of banking, but policy seems always to have dictated that no risks must be taken; and so one may walk through the City of London seeing a quantity of stone but little originality, and less of genuine architectural emotion. If proof be needed of this, stand on the steps of the Exchange; look carefully at the detail on Soane's



The small temple at Abu Simbel, Egypt.

[*From* Egyptian Sculpture.]

screen wall of the Bank of England; then let your eye wander over the façades of five great new buildings, the contribution of our day. James Millar's Union Bank of Scotland should be excepted from this criticism. It is founded on a bank of McKim's that made history, and the whole thing so greatly performs its function, and is so finely modulated in all its parts, that one regrets that we have borrowed so little from the best that America could offer.

With the branch banks we have often cause for congratulation, for at times they strike the English note clearly and with charm, as in the examples by E. B. Maufe, Louis de Soissons and more than one of F. C. R. Palmer's branches for the National Provincial Bank.

Attention must be drawn again to the treatise on planning, for although it is confessedly an introduction to the subject, read with the plans and photographs, it will be found to contain a great deal of useful information.

The Monumental and Commercial Architecture of Great Britain of the Present Day. Vol. ii. By Dexter Morand. London: John Tiranti & Co. Price 20s. net.

KELLY'S DIRECTORY

KELLY'S Directory of the Building Trades, 1931, just issued, reaches its eighteenth year of publication. Like its predecessors, it covers every trade and profession connected with architecture and building throughout England, Scotland and Wales. In addition to the names of upwards of twenty thousand builders, it also includes an extensive section giving, in alphabetical order, a list—considerably revised and extended—of branded articles and specialities used in the building trades, together with the names and addresses of the manufacturers: a list that should be of great assistance to those who wish to trace the manufacturers of building material bearing a distinctive trade mark or name.

Every year the *Directory* seems to grow a little more bulky. In this edition there are no fewer than 3,120 pages (excluding those devoted to proprietary articles and trade names). The tasks of revision and correction must have been as arduous as ever, but nevertheless, these have been done with extreme thoroughness.

Kelly's Directory of the Building Trades, 1931. London: Kelly's Directories, Ltd. Price £2 10s. net.

SOUTH YORKS ARCHITECTS' ANNUAL REPORT

THE forty-third *Annual Report of the Sheffield, South Yorkshire and District Society of Architects and Surveyors for the Year 1930–31* has recently been issued. In the Council's report it is stated that during the year the Director of Education was approached and a suggestion made to him that some proportion of the new school work should be entrusted to private architects, but without result. The Council feel it is unfortunate that in a city of the size of Sheffield the opportunities of architects in practice to design and erect public buildings should be more limited than in any other city of equal size. Other business dealt with by the Council includes the formation of a Peak District Panel of Architects, set up for the specific purpose of preventing, as far as may be in their power, the spoliation of the countryside, by giving free advice on designs and general layout schemes where required; questions relating to the formation of a Lincolnshire Society of Architects; designing of buildings by draughtsmen employed by builders and limited liability companies; West Riding Education scholarships; housing work panels; maintenance scholarships; professional affixes; and a City aerodrome.

The membership of the Society now totals 152, comprising 10 Honorary Members; 64 Fellows; 63 Associates, 11 students; and 4 lay members, showing an increase of fourteen over that for the previous year.

A portrait of Mr. W. G. Buck, F.R.I.B.A., the president, has been reproduced as the frontispiece.

Annual Report of the Sheffield, South Yorkshire, and District Society of Architects and Surveyors for 1930–31.

QUESTIONS THAT ARISE

Lavatory Basins

J. S. B. writes: "*I should be glad to know if your expert can suggest a method of dealing with the waste water from two or more lavatory basins, which it is proposed to instal in a basement, and where the outlet from the basins will be approximately 2 ft. below the level of the drain.*

"*The drain, which is a 6-in. cast-iron pipe, passes along the wall of the basement in which it is proposed to instal the basins. I have noted in* THE ARCHITECTS' JOURNAL *advertisements of cellar and sump drainers, and I have written for full particulars, but I should be glad of any further suggestions your expert might be able to offer.*"

Presumably it is found impossible to raise the basins, with a portion of basement floor, so that their outlets could be introduced to the drain without mechanical aid. If this could be done, and the inlet gulley were of an anti-backflow type, with collecting catchpit sufficient to act as a temporary reservoir should pressure within the drain have closed the valve, the arrangement should work. Without the anti-flooding valve, the drain inlet might be forced by a heavy discharge from higher points connected to the main drain, or should it become (even temporarily) choked.

Failing some such expedient, one of the mechanical devices designed to raise sewage appears to be the only recourse, and will be a relatively expensive luxury to deal with so minor a convenience. It is sometimes found possible to use a Blake's "B" type ram for raising sewage effluent from a depth not more than 8 or 10 ft. below the level of the ram, which itself may be operated from an ordinary open cistern fed off a main supply, but the ram itself passes a bulk of operating water so greatly in excess of the water actually raised that it does not seem likely in this case to afford a reasonable alternative. E. G.

Walls and Flooring

E. N. writes: "*I should be glad if your expert would advise me as to the most suitable materials to use for the floor and walls of a modern operating theatre. The existing theatre floor has cracked badly. The walls are plastered and enamelled over, but are not even. I am about to reconstruct the theatre and would much appreciate your expert's advice. The floors of the hospital are counter floored with maple, which is badly worn, and the authorities propose flooring throughout. Your expert's advice as to the material best suited for this purpose would also be appreciated.*"

The most suitable material for the floors and walls of an operating theatre is Biancola or other similar material (each firm has its own special name for this). The floor should be divided up into squares with a brass or ebonite strip as a precaution against cracking. Alternatively, the floors and walls can be tiled, as is usually done in American hospitals. The colour favoured by the surgeons is a pale grey or pale green. Rubber has been used for the floors and walls of an operating theatre, but it is not so satisfactory as the two other materials mentioned. The best floor for hospital wards is undoubtedly teak or Bagac. The corridors should have a noiseless flooring material, such as Korkoid, Ruboleum or rubber tiles, with a margin and cove skirting of terrazzo or teak. If funds are insufficient to cover these materials, Battleship linoleum has been found to be satisfactory. We cannot gather from the query as to whether the floors and walls of the operating theatre in question are to be reconstructed. This is surely necessary if the job is to be satisfactory, and they should be of fireproof material. L. G. P.

R.I.B.A. FINAL EXAMINATION

Alternative Problems in Design

FOLLOWING is a list of R.I.B.A. problems in design for the year ending December 31, 1932. Additional copies of the list may be obtained on application at the R.I.B.A.:

1 : The drawings, which should preferably be on uniform sheets of paper of not less than Imperial size, must be sent to the Secretary of the Board of Architectural Education, Royal Institute of British Architects, 9 Conduit Street, W.1, on or before the dates specified below.

2 : Each set of drawings must be signed in ink by the author, and his full name and address, and the name of the school, if any, in which the drawings have been prepared, must be attached thereto.

3 : All designs, whether done in a school or not, must be accompanied by a declaration from the student that the design is his own work, and that the drawings have been wholly executed by him. In the preparation of the design the student may profit by advice.

4 : Drawings for subjects *a* are to have the shadows projected at an angle of 45° in line, monochrome, or colour. Drawings in subjects *b* are to be finished as working drawings. Lettering on all drawings must be of a clear, scholarly and unaffected character.

5 : After a design has been approved, it may be re-submitted, together with the specified working drawings, on any of the dates for submission of drawings given below.

6 : All candidates taking the Final Examination in 1932 and subsequent years will be required to include in the four Testimonies of Study, for which they must secure approval before being admitted to the Examination, at least one of the problems involving an acoustical treatment. Where a reverberation table is asked for, it should be as complete as possible and the reverberation formula should be quoted. Acoustic diagrams showing the reflection of sound beams should be to a scale of one-eighth of an inch to a foot. The two subjects set for 1932 which may be treated acoustically are Problems Nos. CXXIV and CXXVII. A list of articles and books on the subject to guide candidates in obtaining the necessary information may be obtained free on application to the Secretary, R.I.B.A.

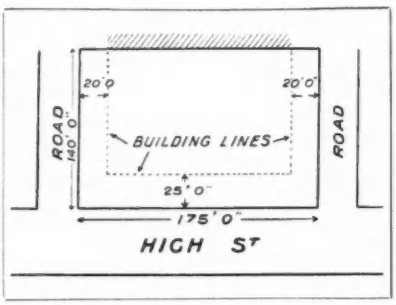
CXXIII : *a : A Motor Coach Inn :* The requirements of such an inn are as follows : Parking space for six charabancs and ten cars, small garage and repair shop, filling station, all to have convenient access and circulation from the main road.

The inn itself must have a small private bar and public bar, and a large restaurant and tea-room to seat 120 persons. The restaurant should overlook a garden. Ample service accommodation should be given for the provision of light meals. Cloak and lavatory accommodation. The manager's apartments will consist of small office, living-room, kitchen, etc., six bedrooms, some of which may be in the roof. It should be borne in mind that in the winter the motor traffic is greatly reduced and the restaurant will be closed for several months. The site is a large field along the road, and as much land as necessary may be used.

Drawings required : One-sixteenth scale block plan. Plans of all floors, sections and elevations, one-eighth scale. Half-inch detail of a portion of the main front.

Working Drawings : The design for a Motor Coach Inn may, after it has been approved, be re-submitted with the addition of one-eighth inch scale plans showing construction, and the roof truss in restaurant drawn to half-inch scale.

CXXIV : In accordance with instruction to candidates No. 6 (above), this problem may be treated acoustically. *a : A Small Town Hall in a Country Town :* The site is rectangular, with a frontage of 175 ft. to the High Street, and a depth of 140 ft. There are no rights of lights on the back boundary.



Accommodation : The following rooms are required of approximately the size indicated. All measurements are in sq. ft. (A) *Council Suite :* (1) Council chamber, 1,100 sq. ft.; (2) committee room No. 1, 600; (3) committee room No. 2, 400; (4) mayor's parlour with lavatory, 300; (5) members' room (male), 300; (6) members' room (female), 150; (7) waiting room, 150; (8) members' lavatory (male); (9) members' lavatory (female). (B) *Town Clerk's Department :* (1) Town clerk's room, 300 sq ft.; (2) assistant town clerk's room, 200; (3) general office, 400; (4) conveyancing room, 200; (5) typists, 200; (6) spare, 150. (C) *Medical Officer of Health :* (1) Medical officer of health private, 300 sq. ft.; (2) assistant medical officer of health, 200; (3) general office, 300; (4) sanitary inspectors, 200; (5) health visitors, 250; (6) typists, 150; (7) spare, 150. (D) *Education Department :* (1) Education general office, 250 sq. ft.; (2) education secretary, 150. (E) *Accountant's Department :* (1) Accountant's private, 300 sq. ft.; (2) general office, 450; (3) rates office, 500; (4) internal audit, 200; (5) costing clerk, 150; (6) typists, 150; (7) spare, 150. (F) *Surveyor's Department :* (1) Surveyor's private, 300 sq. ft.; (2) assistant surveyor, 200; (3) general office, 400; (4) drawing office, 400; (5) building inspector, 200; (6) plan room, 100; (7) typist 150; (8) spare, 150. (G) *Weights and Measures :* (1) Two rooms, each 200 sq. ft. (H) *Caretaker :* Living-room, scullery, larder, store, bath, w.c. and two bedrooms. (I) *Miscellaneous :* (1) Two strong-rooms, 100 sq. ft. each, for each of departments B, E and F. One should be in the basement and one adjacent to the department; (2) boiler house and fuel store; (3) male and female staff lavatories; (4) telephone room; (5) inquiry office near main entrance.

The Council suite should be on the first floor. The Town Clerk's department should be adjoining. The Accountant's department should be on the ground floor, with the rates office easily accessible by the public.

The acoustics of the council chamber should be carefully considered.

Drawings required : Plan of each floor, three elevations, and two sections, all one-sixteenth scale; portion of front elevation, half-inch scale; and reverberation table for council chamber.

b : Working Drawings : The design for a small town hall may, after it has been approved, be re-submitted with the addition of complete working drawings of the council chamber to half-inch scale, together with a sheet of full-size details.

CXXV. : *a : An Archway Connecting two Thoroughfares :* A railway, carried upon semicircular arched brick construction, passes through the business quarters of a town, and arrangements have been made whereby one of the archways is to be used to connect two existing thoroughfares, which run parallel with the railway.

The archway is 60 ft. deep from end to end, 60 ft. wide, and 45 ft. high from the ground to the soffit of the semicircle at the crown.

A public right of way for foot passengers, 20 ft. wide, has been granted by the Railway Company, down the centre of the archway, of a minimum height of 20 ft., which may be increased at the discretion of the designer. The Railway Company propose to utilize the remaining space for use as shops, workshops, etc.

It is considered desirable that the new structure —the skeleton of which is to be of steel—should be as independent as possible from the existing brickwork on account of vibration, and no rights of support for the steel construction upon their brickwork is granted by the Railway Company.

Particular attention must be given to lighting and ventilation.

The Railway Company are exempt from the requirements of the local bylaws.

Drawings required : Plans of floors; longitudinal and cross sections; elevation of one end of the arched opening towards the existing thoroughfare to one-eighth inch scale. Detail of the main entrance arch and one shop bay to half-inch scale.

b : Working Drawings : The design for an archway connecting two thoroughfares may, after it has been approved, be re-submitted with the addition of working drawings consisting of complete half-inch details of one of the shops, which is to be designed for the sale of boots and shoes, together with a sheet of full-size details.

CXXVI : *a : A Design for a Housing Scheme :* An industrial firm proposes to erect a number of houses for skilled workmen on the outskirts of a small town. The building site is rectangular; the north and south boundaries each measure 600 ft.—the east and west boundaries each 475 ft.; the ground falls 8 ft. at an even gradient from north to south, and is bounded by secondary roads of which that on the south is the most important. A recreation ground is provided by the firm elsewhere. The following housing accommodation is to be provided : i : Twelve houses of parlour type with three bedrooms and a floor area not exceeding 920 ft. super; ii : Fifty-two houses of non-parlour type with three bedrooms and a floor area not exceeding 820 ft. super; iii : Four houses of non-parlour type with two bedrooms.

Drawings required : Layout plan to one five-hundredth scale, showing buildings, roads, paths, gardens, etc.

One-sixteenth inch scale plans, elevations and sections, sufficient to show each type of house and method of grouping.

b : Working Drawings : The design for a housing scheme may, after it has been approved, be re-submitted with the addition of : i : Complete working drawings to half-inch scale, showing plans of each floor, section and elevations of one parlour-type cottage; ii : Half-inch scale section through roadway, showing method of construction; iii : Drainage plan of complete site to one five-hundredth scale, showing direction and size of drains on the "combined" system. (NOTE.—It may be assumed that a main sewer exists in all the roads surrounding the site.)

CXXVII.—In accordance with Instruction to Candidates No. 6 (above), this problem may be treated acoustically. *a : A Theatre Club :* A society having as its main function the production of experimental plays, proposes to build its own premises. The accommodation required is as follows :

Miniature theatre to seat 350 persons, 50 of which should be in a gallery. A small but complete stage is to be provided with at least four dressing-rooms and lavatory accommodation, etc. The entrance to the theatre is through a large lounge hall with booking and inquiry office, which also gives access to the club portion of the premises. The club rooms are to be : Sitting-room, card-room, writing-room, restaurant,

bar, and also a bar in connection with the theatre. Kitchens, servants' quarters (no bedrooms), room for night watchman, general and private office. Cloakrooms for theatre and separate cloaks for the club must be provided. (NOTE.—As this theatre is not for public performances some of the rooms may be placed above the auditorium.) *Site :* 40 ft. by 150 ft. Roads at front and back on the narrow frontages. Party walls at the sides from which no light can be obtained.

Drawings required : Plans, two sections and front elevation to one-eighth scale. Half-inch detail of proscenium arch. An acoustic diagram showing propagation of sound from stage on long section is required.

b : Working Drawings : The design for a Theatre Club may, after it has been approved, be re-submitted with the addition of complete working drawings of the auditorium and stage to half-inch scale.

CXXVIII.—*a : A Maternity and Child Welfare Clinic : Site :* The site is level and rectangular, with a frontage to a roadway on the east side measuring 160 ft., and is 130 ft. deep. The building line is 30 ft. from the boundary.

Accommodation : The following is the accommodation required with approximate areas. All measurements are in sq. ft. (1) Waiting hall, 1,000 sq. ft.; (2) doctor's consulting room, 180; (3) operating theatre, 200; (4) recovery ward (adjoining No. 3), 330; (5) dental theatre, 180; (6) X-ray room, 150; (7) orthopædic room, 150; (8) minor ailments room, 120; (9) dark room (adjoining No. 8), 25; (10) sale of food room, 100; (11) weighing room, 150; (12) nurses' room, 150; (13) laboratory, 100; (14) office, 150; (15) one w.c. and lavatory basin for each of the following : male patients, female patients, male staff, female staff; one w.c., bath and basin opening off the recovery ward and the dental theatre; (16) pram shelters for sixty perambulators; (17) heating chamber and fuel store.

Requirements : Good lighting and ventilation. Ease of supervision. No. 11 above should communicate directly with No. 2, and Nos. 8 and 10 should be close to these. Patients should be able to leave the building from this group of rooms, and also Nos. 3 and 5, without returning to the Waiting Hall. The building should be of a single story.

Drawings required : Plan of ground floor to one-eighth inch scale; two elevations to one-eighth inch scale; two sections to one-eighth inch scale ; and detail of main elevation to half-inch scale.

b : Working Drawings : The design for a Maternity and Child Welfare Clinic may, after it has been approved, be re-submitted with the addition of working drawings consisting of complete internal details to half-inch scale, together with a sheet of full-size details.

Dates for the Submission of Designs in 1932 :
Subject CXXIII, February 29; Subject CXXIV, April 29; Subject CXXV, June 30; Subject CXXVI, August 31; Subject CXXVII, October 31; Subject CXXVIII, December 30.

SOCIETIES AND INSTITUTIONS

ARCHITECTURE—WHAT'S THE USE ?

MR. CLOUGH WILLIAMS - ELLIS, F.R.I.B.A., in the course of his lecture on the above subject, the first of the R.I.B.A. series of popular lectures on architecture, given at the Institute on Saturday last, said he thought that at the present moment there was no question but that Sweden led the world in architecture. She had taken great trouble about the background of the lives of its people, both in the towns and cities and in their own homes, and the beneficent results were obvious. The same care for form and design, order and discipline, permeated her manufactures, which was at least one of the reasons for her great success in industry.

In Germany, too, architecture had long ceased to be the plaything of rich individuals or commercial concerns, but was made to work full-time everywhere for everybody. It had been democratised. The great architects and town-planners of Germany were competed for between localities, like their expert town managers or burgomasters, and as in England, Chelsea competed against Bolton for a football forward ! They had got the idea into their heads that fully civilised living was only possible (or at any rate much easier), if you had an orderly, efficiently arranged and gracious setting for it, both publicly in civic town-planning and privately in the intimate surroundings of their homes. It was indeed a strange and disastrous anomaly that, whereas there were at this moment a vastly greater number of really competent architects in Great Britain than ever before in its history —mostly young—there was never, probably in any country, such an overwhelming spate of men and petty building as had poured over the land within the last decade.

Somehow, and to their mutual loss, the architects and the general public had failed to get through to one another. No doubt it was partly the fault of the architects themselves, who had been, perhaps, too intent on the larger fish to take adequate trouble over the requirements of the smaller fry, or to attend to their education so that those requirements should include " right building "—which was architecture.

From whatever cause, we had the melancholy spectacle of a land in which architecture seemed to be reserved for a minute minority, for the cultivated rich and for big business, and where the great mass of everyday building was allowed to go hang, so that any foreigner landing, say, at Brighton and motoring to London, or at Liverpool and proceeding to Manchester, might well conclude that even such elementary qualities as good proportions, pleasant texture, harmonious colouring and general seemliness, were forbidden by statute to anyone below the rank of a super-taxpayer and to any building less important than the branch of a joint-stock bank.

He would find vast new suburbs to confirm this theory, in which, amidst a welter of unrelieved incompetence, both in its general layout and its individual houses, a gracious neo-Georgian bank and a dignified new post office or telephone exchange would proclaim that the English could still build beautifully when they chose, that English architecture was not dead but merely paralysed from the waist downwards, and, however vigorous the head and trunk, such a condition was scarcely one of health.

But, the lecturer asked, could we climb up out of our present darkness into the sunlight of civic and architectural good sense ? He thought not, unless we submitted to being kicked or pulled up by authority, and there was no authority worth the name, no effective discipline, no implication even that, as individuals or as a nation, we had any obligation whatever towards the national estate—an entailed estate of which we were merely the life tenants.

Already our hugger-mugger carelessness had seriously depreciated the value of our property, or, at any rate, gravely prejudiced its future value, whilst in the tangled growths that we were allowing to spring up around our already congested towns we were bequeathing a problem to our unhappy heirs that might well prove insoluble without invasion or an earthquake to help them.

Yet we were not without our gleams of civic sense and, given conspicuous opportunities for doing the handsome thing, now exploited it with more competence and dignity than for a century past. But merely being impressively monumental in the market-place was not good enough : we demanded today that some seemliness, some delight, and dignity even, should be brought into the byways and the common streets.

Or rather, we do not, he concluded, demand it, because the common English citizen, cradled in ugliness, still accepted squalor as normal. How convenient that used to seem—how disastrous in reality !

THE BUILDING OF A HOUSE

" The Building of a House " was the title of a lecture by Mr. E. R. Jarrett, A.R.I.B.A., at the Architectural Association on Saturday last. This was the first of the A.A.'s series of non-technical lectures.

We were living in an age of speed, rapid change and development such as the world had never before seen, said Mr. Jarrett. We must advance—we could not stand still. Standing still was as dangerous as going back along a one-way street. Our forefathers had time for ponderous dinner parties. We had not the time in these days, so we therefore invited our friends to cocktail parties. Though not less expensive, they caused less inconvenience to the domestic staff. With the change in entertainment we had to change our surroundings. The

oppressive background to the heavy meals of past days would strangle a cocktail party at birth, so architects designed surroundings in a lighter key more in keeping with the more cheerful function. They adapted their surroundings to the new requirements of our programme. As the people's views altered in regard to a way of living, so architects modified the houses we lived in.

This speed necessarily made a lot of our work transitory and experimental. We could not say that we had arrived at any conclusion or style, but we were stripping off the extraneous and unessential and there were clear indications that an architecture was being evolved which was in line with present-day conditions.

The hardest-worked word of the moment was economy, and in this connection the post-war work on the Continent might well be studied. Some of the most striking and imaginative architectural efforts had been achieved by German and Austrian architects in works of public utility, and particularly in homes for the people. These nations had to cut expenditure to the last halfpenny, mouldings and ornament had to go by the board and architectural effect had to be obtained in the simplest way by close attention to scale and proportion, unaided by trimmings of any sort. The ordeal was a severe one for the architect, but the results achieved had been of the greatest value to architecture in general, and had proved beyond question that by strict adherence to a programme a notable result might be obtained by a designer of sensibility. Boiled down, it was yet another example of cause and effect.

The lecturer illustrated his arguments by slides covering a wide field of example. Egyptian, Greek, Roman and Renaissance houses were reviewed, and stress was laid upon the importance of local conditions in developing a style. How materials could influence design was brought out by illustrations from stone districts and those where timber was plentiful. He concluded by mentioning more modern methods and materials.

R.I.B.A. EXHIBITIONS OF DESIGNS

The designs of students of schools of architecture recognized for exemption from the R.I.B.A. Final Examination will be exhibited in the R.I.B.A. Galleries from October 14 to 20, 1931, inclusive, between the hours of 10 a.m. and 8 p.m. (Saturday, 10 a.m. and 5 p.m.). The R.I.B.A. Silver Medal for recognized schools and £5 in books is awarded for the best set of drawings submitted.

The designs of students of schools of architecture recognized for exemption from the R.I.B.A. Intermediate Examination will also be exhibited in the R.I.B.A. Galleries from October 24 to 30, 1931, inclusive, between the hours of 10 a.m. and 8 p.m. (Saturday, 10 a.m. and 5 p.m.). The R.I.B.A. Bronze Medal for recognized schools and £5 in books is awarded for the best set of drawings submitted at this exhibition.

MEDIÆVAL AND RENAISSANCE ART

Sir Banister Fletcher, PP.R.I.B.A., lecturing at the L.C.C. Central School of Arts and Crafts on Wednesday last, gave a "Comparative Analysis of Mediæval and Renaissance Architecture in Europe." He pointed out that Gothic buildings, which were distinguished by the pointed arch, were traditional and were the result of the combined effort of master mason and craftsmen, whereas Renaissance buildings, which were distinguished by the circular arch, were designed as works of art and were the result of individual effort.

Contrasting the differences in respect of the essential features of these two great styles—the plans, walls, openings, roofs, columns, mouldings, and ornament—the lecturer emphasized the beauty and strength inherent in both. An interesting set of lantern slides, making clear the fundamental differences, was shown, and prepared the audience for the detailed exposition of Renaissance architecture which is to be given in the succeeding lectures.

RESEARCH IN THE BRITISH GLASS INDUSTRY

Sir Richard Gregory, Bart., LL.D., D.SC., will open at 4 p.m. on Wednesday, October 21, at the Science Museum, South Kensington, an exhibition which will illustrate modern research in the British glass industry. This exhibition is being arranged by the Society of Glass Technology, with the support of the Glass Research Delegacy.

In addition to the exhibition (which will be set out in a small gallery at the right-hand side of the entrance in Exhibition Road), there will be lectures on Thursday afternoons by well-known authorities, dealing with the modern developments in optical glass, plate glass, electric light bulbs, safety glass and artistic glassware. The public will also have an opportunity of seeing glassmaking in cinema films. These films will be shown every day at 4.15 p.m. until the exhibition closes on December 31, 1931.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Dissolution of Parliament

PARLIAMENT was dissolved on Wednesday, October 7, and the polling day has been fixed for Tuesday, October 27.

Houses for Aged People

Mr. Herriotts asked the Minister of Health how many small houses for aged people had been approved by his department; how many had been completed; and what was the average weekly rent.

Mr. Chamberlain said that the erection of 1,380 houses of this type had been approved, and 130 were completed by August 31 last. He had no information as to the rents charged for these houses.

Housing Progress by Local Authorities

Mr. Mills asked the Minister of Health if he would state the number of local authorities who had received sanction for house-building programmes of over 100 houses since January, 1931; how many had been started; and how many of such authorities had received sanction or refusal since July 24.

Mr. E. D. Simon said that the number of local authorities was 126. These local authorities had commenced to build over 27,000 houses since January 1, 1931, but the information available did not enable him to say how many of these houses were included in the authorizations given since that date. The numbers of local authorities referred to in the last part of the question were fourteen and none respectively.

Housing (Rural Workers) Act, 1931

Mr. Perry asked the Minister of Health if he would state if the operation of the Housing (Rural Workers) Act, 1931, was to be suspended or restricted as part of the Government's economy policy; and, if so, what steps would be taken to meet the need for more and cheaper houses in rural areas.

Mr. Gould asked whether it was the intention of the Government to carry out the housing programme of building 40,000 agricultural cottages during 1931–32, as provided for under the Rural Workers Act, 1931.

Mr. Chamberlain said that there was no intention of repealing the Housing (Rural Authorities) Act, 1931, to which he assumed the questions referred. Applications from Rural District Councils under this Act were still coming in, and in accordance with Subsection (3) of Section 1 all such applications would be eligible for consideration provided that they were made before November 30 next. In accordance with the Act, applications would be first considered by the committee appointed by his predecessor, of which Sir Tudor Walters was chairman.

LAW REPORT

QUESTION OF TITLE

Poett v. *Poett. King's Bench Divisional Court. Before Justices Swift and Charles*

AN interesting point of law as to landlord's title was raised by the appeal of the defendant in this case, Mr. A. J. L. Poett, from a judgment of the County Court judge of the Bow County Court.

The plaintiff in the action in the court below was Mrs. J. Poett, who was the mother of the present appellant, and she sued for possession of a house in Gamuel Road, Walthamstow, and for rent and mesne profits. The County Court judge found in favour of the plaintiff.

The defendant now appealed, and Mr. Goff, his counsel, said in the court below the County Court judge refused to admit evidence that the defendant was the freeholder of the premises, and counsel complained that the judge had held that the relation of landlord and tenant existed between the mother and her son. Counsel said his contention was that the land on which the house was erected was conveyed by the mother, the plaintiff in the County Court action, to her son, and the house was built by money raised by mortgage from the Poett family. In this house the defendant resided. There was a book, which was called a rent book, in which weekly payments of £1 were entered, but as a matter of fact they were not rent payments, but represented repayments on account of the mortgage monies. Under these circumstances, counsel submitted that it was wrong on the part of the County Court judge to have shut out documents tendered by the appellant in regard to the conveyance of the mortgage. He contended that the judgment was therefore wrong, and that his client was entitled to judgment.

Mr. Lynton Thorp, for Mrs. Poett, submitted that the County Court judge was right in rejecting the mortgage and conveyance documents, as it was a principle of law that no tenant could impeach a landlord's title. Continuing, counsel said the mortgage was transferred to his client in 1929, and although the appellant owned the land, his client, under the Law of Property Act, was interested in the land for a long term, and the appellant's reversion would not fall in until the end of his client's term. Under these circumstances he submitted that the judgment was right.

The court allowed the appeal with costs, and entered judgment for Mr. Poett, the appellant, with costs in that court and in the County Court.

Mr. Justice Charles delivered the judgment of the court, and said he and Judge Swift had looked at the deeds because they thought they ought to look at them in order to arrive at a right conclusion. As far as he knew, there was nothing in law to stop them looking at the deeds under the circumstances. In the opinion of the court, if the County Court judge had looked at those documents, he would have found that the land belonged to the appellant, and that no rent was paid at all. Here the respondent had said that at first there was no mention of rent, and that it was not mentioned till March, 1927. In the view of the court, the house and the land was the property of the son, and there was no relationship of landlord and tenant between the appellant and respondent. Under these circumstances the judgment of the County Court judge was not good in law.

Mr. Justice Swift agreed.

COMPETITIONS OPEN

October 31.—Sending-in day. Proposed Tuberculosis Hospital, Sully, near Cardiff, for the Welsh National Memorial Hospital. Assessors: C. E. Elcock, F.R.I.B.A., and T. Alwyn Lloyd, F.R.I.B.A. Premiums: £400, £300, £175 and £100. Conditions were obtainable from F. J. Alban, Memorial Hospital, Cardiff. (Deposit £2 2s.)

November 23.—Sending-in day. New Junior and Infants' School, Farnborough Road, Birkdale, for the Southport Corporation. Limited to architects practising or residing in the County of Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £100, £75 and £50. Conditions, etc., obtainable from the Director of Education, 1 Eastbank Street, Southport. (Deposit £1 1s.)

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor: Sydney Tatchell, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from F. L. Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius of Liverpool Town Hall. Assessor: A. H. Moberly, F.R.I.B.A. Premiums: £200, £100, and £50. Conditions, etc., obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

December 31.—Sending-in day. Latest date for conditions: September 31. Proposed New Town Hall and Municipal Building, for the Walthamstow Corporation. Assessor: H. Austen Hall, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Conditions, etc., obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors: Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium: £500; also a further amount of £750 will be awarded to other designs according to merit.

THE ARCHITECTS' DIARY

WEDNESDAY, OCTOBER 14

C. F. ANNESLEY VOYSEY: EXHIBITION OF WORK. At the Batsford Gallery, North Audley Street, W.1. 10 a.m. to 6 p.m. (Saturdays, 10 a.m. to 1 p.m.). Until October 17. **10 a.m.**

SCOTTISH IDEAL HOME EXHIBITION. At Kelvin Hall, Glasgow. Until October 24.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Early Renaissance of Florence." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

THURSDAY, OCTOBER 15

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. First of six lectures on "The History of English Architecture—XIIth Century." By Herbert Mansford. **7.30 p.m.**

SOCIETY OF ANTIQUARIES, Burlington House, W.1. "Excavations at Hollingbury Camp, Sussex." By Dr. E. Cecil Curwen, F.S.A. **8.30 p.m.**

FRIDAY, OCTOBER 16

COUNCIL FOR THE PRESERVATION OF RURAL ENGLAND. Fourth National Conference. At the Guildhall, Bath. Also October 17. **10 a.m.**

HAMPSHIRE AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION. At the Castle, Winchester. Council Meeting, 3 p.m. General Meeting; President's Address, 6.15 p.m. **3 p.m.**

LONDON SOCIETY. Visit to St. Mary's Church, East Ham. 2.30 p.m. At the Royal Society of Arts, John Street, Adelphi, W.C.2. First demonstration of town-planning by films: "1—How not to do it"; "2—The Proper Way," 5 p.m. **2.30 p.m.**

SATURDAY, OCTOBER 17

Sunrise, 6.24 a.m. Sunset, 5.6 p.m.

INCORPORATED INSTITUTE OF BRITISH DECORATORS. At Manchester. "Modern Interior Decoration." By John M. Holmes.

R.I.B.A., 9 Conduit Street, W.1. Second of four non-technical lectures. "Some Opinions Upon Furniture and Decoration." By H. S. Goodhart-Rendel, F.R.I.B.A. Chairman: D. S. MacColl, M.A., HON. A.R.I.B.A. **3 p.m.**

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS. London and Home Counties Branch. Visit (afternoon) to the London Power Company's Station at Deptford.

TUESDAY, OCTOBER 20

INCORPORATED INSTITUTE OF BRITISH DECORATORS. Annual Dinner, to be held in the Empire Rooms, Trocadero Restaurant, Piccadilly Circus, W.1.

KING'S COLLEGE, Strand, W.C.2. Second of nine public lectures on Gothic Art. "English Transitional and Early Gothic." By Rev. Dr. Percy Dearmer. **5.30 p.m.**

INSTITUTE OF FUEL. At the Institution of Mechanical Engineers, Storey's Gate, S.W.1. Presidential address by Sir Hugo Hirst, BT. **6 p.m.**

LONDON SOCIETY. Visit to the works of George Mason & Co., Ltd., 265 Merton Road, Southfields, S.W.18. **2.30 p.m.**

ILLUMINATING ENGINEERING SOCIETY. At 15 Savoy Street, Strand, W.C.2. Report on the progress in Illuminating Engineering prepared by the Technical Committee. **7 p.m.**

WEDNESDAY, OCTOBER 21

GARDEN CITIES AND TOWN PLANNING ASSOCIATION. Housing and town planning tour to Manchester and Liverpool. Departure to Manchester from Euston at 6.5 p.m. **6.5 p.m.**

INSTITUTE OF FUEL. Annual Dinner and Dance, to be held at the Connaught Rooms, Great Queen Street, W.C.2. Sir Hugo Hirst, BT., will preside. 6.45 for 7.15 p.m. **7.15 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Early Renaissance in Northern Italy." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

THURSDAY, OCTOBER 22

GARDEN CITIES AND TOWN PLANNING ASSOCIATION. At the Town Hall, Manchester. Lecture dealing with the activities of the Corporation with regard to housing, etc. 10 a.m. Luncheon (by invitation of the Corporation). 12.45 p.m. Tour of slum areas, housing estates and town-planning roads. 2 p.m. Reception in the City Art Gallery. 8 p.m. **10 a.m.**

FRIDAY, OCTOBER 23

GARDEN CITIES AND TOWN PLANNING ASSOCIATION. At the Municipal Buildings, Liverpool. Address by the Chairman of the Housing Committee on the work of the Liverpool Housing Committee. 10.30 a.m. Visit to Springwood Estate. 12 noon. Luncheon at Childwall. 1 p.m. Visit to housing estates. 2.30 p.m. **10.30 a.m.**

LONDON SOCIETY. Visit to the Chelsea Royal Hospital, Royal Hospital Road, S.W.3. **2.30 p.m.**

SATURDAY, OCTOBER 24

Sunrise, 6.37 a.m. Sunset, 4.51 p.m.

GARDEN CITIES AND TOWN PLANNING ASSOCIATION. At Liverpool. Visit to slum-clearance areas. 10 a.m. Return to London at 2.5 p.m., arriving at Euston at 6 p.m. **10 a.m.**

R.I.B.A., 9 Conduit Street, W.1. Third of four non-technical lectures. "Tendencies in very Modern Buildings." A. S. G. Butler, F.R.I.B.A. Chairman: Sir Richard Paget, BT., HON. A.R.I.B.A. **3 p.m.**

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Second of five non-technical lectures on Present-day Architecture. "Furnishing and Decorating the House." By Edward Maufe, M.A., F.R.I.B.A. **3 p.m.**

TUESDAY, OCTOBER 27

KING'S COLLEGE, Strand, W.C.2. Third of nine public lectures on Gothic Art. "French Gothic: Paris, Chartres, Amiens, etc." By Rev. Dr. Percy Dearmer. **5.30 p.m.**

TRADE NOTES

On Thursday, October 1, the new showrooms of the "Treetex" Insulating Wallboard Manufacturers was opened at 421-4 Australia House, London, W.C.2. These showrooms have been constructed to render the comparatively new science of insulation against heat and sound self-explanatory. Among the exhibits are a sound-proof telephone box, and a contrivance which demonstrates the relative resistance to outside temperatures of an ordinary room and a room built with Treetex. There are also incorporated in the showrooms a number of novel ideas for modern interior decoration, carried out with the same product. Low density and high structural strength are claimed to be the secret of the resistance of Treetex to sound, and this quality also enables the material to resist heat and cold. It might, therefore, be thought that sheets of Treetex would have to be thick and heavy. Actually, however, they are extremely light and flexible, and are suitable, it is claimed, for ceilings, walls and panels in houses. It is interesting to note that should a careless painter use his ladder as a battering ram on the walls, it need not be patched. It would merely be necessary to replace the damaged portion with a new panel, at a trifling cost.

*

A booklet entitled *Architectural Woodwork and Furniture* has recently been issued by Messrs. Drytone, Ltd., of Drytone House, 65 High Street, Camden Town, N.W.1, containing illustrations of several buildings in which Drytone woodwork has been used. These include the Underground Headquarters, 55 Broadway, Westminster, S.W. (Adams, Holden and Pearson, FF.R.I.B.A.); Friends House, Euston Road, N.W.1 (Hubert Lidbetter, F.R.I.B.A.); St. Alphage's Church, Hendon (Nicholas and Dixon-Spain, FF.R.I.B.A.); Peter Potter's Shop, Wigmore Street, W.1 (L. de Soissons and Wornum, FF.R.I.B.A.); Masonic Temple, Birmingham (Crouch, Butler and Savage, F.R.I.B.A.); the Railway Hotel, Edgware (A. E. Sewell, L.R.I.B.A.); and the Nurses' Home, University College Hospital (Michael Waterhouse, F.R.I.B.A.). Among the domestic work illustrated are houses designed by Maxwell Ayrton, F.R.I.B.A., Burgess, Holden and Watson, FF.R.I.B.A., W. J. Palmer-Jones, C. H. James, F.R.I.B.A., Leonard Martin, F.R.I.B.A., Mathew Dawson, F.R.I.B.A., E. A. Stone, and Douglas Smith and Barley, A.R.I.B.A. Each photograph in the booklet is accompanied by a brief description. A photograph of the interior of a house in Hampstead Lane, designed by Douglas Smith and Barley, is reproduced on this page.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Wotton House Hostel, Gloucester (pages 490–494). General contractor, John Simmonds. Sub-contractors : The Brightside Foundry and Engineering Co., Ltd., heating; Smith and Lamerton, electric lighting; Benham and Sons, Ltd., kitchen equipment; Doulton & Co., Ltd., and Shanks & Co., Ltd., sanitary fittings; Crittall Manufacturing Co., Ltd., steel windows; Stonehouse Brick and Tile Co., facing bricks; The Gloucester Stone Co., Ltd., reconstructed stone and staircases; R. W. Brooke & Co., Ltd., wood block flooring; Marley Bros., Ltd., locks; Engert and Rolfe, Ltd., asphalt flats; H. H. Martyn & Co., Ltd., wrought ironwork and carving.

Jantzen Knitting Mills, Great West Road, Brentford, Middlesex (pages 498–499). General contractors, The Pitcher Construction Co., Ltd., who were also responsible for the excavations, foundations, plumbing, glass, plaster and joinery. Sub-contractors : Williamson Cliff, Ltd., facing bricks; John F. Shackleton and Sons, Ltd., stone; A. D. Dawnay and Sons, Ltd., structural steel; Asbestos Cement Building Products, Ltd., special roofings; Moler Products, Ltd., Moler slab partitions; John Boulting and Sons, central heating and ventilation; Duncan Watson, Ltd., electric wiring; Benjamin Electric, Ltd., and Duncan Watson, Ltd., electric light fixtures; Crane - Bennett, Ltd., sanitary fittings; Henry Hope and Sons, Ltd., casements and window furniture; London Telephone Service, telephones; J. W. Whitehead and Sons, Ltd., marble; Metropolitan Water Board, water supply; David Allen and Sons, Ltd., signs.

House at Kirkby Overblow, Yorkshire (pages 500–501). General contractors, William Irwin & Co., Ltd. Sub-contractors : Tunstall & Co., Ltd., damp-courses and asphalt, roofing, rock asphalt ; Expanded Metal Co., Ltd., reinforced concrete; Depledge & Co., Ltd., structural steel; Mellowes & Co., Ltd., patent glazing, casements and window furniture; "Stic B.," Ltd., waterproofing materials; Leeds Marble and Heating Co., Ltd., central heating; Eagle Range Co. and Beeston Boiler Co., stoves; Burrett and Walford, grates, marble, tiling, metalwork, door furniture and mantels; Beeston Boiler Co., boilers; Best and Lloyd, Ltd., and Troughton and Young, Ltd., electric light fixtures; Ellis and Openshaw, sanitary fittings; Cowling and Hobson, plaster.

The staircase hall of a house in Hampstead Lane, London. Designed by Douglas Smith and Barley. Instead of panelling the hall and staircase in the ordinary way, it was decided in this case to use moulded oak boarding of random widths, secured with sherardized nails running in regular lines to form a pattern, thus securing pleasant uniformity. The whole of the work is drytoned to afford a pale weathered finish.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS]

Messrs. Mann, Crossman and Paulin have acquired a site in Upney Lane, BARKING, for the erection of off-licence premises.

Plans passed by the BARKING Corporation: Houses, Alfreds Way, for Mr. A. J. Maffey; factory, Alfreds Way, for Messrs. Scoffin and Willmott; extensions, Tangent Works, Abbey Road, for Mr. Stanley Waghorn; offices and six shops, East Street, for Messrs. Glenny; timber store, Town Quay, for Messrs. Page, Calman & Co.; seventeen shops, Lodge Avenue, for the L.C.C.; two houses, Boundary Road, for Messrs. T. Young and Sons, fourteen shops and sixteen garages, Longridge Road and Lodge Avenue, for Messrs. Hooker and Rodgers; offices and extensions, Jenkins Lane, for Messrs. Gross, Sherwood and Heald, Ltd.; fifty-one houses, Thornhill Gardens, for Mr. I. Leftley; shops and estate layout, Longbridge Road, for Mr. H. E. B. Meech.

The BERMONDSEY B.C. has asked the finance committee to submit a further loan estimate of £10,000 for the purchase of properties in the Rotherhithe Street clearance areas.

The Essex C.C. is to prepare plans for the erection of an admission hospital and the extension of the nurses' home at the BRENTFORD mental hospital. The estimated cost of the hospital is £50,000; and the nurses' home extension £11,500.

Plans passed by the BRENTFORD and CHISWICK U.D.C.: Ten shops, Great West Road, for Messrs. Hearn and Chuter; four houses, Grove Park Gardens, for Mr. A. S. Earl; four houses, Stamford Brook Avenue, for Mr. J. Caney; office and flats, Great West Road, for Messrs. E. H. Burgess, Ltd.; second portion of secondary school, Gunnersbury Avenue, for Mr. T. H. B. Scott; extensions to factory for Messrs. Trico-Folberth, Great West Road, for Mr. F. E. Simpkins; alterations and additions, Queen's Hall, Half Acre, for Messrs. W. G. Allen and C. Brown.

Plans passed at FULHAM: Buildings, Rannoch Road, for Messrs. J. Lyons & Co., Ltd.; conversion to flats, 3 and 4 Gliddon Road, for Messrs. J. Gilbert, Ltd.; additions, 477 Fulham Road, for Mr. C. Bailey; office, Addison Bridge Place, for Messrs. Maxwell & Co.

The HACKNEY B.C. proposes to proceed with the Banister Street clearance scheme.

Plans passed at HACKNEY: Houses, Baker's Hill; building, rear of 31 King Edward's Road; building, Mare Street; mattress factory, Bradbury Mews, Bradbury Street; factory, rear of 54 Brooksby's Walk; substation, offices, etc., Lower Clapton Road; three houses, Clapton Common; 4 houses, Spring Hill; house, Upper Clapton Road; houses, Amherst Road; block of offices, Queen's Road School, Queen's Road; rebuilding, Messrs. Gould's premises, Homerton Road.

The HORNSEY Corporation has obtained sanction to borrow £4,945 for the erection of baths and washhouses.

Plans passed at HORNSEY: Four blocks of flats, Wood Lane, for Messrs. R. W. Hill, Ltd.; alterations, 210 Archway Road, for Messrs. Ruddock & Co.; alterations, 5 Shepherd's Hill, for Messrs. C. Gordon, Ltd.; six houses, Muswell Hill Place, for Messrs. G. Knight & Co.

The Essex Education Committee has approved plans for the erection of new premises for the ILFORD county high school for boys, at a cost of £53,000.

The Essex Education Committee has approved plans for the erection of a technical college at LEYTON, at an estimated cost of £120,000.

SOUTHERN COUNTIES

Plans passed by the EASTBOURNE Corporation: Two houses, Decoy Drive, for Mr. F. C. Benz; house, Baldwin Avenue; additions for Kennett Bros., Ltd., at Brodwick Road, and additions at Ex-service Club, Pevensey Road, for Mr. A. Ford; house, Longland Road, for Mr. W. R. Hamblyn; house, South Lynn Drive, for Messrs. P. D. Stonham and Son; house, Watts Lane, for Mr. H. H. Ford; four houses, Royal Sussex Crescent, for Messrs. Bainbridge and Sons; alterations, 158 Terminus Road, for the Christian Science Society.

The EASTBOURNE Corporation has obtained sanction to borrow £10,200 for the construction of a central motor coach station.

Messrs. Rowsell and Ticehurst have prepared plans for the development of the Peppercombe estate, EASTBOURNE.

Plans passed by the HASTINGS Corporation: Alterations, Old Roar Farmhouse, Silverhill, for Messrs. Callow and Callow; two houses, Bexhill Road, for Mr. J. B. Mendham; house, Fairlight Road, for Mr. T. F. Smith; house, Sedlescombe Road, for Mr. A. Radcliffe; alterations and additions, 2 and 3 Eastern Street, for Mr. P. H. Oxley; eight houses, Hoads Head Road, for Mr. H. H. Ford; house, Amherst Road, for Messrs. Jeffery and Bowcock; extensions, tram depot, Beaufort Road, for Hastings Tramway Co.; ten bungalows, Tudor Avenue, for the New Ideal Homesteads, Ltd.

SOUTH-WESTERN COUNTIES

Plans passed by the CHELTENHAM Corporation: House, Lansdown Road, and alterations to premises, corner of High Street and New Street, for Mr. C. Dickins; house, Naunton Lane, for Mr. T. W. Smith; house, Tivoli Road, for Mr. R. V. Copeland; workshop and stores, Riviera Gardens, for Mr. A. G. Daft; two houses Station Road, Woodmancote, for Mr. R. E. Pearce.

EASTERN COUNTIES

The Essex C.C. Public Assistance Committee is to acquire premises in High Street, BILLERICAY, for adaptation as a children's home.

The Essex Education Committee has approved plans for extensions at NEWPORT grammar school, at a cost of £6,814.

The Essex C.C. has prepared plans for extensions at the SEVERALLS mental hospital to accommodate a further 180 patients, at an estimated cost of £52,600.

MIDLAND COUNTIES

The MANSFIELD Corporation has obtained sanction from the Ministry of Health for the erection, by direct labour, of fifty houses on the Ravensdale estate.

Plans passed by the MANSFIELD Corporation: Two houses, Berry Hill Road, for Mr. H. Baggaley; house, Chesterfield Road, for Mr. J. Beckett; two houses, Sutton Road, for Mr. W. R. Scott; two houses, Chesterfield Road, for Mr. F. E. Mann; house, Little Carter Lane, for Mr. J. E. Withers; bungalow, Clarendon Road, for Mr. W. C. Tyler; additions, factory, Stockwell Gate, for Mansfield Shoe Co., Ltd.; two houses, Somersall Street, for Mr. A. F. Brewen; two houses, Balmoral Drive, for Mr. E. M. Smith; fourteen bungalows, Columbia Avenue, for Messrs. Radford and Jenkins; alterations and additions, Welbeck Hotel, West Gate, for Messrs. James Hole & Co., Ltd.

The South Staffs. Joint Hospital Board is to enlarge the MOXLEY smallpox hospital, at a cost of £3,000.

Plans passed by the NORTHAMPTON Corporation: Two houses, Elmhurst Avenue, for Messrs. Sale & Co.; printing works extension, Wellington Street, for Messrs. Archer and Goodman; cottage, Mayorhold, for Mr. A. Sharman; house, Ardington Road, for the Northants Co-op. Society; ten houses, The Warren, Hardingstone, for Messrs. Jordans; house, Meadway, for Mr. W. W. Partridge.

The SMETHWICK Corporation has approved a report of the borough engineer for proceeding with the erection of a further 400 houses on the Warley estate, by direct labour.

The STOKE-ON-TRENT Corporation has passed plans for alterations at the Imperial Picture Palace, Glass Street, and the Grand Theatre, Hanley.

The STOKE-ON-TRENT Corporation has issued instructions for the preparation of a scheme for the provision of an additional sixty beds at the City Maternity Hospital, at a cost not exceeding £800 per bed.

NORTHERN COUNTIES

The BIRKENHEAD Corporation has obtained sites in Patten Street and Bidston Road for the erection of electricity substations.

Plans passed by the BOLTON Corporation: Twelve houses, Hollywood Road, for Messrs. T. P. Smith, Ltd.; fifteen houses, Walker Avenue, for Mr. W. Turner; two houses, Plodder Lane, for Mr. Thomas Booth; mission room, Southend Street, for International Holiness Mission; temporary church, Ripley Street, for Rev. Father J. O'Dwyer; eight houses, Bromwich Street, for Mr. J. E. Paiton; four houses, Crompton Way, for Mr. John Moore; two houses, Church Road, for Messrs. Haddock and Bowling; two houses, Bailey Lane, for Mr. F. Draper; two houses, Boot Lane, for Mr. J. H. Sharples; two houses and house and shop, Sharples Avenue, for Messrs. Price and Groves.

The HULL Corporation Electricity Committee is to erect three substations.

The HULL Education Committee is to proceed with the erection of another department to accommodate 400 children at the Ainthorpe Grove school.

The HULL Corporation has obtained sanction from the Ministry of Health for the purchase of Winestead Hall and 168 acres of land for the provision of a mental colony.

The HULL Corporation has approved plans for the erection of 168 houses in Marfleet Lane, for the Suttos trustees.

The TYNEMOUTH Corporation is to prepare a clearance scheme for the Liddell Street area.

The TYNEMOUTH Corporation is to erect a central garage at the works depot, at a cost of £8,250.

The TYNEMOUTH Corporation Trade and Commerce Committee has obtained sanction to borrow £22,196 for the purchase and adaptation of Cliffords Fort and the Low Lighthouse.

SCOTLAND

The following figures show the progress that has been made in State-aided housing schemes in Scotland to August 31, 1931: 1919 Act (by local authorities), 25,129; 1919 Act (by public utility societies), 421; private subsidy schemes (1919 additional Powers Act), 2,324; slum clearance schemes, 13,751; under construction, 1,208; 1923 Act, (by local authorities), 4,033; 1923 Act (by private enterprise), 20,101; under construction, 1,989; 1923 Act (by public utility societies), 80; 1924 Act (by local authorities), 51,835; under construction, 6,063; 1924 Act (by private enterprise), 2,975; under construction, 641; 1924 Act (by public utility societies), 127; under construction, 16; 1930 Act (by local authorities), 28; under construction, 2,379; unallocated houses under construction, 8; demonstration houses, 17; steel houses erected on behalf of Government by the Scottish National Housing Co., 2,552. Total completed, 123,373. Total under construction, 12,304. Total, 135,677.

The Ancient Order of Hibernians is to erect a hall in Greenvale Street, GLASGOW.

The GLASGOW Corporation is to prepare a clearance scheme for the Old Shettleston Road area.

On behalf of the Christian Brethren, Mr. James Stewart has purchased a site in Fulton Street, Knightswood, GLASGOW, for the erection of a church.

P

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

FROM THE NEW WORLD: 5

MEASURED DRAWINGS OF AMERICAN COLONIAL DETAILS

ENTRANCE GATEWAY TO ADAMS MANSION, QUINCY, MASS.

THE gateway of the above photograph—that to a house built at the commencement of the eighteenth century—is one of the most perfect examples of its kind, and little comment is needed to draw attention to its studied and refined design. The subtle line formed at the junction of the turned and square portions of the upper balusters is worthy of note, and eloquent of a resourceful vitality of mind that could visualize the parts in proper relation to the graceful whole.

The drawings reproduced to scale within were measured by R. Keith Harris and A. G. Dalmas; and drawn by the former.

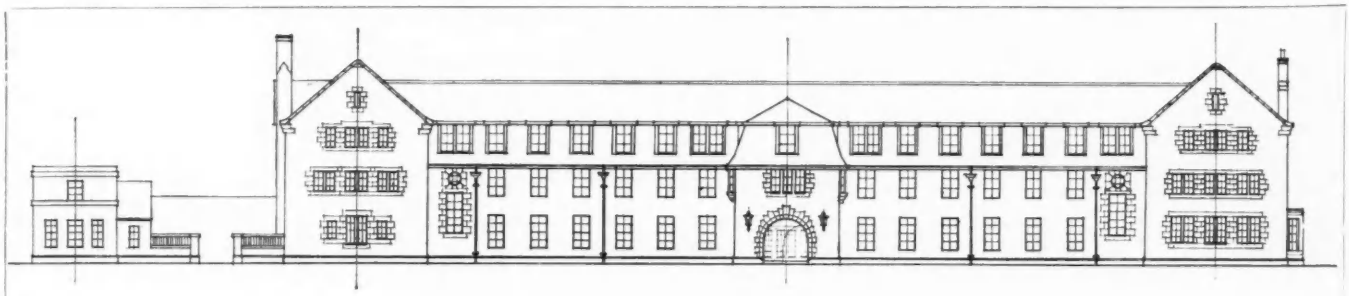
COMPETITION FOR NURSES' HOME, MONTROSE

WINNING DESIGN FOR NEW BLOCK AT THE ROYAL ASYLUM. BY J. A. OGG ALLAN



NORTH ELEVATION

THIS supplement is devoted to some of the principal drawings of the design which won the first premium in the recent competition, limited to architects practising in Eastern Scotland, for a new Nurses' Home at the Royal Asylum, Montrose.

The assessor, John Watson, A.R.S.A., A.R.I.B.A., of Glasgow, made his award as follows :

1st Premium (£75), J. A. Ogg Allan, F.R.I.B.A., Aberdeen.

2nd Premium (£50), Heiton and McKay, A.R.I.B.A., Perth.

3rd Premium, Johnston and Baxter, Dundee.

There were thirty-eight competitors.

The projected building is the result of a decision to house the entire staff under one roof, and provides over a hundred bedrooms for sisters, nurses and others. These are arranged on the two upper floors, and in accordance with the conditions of the competition, all are fitted with built-in wardrobes. Another interesting stipulation was that in each of the bathrooms provision should be made for hair washing and drying.

On the ground floor there is a large recreation room, 50 ft. by 28 ft., and sitting-rooms for sisters and nurses, a lecture-room, a laundry, a dining-room to accommodate fifty persons at one sitting, with kitchen and servery, and a self-contained suite for the matron. It will be noticed that the kitchen and service quarters have a wing to themselves.

The site slopes so slightly as not to interfere with a symmetrical layout, which, as the block plan reproduced on the last page of this supplement indicates, has been conceived in relation to the existing asylum buildings. The proposed Nurses' Home is shown in black.

The appearance was to some extent determined by the conditions, which called for brick and roughcast, with stone dressings. The buildings were to cost not more than £30,000.

It is intended that the grounds and approach shall be laid out with roads and gardens, and that provision shall be made for tennis courts and a curling pond.

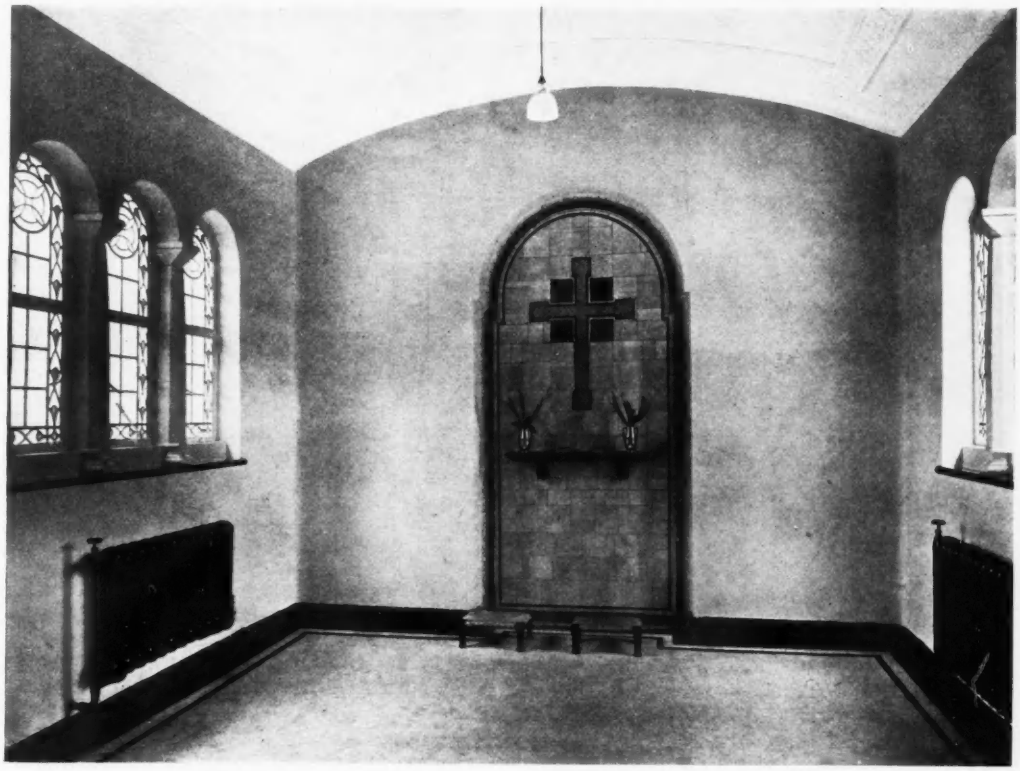
MODERN CHURCH AND CHAPEL INTERIORS: I.



[Paine and Hobday, Architects.

1. MORTUARY CHAPEL, RED HILL HOSPITAL, EDGWARE, HERTS.

THE modern preference for interiors with plain surfaces is sometimes even more strikingly exemplified in ecclesiastical than in secular buildings. When skilfully handled, this austerity of unbroken lines is much more evocative of the true religious atmosphere than stereotyped reproductions of Gothic tracery or Romanesque mouldings. No type of sacred edifice calls for more absolute simplicity than the mortuary chapel, examples of which will be found in Figures 1 and 3.

Figures 3 and 4, which are reinforced concrete structures, recapture the spirit of Gothic without imitating the detail of any of its conventional forms. In the latter, the concrete beams of the ogival vaulting spring from brackets midway between the pointed aisle arches, and placed a little above their crowns. In the former, which is a circular building, they rise straight from the foundations, and then bend inwards at the tops of the windows to meet and interlace in a rosette on the conical roof.

[O. O. Kurz, Architect.

2. THE SEBASTIANSKIRCHE, MUNICH: PULPIT DETAIL

Figures 2 and 5 are examples of unrelieved blank wall treatment. The first interior relies for its effect on the Neo-Byzantine tempera decorations of the pulpit, a very fine wrought-iron altar-rail (unfortunately invisible in the photograph), and periodically renewed wreaths of foliage hung from key-stones over the middle of the aisle openings. Professor Gočár's impressive building is lit from three separate sources: the immense glass apse behind the altar, a series of transverse skylights in the flat roof overhead, and narrow horizontal windows in the side aisles.

Figure 1 is a good example of modern English simplicity which has not quite been able to make up its mind to eliminate all traditional details. One cannot help feeling, however, that something might have been done to make the radiator coils seem more at home in what is an otherwise careful composition. Figure 3 offers a most ingenious solution of this particular difficulty.

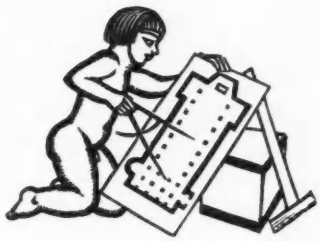
THE ARCHITECTS' JOURNAL



WEDNESDAY, OCTOBER 21, 1931

THE COUNCIL ARCHITECT

ONE of the surest signs of the sickness which has overcome the art of architecture in this country is the ease with which its practice has become grafted upon the lower orders of local government.

The position of city or country architect has always been held in repute as carrying with it great responsibilities of administration and a wide field for the exercise of the art as well as the practice of architecture. In some cases the official architect has been a man of the highest standing, who has found within the limits of his province opportunities which he has turned to great account. Wren and Soane stand out as conspicuous examples.

But in the main, and despite the high qualifications of official architects, many large civic and country buildings have been the subject of open competition, or have been given to the leaders of the profession to design, the administrative duties of the official being valued independently of his claims to be pre-eminently a designer.

That was the position before the war. The war ended, social services expanded at a surprising pace as the country entered upon its gigantic housing programme.

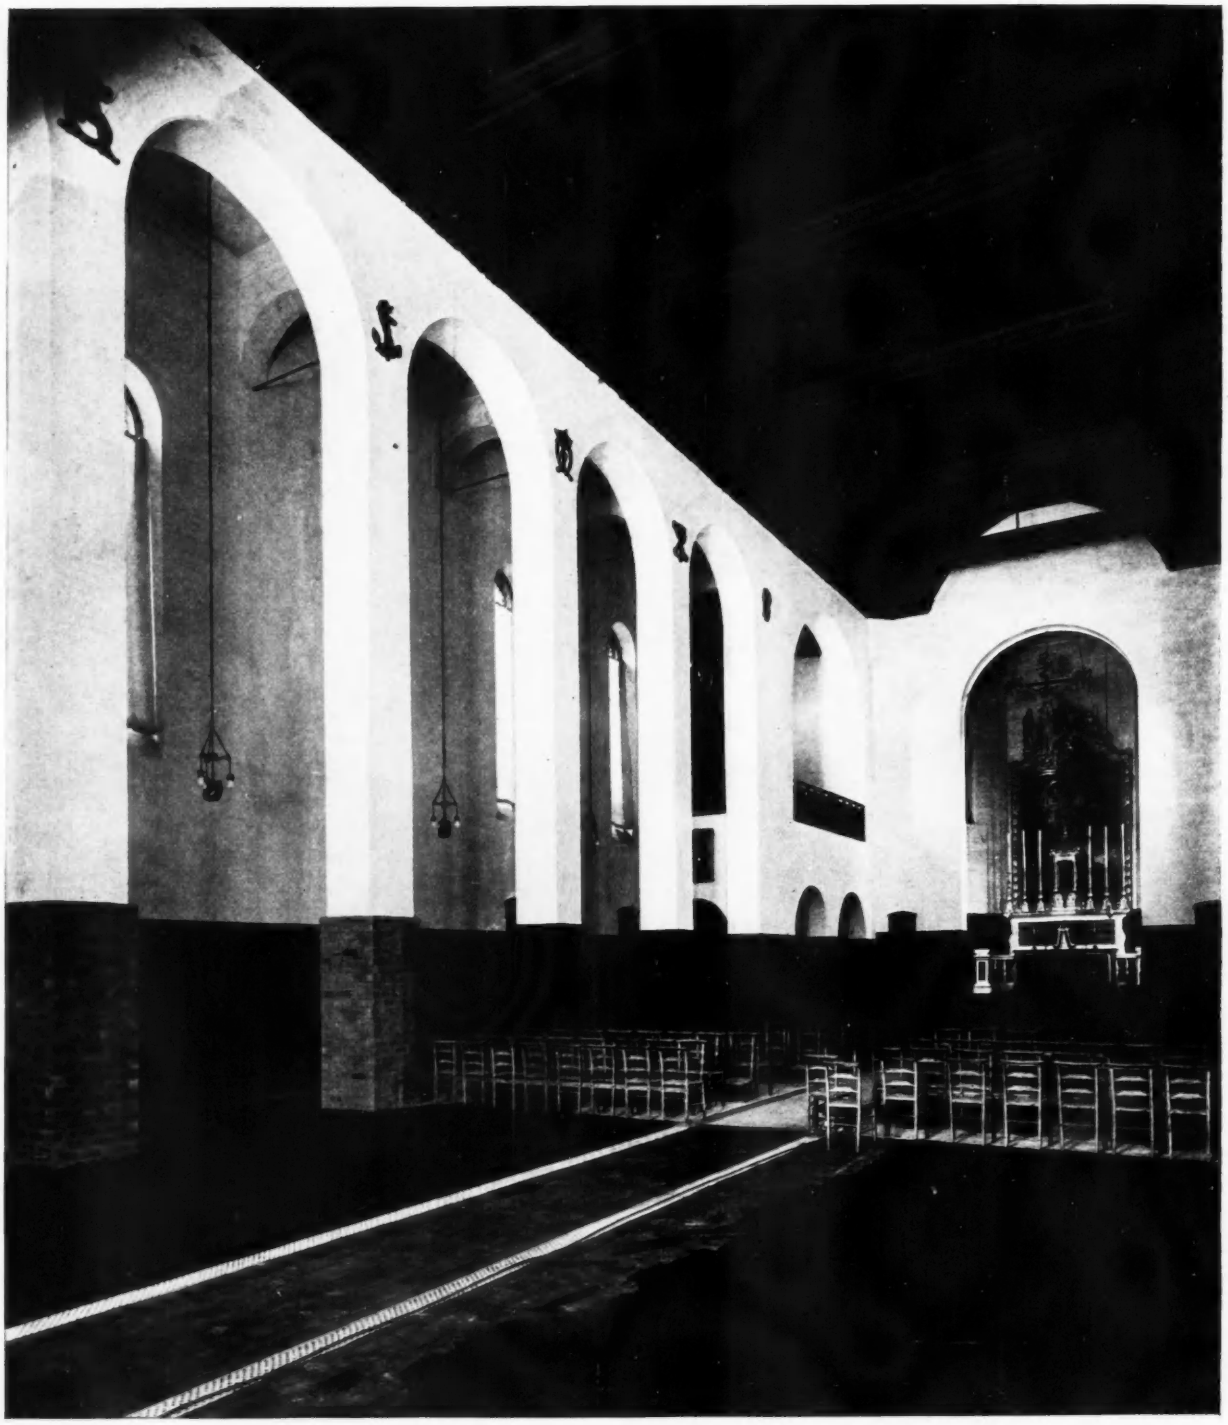
At first, housing was in the hands of practising architects, but before long the larger towns, with enormous building programmes before them, created separate architectural departments under the control of their engineers or official architects. In the case of large towns, the architectural responsibility was accepted, but the smaller councils that were quick to follow suit made light of the architect's work and employed their engineers, surveyors or sanitary inspectors in the capacity of architect, paying them something extra for their trouble, and footing the annual expenditure upon the cheap architectural assistance that alone made the system possible.

This resulted in an outcrop of housing that was in no wise a credit to local administration. If housing alone were in question, we might now be at the end of the trouble, but unfortunately the system is one that is calculated to show immediate economies in local administration book-keeping. It is not surprising, therefore, to find it extended to cover work of a costlier and more ambitious nature than housing, and the local engineer's name appears in connection with the design of schools, hospitals, baths, and all manner of buildings for which a Government loan is forthcoming.

And in the background are the multiplying desks of unknown and unacknowledged assistants, the upkeep of more than a practising architect's office staff, and the extra remuneration of a man unfitted for work which he does not, in fact, perform.

Add to this the particular evil which deprives such a system, under the beck and call of an annually elected council, of the real responsibility which is the very core of the *profession* of architecture, and its dangers may be viewed in their proper light.

It is unfortunate that the *cost* of the system is not publicly available, because it seems to us that the time is come when its bearing, not only upon the economics of local administration, but upon the progress of architectural thought and practice, should be subjected to a minute and impartial examination.



ST. PETER'S ROMAN CATHOLIC CHURCH, EDINBURGH

Mr. Christopher Hussey, in *The Work of Sir Robert Lorimer*, reviewed elsewhere in this issue, and from which the above illustration has been reproduced, points out that St. Peter's Church seems to represent a central type of which the Gothic variants and the Scottish National War Memorial were elaborations. As in his houses Lorimer went back to the Scottish tower, so his churches were natural developments from the Scottish primitive type. The interior, Mr. Hussey continues, was obviously what Lorimer concentrated on in this design of St. Peter's. It has the "rhythm" of a romanesque basilica combined with the simplicity and feeling for spatial relations that mark the best modern work.

NEWS & TOPICS

ENGLISH SITES FOR FOREIGN MANUFACTURERS

THE prospect of tariffs or duties has caused an influx of inquiries for factory sites from foreign firms who have hitherto supplied this country from abroad. The London Chamber of Commerce has in fact been inundated with requests, a great many by 'phone. Nor does it seem that the inquiries are restricted to a few industries, nearly every branch being represented, with perhaps a preponderance in the electrical, wireless and machinery trades. Requests are being sent out to town clerks for details of all accommodation available within their areas, a description of the services offered, transport, labour, local rates, wages, etc. It really looks as though our competitors are going to present us with the lion's share of our returning prosperity.

LIVERPOOL'S CHANGED OUTLOOK ON HOUSING

It seems to me, looking at a recent report on Liverpool housing, that the policy of that wealthy corporation has veered, over the course of years, from the depressingly mean to the sumptuously extravagant. The city must have wasted a great deal of money between these two extremes. The average cost of houses is now fairly low —£298 for a non-parlour house, excluding the cost of development—which does not compare favourably with similar work executed recently at Welwyn. Architectural standards of housing in Liverpool have risen enormously. The new work is urbanely Georgian, built often in long blocks with good connecting walls, the whole very successfully planned. One is reminded, when one looks for these housing schemes on the plan of the city, of the great life-work of Brodie, its late engineer. It is his boulevards that have given the schemes coherence, and made it possible for an already over-large city to throw out still further colonies into the country.

CONCRETE VILLAS FOR £300

I am always anxious to hear of new and cheaper methods of building houses, so it was with extreme interest that I read of the exploits of a Mr. Cruttendon, who is building concrete villas with unskilled labour for £300. But a plague upon these snappy papers and their special correspondents; for they do not say whether the walls of these concrete villas are solid or hollow, or what sort of concrete is used! From the photograph the house looks normal enough, but I don't imagine it is going to set our housing problem to rights.

BUILDING MATERIALS FROM GARBAGE

They are busy in Berlin converting the city's garbage into constructional material—building and paving stones, sheathing boards, etc. The process used is the invention of a Berlin chemist, S. W. Aretz. The garbage is collected by the operating company and brought to the yards, where glass, metal and other solid substances are sorted out and used for filling in low or swampy lands in the vicinity of Berlin. About a hundred tons of the material remaining are processed in the factory daily.

★

A mechanical sorting apparatus separates coarse rubbish from fine. From the latter building stones are made, which are, they say, in every respect equal to the best bricks. The coarse garbage contains large amounts of fibrous material, and from this building and sheathing boards are made which are almost unbreakable, can be worked with ordinary tools, and are cheaper than the usual plaster-of-Paris or other building boards. Other products are briquettes of from 3,500 to 6,000 caloric units, gas, tar and fuel oils. The building stones are cheaper than natural stone, and possess the further advantage that nails or screws can be driven into them, since they are not brittle.

DECREASING IMPORTATION OF TILES

Some interesting information on the decrease in the importation of foreign tiles was given by T. C. Howitt, in his presidential address to the Nottingham, Derby and Lincoln Architectural Society last week. I quote below Mr. Howitt's own words, in order to avoid misapprehension: "Many firms have continued to produce roofing tiles on antiquated methods, but one or two of the leading makers have seen the danger of foreign production, have reorganized the whole of their ideas, produced materials at economic prices and, in turn, have practically brought to a standstill the importation of foreign tiles to this country. Before this serious attack commenced, foreign tiles to the capital value of £120,000 were sent into England in one calendar month, whereas the return for August last amounted to only £19,000. Organized attacks on foreign material supplies on these lines are sure to be effective, and I feel that they should be encouraged by the architect."

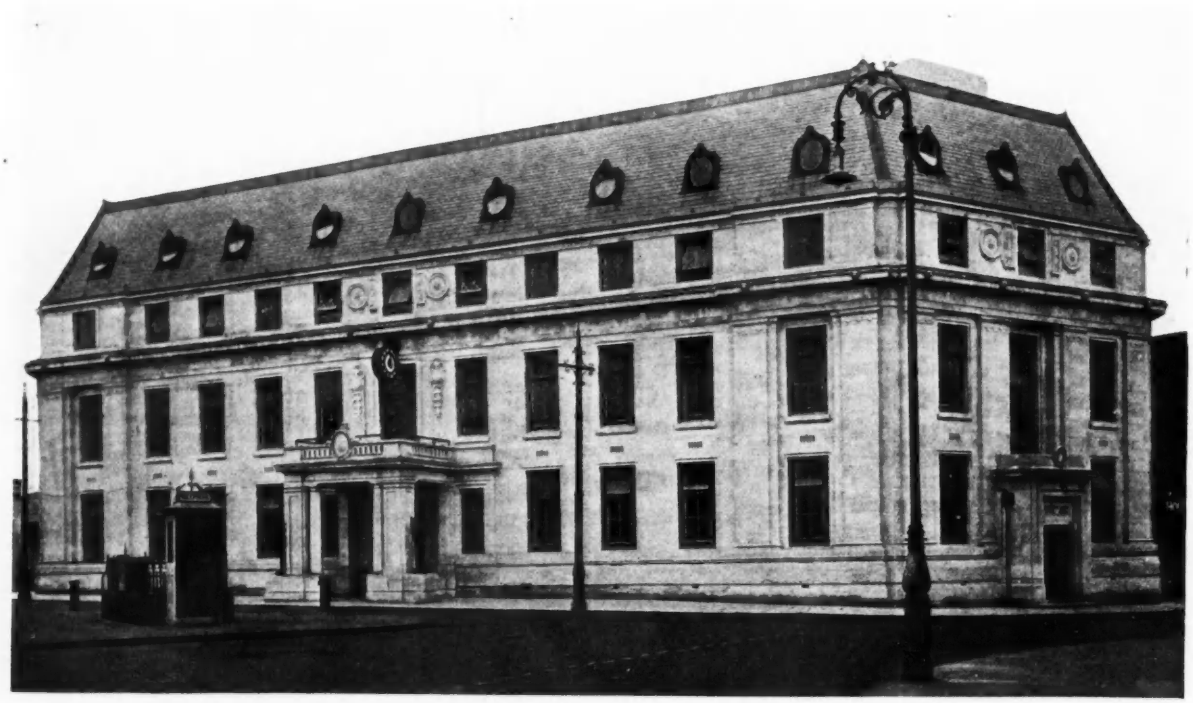
"DESIGN IN INDUSTRY" IN THE U.S.A.

The Public Library and Museum of Newark, U.S.A., has for a long time taken more than a curator's interest in design, that is to say, in everyday industrial design; and the efforts it has made to encourage good design have been practical. I have before me now a booklet called *Design in Industry*, which is in essence an annotated bibliography of all publications, foreign as well as American, dealing with the subject. This booklet is number twelve of a first volume, which have among them placed on record 849 items, either culled from magazines or in book form. It is needless to remark what impetus is given the movement by the possession of such a correlated body of information.

THE DAY OF THE "PLOT"

On November 4, 326 years ago, Guy Fawkes, the instrument of Robert Catesby and the other conspirators in the Gunpowder Plot, was keeping his lonely and perilous vigil under the House of Lords. The kegs of powder, the faggots, the coal, the slow-match, allowing him quarter-of-an-hour's "law," were all laid in readiness: materials of destruction. At this season of the present year, I have become aware, in my comings and goings in Queen Anne's Gate, that a plot with very different aims—to wit, constructive ones—has been going forward in the offices of the JOURNAL. It is due to be exploded the self-same day. But there is no secret about it. On the contrary, there is, I am told, an announcement in print on another page giving away the conspirators and the parts they have played in compiling the New Materials issue which is to see the light on November 4 next.

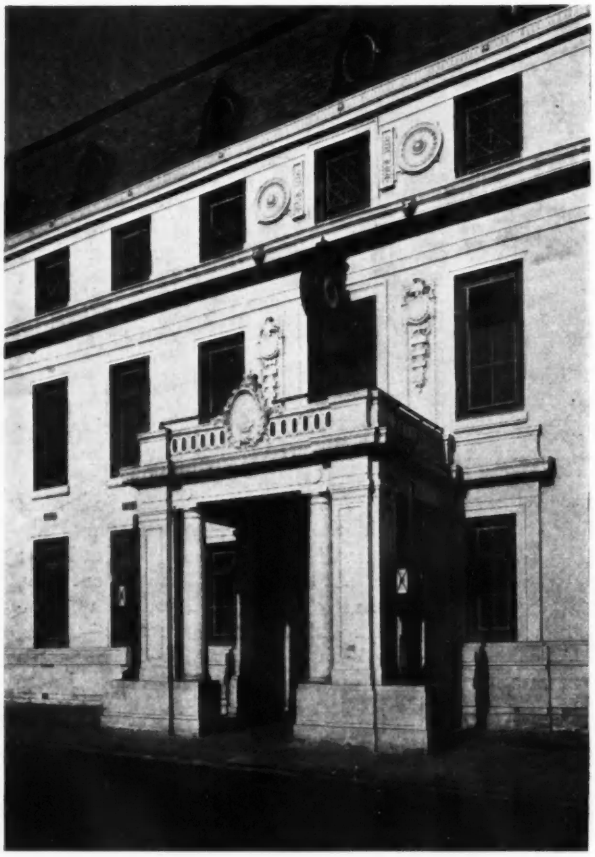
ASTRAGAL



The main front, to Broadway, of the Municipal Buildings. The walls are faced with Portland stone and the roof is covered with Westmorland green slates. Metal windows and dormers are fitted.

WIMBLEDON'S NEW

FROM DESIGNS BY



The main entrance to the Municipal Buildings from Broadway. On either side is a foundation stone, laid in February, 1930: one by the Mayor, Councillor G. T. Burrows, J.P., and the other by Alderman Shirl Mussell, F.C.I.S., Chairman of the Town Hall Committee.

ON Thursday, November 5, Prince George will officially open the new Wimbledon Town Hall and Municipal Buildings. It will be recalled that the designs of Messrs. Bradshaw Gass and Hope were awarded the first place in a competition promoted by the Wimbledon Corporation in 1928.

The site is of irregular shape, to take full advantage of which the municipal buildings have been planned to occupy that part of the land facing the Broadway, the town hall being placed behind. On the ground floor of the municipal buildings are the medical officer's and the borough treasurer's departments, and the rates office and the electrical engineer's room. Secondary stairs and lifts in close relation to the subsidiary entrances facilitate communication with the upper floors.

The council chamber is on the first floor, and is conveniently planned in relation to the main staircase, ante room, and the suite of committee rooms on the Broadway front. Retiring rooms for members of the council are also provided, and there is a gallery for the public, separately approached from the street.

On the first floor, in addition to the council chamber suite and committee rooms, are the mayor's parlour, councillors' library, the town clerk's department, and rooms for the

The Municipal Buildings; the Town Hall occupies the separate building seen on the left. The two blocks are connected by a bridge to enable them to be used in conjunction on civic occasions.

CIVIC BUILDINGS

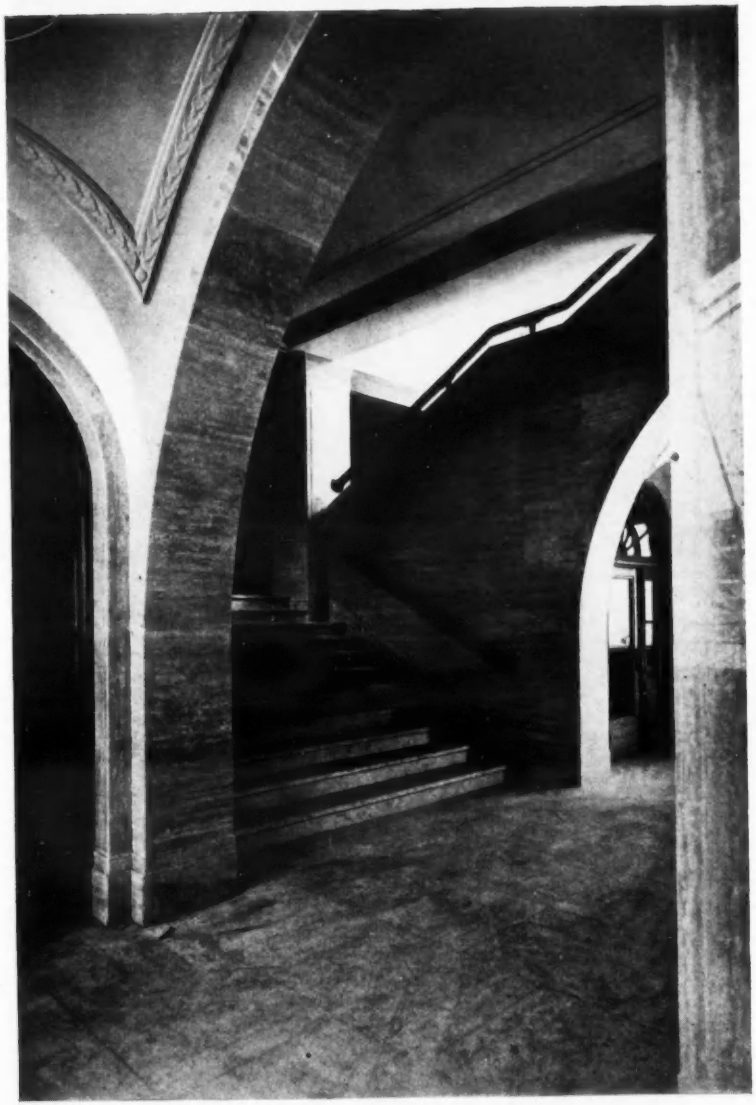
education clerks. On the second floor are the borough engineer's department and spare office accommodation; and on the third floor the valuation department, registration offices, general typing room, spare offices, and the caretaker's flat. In the basement there is room for general storage, the electricity cooking demonstration room, electrical substation, and the heating plant.

The approach to the Town Hall itself is through a covered portico, entrance vestibule and spacious crush hall, the walls of which are treated in marble stuc of soft tones. Seating accommodation in the assembly hall is for 929 persons, and there is further accommodation for about 100 on the stage and for 498 in the balcony. The assembly hall is fitted with a spring floor for dancing, and there is ample cloak and retiring-room accommodation on both the ground and balcony floors.

The stage is designed for cinematograph entertainments, concerts and stage plays, as well as for all usual civic functions. Space for an orchestra, sunk below the level of the hall floor, is provided. A modern organ also forms part of the equipment, so arranged that the console can be raised to the level of the orchestra rail. Behind the stage are dressing rooms for artistes, orchestra and chorus. Ample exits permit of the speedy clearing of the building in case of emergency.

BRADSHAW GASS AND HOPE

One of the two subsidiary entrances to the Municipal Buildings. Each has revolving doors and gives access to the corridors and secondary staircases leading to the administration offices of the departments. They are planned one at either end of the main front.

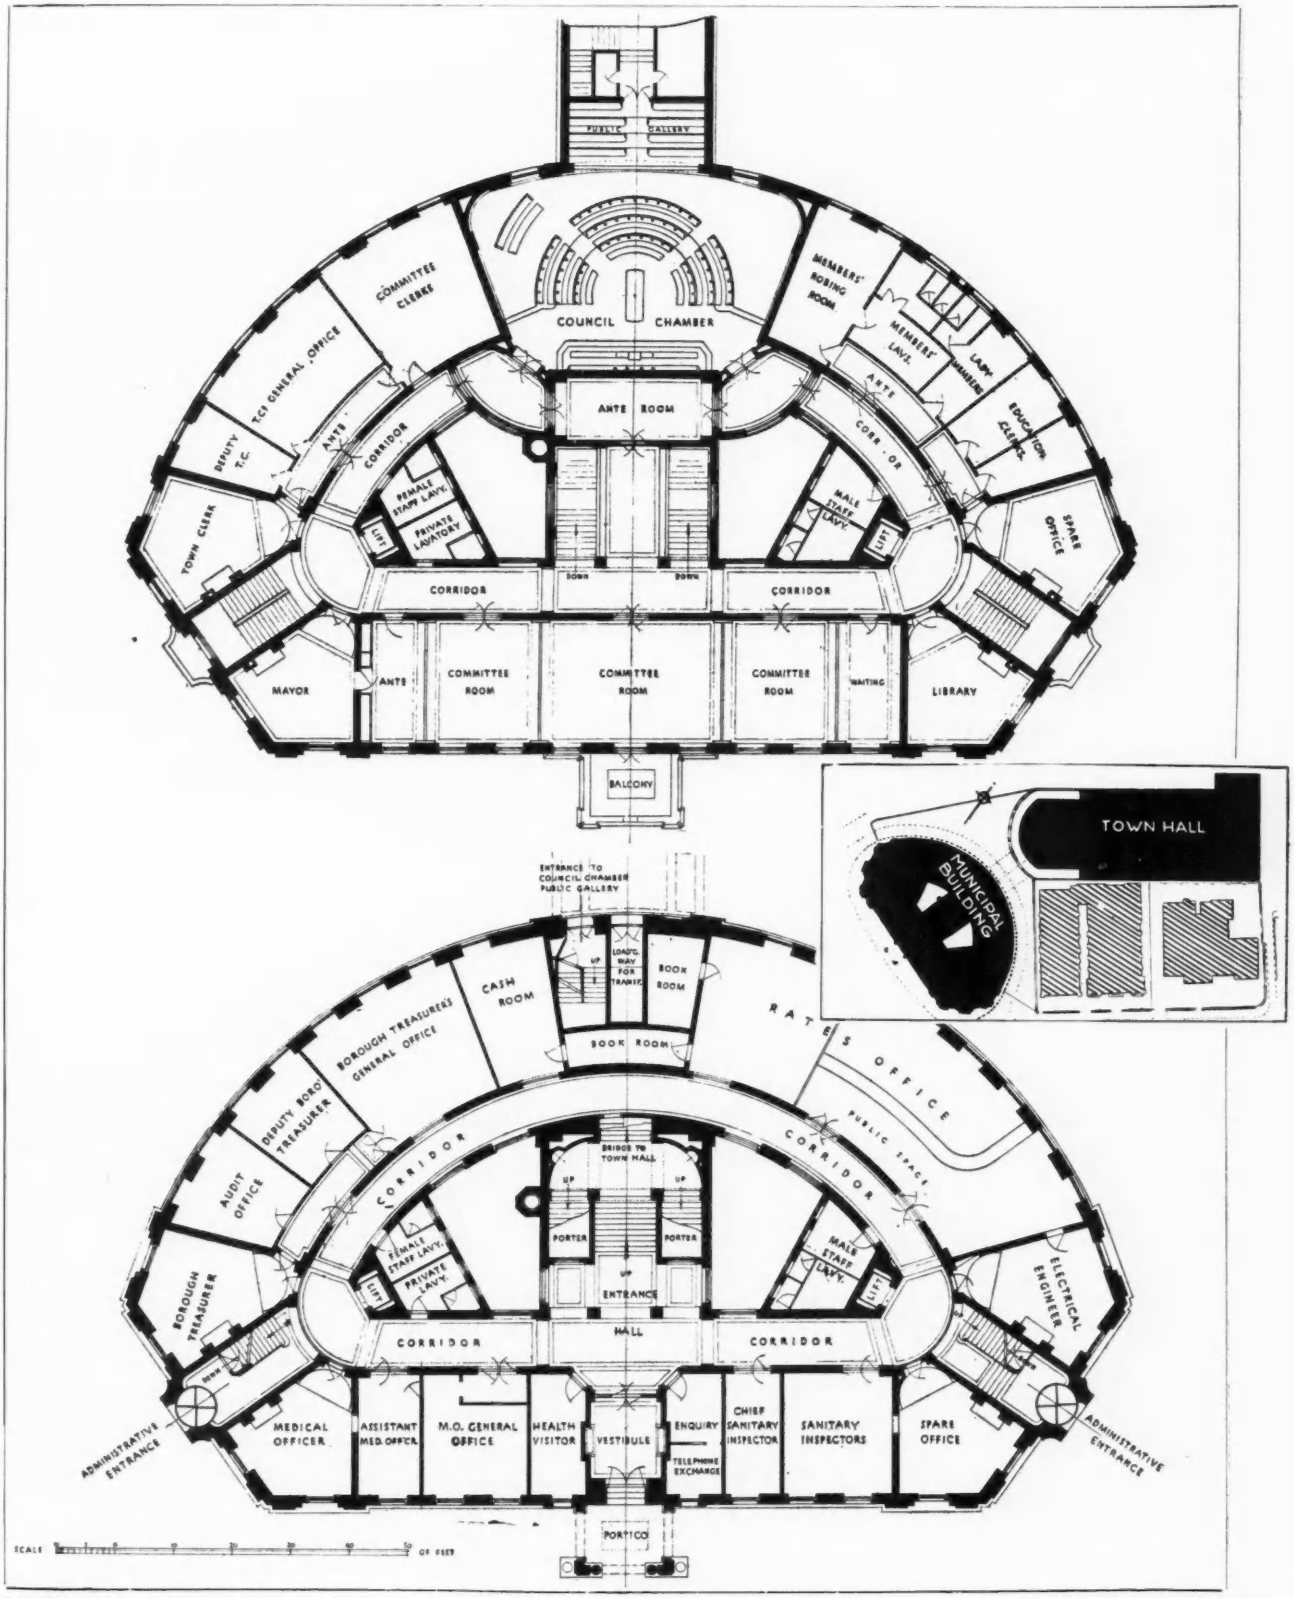


Wimbledon Civic Buildings, S.W.]

Facing the principal entrance to the Municipal Buildings is the grand staircase, the main approach to the council chamber and committee rooms on the first floor.

[*By Bradshaw Gass and Hope.*

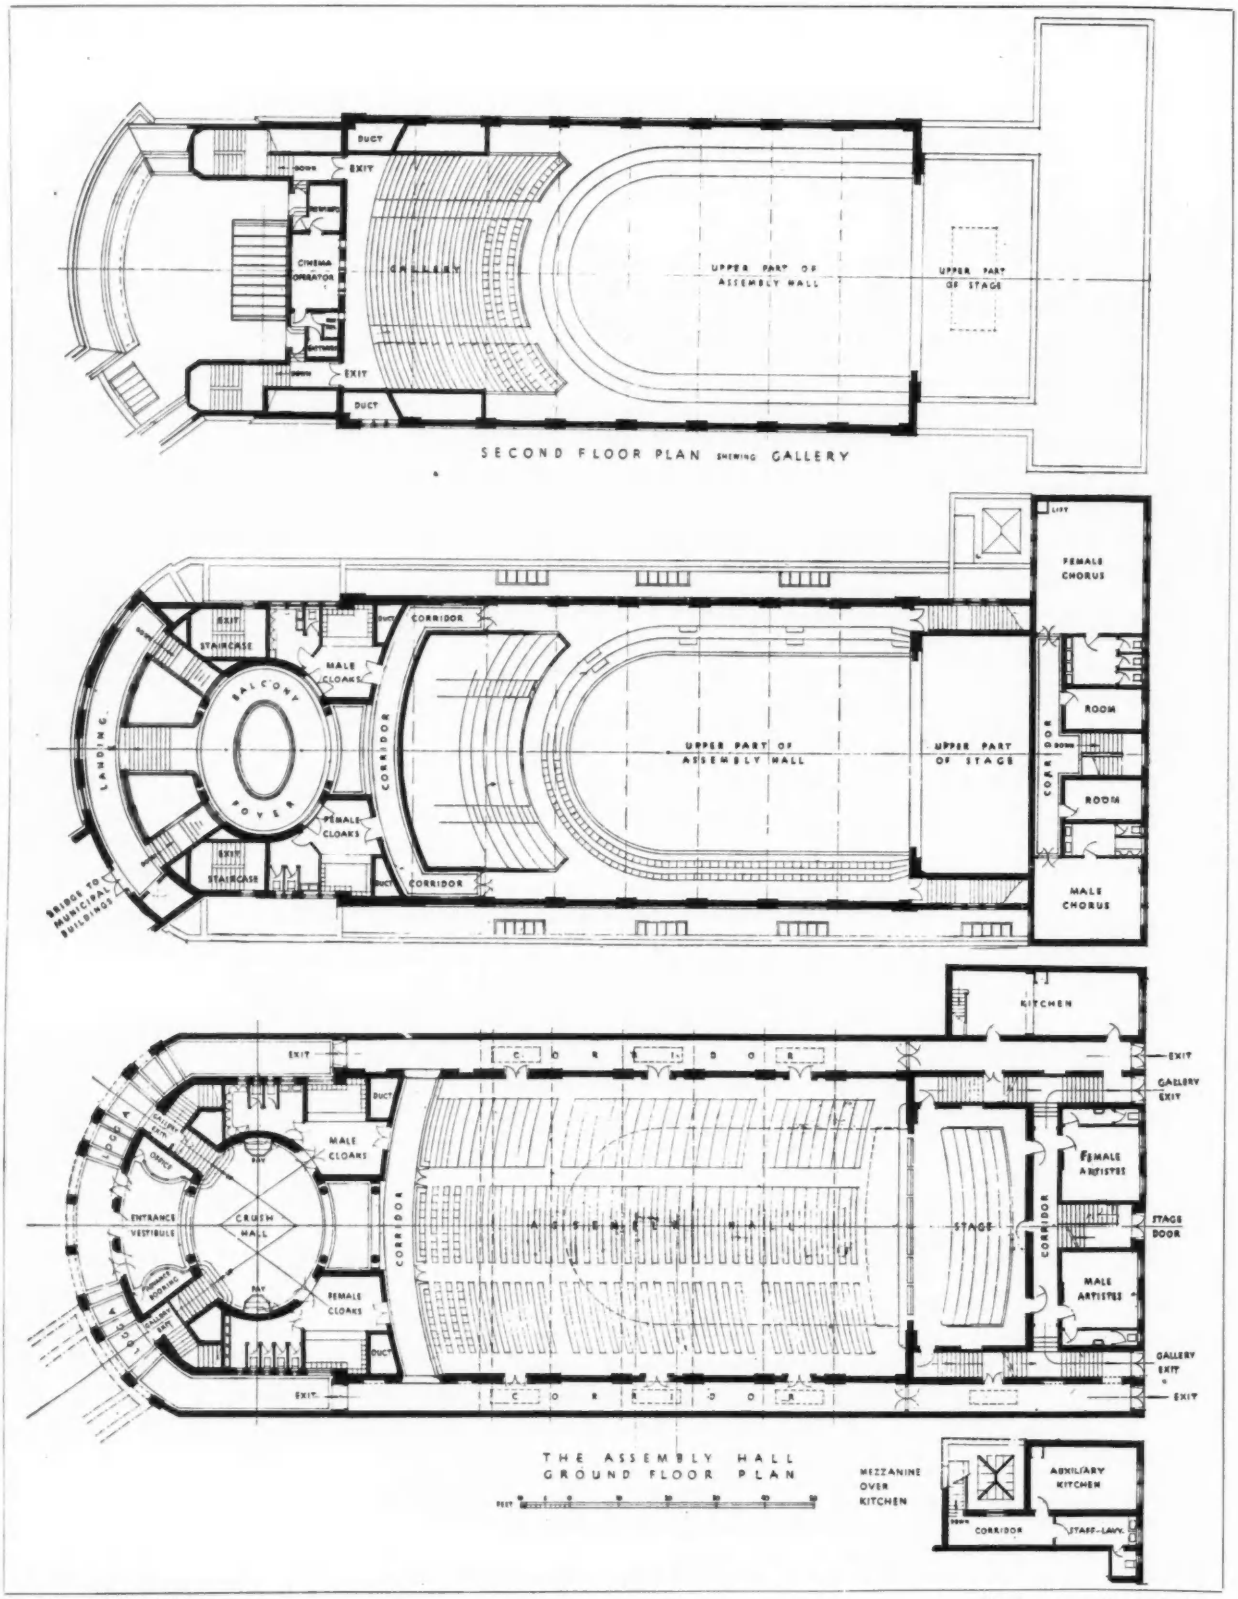
The Assembly Hall staircases leading up to foyer and down to crush hall—at balcony—and ground-floor levels. The foyer also connects with the Municipal Buildings.



Wimbledon Civic Buildings, S.W.] [*By Bradshaw, Gass and Hope.*

The Municipal Buildings block : ground- and first-floor plans. At ground level are departmental administrative offices; above are council chamber, mayor's parlour, town clerk's and committee rooms, library, etc. The Assembly Hall block (for plans, see overleaf) is separate, but there is a connecting bridge. The relation of the two is shown by the small block plan inset.

D



Wimbledon Civic Buildings, S.W.] [*By Bradshaw, Gass and Hope.*

The Assembly Hall block : ground-, first- and second-floor plans. The many-purpose hall occupies all three floors. Near the stage and green rooms is provided a kitchen, with a mezzanine auxiliary. Public entrance is at the other end. Here are vestibule, crush hall and ample cloakrooms, etc., embraced by a loggia connecting two flanking corridors—an arrangement repeated above.

The main north front; the central door admits to an entrance hall, and thence, by half-doors, either side of an inquiries desk, to the general office. The walls are of brick, and the dressings of reconstructed stone.

SALT UNION
Stoke Prior, Worcestershire
DESIGNED BY C. F. LAWLEY HARROD

THE new office block for the Salt Union, Ltd., has been erected on a site outside the works, facing the main entrance, and completes a scheme of improvement originated some years ago. The building faces due north, having a frontage of 150 ft. by an average depth of 40 ft., and provides for a lofty and spacious general office, extending through two floors, necessary private offices and a caretaker's house. It is set in suitably laid-out gardens.

The outside walls are faced with rustic multi-coloured bricks, with dressings of reconstructed dragged surface Weldon stone. The main entrance doors are placed in the centre of the north front and give access into a marble-floored entrance hall. Inquiries are made at a counter which separates the entrance hall from the general office.

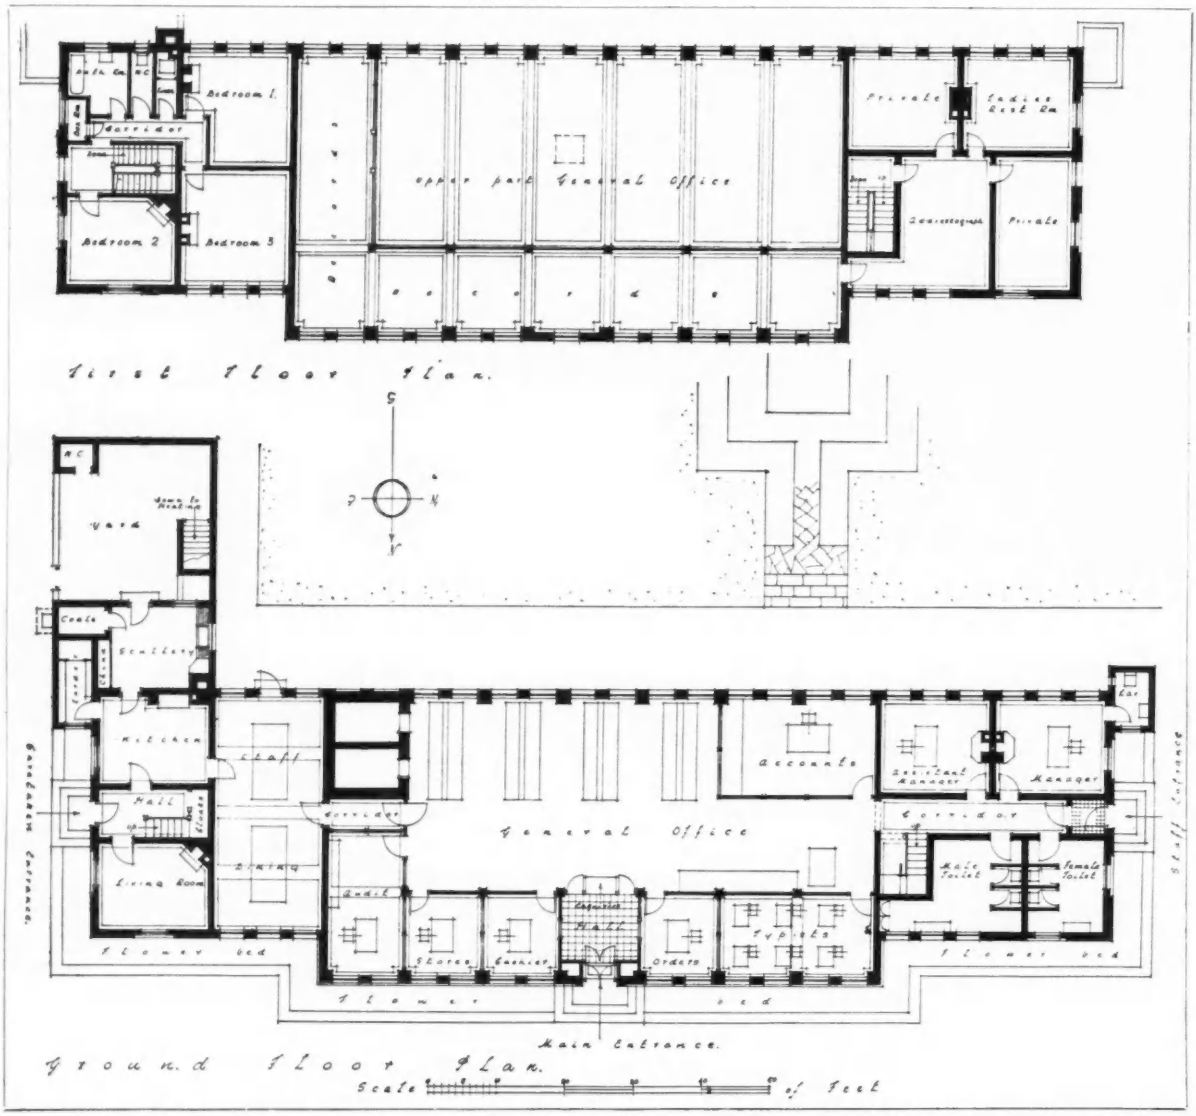
The general office is 80 ft. long by 40 ft. wide by 20 ft. high, and is lighted by high narrow windows in the north and south walls. The private offices, having communication with the general office, are placed along the north side, a gallery being formed above to serve as a storage place for records.

The staff entrance, which is at the side of the building. The bricks are rustic multi-coloured facings.

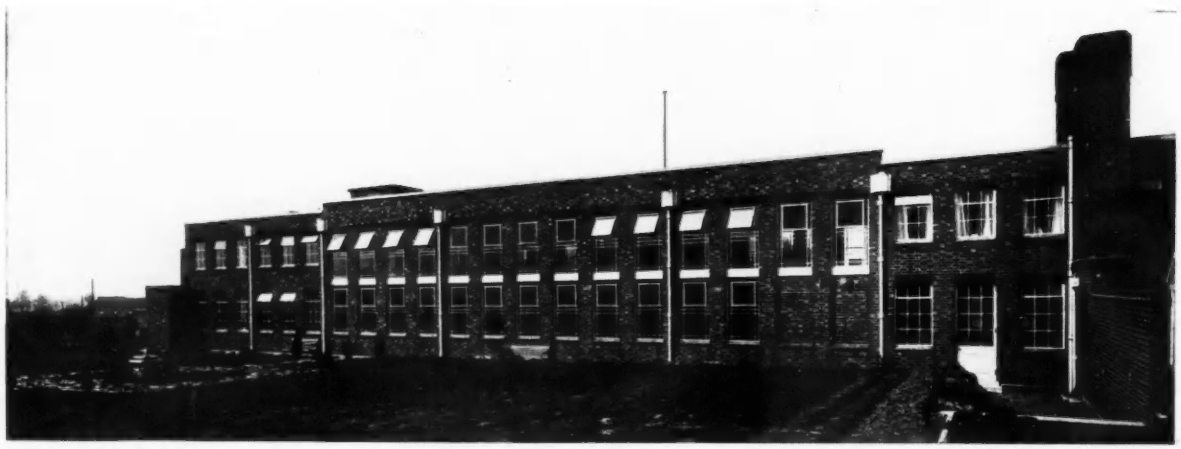
On the east side of the general office block are placed the caretaker's house and staff dining-room; and on the west side the staff entrance, toilet, and managers' private rooms.

The walls are finished internally in sanded face plaster, coloured dove-grey, the ceilings being finished broken white. The joinery and fittings are in mahogany. The floors generally are finished in wood blocks, and the windows glazed with Vita glass. The caretaker's kitchen and lavatory blocks are tiled from floor to ceiling, the floors being finished in red quarries with cove skirtings.

The artificial lighting is electrical, the diffused bowl system being employed; and the heating is by low-pressure hot water.

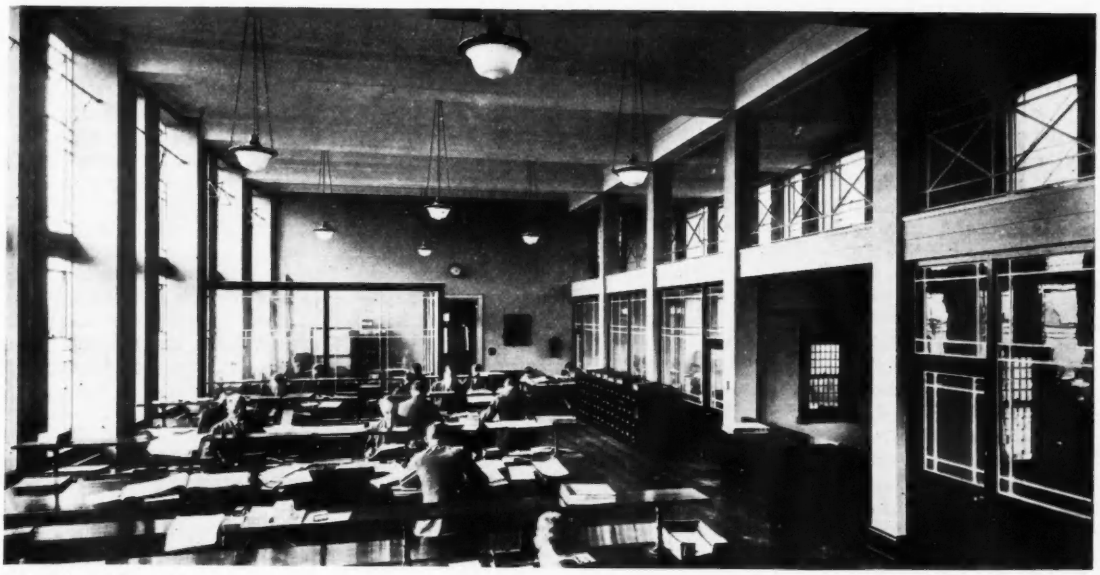


The ground- and first-floor plans. The former provides general and managerial offices, the staff dining-room and adjacent kitchen, which dovetails in with the caretaker's house. This has a separate entrance, and, on the first floor, three bedrooms and bathroom. The upper floor is largely occupied by the lofty general office, but also contains a ladies' rest room and two private rooms.



Salt Union Offices, Worcs.] [*By C. F. Lawley Harrod.*

The south or back elevation. The caretaker's house occupies both floors of the nearest end of the building. Here, too, is the heating chamber. The deep windows light the large general office.



Salt Union Offices, Worcs.] [*By C. F. Lawley Harrod.*

The general office, showing the entrance hall and inquiry desk on the right. The accountants are accommodated behind the glass screen seen on the left. The doorway in the far wall leads to the managerial rooms.

Bernard Whistlow, F.R.I.B.A.: An Autobiography: xxii

THE FUN OF THE FAIR

BY KARSHISH

(H. B. CRESWELL)

I HAVE said that it was my wife's education of me in the springs of human motives, and particularly her wholehearted efforts to advance me by intricate social manœuvrings, which, more than any intrinsic capacities in myself, established me in practice and gave me an entrenched position in life. I have instanced some matters in which Nancy put me wise; and I will now say something of the social game—as I will call it—for I believe this social game to be indispensable for success to all except the most exceptionally gifted among architects; and that, even of these, the number who accomplish their ends in the obscurity which is possible for the painter, sculptor, musician and author, is so small as to be negligible. Even Philip Garston, who never moved a step aside from direct accomplishment, or was actuated by ulterior motives, was inevitably drawn into the vortex of social life; and his success owed not a little to the notoriety of his outstanding personality.

Garston never played the social game or gave it a thought, and was so searching in his ridicule of my exploits in it that I left off speaking of them; yet I secretly envied his independence of thought and spirit with an envy which I have since fully justified in myself, for the social game imposes on the adept a crafty, insincere, circumspection in his actions, in his relations to persons, and in his attitude to events: his deportment of mind has at all times to be a falsity. He must sacrifice acquaintances and even friends, and forswear his convictions, in the cause of a diplomacy of which the ends are contemptible and the means to them degrading.

The game, when played devotedly, so that it becomes a habit of mind, is demoralizing. Men or women who are always "out for blood" become so deformed in nature that—as I have observed—their ambitions for their children even become vile. They lose touch with all that is human in life; become deserts to all men of generous impulses; and I am convinced that their pursuit of contentment is as hopeless as with those who make avarice their god.

I can speak with confidence of the social game, for I have played it; but Garston was wrong when he told me, brutally, that I was "one of the great Tom-cats of architecture that rub themselves against the legs of all who can advantage them, and arch their backs at everyone who can't": I was spared any such fate because, though Nancy played the game earnestly, she never played it seriously. It was, with us, always a game and nothing but a game—an affair of moves and countermoves; and though I was often humiliated or angered by a snub or a rebuff, Nancy never was so, but laughed and set about devising new schemes for assaulting the old stronghold or reducing it by advance in a new direction. We often used to invent plans of action as we lay chuckling together in bed, and the rapid growth of my practice rewarded the trouble we took, but, looking back, I realize that in those days my social designs were a greater preoccupation with me than my architectural.

Nancy, however, well understood the surrender involved by all this. Once, after we had been laughing together over a petty discomfiture we had dealt an opponent, she broke off with a sigh: "You know, Pidge, some day when your ship really comes in we must get out and away from all this."

I only perfectly understood all that had been in her mind when she said this, after I was forty and she dead, and the war had come to teach many things: for so it is, that a man takes colour from the life in which he seeks to establish himself; and so it is that generally-accepted ideas are commonly wrong-headed, that men who are observers of life and not mere participators in it are always in a minority, and that the generality are always wiser and better than the institutions they serve.

The social battlefield of Nollingborough and its neighbourhood was much the same as that of many other small country towns. As has been said, the Nollingborough *mêlée* was centred in the Rectory circle, that of

the neighbourhood in families classified as " county," and in the big-wigs of the hunting fraternity. The combatants were uniformly armed by power of peck; and the pecking order was matter for unending contest. I was hard put to it to win what I considered to be my rightful place in that order, for I had to work my way up from being classified as " a young man in the Steel Works," and to combat the implications of ignorance and low birth which naturally attached to anyone reduced to practising as an architect in such a place as Nollingborough.

In these struggles I received many pecks so shrewd that I wince to remember them : the pecks I gave I have for the most part forgotten. If in what follows I describe the sufferings of a thin-skinned snob, I can only say that such a thin-skinned snob was I; I do not ask for sympathy but for attention only, and the point for note is that though these assaults are remembered because they particularly caught me on the raw or otherwise distressed me, they were in kind, though not in degree, typical of the give-and-take of my daily life.

When, before my marriage, the great Archdeacon, the Rector of Nollingborough, honoured me with his recognition—my father was by that time a well-known ecclesiastic—he did not call, but sent me his card in an unsealed envelope by the halfpenny post. It is true that I lodged at a farm, up a by-road, two miles from the rectory; but this bland assumption of patronage and condescension cut me to the bone : it first crushed me with humiliation and then made me boil. After I had boiled over I boiled down. I did not return the compliment by post—as Garston would certainly have done — but swallowed my humiliation and left my card in person; and it was lucky for me I did so, for the invitation to help in my famous bazaar followed.

A year later, I lunched alone with the Archdeacon and, apparently, he thought that I was in danger of being too much honoured unless he gave me a peck before parting, for after we went to his study for coffee, with great zest he selected a cigar for himself from a box on a side-table without offering one to me or—of course—asking me if I smoked. I have never forgiven him this peck. I could not leave, as some bazaar business had to be discussed, and he made me feel that my poor little return peck of filling my pipe and then asking him for a light, had quite missed the mark.

These examples may seem instances of very bad manners; no doubt they were so, but they were the actions of one who knew what good manners were, and they were designed to humiliate. I often suffered even more when no peck was intended, for a slight is the worse when it appears that the slighter judges the slighted not to be in a position to feel any slight.

When I rebuilt Tamberton Manor for the Marquess of Goulash I was often made to suffer acutely in this way. Goulash was always frank and cordial to me, with an ease of manner and considerateness which banished any sense of inferiority of station. It is second nature in men of high rank to condescend gracefully; but Goulash, even to my sensitive perceptions, never in the least seemed to do so, although it was made clear that he was himself extremely sensitive to recognition of his rank.

Once, after the family were in residence and I had gone to the house on some business and parted with him and Lady Goulash in the garden, he whistled to my retreating back as I crossed the lawn and said : " Have some tea ? We're just going in."

I was hurt by his whistling to me. I felt he would not whistle to an equal. Then, it seemed to me that he would not have whistled if it had occurred to him that I was *not* an equal—I do not mean in rank, but socially equal, as all gentlefolk essentially are. The point worried me, and I have not settled it to my satisfaction even yet.

On another occasion we had a kind of contest when he took me into the house by the tradesmen's entrance. He did not take off his hat, so I did not take off mine. He kept his hat on when we went into the kitchen : I was not going to honour his cook and kitchen-maids by taking off mine, but I could see he noticed this and thought I was assuming too much, or, for some other reason, he disapproved. We passed towards the front of the house side by side : no word passed, and there was distinct tension in the air. When we went through the door into the hall he still kept his hat on, but I, with a certain repugnance, took mine off. The tension at once relaxed, but I was hurt that Goulash should continue to wear his hat when we were together in the library. He certainly would not have done so with a guest who had uncovered. I had no doubt that he acted in this way deliberately, as a final flourish or gesture of putting me in my place.

I had had a very awkward moment with my hat the year before, when the house was rebuilding and lunch was laid out in a room of the coachman's — unfurnished — cottage. The Marchioness and her sister were in the room, and when I entered I took off my hat; but as Goulash continued to retain his, I, after a quarter of a minute, put mine on again and discarded it only when he led off sitting down to table. The matter was to me of enormous importance then, and it seems so now.

Nancy, before I married her, hunted; and though she was in no position to entertain, she was a favourite with the jolly sporting fraternity, was often mounted by friends, and had a large circle of acquaintances. Her position in the pecking order was therefore far above mine, and she had none of my sensitiveness, for, though her perceptions were far keener, the heaviest pecks left her unmoved and she was able to give as good as she got.

She explained to me that it was a rule of her game to antagonize those with whom she failed to get on a satisfactory footing : " For," said she, " everyone will respect you whom you can make afraid of you; and it is much better to be abused than ignored by any particular person, for few old friends will think the worse of you, and you will find new ones among those who dislike your opponent." I remember a good instance of Nancy's methods when hard-pecked.

There lived, a few miles from Nollingborough, a very great lady and a very great snob, a certain Mrs. Archer Pitt, whose social position had been made unchallengeable by the circumstance that she had entertained R–y–lty. She was so well connected that she lost nothing in being without a title; and she completely cut the ground from under the feet of those who might sneer at the origin of her husband's riches in a Britannia-metal manufactory, by calling him " Spoon."

Nancy was one of hundreds asked to this woman's garden party, but—apparently—Mrs. Archer Pitt did not know Nancy by sight; and as a result Nancy, in a stationer's shop, was—apparently—quite unaware who Mrs. Archer Pitt was, when that lady came in and occupied it. These little exchanges were like passing the time of day with us, but Nancy's peck must have been even better than she knew, for one evening, a short time afterwards, the great lady sent her butler four miles to our house with an oral message to Nancy that Mrs. Archer Pitt would be obliged if Nancy would cease to employ as seamstress a certain woman in the village, as *she* was doing all that was necessary for the person in question.

Nancy sent a note back by the butler, in reply :

DEAR MRS. PITT [no " Archer," observe; a heavy jab !]

Thanks so much, and so kind of you, for, of course, you know so well what is necessary for these people.

What an agreeable man Mr. Bates is; it was nice of you to let him come, and I am *greatly* interested in your new sink. Mr. Bates thinks ours

will do for the present—though you would be *much* more particular, I expect: however, I must write no more now, as he is waiting.

Yours sincerely.

Mrs. Archer Pitt got all she wanted that time, I fancy; and she and Nancy thereafter kept at opposite ends of the social hen-run; but where Nancy scored was in keeping a copy of this letter to point a good story for her friends, some of whom amused themselves afterwards by mentioning Mrs. Bernard Whistlow to the Great One for the pleasure of observing contortions of dignity in contest with exasperation; for, of course, Mrs. A. P. knew that the story was abroad.

It may be wondered what all this has to do with the building up of an architect's practice; but this will be clear when I say that such episodes flood my memory, and that they were salient combats in a general engagement which involved us on all sides every day of our lives. For a man to have any importance as an architect in the provinces, or to be conceded any skill or merit among those who are in a position to establish his reputation, he must attain a social position which allows him to mingle with the "best people" and causes him to be envied and pursued by those who are lower down in the pecking order.

For every commission I won from my connection among influential people, I gained half a dozen from those who sought me merely because I was socially more successful than they were, and therefore made contact for them, so to speak, with glories they aspired to but could not reach.

Nancy, as I have said, played the social game as a game only; but even so it was an arduous and demoralizing preoccupation, as I came to know only when—as was to happen—I found myself forcibly enlarged from it.

Two years after our marriage we took the risk and moved into a larger house so that we could entertain. This was no less than a gamble in which we staked the whole of our joint means; but, as Nancy foresaw, the speculation proved a sound one: my earnings increased rapidly. The game, however, was not worth the candle. It is no pleasure to entertain—to give dinner-, garden- and bridge-parties—when you dislike or distrust most of your guests, are bored by many others, and have no other purpose than to gain social weight. Nancy made light work of it all, but it was an anxious task laying our schemes and devising our snares; and the strain of playing up to the mark we had set was great, and we commonly saw the back of our last guest with a groan of relief.

One constant source of stress for me was that I could not get away from people: at any moment I might run into somebody unexpectedly and have to adjust myself to the needs of the game; to be warm, indifferent, ingratiating, or prepared to snub, with recourse to refinements of great complexity and the exercise of nice judgment.

This lady had behaved in an offhand way to Nancy a week before, at the house of a woman whom she was jealous that Nancy should be received by: I had either to let her suppose that I set no store by her social pretensions and so make her have a higher opinion of our position, or, by making myself particularly agreeable, flatter her into thinking we set a high value on her acquaintance; and which to do, and how to do it, was a teasing question, and a delicate job. One had to feel one's way or one might take a peck as a reward for not giving one.

That man had on a late occasion threatened my dog, which had approached his, and his manner had showed a disregard for what I held to be my social importance, for my house was as big as his and I entertained more and knew just as good people: how should I greet him so as to re-establish myself? I might be snubby and leave it to him to realize he had over-stepped the mark; or flatter him by appearing to swallow the small affront; or boisterously chaff him as though I were overlooking the bad manners of one whose acquaintance I did not value.

Nancy gave pecks on my account, and I on hers; and she lavished her charms so that she would have plenty of ground to work on by withholding them. We discussed our most trivial social interchanges daily and fortified ourselves for future conflict. I remember that a wretched little woman—the wife of the master of a private school—had the effrontery to ignore Nancy because she was in the glory of public conversation in the street—probably on some parish business—with the Rector of Nollingborough. Next day I met her and cut her dead: my peck so disconcerted her that she became crimson and fell off her bicycle.

NEXT WEEK—XXIII: THE SWORD FALLS (AND CONCLUSION).

The previous instalments appeared as follows:—

May 27.	i:	I am Articled.
June 3.	ii:	Episodes of Pupilage.
June 10.	iii:	Episodes of Growth.
June 17.	iv:	My First Job: The Sewer.
June 24.	v:	My First Job: The "Pipes."
July 1.	vi:	I Turn Clerk of Works.
July 8.	vii:	Bradshaw & Son: Builders.
July 15.	viii:	Joe Richards: Foreman.
July 22.	ix:	Trials of a Clerk of Works.
July 29.	x:	A New Venture.
Aug. 5.	xi:	The Resident Architect.
Aug. 12.	xii:	An Architect's Early Gruel.
Aug. 19.	xiii:	An Uphill Fight.
Aug. 26.	xiv:	A Disaster.
Sept. 2.	xv:	The Law's Majesty.
Sept. 9.	xvi:	A Failure and a Success.
Sept. 16.	xvii:	Private Practice at Last.
Sept. 23.	xviii:	Provincial Practice.
Sept. 30.	xix:	Forging Ahead.
Oct. 7.	xx:	An Architect's Wife.
Oct. 14.	xxi:	I Quarrel With My Partner.

NEW MATERIALS ISSUE

The Architects' Journal for November 4

ON November 4, 1931, a special issue of THE ARCHITECTS' JOURNAL devoted to the New Materials will be published. It will be a specially-enlarged number, taking a comprehensive view of the ever-increasing range of building commodities available to the architect, particularly for decorative purposes.

In addition to the usual current features, the following eminent authorities will contribute illustrated articles on the subjects indicated:

MATERIALS FOR ARCHITECTURE

A general introduction to the number, by Wells Coates.

PLYWOOD, LAMINATED BOARDS AND VENEERS

Their manufacture and decorative possibilities, described by J. Murray Easton.

MODERN SYNTHETIC FACING MATERIALS

Notes on glass, ceramic tiles, cellulose compositions, synthetic stone and marble, etc., by Raymond McGrath, a pioneer in their utilization.

THE NEW METALS

The stainless steels; copper, bronze, nickel; the aluminium alloys; electroplating in various metals; by Alexander H. Hayes.

MODERN FLOOR COVERINGS

Terrazzo, marble, asphalt, manganese compounds, rubber, parquet, linoleum; by Ll. E. Williams.

MODERN WALL BOARDS

The characteristics of the multitude of synthetic products available today; by Frederick Etchells.

MODERN PAINTS AND DECORATIVE FINISHES

Cellulose, metallic paints, plastic paint, distempers: their capabilities and methods of application, by spray or hand-painting; by Harold Tomlinson.

NOISE AND ITS ABSORPTION

Acoustic complaints and methods of combating them; by Hope Bagenal.

For this occasion only the customary supplement plates are not being printed separately, but are being increased in number and bound into the body of the JOURNAL.

LETTERS FROM READERS

Art and Industry

SIR,—The question of the obtaining of suitable fittings and finishing items for a job is really the choice of a suitable manufacturer. Personally, I find the big firms almost impossible: one's ideas have to pass through sundry executive limpets before they reach the real craftsmen. With a small firm, however, one can get down to it with the man who is going to make the things and, consequently, can evolve suitable articles with one's ideas and his help. There is no dearth of good craftsmen who can make practical the vaguest designs, and it is only by keeping designs vague that reasonable work can be done.

The architectural designs for furniture, handles and such items, that are drawn to scale on paper and sent to be executed, are hardly ever worthy of notice, as they invariably have a sort of art-and-craft heaviness. This work can only be done by the specialist.

I have found that even if one employs a sculptor to model a door handle, his method of meeting the wood has to be re-treated; as he carries his moulding a practical man has to finish it where its fixings come. BASIL IONIDES

SIR,—Your correspondent, W. A. R. Stringfellow, is evidently not fully aware of the conditions in the design departments of the majority of those manufacturing firms which keep a staff of designers.

The fact that in many cases the chief of the firm "has no idea of the meaning of modern design" may be perfectly true, but it also follows that if he, on the one hand, either rigidly adheres to "period," old-fashioned and well-tried types of design, or if, on the other hand, he ventures to try what he considers is "modern," by copying "the worst of crude French design," the designers in his design department have no earthly chance of showing whether they themselves understand and can produce modern commercial design or not.

It is therefore obvious that their school of art training—if they have had any—cannot be blamed for that.

I know brilliant young students who could produce anything equal to the Continental designs for which W. A. R. Stringfellow professes such an admiration, were they given a chance. Unfortunately, in order to earn their livings and keep their jobs, they have to continue producing for their employers designs which they as artists call pure "tripe." Any suggestion of originality or modernism or fine colour may endanger their posts, and in these times the risk of losing a designer's post is too great.

Again, I know firms which pay for a weekly bundle of sketches, photos, colour reproductions, etc., of almost any conceivable type of work to be sent to them from Paris by an agent, who does nothing else but collect these Parisian crudities for his clients. Parts of these designs, whether appropriate or not, are then selected and worked up into "modern designs." What can a young designer do under such conditions if he dare not lose his job?

This is not the fault of the schools of art. All this is done in spite of their efforts, and it is the chiefs and the retailers who are at fault for demanding this type of work from the designers.

It may also surprise your correspondent to hear how some of the trade designers are recruited, and that they may not have entered a school of art at all. Is he aware that in many large firms designers are not specially recruited or selected from those known to have some artistic ability?

Actually, in many cases, they are engaged straight from the elementary school, without even the culture of a secondary school, and they are then set to work as paint grinders, errand boys, shop-sweepers, and given other menial tasks. In time, if there is a vacancy in the design room, they are brought in as required, to fill in outlines with paint, etc., and eventually, if neat and tidy, they may be promoted to the actual design work.

Some of these boys may be sent in the evenings after a long day's work, and when they are hardly fit for serious study, to the nearest school of art, but in many cases the boys have small natural ability, and it is possible to teach them very little; and very few could appreciate the finer considerations involved by the study of the contemporary design of today. One cannot blame the schools of art for the material that is sent to them.

Careless recruitment for the art industries is at the bottom of many of our troubles, and manufacturers would do their firms a real service if they in future made reasonably certain that those whom they engage come to them with some sort of guarantee of ability, and that they have been tried out to some extent by attendance at an art school. Employers have said to me: "I like to take them straight from school at fourteen, and then I can break them in as I want them." Unfortunately, this is a wasteful method, as one manufacturer admitted to me that not one in six turned out well enough to be worth keeping, and certainly not worth putting into the design department.

Manufacturers must realize that they cannot have it both ways. They must either engage a really first-rate artist designer and take their courage in both hands, and trust him to do what he knows is right, as the Swedes have done with such conspicuous success, or pay more attention to recruitment and allow time off for their designers in the day-time to attend the school of art, or even to have organized trips to see such exhibitions of sound and modern work as may be available. It is the widening of the outlook which is so difficult. The art teacher himself, owing to the usual conditions of his appointment, has too little opportunity of getting up to London even from the provinces, and an occasional visit to the Continent is almost beyond his means.

I welcome W. A. R. Stringfellow's suggestion that "some weeks in every year should be spent in visiting the various guild centres throughout Europe," and as one who has occasionally been able to do so, I can most heartily endorse his opinion of the value and stimulus of such visits. I wish it were possible for this idea to become a part of the art teaching system for art industries, but it is so largely a matter of finance that I fear that little can be done, except by the visits of individuals at present.

I can assure W. A. R. Stringfellow that if he can hold a similar exhibition to that which he has mentioned, either in Leeds or Bradford, there would be no lack of interest. I can guarantee that more than "three students" would attend from the local schools of art.

DOUGLAS S. ANDREWS

Beguiling the Visitor!

SIR,—Karshish's hero's trick of carrying a roll of drawings reminds me of a flourishing architect in my student days. He had a collection of envelopes addressed to the Prince of Wales, the Archbishop of Canterbury, the Prime Minister, etc., and they were spread rather ostentatiously on his desk when a visitor arrived.

S. B. CAULFIELD

R.I.B.A. SCHOLARSHIPS

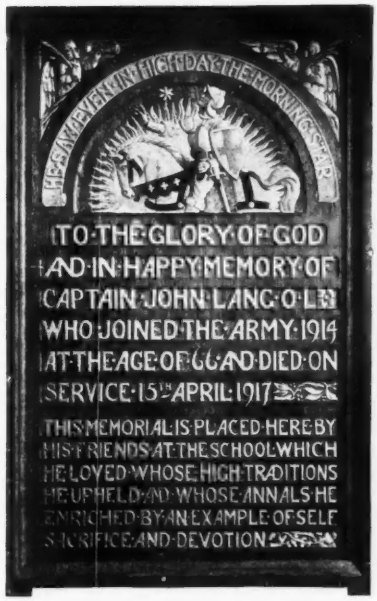
The R.I.B.A. announce that the following scholarships, each of £100 a year, have been renewed for a further period of one year: Mr. Hubert Bennett (School of Architecture, University of Manchester), Mr. Ralph Dickinson (Birmingham School of Architecture), Mr. F. W. Wright (Department of Architecture, University of Sheffield).

The Artists' General Benevolent Institution Maintenance Scholarship of £100 a year has been awarded to Mr. M. G. Gilling, of the Liverpool School of Architecture, University of Liverpool.

The Ralph Knott Memorial Maintenance Scholarship of £45, tenable at the Architectural Association School of Architecture, has been awarded to Mr. C. L. Sjostrom.

THE WORK OF SIR ROBERT LORIMER:

REVIEWED BY P. M. STRATTON



Three examples of oak war memorials designed by the late Sir Robert Lorimer.

THE work of design is under constant threat of dwindling into a game of Patience, where the player continues to turn up one card after another, and either fit them all into the required sequence or abandon the game. A great deal of present-day English work is a play game of this sort. An increasing amount of foreign modernist design gives no higher satisfaction than a Patience table when the cards have come out. The directly creative mind is so rare that a man like Sir Robert Lorimer has an importance out of all proportion to the amount of his work, and even to the quality of it. He becomes an incentive to countless individual efforts.

Mr. Christopher Hussey, in what is the most interesting part of his book, discloses the sources of Lorimer's inspiration. First, "he loved his country, his work, and the things with which it brought him into contact—rough stone and sweet-smelling wood ... the result is that the buildings live." During his boyhood his home was Kellie Castle, an old secluded stronghold in Fife, which his father restored. To young Lorimer it was a place nearer both enchantment and reality than Edinburgh, and it was haunted by kind masons and carpenters, who taught him the feel of materials and tools. Kellie made him an architect. He was apprenticed to Rowand Anderson for four years, and learnt the grammar of Gothic. He then passed to Bodley's office for eighteen months, and came under the influence which was strongest after Kellie, for he entered into the life of the arts and crafts movement at its centre, and grasped the management of colour and texture, and the meaning of the individuality of substances. By the time he left Bodley's he had made his soul as an artist.

His work, as Mr. Hussey shows, can be best divided, not chronologically, but into types—restorations, the English manner, Scottish houses, ecclesiastical and civic work, war memorials, crafts. But in this division there is much overlapping. Dunderave, for instance, he not only restored, but added to: a grim old castle on the shores of Loch Fyne, L-shaped on plan like an arrowhead, five stories high, crowned with steep roofs and stunted chimneys; this compact engine of war has all its character accentuated by the low horizontal masses of Lorimer's building (see page 535), planned to enclose a courtyard behind it. Within the new rooms are charming plasterwork by Thos. Beattie and Sam Wilson, and delicate bird's-eye maple panelling—these rooms are each of them separate works of art, as it were gifted children in one family.

So also Lorimer's English work includes Lympne Castle, which was to some extent a restoration; and Brackenbrough in Cumberland (see page 534). The latter work necessitated a long spreading plan entirely different from the close order of the Scottish large house. All the effects of light and shade have been set to amuse: the interminable fronts and incidents flow one out of another as in a picaresque novel; at the same time a general low skyline rules in the design. The detail of this work shows the Bodley influence before it had been finally incorporated in Lorimer's mature style. Hence, the church he built at Aldershot (see page 536) as late as 1926, is much more mature and individual. The intrinsic beauty of English bricks (the reds and the greys) is realized in a design proper only to brickwork, and the weaving of verticals and horizontals into a homogeneous plaid shows a rich and ingenious mind. Within, the dainty austerity, like grey clouds on snowy hills, fits the Scottish nature at its religion. For this interior is a frozen version of the St. Peter's Roman Catholic Church in Edinburgh, built in 1906-8 (see frontispiece to this issue). There are the same white arches and wagon-vaulted roof: in the earlier case the roof is a richer tint, the basilica is

A view of Dunrobin Castle, Sutherland, from the east (reconstructed 1915–19). Whilst occupied as an Auxiliary Naval Hospital in June, 1915, fire broke out; this was confined, however, to the compartments added to the castle by Sir Charles Barry between 1835 and 1850. The old part of the castle is perched on a steep declivity overhanging the sea. It is claimed to be the oldest house in Scotland continuously inhabited, and there is little doubt that the keep was originally built about 1275 by the first Earl of Sutherland.

The loggia and hall bay; and the ground-floor plan of Brackenbrough, Cumberland (reconstructed 1903).

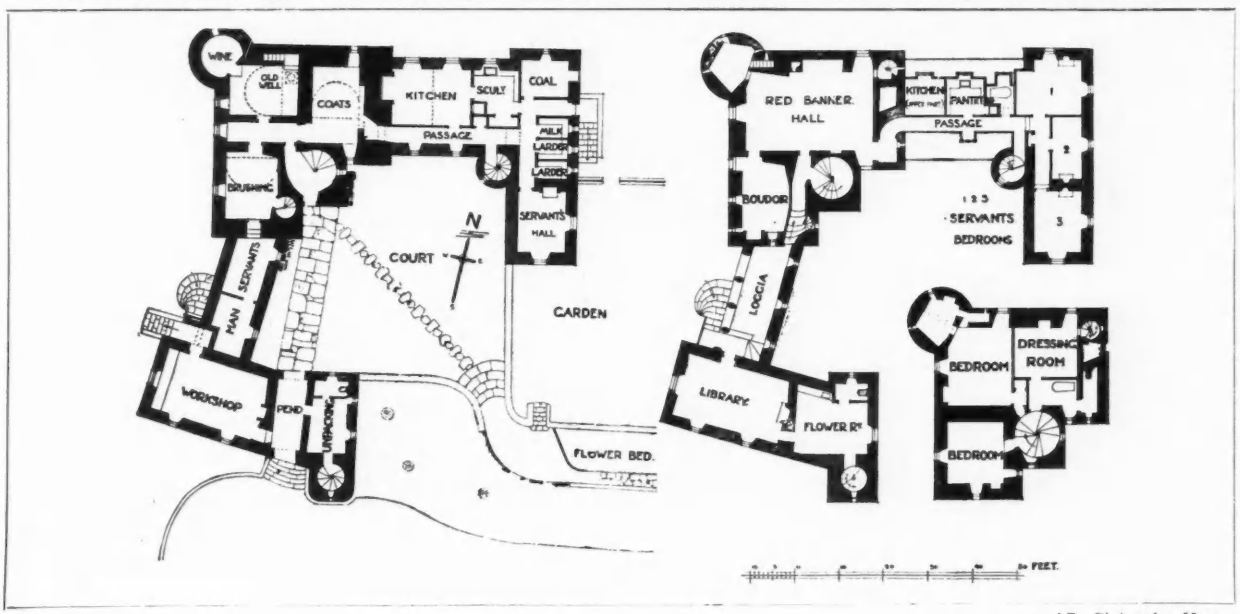
darker, and the whole is furnished and vivified by the crowded sanctuary. It was in the Thistle Chapel, 1909-11, and the Scottish National War Memorial, 1924-28, that Lorimer found his fullest expression—both works so well known and illustrated that there is no need to reproduce any of Mr. Hussey's excellent photographs. As he says, the War Memorial is open to criticism in the mingling of motives and styles, and yet, thanks to Lorimer's overpowering personality, it achieves unity and success, and was greeted by "the explosion of public praise and popular enthusiasm." Of Lorimer's minor war memorials there are endless examples, and those shown on page 533 give some idea of their variety; each was a different and a separate creative act.

Dunderave Castle, Argyll (reconstructed 1911–12), showing in the foreground the new buildings added by Lorimer.



[*By Christopher Hussey.*

Dunderave Castle: ground- and first-floor plans. In reconstructing the castle, the architect's problem was to provide a suitable kitchen wing and additional sitting-rooms without dwarfing the original tower (see photograph above). He had recourse to the method employed frequently in the past, namely, to convert a tower house into a courtyard house by the addition of low outbuildings, some of which should act as a gatehouse to the court.

St. Andrew's Presbyterian Church, Aldershot (1926–27) : one of the few buildings for which Lorimer used brick externally.

SOCIETIES AND INSTITUTIONS

Architecture and Decoration

Following are some extracts from the paper on "Some Opinions upon Architecture and Decoration," read by Mr. H. S. Goodhart-Rendel, F.R.I.B.A., at the Royal Institute on Saturday last.

I MUST beg those to whom "period" decoration seems a very dead horse to be patient while I remonstrate with those who may believe that something can still be done by flogging it. After all, it sounds plausible to ask, as many people do, why one should invent something that may be bad, when one can copy something that is good? It is no real answer to this question to say that copies are usually failures, since they can be indistinguishable from originals. It is also not a complete answer to say that copyism is unprogressive and cowardly, since a great many people resist progress and euphemize cowardice as "safety first."

To argue that the process of copying sterilizes artists and craftsmen carries little weight with those who consider that the crying need of modern art is birth control. To ask how to decide what to copy—ah! that gets nearer the true confutation: let us press that question home—when you say "Copy something that is good," what do you mean by "good"? Unconditionally "good" in all surroundings? Is there any such thing? Good as a background for your life, in spite of its having been made as a background for lives quite different from yours? Are you sure that that background won't make you look rather silly, or, shall we say, a little inconsequent? As good in combination with your modern clothes and gestures as it was with those of the people it rightfully belonged to? Is not that asking too much of even the most adaptable decoration? Well, good enough, then; it may or may not be good enough for many people; but those people have no reason to think very well of themselves.

Not that the uncompromising modernist has all right on his side. Novelty must be naturally generated—it cannot be made by a mere effort of will. Doing what nobody has done before may be only doing what nobody has been fool enough to do before. Our habits, our clothes, our speech, our very thoughts, are all composite of old and new, and will accord no better with exclusively new surroundings than with those that wholly imitate the past.

Because "period" decoration is no decoration at all, but merely a vulgar substitute for it, it does not follow that true decoration can have no style.

The better tendencies in the art of our day lead toward extreme economy of means. We suspect, often with justice, those who habitually use forms rich in associations, such as pilasters, pediments, traceries, crocketings, of greedy insensitiveness, of biting off more than they know how to chew. There are, however—and let us hope there always will be—some designers capable of handling the full architectural orchestra of traditional instruments with originality and mastery. Their opposites—the designers to whom a panel is licence and a moulding an orgy—are liable to save our pockets by the starvation of our appetite. We ask for architecture and they give us construction; we ask for decoration and they give us disinfection; we ask for furniture and they give us sanitary bins as cabinets and surgical appliances to sustain us when we sit.

I have suggested that domestic decoration is a domestic affair, that most men leave it to their wives, and that the wives select and arrange objects designed and made by other men. Perhaps I should have added then that when there is much to be done the wives are very apt to employ individuals or a firm trading as decorators, for of these people I have something to say. "Decorating," as practised today, is a complex trade, a little like architecture, a little like scene-painting, a little like millinery, a little like collecting, and a little like—decorating. It needs the skill of a draughtsman, an antiquarian, a shopkeeper, a diplomat and a first-class cook. And here I am going to be extremely disloyal to my own profession, and to say that if anybody expects the average architect to be able to compete with the skilled decorator at the decorator's particular game, he will be sadly disappointed.

Those of us who have studied and practised modern decoration know well how much time it has taken us that might equally have been devoted to pure architecture, and I think we should admit that those architects that have not so divided their energies, and that need the collaboration of a decorating specialist, may be anything but worse men than ourselves. At the present perhaps we have the advantage, since competent decorating specialists are exceedingly rare. I think, however, that what we should hope for is not increasing experience of decorating among architects so much as increasing experience of architecture among decorators. That this experience may be operative, also, it may be necessary for decorators to obtain a standing independent from shops with stock to dispose of.

In the opinions that I am now going to offer you upon the actual method of decoration I shall speak less as an architect than a decorator, and I shall therefore begin, as every decorator should, with the proviso that if a new building is in question the architect must be consulted on all points in which he regards himself as interested. This is a matter of policy as well as of courtesy—much better results can be got by architect and decorator together than by the decorator alone: unless, of course, the decorator is called in to correct the faults of the architecture—a painful possibility that delicacy forbids me to contemplate.

The decorator deals with three surfaces—those of ceiling, of walls, and of floor. Of these, the first two can be flat or curved. I do not think that even the most modern designer has yet made a curved floor. Floor and walls will normally be partially covered by furniture and people; the ceiling will normally be visible in its entirety. It therefore seems strange that in a house it is usually the last thing that anybody thinks of decorating. Floors, on the contrary, are apt to be over-decorated, whether by carpets or by patterns in marble or tile.

The first desideratum in the decoration of a floor seems to me to be unity; the second, subordination to the decoration of the walls.

When I said that the first desideratum in the decoration of a floor was unity, I hinted what I now avow—that I do not find any combination of rug and surround so satisfactory as an unbroken surface of one material. In hotels and restaurants this unbroken surface is essential; waiters cannot be trusted not to trip up over the edges of rugs laid across their paths. Although I prefer that the surface should be unbroken, I do not think that the colour should be so.

Before we consider the decoration of walls, we must examine the function that walls have to fulfil. I do not mean structural functions; those are only the concern of the decorator when they call for decorative emphasis, which they rarely do. I mean, on the contrary, the functions of their surfaces in our daily lives. Wall-surfaces make our indoor scenery, and are often required to do no more. They also provide the only vertical plane we have constantly before our eyes, and may be used for the display of things that otherwise must be stored and perhaps forgotten or mislaid. Again, they can give prominence to writings, whether edifying, like mottoes, or cautionary, like "Shut the Door," or "Mene, mene, tekel, upharsin." They can hold up bookshelves; they can provide a field for paintings; they can be dissimulated with mirrors.

Public buildings and the parade part of large houses are in a different case. Here, generally, some architecture will have come indoors, and strictly architectural decoration is too large a subject to be included in this random collection of remarks. It is a subject insufficiently studied nowadays; such intricate problems as the effective application of gilding, or the relations between colour and cast shadows do not seem to be even recognized as existing by the gentlemen who stipple and wipe us into modishness. You may or may not like the elaborate harmonies achieved by Crace, by William Morris, by Professor Aitchison, by Charles Kempe, but I do not think that you can deny that these men possessed professional skill and experience that makes the work of most decorators of today look rather amateurish in comparison.

My list of possible surfaces for ceilings will be a very short one. Stone-vaulted ceilings are too rare to need consideration, but imitations of their surface are fairly frequent in halls and passages. Wooden ceilings are commoner, and have every practical advantage over those of plaster when the construction of the ceiling is wooden too. From the first moment that plaster is suspended over our heads on the customary framework of laths, it is always trying to fall upon us, and not infrequently it succeeds in its aim. Fibrous plaster screwed up in slabs is less homicidal in temper, and for this reason is frequently used. Metal ceilings reverberate unpleasantly, and have not had the success that was predicted for them on their introduction. These are all the ceiling materials commonly available, and among them plaster, with all its disadvantage, holds the day.

I do not pretend to have enumerated all the pieces in the game of decoration, but I have probably mentioned enough to remind you what a complicated game it is. The object of the game is to give pleasure to onlookers, and there are as many ways of playing it as there are players. It is only the inexperienced that fancy it can be mastered by any infallible system; those who have played it longest play it with the greatest freedom.

I shall here offer in tabloid form one or two precepts I have made for myself from experiences of success and failure:

First.—The general tone of the floor must be definitely lighter or darker than the general tone of the ceiling, and the tone of the walls must either be identical with that of one or the other or intermediate between them. If this be a true rule, we shall discover from it that walls either lighter or darker than *both* floor *and* ceiling are inadmissible, and this is my opinion.

Second.—Never forget the colour of the wood your furniture is made of. People generally do. Mahogany is particularly liable to alter the effect of greens placed next to it, and walnut often makes mischief for tawny colours.

Third.—Always foresee the yellowing that oilpaint will undergo from time. Be chary in the use of that house-painter's panacea, the umber glaze, remembering that age will umber your colours still further.

Fourth.—Break down almost every paint you use with a suspicion of black. This sounds like flagrant quackery—and I daresay it is. Nevertheless, I recommend it from experience as a useful precaution against crudeness. If you can see easily that black has been added, you have put in too much.

Fifth.—Never rely on matching up oil and watercolour. If they are alike at first, they will speedily become different.

Sixth.—The one tint that should usually be barred for plain surfaces in a room is that of the ground of any patterned material adjoining them. If this precaution be neglected, the material will lose all solidity of effect, and the plain surface will look poor by the side of it.

Seventh.—Pick up the colour of your curtains in some objects farthest removed from the windows—cushions, covers or what not. Only so can you prevent a room looking lop-sided at night.

Eighth.—If your ceiling is pronouncedly coloured, always put a large piece of it in just above where you are trying the colours for your walls. The amount of mutual reflection between walls and ceiling is almost always underestimated.

Ninth.—Try your wall-colours upon a surface in half-shade, and, when you are satisfied, make an extra trial in full shade. Leave the unshaded surface to take care of itself.

Tenth.—Test everything by artificial light as you go on.

People tell you they dislike pattern, meaning that they dislike what they recognize as pattern.

They dislike flowery wallpapers, preferring stippled paint. They dislike stencilled diapers, preferring marbling or clouding. They dislike stamped leathers, preferring those with a natural grain. Yet stippling, marbling, clouding, and the grain of leather, are all patterns, if they only realized it. There are other people more ascetic still, who do make every surface as flat and unbroken as can be. They then almost invariably play every imaginable prank with trick-lighting, covering their flat surfaces with an extremely elaborate tracery of mingling shadows.

I do not think it matters much æsthetically whether a pattern of the negative kind be aimless and non-repeating like the streaks in graining or marbling, or systematic like a Chinese diaper. Since machines produce patterns very conveniently, I am inclined to think that mechanical patterns are a gift of progress that we are foolish to refuse. The more mechanical a machine-made pattern appears, the better it will be, and the better suited to its negative function. On surfaces that both by day and by night will be crossed by shadows the decorator must use his discretion whether to break those shadows by pattern, or to leave them alone as an element in his design. On surfaces in full light, pattern of some sort is usually desirable, unless the scale of those surfaces is small in relation to the size of the room.

I have already said a good deal about furniture by implication, since form, colour and pattern are as much its elements as they are those of decoration. There is no time now to talk about cabinet-making and chair-making, both large subjects. The cabinets and chairs of houses always seem to me better regarded as the personal effects of successive owners than as integral parts of the decoration: no doubt they should be chosen to harmonize with their surroundings, but over-scrupulosity concerning this can easily lead to the vulgarity of what is known as "correct" decoration. To non-domestic buildings different laws apply; the harmony that should rule the colour and form of their walls must not stop short of the movable objects within those walls. Non-domestic buildings also must be rigorously rationed as to furniture—nothing essentially unnecessary should find a place in them. I do not think this is true in houses—we do not banish all essentially unnecessary people from our families, and I doubt if we are justified in banishing all essentially unnecessary objects from the family scene. Probably shortage of domestic labour will prevent us from contriving again those elaborate obstacle-races from door to fireplace in which the Edwardians delighted; silver-tables, jardinières, photograph-screens and milking stools have had their day.

I trust, however, that we may never come to the opposite extreme of frugality urged upon us by some theorists, who seem to believe, that everything not constantly in use should be regarded as litter and treated accordingly. I venture to suggest, indeed, that what is needed nowadays in architecture and decoration is a little more litter all round—and I am glad to see that in feminine costume at least the word elegance is ceasing to be one of no meaning. The combination of elegance with economy is a problem forced upon us now, as many times before—and I trust that it may meet with a happy solution.

Architectural Expression

Below is summarized the paper on "The Development of Architectural Expression," read by Mr. H. Austen Hall, F.R.I.B.A., at a meeting of the Sheffield Society of Architects held on October 8.

IT is convenient, perhaps, to commence with a short survey of recent architectural history; and for this purpose I will begin with a reference to Somerset House. Sir William Chambers, as you know, was the most scholarly architect of his time, and we can appreciate the greatness of his principal work. But the conception seems to me to be architectural and formal rather than human and intimate. His mind was concerned with the splendid site he had to develop, rather than with the lives of the people who were to occupy these great offices. All the things on which we set such value today, such as light and air, convenient access, and what is called direct planning, are absent from the scheme. But, fortunately, the age of planning solely for external effect is past, and we now have buildings in this country second to none for convenience and good contrivances. The advance is truly enormous, but I think it is one-sided. The skill of contrivance—of making convenience and order the first consideration—has not been well-balanced by a proportionate degree of imagination in external expression. It is as if the stark reasoning of the modern mind was unfitted, by that very thing, for the more delicate imaginings of the heart. For this reason we see numerous admirable plans and fewer elevations that can be called interesting. People will say that it is enough for the elevation to express the plan. I do not think it is enough, by any means.

Speaking at the R.I.B.A. recently, Sir W. Rothenstein said that to be a good critic it is not necessary to have a knowledge of painting. He said: "Let the critic concentrate on his subject and he will find ideas coming to him—just as the painter does when he concentrates on his subject." The art of concentration brings a matter into focus. It also brings a train of ideas from sources unknown to us, but which seem to abound when we tune in to the problem before us.

Sir J. J. Thompson, speaking recently at a British Association meeting, said that the important moments are the intervals of thought, for it is only when thought is interrupted that ideas can come—a sort of prepared vacancy allowing the subconscious mind to develop the themes upon which the conscious mind has been encouraged to dwell.

There is no doubt that modern planning is the result of laborious concentration, just as most modern elevations are evidence of the lack of it. Perhaps that is why tradition is usually followed. But tradition is only the path, not the goal. The path runs forward as well as behind us, as the compass points south as well as north. To say that traditional forms lead nowhere is absurd, for the whole history of art through the ages contradicts such a saying. There is continuity in all expressions whatever of the human spirit. Tradition, if it conveys nothing from one period to another, is misnamed. I am sure the majority of students will go forward and do better on traditional lines.

But, you will say, what are we to do with the men in the fairway—the leaders of thought whose feet are frost-bitten with the past, and who repeat and repeat with varying degrees of badness? How are we to get on unless we leave them entirely alone? I would suggest a way to you. This: that there are more ways than one of playing a stymie. It cannot help you to give up the hole, or play on to another green. There is no need to look far for a precedent in such a case as ours today. The cathedral builders, tired of Norman work, did not hesitate to bring the new foreign manner into this country, where it flourished exceedingly, and produced a flower of its own, quite native and indigenous to our shores in its ultimate expression. The Italian fashion of Inigo Jones soon became familiar and suitable. Wren was no mean judge of these things, and he considered it was the best architectural expression of his times and so employed it in the national Cathedral; but while he was doing this great work a new development was taking place—the Dutch influence. His master mind felt the strength of that influence, and to it we owe the spires of our City churches, as well as countless lovely houses all over England, including Hampton Court.

After Wren we have the Classical revival, a purer form of design from the birthplace of pure form, in Greece, not Italy. But with the advent of the Gothic revival, something seems to have gone wrong. The artificial turn towards romantic form had no such result as we have catalogued on the previous occasions, and a period of almost unrelieved boredom ensued. Even great men such as Street were devitalized. Out of the murk and darkness of the Gothic revival, as such a period of make-believe is unhappily named, emerges one bright star—and that is Norman Shaw. Do we realize that we all owe our salvation to one man, and that his influence today is still predominant?

And what is our position today? We find that architects have reached a limit, apparently, to the possibilities of the Norman Shaw tradition. Are we then going to make the mistake of Gothic revivalists, and skip a few centuries of thought as if they had never been, and wear fancy dress? I don't think so. But there is another mistake the Gothic people of 1850 made. They closed their eyes to foreign thought, and tried to get life out of their own valley of dry bones. Their predecessors, you notice, all took the world movements of their times and developed them in English soil. It is in this respect that I would follow them now—not being untraditional, but grafting the English oak with pure and fresh ideas. History teaches us that only a wise and prudent understanding of world tendencies leads to great results—just as we owe our national vitality to a mingling of many races in our blood.

I would, therefore, found my new expression on the work of a country that is vital and satisfying in its art, such as Sweden, for I feel that there we have mutual sympathy that is both racial and æsthetic.

And now let us consider the modern point of view in closer detail. Take a Georgian or period door of 150 years ago, and a modern door of laminated board covered with fine veneer. The first thing that strikes us is the absence of panelling in the latter. Why no panelling? The answer is, of course, that it is no longer necessary for the construction. Architecture and the decorative arts differ from painting and sculpture in this, that while the materials for the last two have remained practically unaltered through the centuries, the architect's materials have been profoundly altered. The whole history of architectural development is not so much social and cultural as structural.

I have chosen to talk to you about doors because the illustration serves so well to explain what is happening in the development of all architectural expression. The door gives us the human scale in building—and what I have said about door design applies equally to rooms of which doors form a part—and so of the whole building. The cornices are disappearing inside and outside our buildings, and a new interest is being given to our skylines, which are much higher than the older buildings to which we were accustomed. The windows are found to need no ornament. As we are realizing better the blessings of light and air, we find it is these which determine the size and position of windows rather than the fixed rules of the Italian masters.

It is an entirely wholesome and salutary point of view, but being also uncompromising it frequently leads to artistic conflicts from sheer honesty of expression.

IN THAT CONTINGENCY

The following abstracts of inquiries represent a number of those recently submitted to the Building Research Station. The information given in the replies quoted is based on available knowledge. It has to be borne in mind that further scientific investigations may in the course of time indicate directions in which the replies might be supplemented or modified. Moreover, the replies relate to the specific subject of each inquiry, and are not necessarily suitable for application to all similar problems. Crown Copyright Reserved.

Surface Disintegration of Facing Bricks

AN architect wished to know the cause of the deterioration of facing bricks in the walls of a country house, and desired advice on remedial measures. The house was erected some nine years ago, and for the past two years there has been continual disintegration and spalling of the exposed faces of the bricks.

The specimen brick submitted appears somewhat soft and friable on all faces, and would be judged to be underburnt. Parts of the outer face of the brick are spalled off, and under the remaining portions of the original face there is a white deposit, which is not to be found on the unweathered faces.

A layer of brick $\frac{1}{8}$ in. thick was removed from the weathered and inner faces of the brick for examination, and soluble salts were extracted from these layers in the following proportions by weight :

	Weathered Face.	Unweathered Face.
	Per cent.	Per cent.
Total Soluble Salts	4.89	0.74
Sulphur Trioxide (SO_3)	2.42	0.30

It was found that the soluble salts consisted mainly of sodium sulphate, although sulphates of magnesium, potassium and calcium were also present. Tests showed the brick to possess medium resistance to crystallization of sodium sulphate.

From the foregoing tests it would appear that the spalling of the face of the bricks was due to the crystallization of sodium sulphate. The origin of the salts could not be traced with certainty, since only one brick was tested and no unused bricks were available. Soluble salts in brickwork may be derived from the soil, from the mortar, from other materials in contact with the bricks, or from the bricks themselves. In the case of a normal brick wall, with dampcourse and not in contact with other materials, the probability is that the high sodium sulphate content would have been originally present in the bricks. The soluble salt content of bricks may often be decreased by harder burning.

It is to be regretted that there is little that can be done to arrest decay of this sort. The most useful remedy is copious washing with a hose at fairly frequent intervals, with a view to reducing the concentration of soluble salts in the face of the bricks. Whether the trouble can be entirely overcome in this way must depend to a considerable extent on the origin of the salts and the amount available.

Transmission of Sound through Glazing

An architect requested the views of the Building Research Station on the problem of transmission of sound through glazing.

The window presents a difficult problem in sound insulating design, and it is necessary, when considering it, to bear in mind the three ways in which air-borne sound may be transmitted through windows, (*a*) through the body of the materials of which the window is constructed ; (*b*) through interstices, *e.g.*, the joint between glass and frame, or between frame and masonry, and (*c*) by vibration of the window as a whole, or of the individual panes of glass.

As regards (*a*), no special type of glass is known to have special merits as a sound insulator, but it may be said that the greater the weight per unit area the better. The possibility of transmission through interstices (*b*) can be avoided, of course, by good construction and careful attention to detail. It is desirable to provide for artificial ventilation to take the place of open windows during the period when rooms reserved for important meetings are in occupation.

The bulk of the sound transmitted through windows is undoubtedly due to (*c*), the small ratio of thickness to area in individual panes, and the window as a whole making the membrane effect predominant. In the first place, therefore, it is important to employ frames as heavy and rigid as is reasonably possible. In windows of constant overall size, the ones having the smaller panes have been found to transmit less sound.

Double glazing is advantageous when the glass is fixed in separate frames, preferably with the panes bedded in saddler's felt or rubber. There is practically no advantage to be gained by glazing in the same frame with, say, two $\frac{1}{8}$-in. panes placed very near to one another, over glazing with one $\frac{1}{4}$-in. pane; there is indeed, not very much advantage in two $\frac{1}{8}$-in. panes over a single $\frac{1}{8}$-in. pane if they are fixed in the same sash and very close together. The advantage of the air cushion appears, indeed, to be largely dependent on the thickness of the air layer, and a thickness of less than about 1 in. scarcely gives sufficient improvement to warrant the expense of double glazing. Investigations have indicated that a large measure of the value of double glazing is reached if about 2 ins. separates the panes. In all forms of double glazing the membrane effects will be minimized by making the separate membranes composing the window dissimilar.

It will be seen, then, that to obtain really good sound insulating qualities in the windows it would be desirable to employ double glazing in separate and dissimilar rigid frames, the thicker the glass and the smaller the pane size the better. If a double frame is out of the question, and it is impracticable to place the double glazing in the one frame at something approaching 2 ins. apart, then reliance might as well be placed on single sheets of as great a thickness as is reasonable, and a rigid frame.

Treatment of Corroded Water Main

The architect of a local authority requested the advice of the Station in the following circumstances. In connection with institution buildings a 3-in. iron water main was laid for the purpose of fire protection. Water had not been drawn from this main for a number of years, and it was found recently that the supply of water through the main was seriously reduced, the pipes being partly blocked by corroded metal on the inside. Failing some form of treatment to clear the pipes, the authority would be obliged to renew the main.

The usual treatment adopted for the protection of metal water mains is a coating of a bituminous preparation applied hot; this, however, would not be expected to provide a permanent remedy against corrosion. It is understood that non-corrosive pipes, such as asbestos cement pipes or pipes of reinforced concrete, are now coming into use, although the latter type are mostly confined to pipes of large dimensions.

In the case of a water main, where little, if any, water is ordinarily drawn off, it would be anticipated that even though the supply of water had been seriously reduced, the actual loss of metal from the walls of the pipes might be comparatively slight. If this were found to be the case, and there is no sign of pitting of the metal by corrosion to such an extent as seriously to reduce the thickness of metal, it might be worth while to consider the possibility of cleaning the pipes by means of acid to remove the " furring " on the inside.

By the addition of substances generally referred to as inhibitors, it is possible to prepare an acid solution which will dissolve rust and lime scale without serious attack upon metal. Inhibitors

have been used for pickling steel for many years, and they have recently been applied in America for cleaning out rust-tuberculated pipe systems. By such methods it might be possible to restore the mains at a cost trifling in comparison with the cost of renewal. So far as is known, this method has not been used in this country. In order that the operations may be performed, it is necessary to cut off the system from the mains at the lowest point; to introduce an acid at the top of the system so as to fill it completely; and to provide means for flushing out the system from the top afterwards by a strong current of water to wash out loosened tuberculation and deposits.

A suitable solution would be ten gallons commercial hydrochloric acid to which is added ten gallons of hot water and 1 lb. quinoline.

The cost of the quinoline is about 17s. 6d. This solution would treat about sixty feet of pipe. It would be well as a preliminary to test a short length of pipe as an experiment. The solution should be made up in a wooden vat, and care should be taken in filling the pipe to avoid danger from bubbling up of acid due to slight evolution of gas during treatment.

The solution should be left in the pipe for eight to twelve hours.

A description of the treatment of a pipe system is given in *Chemical and Metallurgical Engineering*, Volume 34, 1927, page 423.

Coarse Aggregate for use in Concrete

A civil engineer submitted a sample of the coarse aggregate proposed to be used in concrete work in which he was interested. The particular point on which information was required was whether the presence of a considerable proportion of fine dust should be admissible.

The examination of the sample of broken granite submitted showed that over 50 per cent. by weight passed through a No. 4 ($\frac{3}{16}$-in.) sieve, and that a considerable proportion of fine dust was present.

The presence of dust to the extent of more than one or two per cent. is definitely harmful to concrete. When the dry materials contain an excess of fine particles, a considerable increase in the quantity of mixing water is necessary, and a decrease in the strength of the finished concrete will result.

If, as stated, the granite is to be combined with cement and sand in the proportions of 1 : 2 : 4 then an apparently oversanded mix will result, and will lead to an excessive water requirement, lack of workability and low strength. If the granite be used without sand, merely mixing the cement and granite in the ratio of 1 : 6, then a good strength will be obtained, although the concrete will not be particularly workable. If the granite is first sieved on a No. 4 sieve, and only the retained material used with ordinary sand, then a good concrete could be made; the removal of the fine dust from the granite (material passing a No. 30 sieve) would not be sufficient to improve the quality of the concrete.

COMPETITIONS OPEN

October 31.—Sending-in day. Proposed Tuberculosis Hospital, Sully, near Cardiff, for the Welsh National Memorial Hospital. Assessors: C. E. Elcock, F.R.I.B.A., and T. Alwyn Lloyd, F.R.I.B.A. Premiums: £400, £300, £175 and £100. Conditions were obtainable from F. J. Alban, Memorial Hospital, Cardiff. (Deposit £2 2s.)

November 23.—Sending-in day. New Junior and Infants' School, Farnborough Road, Birkdale, for the Southport Corporation. Limited to architects practising or residing in the County of Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £100, £75 and £50. Conditions, etc., obtainable from the Director of Education, 1 Eastbank Street, Southport. (Deposit £1 1s.)

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor: Sydney Tatchell, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from F. L. Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius of Liverpool Town Hall. Assessor: A. H. Moberly, F.R.I.B.A. Premiums: £200, £100, and £50. Conditions, etc., obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

December 31.—Sending-in day. Latest date for conditions: September 31. Proposed New Town Hall and Municipal Building, for the Walthamstow Corporation. Assessor: H. Austen Hall, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Conditions, etc., obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

January 1, 1932.—Sending-in day. Proposed Church at Low Shiregreen, Sheffield, in connection with the Bishop of Sheffield's 100,000 guineas appeal (limited to architects with an office in the Sheffield Diocese). Assessor: C. C. Thompson, F.R.I.B.A. Full particulars obtainable from the Hon. Secretary, Sheffield South Yorkshire and District Society of Architects and Surveyors, 15 St. James' Row, Sheffield.

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors: Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium: £500; also a further amount of £750 will be awarded to other designs according to merit.

THE ARCHITECTS' DIARY

WEDNESDAY, OCTOBER 21

GARDEN CITIES AND TOWN PLANNING ASSOCIATION. Housing and town planning tour to Manchester and Liverpool. Departure to Manchester from Euston at 6.5 p.m. **6.5 p.m.**

INSTITUTE OF FUEL. Annual Dinner and Dance, to be held at the Connaught Rooms, Great Queen Street, W.C.2. Sir Hugo Hirst, BT., will preside. 6.45 for 7.15 p.m. **7.15 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Early Renaissance in Northern Italy." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

SCOTTISH IDEAL HOME EXHIBITION. At Kelvin Hall, Glasgow. Until October 24.

THURSDAY, OCTOBER 22

GARDEN CITIES AND TOWN PLANNING ASSOCIATION. At the Town Hall, Manchester. Lecture dealing with the activities of the Corporation with regard to housing, etc. 10 a.m. Luncheon (by invitation of the Corporation). 12.45 p.m. Tour of slum areas, housing estates and town-planning roads. 2 p.m. Reception in the City Art Gallery. 8 p.m. **10 a.m.**

THANET SCHOOL OF ART LECTURES ON ARCHITECTURE. At Chatham House School, Ramsgate. "The Splendours of Greece." By R. Goulburn Lovell, A.R.I.B.A. **7.45 p.m.**

FRIDAY, OCTOBER 23

GARDEN CITIES AND TOWN PLANNING ASSOCIATION. At the Municipal Buildings, Liverpool. Address by the Chairman of the Housing Committee on the work of the Liverpool Housing Committee. 10.30 a.m. Visit to Springwood Estate. 12 noon. Luncheon at Childwall. 1 p.m. Visit to housing estates. 2.30 p.m. **10.30 a.m.**

LONDON SOCIETY. Visit to the Chelsea Royal Hospital, Royal Hospital Road, S.W.3. **2.30 p.m.**

SATURDAY, OCTOBER 24

Sunrise, 6.37 a.m. Sunset, 4.51 p.m.

GARDEN CITIES AND TOWN PLANNING ASSOCIATION. At Liverpool. Visit to slum-clearance areas. 10 a.m. Return to London at 2.5 p.m., arriving at Euston at 6 p.m. **10 a.m.**

R.I.B.A., 9 Conduit Street, W.1. Third of four non-technical lectures. "Tendencies in very Modern Buildings." A. S. G. Butler, F.R.I.B.A. Chairman: Sir Richard Paget, BT., HON. A.R.I.B.A. **3 p.m.**

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Second of five non-technical lectures on Present-day Architecture. "Furnishing and Decorating the House." By Edward Maufe, M.A., F.R.I.B.A. **3 p.m.**

TUESDAY, OCTOBER 27

KING'S COLLEGE, Strand, W.C.2. Third of nine public lectures on Gothic Art. "French Gothic: Paris, Chartres, Amiens, etc." By Rev. Dr. Percy Dearmer. **5.30 p.m.**

LONDON SOCIETY. Visit to "Atlanta" Women's Engineering Workshops, 1 and 3 Brixton Road, S.W.9. **3 p.m.**

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS. London and Home Counties Branch. At 1 Wilbraham Place, S.W.1. "Architectural Acoustics." By C. W. Glover, L.R.I.B.A. **7 p.m.**

WEDNESDAY, OCTOBER 28

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Palaces and Villas of Rome." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

THURSDAY, OCTOBER 29

THANET SCHOOL OF ART LECTURES ON ARCHITECTURE. At Chatham House School, Ramsgate. "The Roman Empire." By R. Goulburn Lovell, A.R.I.B.A. **7.45 p.m.**

SATURDAY, OCTOBER 31

Sunrise, 6.49 a.m. Sunset, 4.38 p.m.

R.I.B.A., 9 Conduit Street, W.1. Last of four non-technical lectures. "The Uses of An Architect." By H. B. Creswell, F.R.I.B.A. Chairman: Charles Marriott, HON. A.R.I.B.A. **3 p.m.**

MONDAY, NOVEMBER 2

R.I.B.A., 9 Conduit Street, W.1. Inaugural Meeting: President's address. **9 p.m.**

TUESDAY, NOVEMBER 3

KING'S COLLEGE, Strand, W.C.2. Fourth of nine public lectures on Gothic Art. "Symbolism and Iconography." By Rev. Dr. Percy Dearmer. **5.30 p.m.**

INSTITUTE OF LANDSCAPE ARCHITECTS. At the Royal Horticultural Hall, Westminster, S.W.1. Presidential Address. **3.30 p.m.**

WEDNESDAY, NOVEMBER 4

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "St. Peter's Cathedral and the Vatican, Rome." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

THURSDAY, NOVEMBER 5

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Hardwoods." By Alexander Howard. **7.30 p.m.**

SOCIETY OF ANTIQUARIES, Burlington House, W.1. "Further Excavations on Macedonian Sites." By W. A. Heurtley. Also "Recent Discoveries at Vinca by Dr. M. Vassito." By Professor J. L. Myres, F.S.A. **8 p.m.**

TRADE NOTES

In order to demonstrate the suitability of Duresco paint for the treatment of building exteriors, the "inset" advertisement of the Silicate Paint Company (J. B. Orr & Co., Ltd.), of Charlton, S.E.7, in this issue of THE ARCHITECTS' JOURNAL, has been specially printed on paper with an actual Duresco surface. This unique method of advertising should prove of great value to our readers, because, by it, they are afforded the opportunity of judging from the actual advertisement, the relative merits of Duresco paint for its specified purpose.

*

In the *Cult of Colour*, a new brochure recently issued by the White Lead Publicity Bureau, of 36–37 King Street, E.C.2, much interesting information is given concerning colour and comfort in home decoration. Four of the eight decorative schemes illustrated in the brochure, all in colour, were prepared for the stand of the White Lead Publicity Bureau at the Decorators' Exhibition, held at Newcastle-on-Tyne last month. The designs are for a dining-room, sun parlour, bathroom and nursery. The remaining four designs illustrated are for other typical rooms of the modern house: the lounge, entrance hall, a bedroom, and the kitchen. The whole of the painting in the colour schemes described has been executed in white lead paints, conforming to the quality standard of the British Standard Association's specification. The colours have also been taken from the British Standard schedule of colours, issued by the same Association. A feature of the Bureau is a special studio service for the preparation of colour designs.

*

Messrs. Lumbys, Ltd., of Greetland Boiler Works, Halifax, have recently issued a leaflet illustrating, by means of sectional drawings, their new series of sectional cast boilers. Among the many advantages claimed for the new models are a more direct fire surface, a larger fire-box capacity, and a larger waterway over the crown of the fire-box. The boilers are suitable for oil fuel, and it is said that they can be banked for twelve hours.

*

In order to mark the occasion of the second International Congress of the International Commission on Illumination, held in Great Britain last month, the British Commercial Gas Association recently issued a brochure entitled *Daylight by Night*, containing illustrations and descriptions of some of the modern installations of gas lighting in the more important thoroughfares of Great Britain. The sixty-four illustrations—five of which are reproduced in colour from renderings by Mr. William Monk, R.E.—serve to prove how gas is used with brilliant effect to light the streets of London, the main roads of provincial cities, and the promenades of fashionable spas and seaside resorts. It is pointed out in the introduction to the book that a recent investigation into mileage showed that four-fifths of the streets in Great Britain are illuminated by gas.

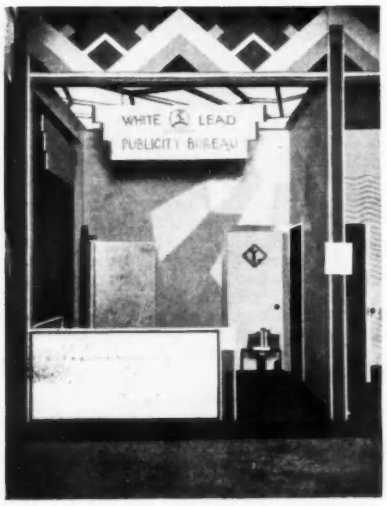
*

The Midland Electric Mfg. Co., Ltd., of Birmingham, have just issued a catalogue in which they illustrate and describe the full range of their manufactures. In addition to the Glasgow-Rex and Memrex series of switches and combined switches and fuses, there are also illustrated a number of new designs, including the Memota motor control gear and the Memkuka cooker control unit, etc. Much useful information in connection with public regulations, as applied to the installation of switch and fuse gear is given; together with a number of tables dealing with cable capacity, fuse wire, wiring of motors, etc. The catalogue may be obtained, free of charge, on application to the Company.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

Town Hall and Municipal Buildings, Wimbledon, S.W. (pages 522–526). General contractors, Galbraith Bros., Ltd. Sub-contractors: Dorman Long & Co., Ltd., constructional steelwork; Richard Hill & Co., Ltd., steel fabric reinforcement to solid concrete floors; Caxton Floors, Ltd., hollow tile floors; Crittall Manufacturing Co., Ltd., metal windows; W. H. Heywood & Co., Ltd., roof glazing; Limmer and Trinidad Lake Asphalt Co., Ltd., asphalt work; J. C. Edwards (Ruabon), Ltd., terra-cotta ridges and hip tiles; F. Braby & Co., Ltd., copper covering to dormers; Doulton & Co., Ltd., sanitary fittings; J. Whitehead and Sons, Ltd., marble wall finishings; Diespeker & Co., Ltd., terrazzo floor finish; Hollis Bros. & Co., Ltd., wood-block floors; Gilbert Seale and Son, Ltd., fibrous plasterwork and stone and wood carving; Veronese Co., reconstructed stone dressings to Town Hall; F. Morton Junr. & Co., spring floor in public hall; Benham and Sons, Ltd., heating and ventilating installations; G. E. Taylor & Co., electric lighting installation; Cashmore Art Workers, steel domes and leaded lights; Morris-Singer Co., ornamental ironwork; W. Macfarlane & Co., gates and railings; S. Elliott and Sons (Reading), Ltd., revolving doors; Smith, Major and Stevens, Ltd., electric lifts; Dreadnought Fireproof Doors, Ltd., fireproof doors; Gent & Co., electric clocks; Art Pavements and Decorations, Ltd., wall tiling; W. and R. Leggott, Ltd., locks and door furniture; J. Gibbons, Ltd., door springs; Pyrene Co., Ltd., fire appliances; Osler and Faraday, Ltd., electric light fittings; Bromilow and Edwards, Ltd., organ lift; Turner Lord & Co., furniture, chairs and tables; Elys, Ltd., soft furnishings; Hampton and Sons, Ltd., carpets and floor coverings; J. Compton Organ Co., Ltd., organ.



The stand of the White Lead Publicity Bureau, at the Decorators' Exhibition, held at Newcastle-on-Tyne last month.

Salt Union Building, Stoke Prior, Worcestershire (pages 527–529). General contractors, J. and A. Brazier, Ltd. Sub-contractors: Val de Travers Asphalte Paving Co., Ltd., asphalt and waterproofing materials; Siegwart Fireproof Floor Co., Ltd., reinforced concrete, fireproof construction, and special roofings; Empire Stone Co., Ltd., artificial stone; Charles Wade & Co., Ltd., structural steel; Pilkington Bros., Ltd., Vita glass; Acme Paving and Flooring Co. (1904), Ltd., wood-block flooring; W. Matthews and Son, central heating; Parker, Winder and Achurch, Ltd., sanitary and kitchen fittings, grates, tiling and mantels; Hope's Heating and Lighting, Ltd., electric wiring and electric light fixtures; A. Brown & Co., door furniture; Henry Hope and Sons, Ltd., cast-lead letters, casements and window furniture; Dictaphone Co., Ltd., internal telephones; John Booth and Sons, fireproof doors; Walter Macfarlane & Co., Ltd., ornamental cast-iron gates, railing and folding gates; John Boulton, marble; A. Brown & Co., cloakroom fittings.

In the list of contractors for the New Hostel for Students, Wotton House, Glos., illustrated in the last issue of the JOURNAL, the name of the Fawcett Construction Co., Ltd., who supplied and erected the fireproof floors over the kitchens and corridors, was inadvertently omitted.

ANNOUNCEMENTS

Owing to the forthcoming demolition of premises in New Street, Mr. Arthur J. Wood, F.R.I.B.A., has removed his office to 5 Grey Friars, Leicester. Telephone No.: Leicester 5285.

Mr. T. J. Cahill, B.A., has been appointed Assistant Lecturer in Architecture at Armstrong College, University of Durham. He has had professional experience both in Manchester and London.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The BARKING Corporation is to utilize sixteen acres of land in Movers Lane for the erection of houses.

P

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

BATHING BEACH AT WANNSEE, BERLIN

SOME FURTHER DETAILS TAKEN FROM THE BUILDINGS ALREADY ERECTED

[Martin Wagner and Richard Ermisch, Architects.

THE TERRACE FACING THE BEACH, AND ONE OF THE STAIRWAYS

AS stated in the supplement with the issue for October 7, devoted to this subject, the dressing pavilions are connected by a covered way, with several stairways leading up to the terrace above. Illustrations of both features are now given.

The covered way makes a useful refuge in sudden downpours, and also binds in an effective architectural way the numerous single blocks.

The buildings are constructed on steel framework, part of which is left showing, though most of it is covered with bright yellow clinker bricks to tone with the sandy beach. All visible ironwork and the woodwork to the windows and roof are painted white, so that the general appearance throughout is bright and clean.

The interiors are treated in the same way.

The entire construction of this well-coordinated group of buildings is solid, yet simple and cheap, neat and functional. From the broad outline to the last detail, the scheme reveals sure grasp of the requirements for a populous pleasure centre of up-to-date character.

THE WINDOW FEATURE TO THE JUVENILE READING ROOM, HENDON CENTRAL LIBRARY

THE above photograph and the architect's detail drawings reproduced overleaf show a new mode of ornamenting a façade: by the introduction of a combined carved window-head and half-domed niche. There are two of these windows, one on each side of the main entrance to the library, as will be seen from the general view on the last page of this supplement. A. H. Wilkinson executed the carving. The library was fully illustrated and described in "The Architects' Journal" for May 27, 1931.

VIADUCTS IN CONCRETE

1. *COLLIERY VIADUCT SIDING, SEUFTENBERG, GERMANY.*

By courtesy of Bauunternehmung Dyckerhoff and Widmann A.-G., Wiesbaden-Biebrich.]

LIKE the great Roman aqueducts which were their prototypes, modern concrete viaducts are impressive by reason of the almost metrical swing of their repetitive rhythms.

The railway brought the viaduct into its own again—more often as a drab sequence of yellow-brick arches than of stately stone piers. Today, the motor road is availing itself of the same model in forms peculiar to concrete. Compared with Continental countries we have still few major examples of concrete construction to our credit, but the Lea Valley Viaduct on the North Circular Road (figure 4) is a fine outstanding exception. Like figures 3 and 5, this is really the prolongation of an ordinary river bridge across a marshy valley bottom liable to be flooded for considerable periods at a time.

Figures 2 and 5 are railway viaducts, 479 and 328 metres long, respectively. Figure 1 is a rather peculiar type of colliery siding. In common with figure 5 it has solid piers; whereas the platform of figure 2 (conspicuously zigzagged with expansion joints) is raised on splayed, peg-top trestles, and that of figure 4 on groups of pile-like columns. All four have rectangular-shaped arches.

Figure 3, which follows traditional elliptical-arch design, though with much flatter spans than would be possible in masonry, was the subject of a limited competition among leading German architects. Since then the plans have twice been altered. At present it consists of twelve arches with a total length of 380 metres. From right to left the first three measure 29·45, 40·75 and 29·45 metres; while the remaining nine (most of which do not appear in the photograph) vary from 22 to 28 metres. This viaduct is shortly to be extended a further 100 metres on five additional arches; while the width of the platform is to be increased from 12 to 18 metres. The two 1·50 metre wide pavements will be taken into the roadway, and replaced by others, double their existing breadth, which are to be cantilevered out from the parapet.

CONTROL OF ELEVATIONS

THE first thing that leaps to the mind when this subject is discussed by architects is—whose elevations? Are we speaking of the worst forms of rural desecration, of urban vulgarity, picturedromes and the like, or of more socially exalted buildings?

By what standards are the officials of urban and local authorities to "criticize, approve, or reject plans and elevations for all buildings"?

Are these same officials to use their critical faculties as part of a considered plan of street architecture, arising out of the town plan for the place as a whole? On what are their judgments of the fitness of material to be based? To what criteria will they turn? From what reservoir of knowledge, artistic experience and sensitiveness to architectural form will they draw in pursuance of their high, their magnificent, calling? What is their taste? Where is their education? And who, over the length and breadth of England, are they?

We know, of course, who they are, and that, for all but the officials of a few large cities, the Architects' Advisory Panels are set up to supplement the actual want of knowledge and judgment which the Bath Clause and the Town and Country Planning Bill presuppose so plenteously to exist.

But is not the whole machinery of this control, unless it is to apply ONLY to the lowest forms of unlearned building, constructed to work only in retrospect?

What standards of architectural taste and fitness reside in this country are to be found nearly entirely among architects, and even with them they are insecure and transient. But at what stage in the machinery of this control is this taste and judgment applied, and with what degree of finality? The answer must be that the architect's knowledge is called for at the latter end, and has a moral and persuasive force only.

Or, again, at what stage in the design of a particular building, and in its financial promotion, is the local authority called upon "to consider, criticize, approve or reject the plans and elevations"? Once again, it is at the latter end, when the designer has earned half his fees, and the promoter has estimated nearly all his costs.

What is to happen when in a small town there is about to be built a large super-picturedrome, a housing development, three chain stores, and a cattle market and public lavatory—these last by the official architect himself?

Nothing calls upon the promoters of these projects to disclose their first plans, yet in each case the form and lasting appearance is then decided upon, after which further comments are but scratchings, as likely to take away what character lay there as to add new merit.

We may sound biased in our inquiries, but it seems true to say that no form of building is proposed to be excepted from control, despite the fact that designs of architectural merit can only be judged by trained architects of high standing, or from the standpoint of a well-worked-out plan for a town as a whole. And if control will not apply to the greater, it will be of little use in the lesser, and the value of this control falls to nothing.

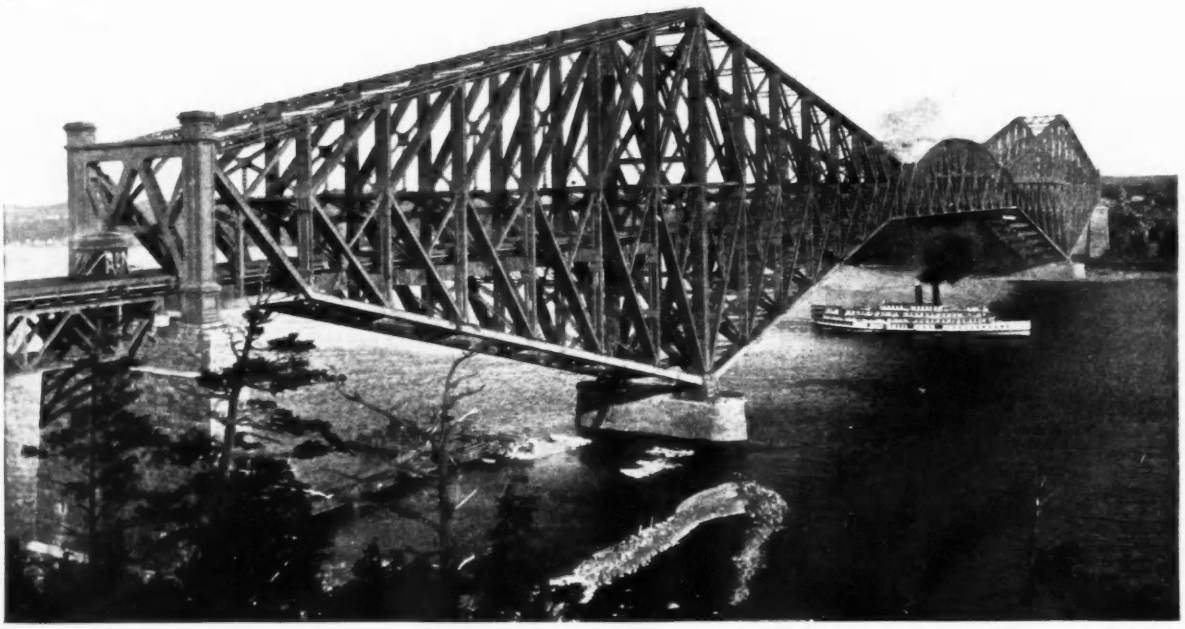
In Germany there may be control, but it is persuasive control, and Germany is a cultured nation, with a vigorous constructive architecture unlike the degenerate weed we are trying so desperately to coax back to life in this country.

Control can in the end be applied only by moral force springing from the acceptance of a high standard of culture and civic pride. These, in their turn, are the results of a desire for order.

The control of architecture must be preceded by the reform of architecture if it is to be applied with results that will be of lasting benefit and not merely a source of annoyance and the cause of expense.

The control over the building of cottages, factories and shops, three very important items in the appearance of both town and country, has largely passed from the hands of competent designers.

The standards of design must be raised, and the necessity for the employment of good designers for these things must become a matter of course, before we can afford, as architects, to allow the control of still further sections of building to pass from our hands into those of local authorities—if, indeed, it should ever be necessary to impose control of æsthetics by force of a legal code.



THE QUEBEC BRIDGE IN CANADA

It is no exaggeration to state that the prestige of the steel structure will ultimately depend, not only upon its practical efficiency, its economy and its speed of erection, but also upon its beauty.

Proof that the men who are in control of the steel industries in this country are well aware of this is given by the publication on the part of the British Steelwork Association of a second volume of *The Steel Bridge*, a book devoted solely to æsthetic considerations, and illustrated, so far as can be, by reference to a number of existing bridges. These vary, as must any range of subjects reaching over several decades in artistic excellence, but they are of great interest in showing the various treatments made possible by the use of structural steel. Among them is the Quebec Bridge, illustrated above, the foreshortened view of which is apt to suggest a massiveness of steelwork which is, in reality, not out of proportion to the enormous span.

To what extent, it may be asked, is it possible for steel to increase its popularity in the architectural domain? Perhaps the best reply is the following, given by the Association itself:

"Many architects, while of course they already employ steel girders to form a skeleton framework for their buildings, yet consider stone and brick to be the only facing materials which possess architectural dignity. The all-metal building has not yet made its appearance, but a number of railway stations, not at all to be despised, were erected in the Victorian era, and show what can be done with glass and steel in combination. The promising beginnings in the architecture of steel have not so far been followed up, but it remains for designers to explore such possibilities further and to discover whether a material so powerful and so pliable as steel may be adapted to the creation of a modern style as subtle and distinguished as any of those which architects have produced in the past."

NEWS & TOPICS

Mr. Percy Webster Adams, of Adams, Holden and Pearson, who captained the Rugby fifteen against the South Africans on October 17; and was elected L.R.I.B.A. on October 19.

THE WRONG KIND OF ECONOMY

THE Prime Minister's declaration of a few weeks ago to the effect that the Government was not intent upon economy of the wrong kind, which places too harsh a veto on the social services, was welcomed as a sign that panic measures of retrenchment would no longer receive encouragement in official quarters. It will, of course, be realized that, during the stress of a General Election, the Prime Minister has no time to see to it that his promise in this matter is put into effect. But we may hope that if and when he is returned to office he will put a stop to the present insane policy of cutting down housing schemes to such an extent that thousands of people living in conditions of appalling squalor have now little hope of relief.

*

The recent decision of the Ministry of Health that under the housing schemes of Local Authorities only houses of the smallest and cheapest type will be sanctioned in future is a complete reversal of the policy advocated by all housing reformers, namely, that the "large family" problem is the one most urgently needing solution. And, as Mr. Henry Aldridge points out in an article contributed to *The Star*, the difference in price between the A1, A2 and A3 types is now so small that to keep from 2,000 to 3,000 men out of employment while new plans are being drafted is the antithesis of all that we mean by national economy.

"THE ARCHITECTURE OF RUGBY"

The game, that is, not the school. It is the simplest truism to say that every outstanding Rugby football player has evinced a strongly developed sense of rhythm. So it would seem to be only in the natural order of things for architects to shine at what the evening papers are pleased to call "the handling code," since architecture is the art of interpreting formations in rhythms of the kind of openings and scrums that are termed voids and solids. Rugby enthusiasts were probably rather disappointed at the form shown by London against the South Africans at Twickenham on Saturday, October 17. Certainly three points to thirty was not on the face of it a particularly impressive display. But that solitary try, the result of a smart recovery initiated by Coote, was largely due, as *The Times* noticed, to good backing up by Adams. I wonder how many readers of THE ARCHITECTS' JOURNAL (or, for that matter, of the sporting columns of the daily and weekly papers) will have realized that the Surrey player who captained London on this occasion was none other than Mr. P. W. Adams, of Adams, Holden and Pearson, the firm to whom London owes its one entirely successful Modernist building: the Underground Headquarters in Broadway, Westminster?

*

It would be interesting to know what other architects have distinguished themselves as Rugby players, or, conversely (and as most people would put it), what Rugby players as architects. The A.A. is an excellent nursery of the game, and in many seasons fields a very hot team—just to show the hospitals that Rugby is not a medical monopoly. Embryo surgeons may excel at "the cut through," just as stockbrokers are unrivalled at "selling the dummy"; but no profession, not even "gunners," should be able to compare with architects in mastery of the technique of those parabolic curves—trajectories so graceful that the emotional Corbusier would relapse into pages of rhetoric about the ballistical beauty of pure form traced in Euclidian space, if someone could persuade him to go and see a Rugby match—which the elliptical ball describes in "finding touch" in your opponents' "twenty-five," or the conversion of a difficult try from far out. But if it comes to that, ordinary bricklayers should have the safest of "hands" at scrum half. It is a thousand pities they waste their dexterous talents at the bootwork of mere "Soccer"—but then trades-unionists always favour any form of Association.

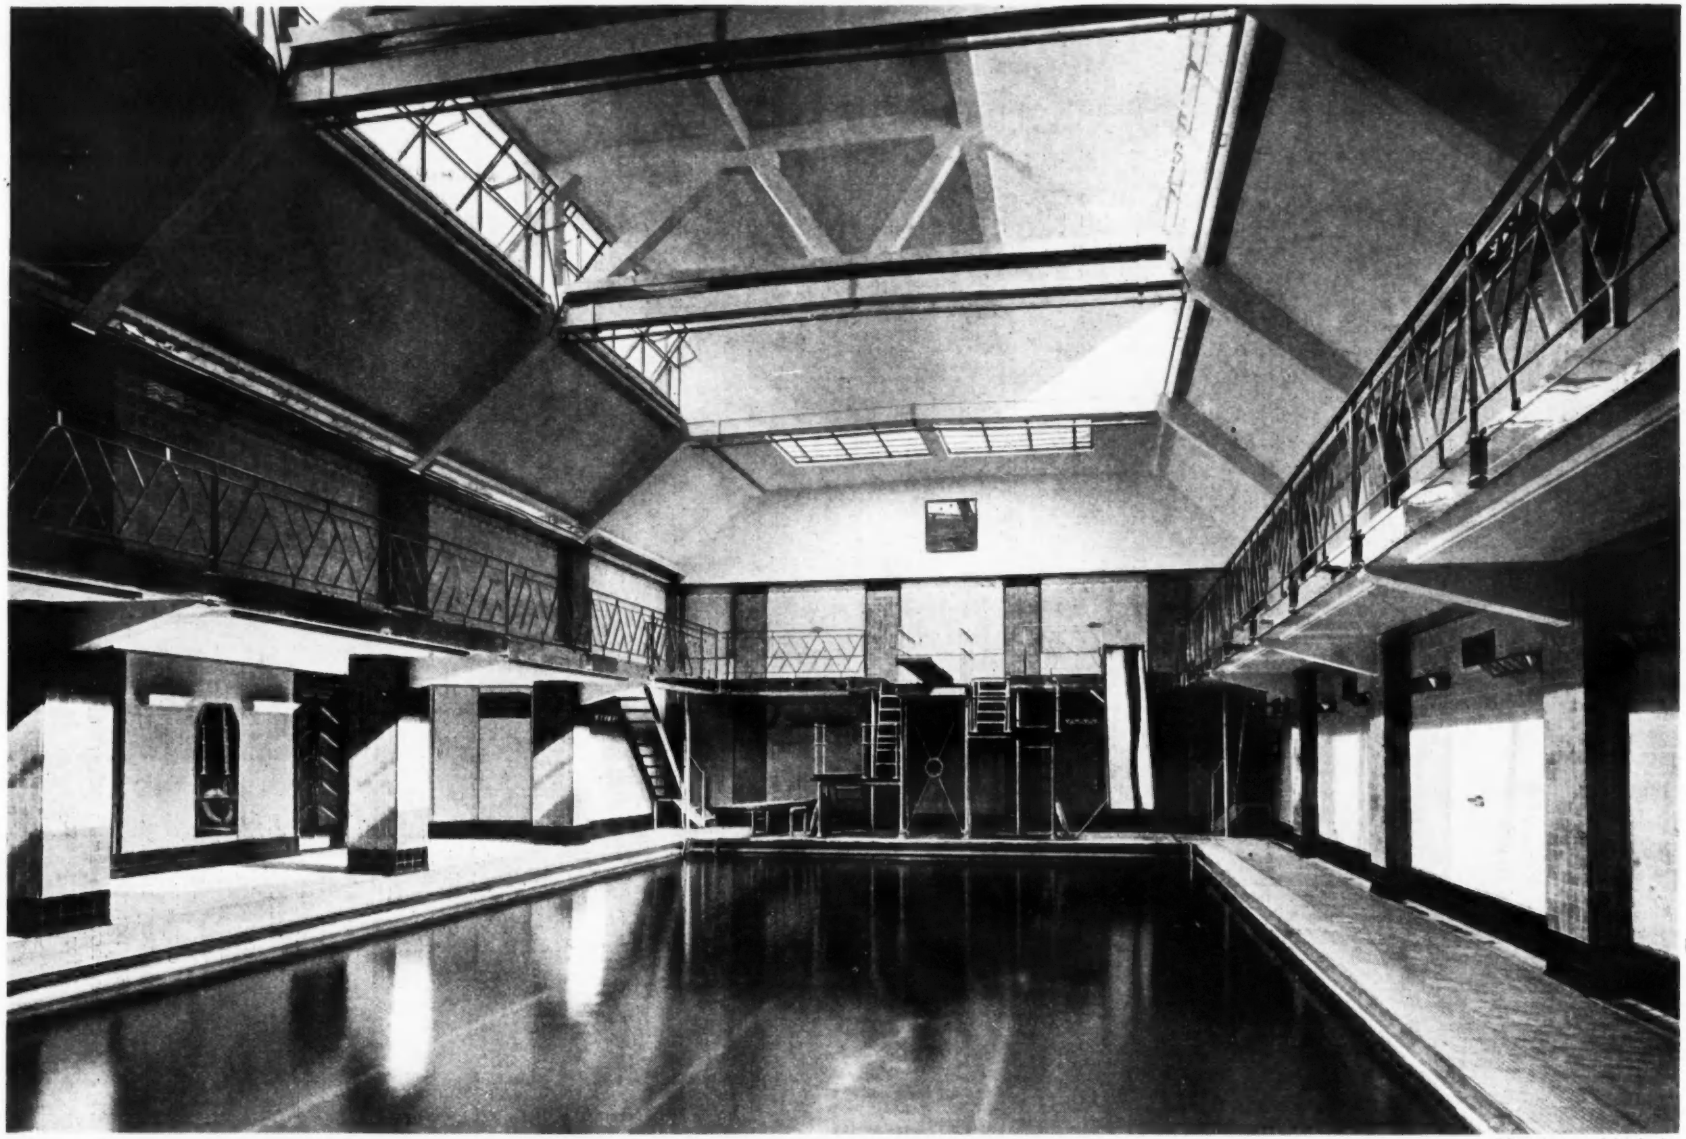
THE TOWN-PLANNING FILM

I went last week to see the German Town-Planning film, which was shown by the London Society at the Royal Society of Arts, and found it an excellent sketch design for the really good town-planning film I look forward to seeing one day. It is extremely interesting and vivid, and the method adopted, that of alternating shots of a scale-modelled town with shots taken from actual examples, brings home the points with force and clarity. You are shown a manufacturing town in the process of haphazard agglomeration, with the evil results in graphic and pictorial detail. Then you are shown on the same site the reasoned processes of town-planning, building the same town in a better way. It is simple, and it is convincing enough to be sent to every school and society that will pay the small rental charged for it.

INDUSTRIAL DESIGN AS A SELLING FACTOR

The D.I.A. held an important luncheon on Tuesday, October 20, when "The competitive value of good design in industry" was discussed by three eminent business men. The luncheon coincided with the opening, at Shoolbred's old store, of an exhibition of foreign-made goods that are sold in this country. The most cheering words came from Mr. Frank Chitham, who, as Managing Director of Harrods, ought to know his subject. He spoke of the increasing importance of design as a selling factor. Price must always count, he said, but style, design, colour and fitness for purpose are in fact more important than price. In support of this statement, he spoke of the new element of risk which has entered into what were once stable lines, and instanced kitchen utensils, once unvaryingly dull and normal, now colourful, better designed and improving themselves every month.

ASTRAGAL



[*By Slater and Moberly.*

SWIMMING BATH IN A HOSTEL

The bath, looking towards the deep end. The railings of the balcony, which runs all round the hall, are of stainless steel. The piers and architraves are faced with blue glass tiles ; the pool is lined with vivid blue tiles, in keeping. There is underwater flood-lighting ; other illumination is all reflected. (See the facing article and the supplement accompanying this issue.)

STAFF SWIMMING BATH

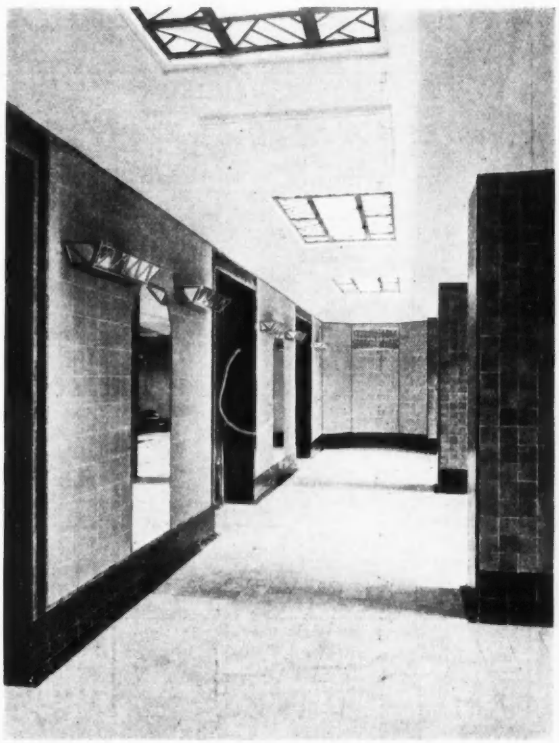
Added to a Gower Street Hostel

FROM DESIGNS BY SLATER AND MOBERLY

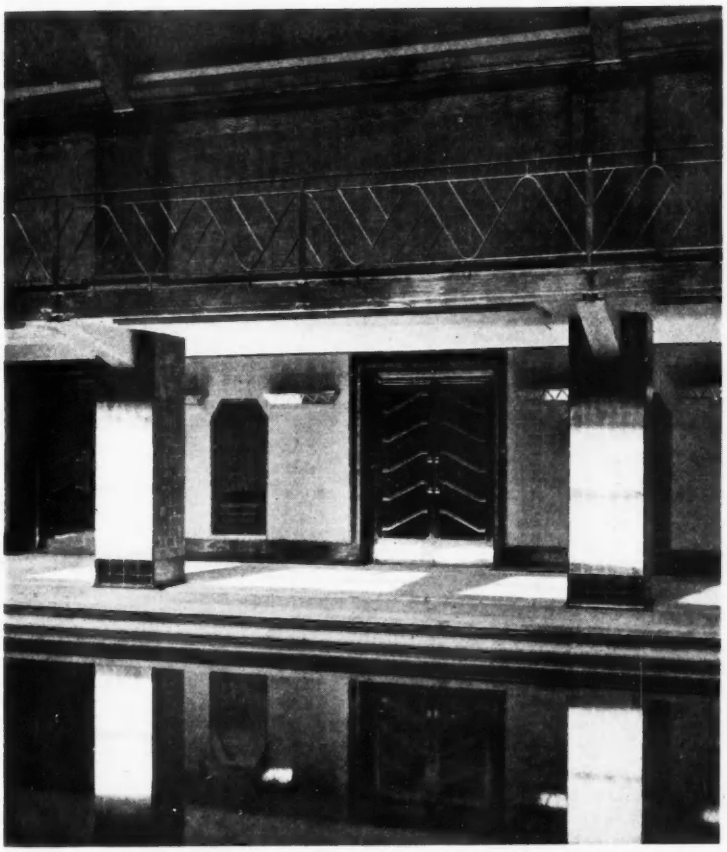
JUST twenty years ago, Messrs. Bourne and Hollingsworth, Ltd., of Oxford Street, completed a large hostel for their staff on a site on the east side of Gower Street. This building was designed upon an H-shaped plan, with two lighting areas, and had for many years the advantage of a vacant site to the south. This site is now occupied by the new premises of the School of Hygiene and Tropical Medicine.

Some twelve months ago Messrs. Bourne and Hollingsworth decided that, if it were in any way practicable, they wished to add to the amenities of the hostel by providing their staff with a swimming pool.

The only possible position for this was in the south lighting area, but the difficulty of access for labour and materials for the construction of so complicated a structure as a modern swimming bath would have been almost insuperable, had it not been for the kindness and neighbourly attitude of the authorities of the School of Hygiene, who, when approached, consented to allow access from their own courtyard, which adjoined the site.



The accommodation terrace. One side of the pool lies to the right; the centre doorway on the left is the exit to changing rooms, while entrance is by the other two, via ablution rooms only.



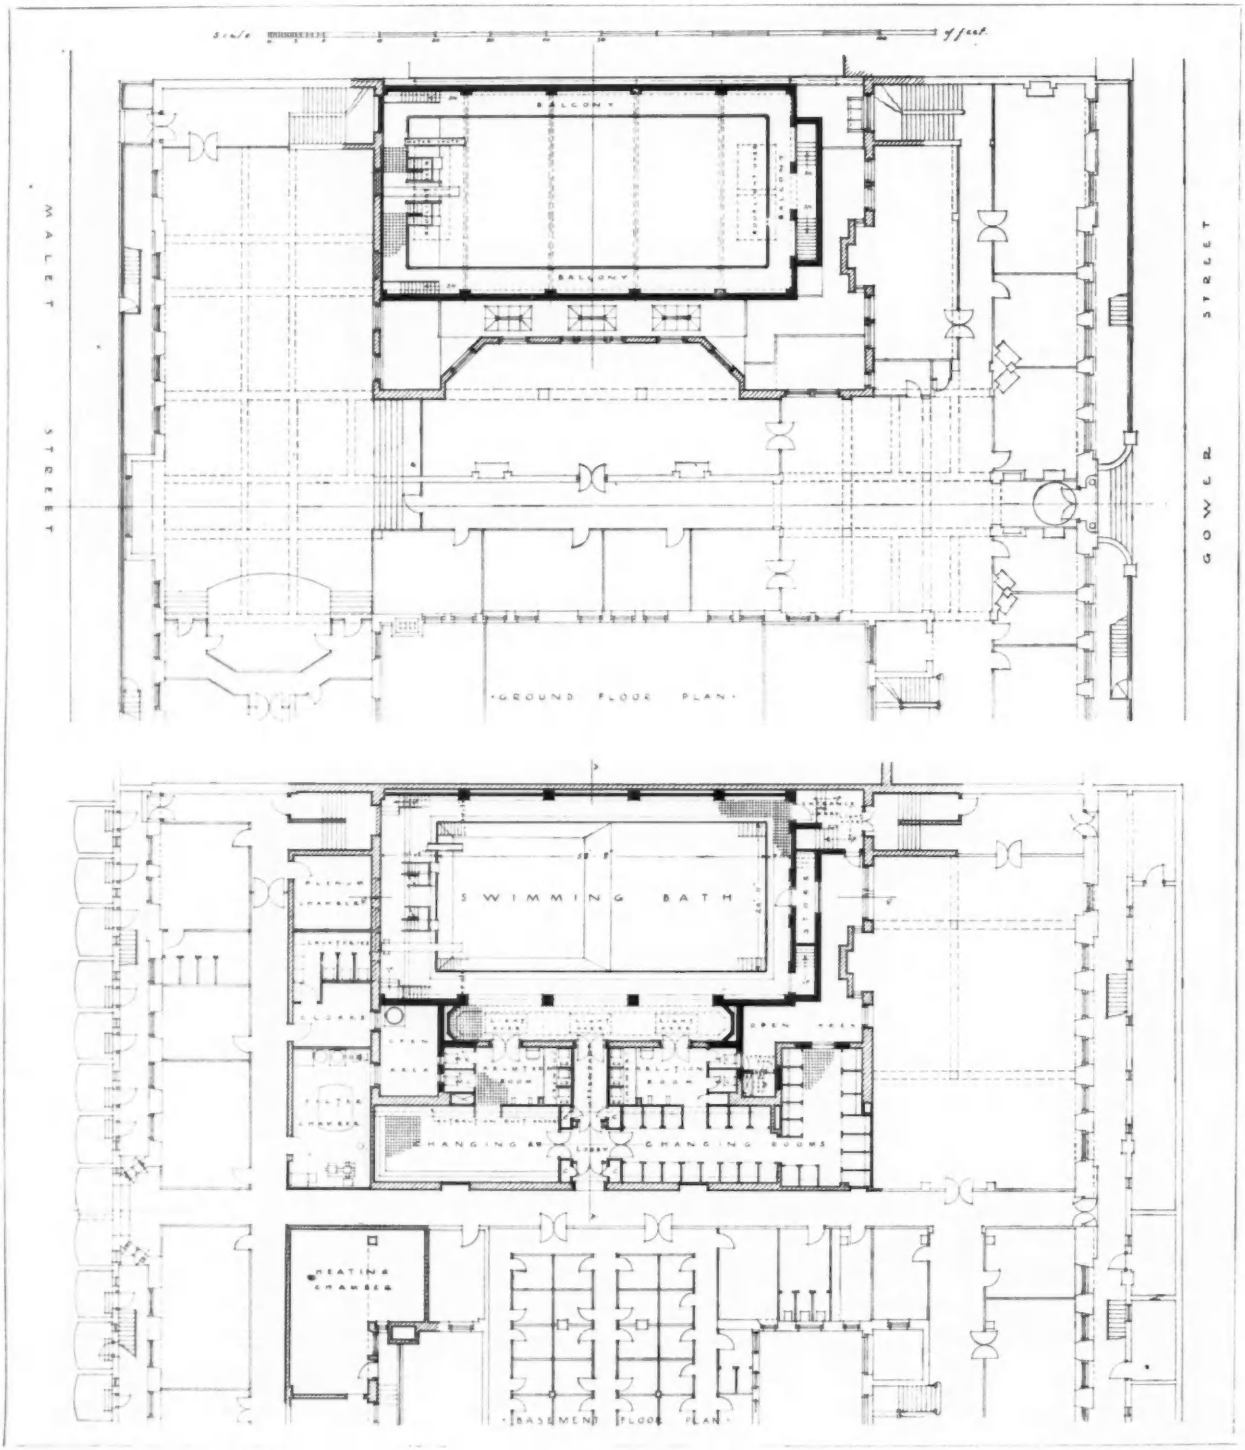
Looking across the bath towards the accommodation terrace, this view shows the design of the doors in the openings shown in the upper picture on this page; there are wall mirrors and light fittings between them.

The problem for the architects was to plan a bath as large as the site would admit, with ample facilities for diving from standard diving boards, without interfering unduly with the lights of the existing building, and without damaging the light and air of their accommodating neighbours.

The drawings show how far this problem was solved. It was decided at an early stage to recirculate the water, a process which involved the usual filtration plant, and, as the exigencies of the site prevented the emptying of the bath to the main sewers by gravity, owing to the question of levels, it was decided to fill and empty the bath by the same pump which was used for the recirculation.

A balcony for spectators all round the bath hall was considered a *sine qua non*. As much daylight as possible was considered desirable, but (as the bath would be actually used largely in the evenings) artificial lighting effects were obviously of importance. The usual central light was therefore abandoned, and clerestory lighting, with lantern lights at the two ends only, was adopted.

By making use of existing rooms in the basement surrounding the original open space, changing-room accommodation was provided, and ablution rooms were introduced between the changing rooms and the bath hall, without trespassing on the space available for the bath itself.



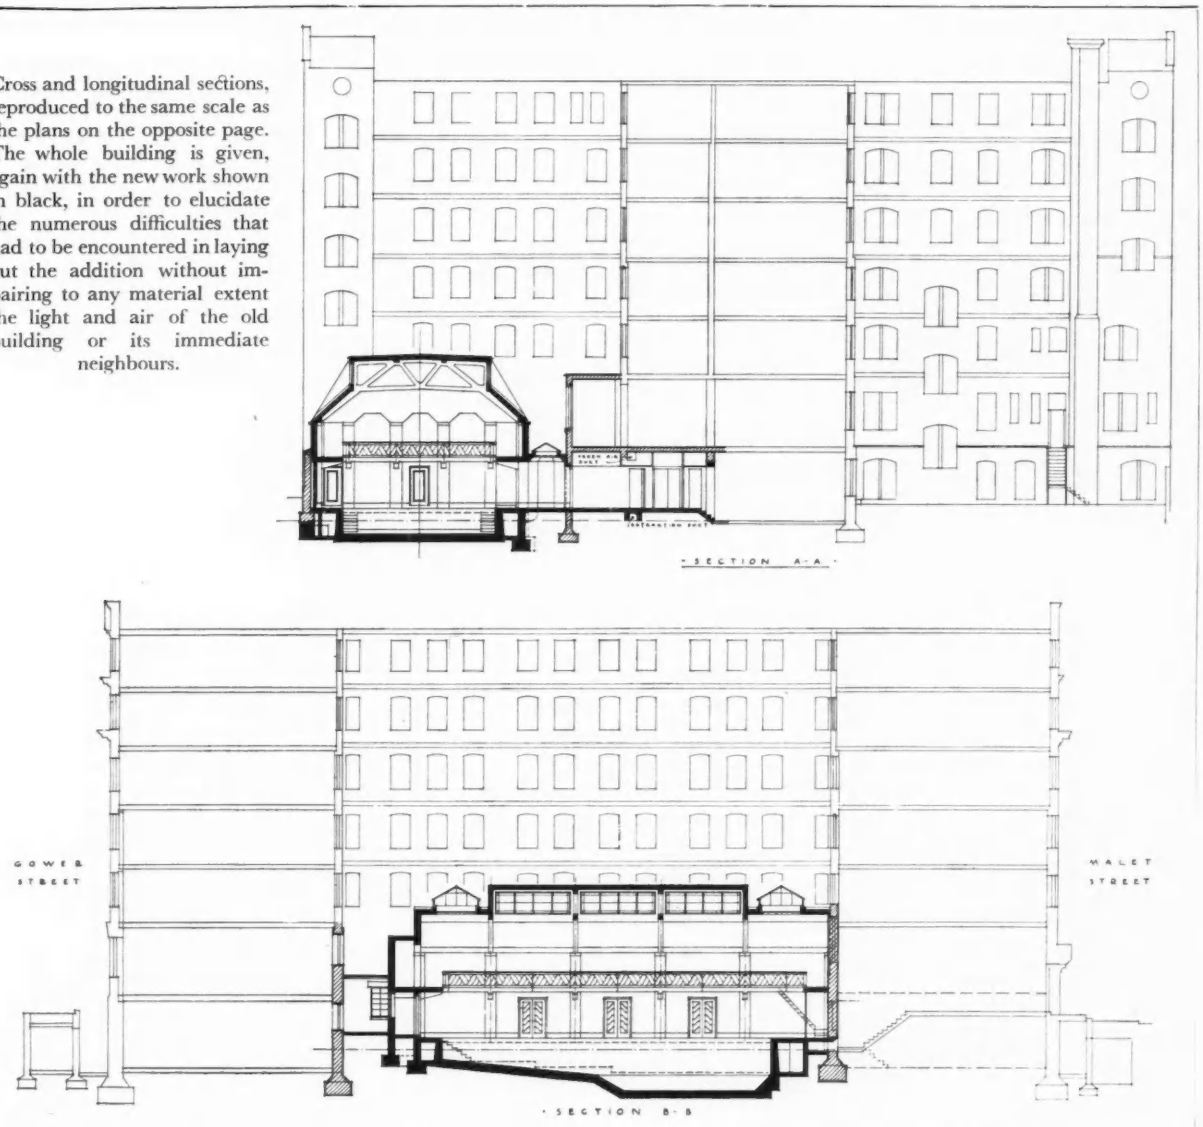
Swimming Bath, Gower Street, W.C.] [*By Slater and Moberly.*

Plans at basement and ground levels. The problem was to add a sizeable swimming pool and the essential changing accommodation within a building twenty years old. This was done by appropriating one of the lighting areas of the original H-shaped plan, and a few of the surrounding rooms. The drawings show the whole of the site: the new work in black, and the old, involved in the addition, hatched.

As far as decorative appearance was concerned, a blue and buff scheme was finally decided upon. After exhaustive experiments, it was discovered that all blue ceramic tiles lost their brilliance in artificial light, and it was decided to employ blue glass tiles, which retained their colour in all circumstances, for the piers and architraves around the various openings.

The inside lining of the bath itself is of vivid blue tiles toning with the blue

Cross and longitudinal sections, reproduced to the same scale as the plans on the opposite page. The whole building is given, again with the new work shown in black, in order to elucidate the numerous difficulties that had to be encountered in laying out the addition without impairing to any material extent the light and air of the old building or its immediate neighbours.



Swimming Bath, Gower Street, W.C.] [*By Slater and Moberly.*

glass tiles. Special non-slip tiles were used for the floor of the bath surround. Stainless steel was employed for the balcony railing and the doors to the bath house. The bathing boxes were made of ebonized mahogany, with stainless steel fittings.

Panel heating is employed under the balcony soffits, as well as low-pressure hot-water pipes under the clerestory windows and in the lanterns, and the problems of condensation are minimized by continuous changes of air by means of a plenum plant discharging under the balcony and extract fans in the roof. The whole of the external walls and roof slopes were also insulated with 1-in. thick wall boards for the same reason.

The artificial lighting has been carried out entirely by reflected light off plane surfaces of concrete painted with plastic paint, and four distinct sources of light are employed which can be combined or used separately at will :

a : The water of the bath itself is illuminated by eight 500-watt floodlights fitted in the sides of the bath.

b : The soffit of the balcony is lighted by isolated fittings of stainless steel and blue enamel, fixed to the walls.

c : The sloping portions of the roof are similarly lit by continuous bands of lights running from end to end of the building.

d : The flat roof is lighted by bands of light fixed to the bottom booms of the roof trusses, which are cased in concrete.

One of the supplements with this issue is devoted to a further illustration of the bath-hall

New Material Issue

The next issue of THE ARCHITECTS' JOURNAL *(November 4) will be a specially enlarged number devoted to the New Materials. Among the subjects and contributors are :*

"Materials for Architecture," by Wells Coates.

"Plywood," by J. Murray Easton.

"Modern Synthetic Facing Materials," by Raymond McGrath.

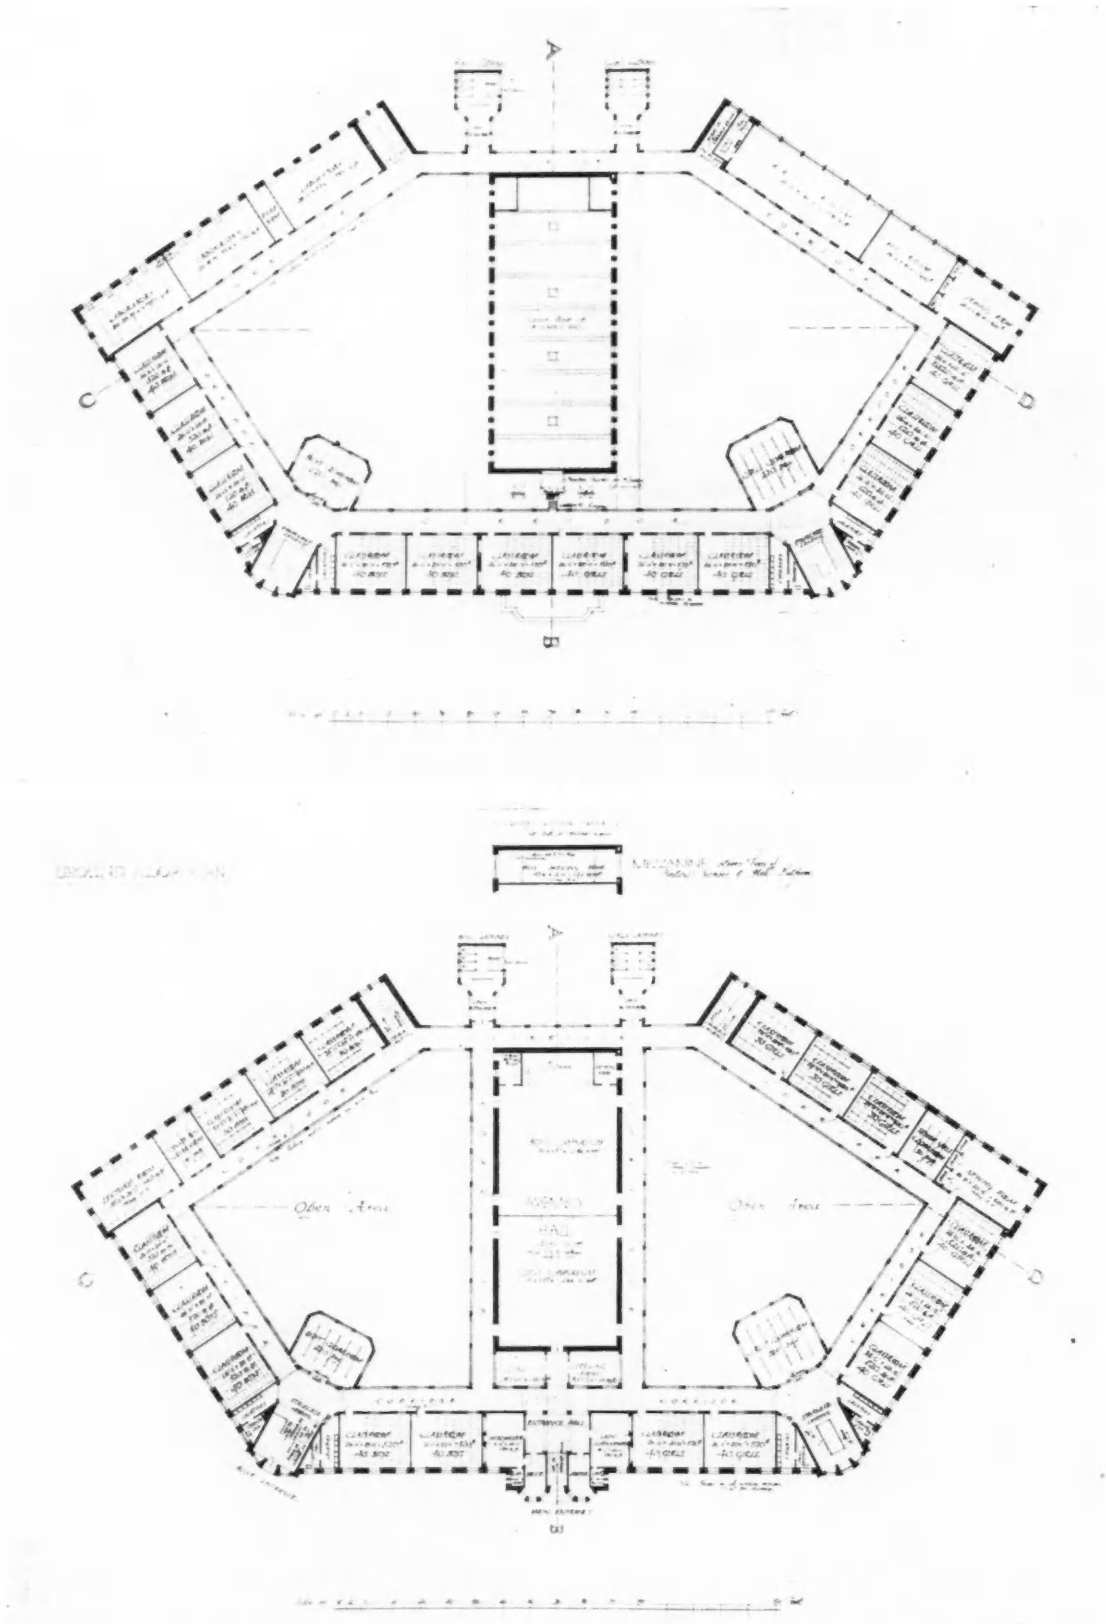
"The New Metals," by A. H. Hayes.

"Modern Floor Coverings," by Ll. E. Williams.

"Wall Boards," by Fredk. Etchells.

"Modern Paints and Decorative Finishes," by Harold Tomlinson.

"Noise and its Absorption," by Hope Bagenal.



Logie Central School, Dundee.] [*By Maclaren, Soutar and Salmond.*

Ground- and first-floor plans. There is also a lower ground floor containing a dining-room and accommodation for educational handiwork, cookery, laundry and instruction in household management. An assembly hall, illustrated on page 560, twenty-eight classrooms, two art rooms, and three laboratories are included on the upper floors.

LOGIE CENTRAL SCHOOL, DUNDEE

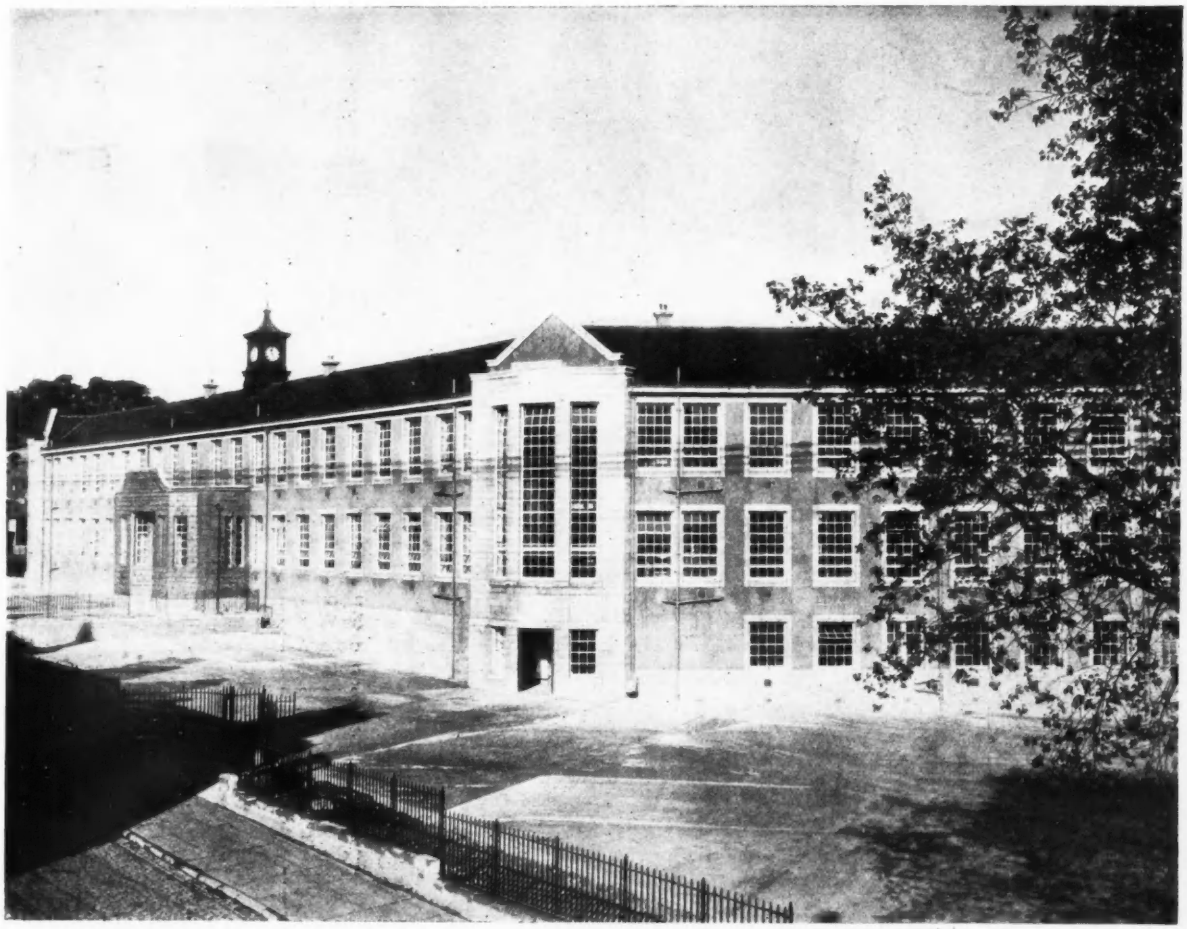
DESIGNED BY MACLAREN, SOUTAR AND SALMOND

IN this school accommodation is provided for 1,020 pupils passing through the intermediate stage. The design won first place in a competition, promoted by the Dundee Education Authority and limited to architects practising in Scotland. Mr. John Arthur was the assessor.

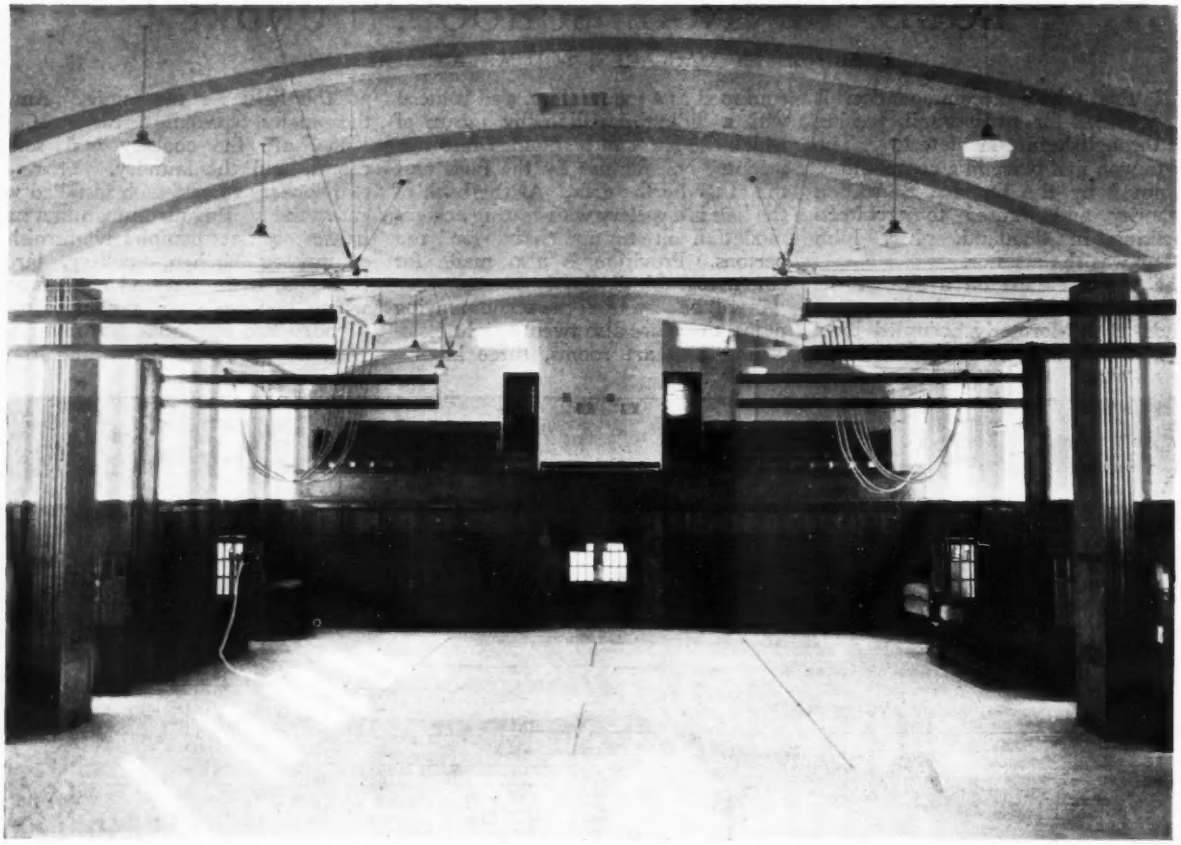
The school stands on a site at the corner of Blackness and Glenagnes Roads, a site formerly occupied by a block of buildings known as Western Poorhouse and used during the war as a military barracks. It consists of a lower ground and two upper floors. At ground level the main entrance leads direct to the assembly hall, which forms a central division between the classrooms for the boys' and the girls' departments; and two other entrances, one for boys and one for girls, are placed one on either end of the principal front. The assembly hall is equipped as a gymnasium, and is fitted with a sliding partition, by means of which the hall can be divided into two sections, one for use by the boys and the other by the girls. At the back of the hall is a gallery with seating accommodation in tip-up chairs for 120 persons. Provision is also made for cinematograph displays.

As will be seen from the accompanying plans, there are also twenty-eight classrooms, two art rooms, three laboratories, and accommodation for educational handiwork, cookery, laundry and household management instruction, a school library and medical inspection rooms. The classrooms are on the two upper floors, and are planned around two open quadrangles on either side of the assembly hall, with enclosed corridors or verandas. Special care has also been taken in the planning of the two art rooms to obtain the best possible light for the pupils. Among the many special features of the school are the cookery and sewing rooms, and the laundry. There are two cookery rooms, each installed with gas as the heating medium, and a small house or flat completely furnished, comprising kitchen, scullery, larder, bedroom, bathroom and napery press, where housewifery is taught. In the laundry are gas boilers, twenty tubs with hot and cold water, and ironing tables with electric irons. The sewing classrooms are equipped with cupboards for each pupil, having drawers with divisions, and hanging cupboards to prevent garments from being creased.

Other features are the joinery and metal workshops. These are equipped with machinery such as saws, turning lathe, a crucible, boring machines, etc. Adjoining is a furnace room with anvil. Gas is used instead of the ordinary fuel.



The main front, showing the corner entrance to the girls' department. The deep triple window lights the staircase. To the left is the principal entrance leading direct to the assembly hall; and beyond, at the other corner of the building, is the boys' entrance. The school accommodates 1,020 scholars.



The assembly hall is equipped with gymnasium apparatus and a projection box and screen for the display of cinematograph films. A gallery at the rear provides seating, in tip-up chairs, for 120 persons. A sliding partition enables the hall to be divided into two independent sections, for the use of boys' and girls' squads.

Logie Central School, Dundee.] [*By Maclaren, Soutar and Salmond.*

Looking from the girls' staircase on the first floor along the corridor towards the boys' staircase. The corridor runs round all the six inner sides of the school.

It is also notable that the three laboratories, two for scientific and one for electrical study, and the two science rooms, have ample store-room accommodation, also fume cupboards to take the gases from any evil-smelling liquids which the young scientists may concoct during their studies.

Accommodation is also provided for the medical attendant, and comprises inspection room and waiting-room, and a special dark-room. There are also a dining hall, with kitchen and servery, for scholars living a distance from the school, ample cloakroom facilities for boys and girls, and a bicycle shed.

Throughout the school a system of natural cross-ventilation has been adopted. The heating system is by low-pressure hot water, and there is also a boiler for supplying hot water for the laundry, etc.

R.I.B.A. Final Examination

The following are the dates on which the forthcoming R.I.B.A. Final Examination will be held :

December 2 to December 10, 1931, inclusive. (Last day for receiving applications : November 2, 1931.)

Bernard Whistlow, F.R.I.B.A. : An Autobiography : xxiii (conclusion)

THE SWORD FALLS

BY KARSHISH
(H. B. CRESWELL)

IT is not to be thought that my years of private practice at Nollingborough were unhappy because the social manœuvrings upon which I largely depended for commissions were irksome and ugly. It was only after I had turned my back upon all that life that I realized how exacting the social activities it involved had been; for I was in those days possessed of the resilience of early manhood. Nancy—my wife and colleague—was perpetually cheerful, and my success was by leaps. For five years my gross earnings averaged £2,844, and my net profits more than £2,000. Nancy's private income was about £400, and we spent £1,200, so that, after paying life assurance and income tax, I was able to put by more than a thousand a year, and before I was forty-five I had saved nine thousand pounds, in spite of having spent considerable sums in furnishing and setting up house.

Before the war, a married couple living in the country and spending £1,200 a year were well-to-do : and though we might have spent much less and been the happier, I should certainly, in that case, not have put by so much or been nearly so prosperous or well secured in my profession; for the five hundred or so we squandered in making a splash was an investment, and I might have made out a plausible case for including it as part of my office expenses in income-tax returns.

It cost nothing, and was all in the day's work, to keep the table in the hall well baited with the visiting cards of socially eminent acquaintances; to decide to repulse an offer of apples from the Rector's orchard as compromising our patronage of the Church; to see that photographs of Nancy and two of her girl friends standing (secretly) on books in their presentation trains and ostrich plumes, were prominent on the drawing-room table and the silver frames well polished; and that "Bogie"—a cabinet photograph of a sad, hairy little old man, who was an Irish baron and a distant connection of Nancy's, in the robes he wore at King Edward's coronation—was well displayed. When, however, Nancy decided that I ought to hunt, it was a different matter. This was a considerable item in the cost of our establishment, but, as usual, Nancy was right. It undoubtedly pays an architect to hunt. I had never been on a horse since my boyhood at Yaw, where I had the occasional use of a pony for many years; but Nancy egged me on, and after I had attended a riding-school in London, she passed me as presentable. There was stabling and a paddock with the house we rented, and we bought two steady, aged hunters for a little over a hundred pounds, joined the South Warrops Hunt, and for four years I hunted, as the word was understood by seventy per cent. of the fields of five hundred that sometimes attended the meets of two neighbouring packs of foxhounds—that is to say, I wore spotless pipe-clays, beautifully tailored coat, well-ironed hat, white buckskin gloves, starched stock and a bunch of violets; went out nearly twice a week to tittup along drifts and farm roads, unhook gates, sometimes gallop a field or two and jump an easy gap; saw something of the sport and played the social game for all I was worth.

At the hunt ball, I, like others, wore pink, as I did not mind being conspicuous *there*. Once, when I took a scratch across my face from a hawthorn, I felt a devil of a fox-hunter and rejoiced in my wound like a German duelling student; and when I once was cannoned off at a gap and bashed my hat and got plastered with mud, I rode round to the far side of the town and through it to my office to parade my sporting hardihood and relish the envy of the townspeople at my social eminence. The worst accident I had was when Julep unexpectedly threw up his head in the stable-yard and knocked out four of my front teeth. This revolting disfigurement, as being the result of an accident in the hunting-field, was a great recommendation to me; I, unexpectedly, found myself in request, and as it was five weeks before dental replacements could be made, I got considerable benefit from the hurt, and, if I may generalize, would say that it pays the hunting architect to lose his front teeth.

I used to chafe at the time I gave to this pursuit as I did at that I lost attending lawn tennis parties, far and wide, in the summer; but I loved those winter mornings, and the flavour of them, and the scene, and the horn of the huntsman and the cries of men and of hounds, are a treasured possession of my memory and a constant source of happiness and of contentment of mind, even when I forget who shared those pleasures with me. I used to motor to the office more or less in hunting kit; deal with the letters; go round the drawing boards and then pick up Nancy and bustle off to the place to which Geoff had gone on with the horses, where we would mount and leave Geoff to take the car back and get on with trenching the celery or some other of his many duties.

Nancy, as I have said, had let herself go after the bad toss she took, and made no attempt to face the jumps, so that we were two of a kind; but she was remembered as a straight goer in the past, and was hail-fellow-well-met with the best of the mob. I took rank as her escort and was received on a footing which my prowess as a horseman would never have given me; and the position I thus won, and the intimacy with Nancy's many friends that resulted, were an enormous advantage to me. Although the work I got to do was for the most part small jobs that were neither very interesting nor very profitable, I was kept busy and had many opportunities of exercising my full capacities and of building up the reputation of being a good architect, which the acceptance of some of my designs at the R.A. exhibitions did much to enhance.

The most important work I did during my Nollingborough days was the rebuilding of Tamberton Manor for the Duke of Bamfort. This opportunity I owed entirely to Nancy. The agent for the Duke's Huntington estates was a dry, methodical, cautious old man; and though we had, with some difficulty, managed to get him and his wife to dine with us, and they had returned the compliment, I could never get on terms of intimacy with him; but Nancy, with infinite trouble, foreseeing that it might be of great advantage to me, made a complete capture of the wife. Mrs. Peterson was twenty-five years older than Nancy, her two sons were in remote parts of the Empire, and she had no daughter. The relationship Nancy set up was that of a young inexperienced married woman, needing the guidance of an elder, and she was perfectly charming to Mrs. Peterson.

The whole thing was a horrible nuisance, for Nancy not only asked Mrs. Peterson's advice, but *took it*, so that I was even put to the trouble of altering the arrangement of the flower beds in the garden. We never knew at what moment the old lady might not appear and, though she had not nearly such a good position socially as we had, Nancy submitted to being even patronized by her. Nevertheless, the wisdom of all this was proved when one day Mrs. Peterson bustled in to give us first news that Tamberton Manor, which had been untenanted for many years, was to become the winter residence of the Duke's heir,

the Marquess of Goulash; and that she had "made Henry promise" he would recommend that I should be consulted in the matter of the alterations that would be necessary.

The original Tamberton Manor had been entirely effaced. It had first decayed to being a farm, and had then for hundreds of years been subject to haphazard alterations and additions to fit the needs of successive generations of dowagers and younger sons until it was a shapeless agglomeration of hand-to-mouth expedients, indifferently built and without any architectural consciousness.

The house, in fact, merely encumbered the site; and it would have been better economy, and but little more cost, to have cleared the whole of it away. That was not done because no opportunity was given me to propose anything so drastic, and it is because of the circumstances that denied me that opportunity, and because I have, by the experience, since been able to guide clients to wiser courses, that I mention the house at all; for though I was successful in entirely satisfying those who employed me, the new house is so tormented by certain foundations and walls of the old which are embodied in it that the resources of architecture (as available for me) are defeated, and the design has no expressiveness. Tamberton Manor is merely a big house—I hate the sight of it.

The circumstances which led to this unhappy result—and which often lead to similar results — were that the problem presented was never faced, but was disposed of by a process of advancing piecemeal from one consideration to another. Dukes are autocratic people, and when I found I had Peterson on my side in thinking a more comprehensive approach to the subject clearly advisable, and said to His Grace: "Mr. Peterson thinks it would be wise to consider—so-and-so," His Grace replied with promptness: "Damn Mr. Peterson," and I felt it unnecessary to press for the like dedication of myself.

The matter was complicated by the prejudices and sentiments of several members of the family, and I shall sufficiently indicate the way in which these were gradually dislodged when I say that I was first asked to report on the cost of an inventory of improvements prepared by the clerk of works of the Duke's chief estates, which included an item: "Fix rail in lavatory by first floor side passage to hang a towel on," approved by the word "good" in the Duke's hand; and that at the end of three months I received instructions to get out contract particulars under my estimate of thirty thousand pounds.

I cannot in this connection resist recording an exploit of my clerk, although the story is against myself and is a grotesque comment on my social preoccupations. Bellis, my typing and general clerk, was the sort of ass who is yet no fool. He would confidently type words belonging to no language on earth if he thought I had uttered or written them, and nothing was too unimportant for his attention except really important things. The office, in fact, was an elephant on whose back Bellis crawled with the minute concentration of an ant on what lay under his feet; but he was the soul of loyalty and conscientiousness, could put his hand on anything, instantly, and the joy of his life was to be able to hand me my pen before I had time to reach for it, or to find I had left my pipe in his office before I knew I had lost it.

One of Bellis's duties was to organize the distribution, by the office boy, of tea, in the afternoon. A day came when Goulash was to call at my office to discuss preliminary sketch plans. I had met him once at the Duke's head agent's in London, and had cadged a nod from him in the hunting field. Bellis was enormously impressed at a live Lord's coming to the office, and no doubt he noticed that I wore a lounge suit instead of the breeches and leggings with which I commonly sought to cut myself off from other professional men in the place. He followed with zest my directions for tidying up the room, arranging it for the interview and garnishing it so as to make it seem the abode of a man of cultivated leisure —for I was ashamed of the implications of squalor in my obscure backwater of the abject little town—and his native solicitude was tuned up to snapping point, so that, apparently, he presented to himself the very difficult question: "How much milk does a Marquess take in his tea?"

The great man came, and we were standing with our heads together at the drawing bench when Goulash signed to me that my attention was wanted, and I looked round to see Bellis hanging forward into the room, with one hand on the handle of the door and the other behind the jamb like a very polite ticket-inspector asking of the first class—"All seasons."

"What is it?" I asked; annoyed that there should be any reason whatever for interrupting me at such a moment.

Bellis mumbled with an air of mystery and secrecy, as though it was important he should not be overheard.

"I can't hear what you say," I said.

"Shall I get a pen'oth of milk or three ha'poth, sir?"

I made a wide sweeping gesture of pushing the poor man from me, and he retired with his problem unsolved. He had never before asked me about milk, which I only knew of as an item in his petty cash; but his anxiety to honour the occasion with a solicitude more microscopic than ordinary gave me the sensations of a silken, be-ruffed, strutting, Elizabethan courtier, suddenly aware that the bran has run out of his trunks.

It was just after the completion of Tamberton Manor that the same inscrutable edicts that had built my fortunes began inconsequently to tear them down. For no fault of my own, I had, one after the other, several of those disappointments of which all architects have experience, when the plum within grasp is snatched away. A client died just after he had instructed me to get out sketch designs for a new house; a house I was altering was burnt, and the consequent business troubles were wearying and all building projects abandoned. A church which I had good reason to expect I should be asked to design was entrusted to another architect, owing to the Rector whose good offices I relied on being called to another living. At just about this time, acting on a hint given me by a friend, I discovered that my confidence in my office staff was misplaced and that they took advantage of my considerable absence from the office. I found I was being cheated in all sorts of ways by men leaving the office, playing chess there and clearing the floor for games; and then the shattering blow of my life came, for Nancy became seriously ill and, after a long struggle, died.

This was early in 1913; and before the war came to put an end to my work, close my office and call me to other work in other places, I had learnt how irreparable my loss was. My hold on life seemed to relax; I seemed to be regarded as belonging to the past in which my mind lived. Nancy had borne the brunt of the battle as we understood it. A house which was not her home was a desert for me: I left it. Nothing seemed worth the striving for, and I could not understand why I had ever thought it was. I drew more and more into myself, and the daily round of my work was, if not entirely joyless, automatic. It may have been well for me that the war tore me up by the roots from ground where, four years later, I could no more have replanted myself than a tree could.

A new life and a new field of activities lay before me: these also now lie, for the main part, behind; but as one grows older one gets a more solid and complete satisfaction out of life. One learns that happiness is within oneself and not dependent on outside circumstances; that the beautiful things of life are the property of all who have the small wisdom necessary to recognize them; and that to desire nothing is to possess all.

THE END

INCOME TAX, 1931—32

Important Changes for the Current Year

BY M. L. HARGREAVES

THE alterations in the allowances, rates, etc., which have recently become operative by the introduction of the Supplementary Budget are retrospective to April 6, 1931, i.e. they take effect during the current year.

The most important alterations will easily be ascertained by the comparative table set out herein, as compared with those for the previous year, 1930-31.

	1930-31	1931-32
Personal allowances :		
Married	£225	£150
Single	£135	£100
Widow and Widower	£135	£100
Housekeeper	£60	£50
First child	£60	£50
Second child	£50	£40
Twins	£110	£90
Each subsequent child	£50	£40
Reduced rate ..	£250 at 2/-	£175 at 2/6
Dependent relative ..	(no change)	
Earned income allowance must not exceed	£250	£300
Earned income allowance	one-sixth	one-fifth
Insurance premium rates	2/3, 3/4½ and 4/6	2/6, 3/9 and 5/-

The standard rate of income tax will be 5s. in the £.

To gross up one's dividends for the year under review, take the net figure received, and add one-third to it. Thus, if £9 were received net from a dividend, the amount to be entered in the appropriate section of the form would be £12 (£12 less tax at 5s. in the £ = £9).

With regard to the cases in which adjustments may be necessary to make good the deficiencies in the amounts of tax deducted from payments made before October 15, 1931, which fall into the two classes below, one cannot do better than write to :

The Secretary,
Inland Revenue,
Somerset House, W.C.2

for the circular which has been issued, showing how the adjustments necessary are to be made.

The two classes referred to above are :

1 : Tax deducted directly on behalf of the Revenue from payments which are not made out of profits or gains brought into charge to income tax.

2 : Tax deducted from payments made out of profits or gains brought into charge to income tax.

With regard to payment of tax the following rules will be in force :

Income Tax Schedule "A," 1931-32

The whole of the tax will be due and payable on January 1, 1932.

Income Tax Schedules "B," "E," and "D," 1931-32.

Three-quarters of the tax will be due and payable on January 1, 1932 (extended to March, 1932, in proved cases of hardship).

One-quarter (balance) on July 1, 1932.

There will be no change with regard to the rate of payment of surtax for 1930-31, except that there is an increase in the tax payable amounting to 10 per cent.

It will be observed that the only beneficial changes in the allowances, etc., are the earned income allowance, which, on an income of £540, is increased from £90 to £108, and in the rates applicable to allowances in respect of payments for life assurance premiums, which have been increased by 3d., 4½d., and 6d. respectively.

QUESTIONS THAT ARISE

Defective Water Pipes

F. B. writes : "*Five years ago I acted as architect for the erection of a subsidy house for a private client. There was no bill of quantities. The specification gave the bores of the lead water pipes which were to be 'of the weights required by Local Authorities.' The R.I.B.A. Form of Contract used also included the following clause : 'The Contractor shall conform to the . . . regulations and Bylaws of any Local Authorities and of any Water and Lighting Companies with whose systems the structure is proposed to be connected.' The work was duly completed and approved by the water engineer of the Local Authority (who supply the water). I also approved same, and in due course issued a final certificate.*

"*I have now heard from the client, who states that between May 30, 1928, and August 14, 1931, there have been no fewer than eleven occasions on which bursts have occurred, necessitating the attentions of a plumber. My client claims compensation from me on the grounds that the pipes fixed were too light for the pressure, and should not have been approved. Upon making inquiries, I find that the Local Authority have never had regulations governing the weights of pipes, but that ¾-in. to 11 lb. pipe is usually used in the district. I have weighed a length of the defective pipe and find it is ¾-in. to 9 lb. per yard.*

"*Before fixing this pipe (or at any time for that matter) the contractor never consulted me as to the weights I intended to be used, and I approved the work under the impression that the pipes were 11 lb. per yard. I should not have done so had I known they were only 9 lb. My client had the bursts repaired on each occasion by local plumbers (who did not execute the original work) and did not inform me of the trouble until after the last occasion.*

"*Would you please let me know your expert's opinion on my legal position in the matter. I am afraid I have no grounds for a claim against the contractor.*"

The liability of the architect depends upon the terms of the contract with his principal.

I am ignorant as to these terms, and therefore it is not possible for me to express a final opinion.

Generally, before an architect issues his certificate, he is under a duty to see that the builder has carried out his contract in a proper manner, and has used proper materials. The architect's principal has no technical knowledge, and it is for this reason (amongst others) that the architect is engaged.

Once it is established that the architect is under a duty to examine the materials, a breach of such duty gives rise to an action for damages, if, as a result of such breach of duty, damage arises. E. F. I.

Damage from Creeper

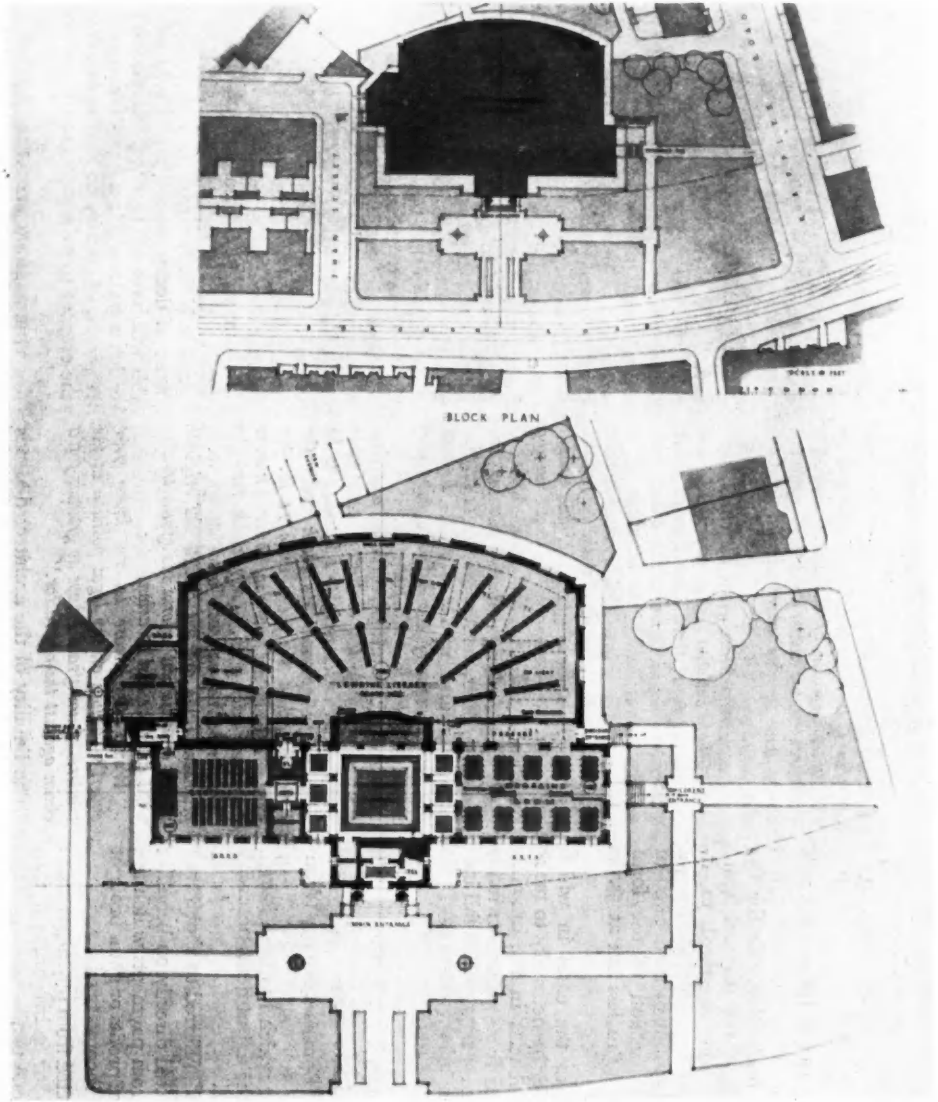
W. F. D. writes : "*I should be glad to know if your expert considers Virginia creeper, especially the small variety (Beechy) to be detrimental to the external stonework of a church. The small variety has nearly covered the south wall of the church. Does your expert advise immediate removal?*

We have not yet encountered an instance in which the growth of Virginia creeper on masonry could be considered to have had any significant deleterious action. Mr. A. R. Powys, however, states that he has seen damage caused by Virginia creeper of all kinds (see *The Repair of Ancient Buildings*, pp. 72 and 135).

It is likely that the present condition of the masonry of the building in question will determine whether the creeper ought to be removed.

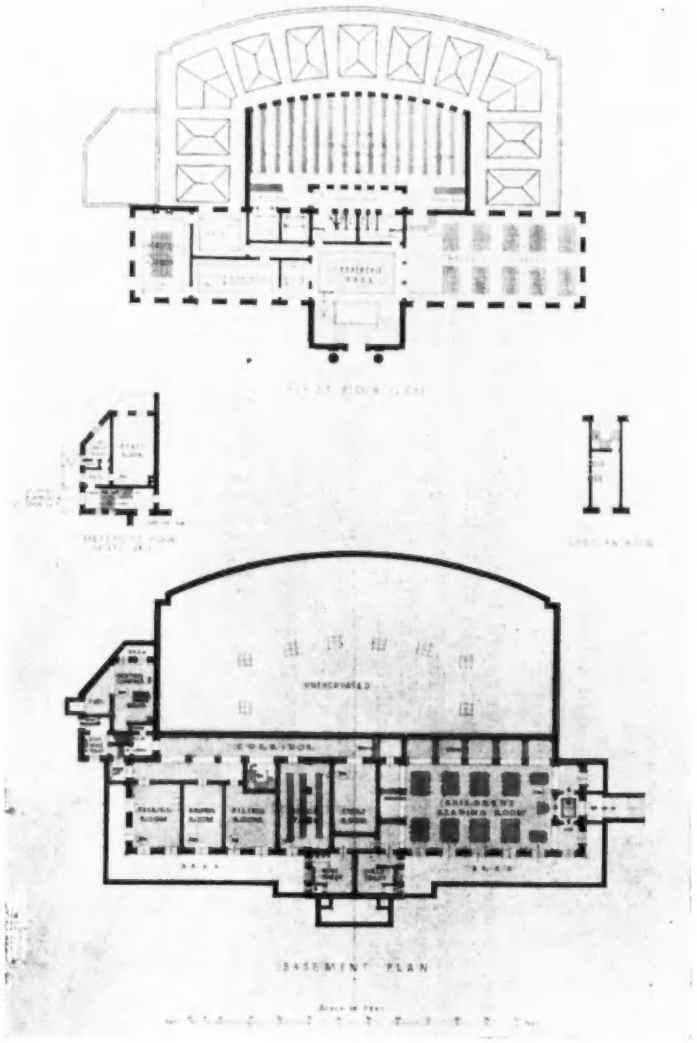
In our view, mechanical disruption due to the growth of the stems in crevices is likely to be the only serious cause of decay, and it is unlikely that this will have effect, except on surfaces which are already in a state of disrepair. It would, of course, be unwise to allow the creeper to gain access to the gutters and roof.

THE BUILDING RESEARCH STATION



Birkenhead Central Library Competition: Winning Design.]

Block and ground-floor plans. The lending library, which occupies the whole of the rear part of the building, provides accommodation for 65,000 volumes. On this floor also are the lecture and magazine rooms and the staff working office.



[*By Gray, Evans and Crossley.*

Basement, first and mezzanine (housing the staff working office) floor plans. The store-room, on the first floor immediately above the lending library, has a storage capacity for 50,000 volumes.

BIRKENHEAD CENTRAL LIBRARY COMPETITION

WINNING DESIGN: BY GRAY, EVANS AND CROSSLEY

MR. ANDREW N. PRENTICE, A.R.I.B.A., the assessor in the competition for the proposed Central Library, Birkenhead, has made his award as follows:

First premium (£250), Messrs. Gray, Evans and Crossley, of 51 North John Street, Liverpool.

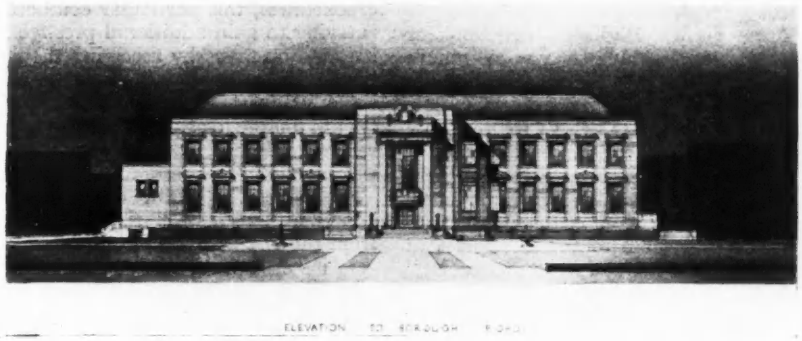
Second premium (£175), Messrs. Richard Owens and Son, of 3 Crosshall Street, Liverpool.

Third premium (£100), Messrs. Willink and Dod, of Cunard Building, Liverpool.

The competition was limited to architects who had been resident or had had an office within a twenty-miles radius of Birkenhead Town Hall, subsequent to January 1, 1930.

The Central Library, the approximate cost of which is about £40,000, is to form one of a group of buildings to be erected at an estimated sum of £200,000.

As will be seen from the block plan on the facing page, the main entrance to the library is situated in Borough Road, and those for the children and the staff in Raffles Road and Shaw Street, respectively. A subsidiary entrance has also been provided by a road connecting with Raffles Road.

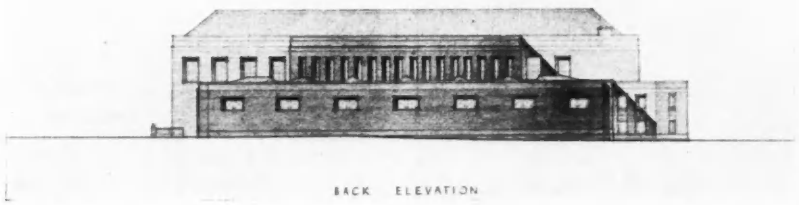


The principal elevation, facing Borough Road. The one-story projection on the extreme left, containing the staff entrance, is set back from the main building line.

The entrance hall, which gives direct access to the lending department, is flanked on the left by the lecture-room and the staircase and book lifts, and on the right by the magazine room. The working office for the staff, which is housed on the ground and mezzanine floors, overlooks Swan Street.

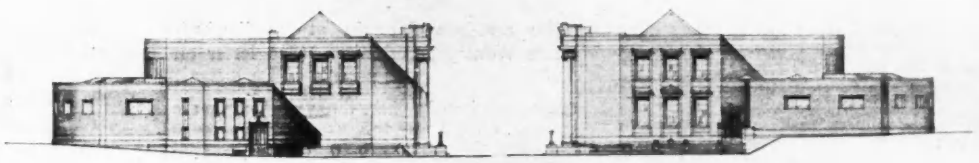
The basement floor accommodates the children's reading-room and the packing, filing and binding rooms. The ground immediately beneath the lending library has been left unexcavated.

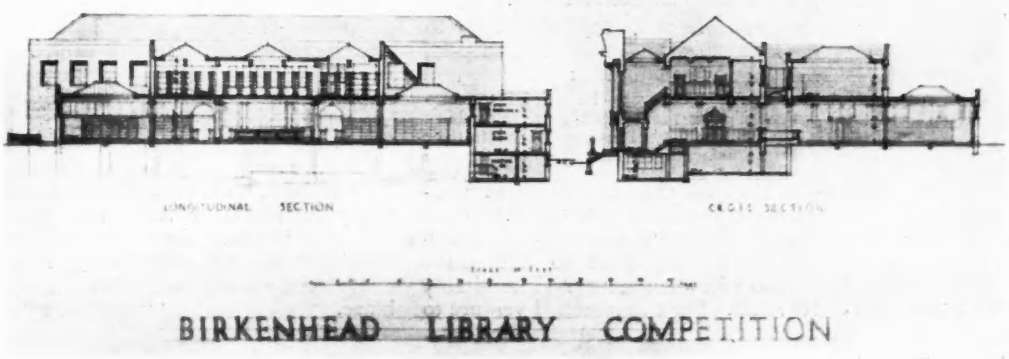
The first floor comprises a storeroom, with accommodation for 50,000 volumes, reference library, committee and librarian's rooms, etc.



The rear elevation. The horizontal windows in the shaded portion of the building light the lending library, and the vertical ones above, the store room

The architect's elevational drawings to Shaw Street (left) and Raffles Road (right). The ground beneath the one-story portion of the building, housing the lending library, has been left unexcavated.





Longitudinal and cross sections. As will be seen from the former, the staff quarters are planned on the ground and mezzanine floors, with the heating chamber immediately below, on the basement floor.

LETTERS FROM READERS

R.I.B.A. Premises Competition

SIR,—Your leading article for October 14, in which you comment upon a certain question asked of the assessors in the competition for new premises for the R.I.B.A., invites some melancholy reflections.

In the first instance, I cannot help feeling that when this particular competitor, in a moment of too candid self-revelation, hinted to the assessors that they should accept a "modernist" design, there was a golden opportunity for a rebuke. Surely, many of your readers will realize the profound discourtesy, not to say impudence, of the communication. Let me first comment upon the form in which the competitor's question to the assessors was couched

The first thing to note is that it can scarcely be considered a question at all, but is, in reality, nothing more nor less than a little discourse which the competitor has seen fit to submit to the attention of the assessors. For the benefit of your readers who have not seen the answers to questions in this competition, I may quote the third paragraph of the competitor's statement. After a reference to an alleged hint in the assessors' instructions to the effect that the proposed building should accord in some measure with its near neighbour, the B.B.C. Station, he says :

> On the other hand, if the promoters feel that a future generation may be unable to appreciate some of our recent buildings, acclaimed as masterpieces at the present time, and that the vogue for reproducing short lengths of American skyscrapers is but representative of a phase through which we are passing on our way to discovery of the appropriate architectural expressions in stone-faced steel structures too high to solicit traditional treatment and too low to admit of their successful handling as plain masses of masonry holed for windows, a hint to this effect is needed.

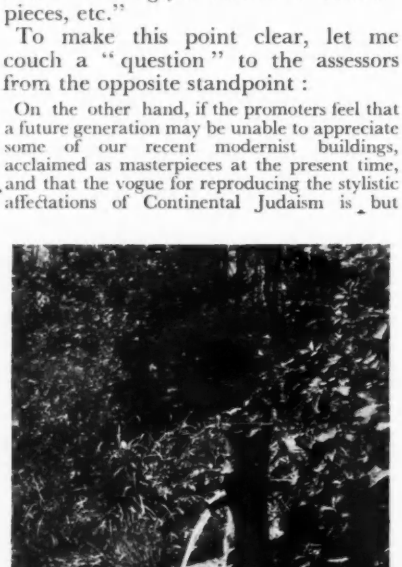
And then, in the last paragraph, he comes to the crux of the matter, and says :

> It would, moreover, be helpful to competitors if some pronouncement were made as to the advisability of incorporating into their designs ornamentations and features of the type known as "modernist," in view of the very conflicting opinions of eminent architects concerning the merits of these novel adornments.

This is not a very ingenuous document, for it must be obvious to the merest novice in the art of reading his native language, that in the first paragraph quoted the competitor is not seeking guidance or information from the assessors, but is in effect saying : "*I* feel that a future generation will be unable to appreciate, etc., etc." But, even in altering his phraseology to this extent, I have not truly indicated the full degree of dissimulation here expressed. In his intellectual crookedness, this particular competitor is trying to gain additional prestige for his own opinions by ascribing them to "a future generation." Had he been entirely honest, he would have written : "*I* am unable to appreciate some of our recent buildings, acclaimed as masterpieces, etc."

To make this point clear, let me couch a "question" to the assessors from the opposite standpoint :

> On the other hand, if the promoters feel that a future generation may be unable to appreciate some of our recent modernist buildings, acclaimed as masterpieces at the present time, and that the vogue for reproducing the stylistic affectations of Continental Judaism is but



The cast-iron fountain at Shellingford, near Wantage, Berkshire. (See letter on this page).

> representative of a phase through which we are passing on our way to discovery of a suitable architectural expression in stone-faced steel structures, and that the street formation renders inappropriate the crudities of style which result from depriving architecture of three-quarters of its intellectual content in obedience to the slogans "functionalism" and "fitness for purpose," a hint to this effect is needed.

Then, having read my little lecture to the assessors, with a suppressed snigger, I could have continued :

> It would, moreover, be helpful to competitors if some pronouncement were made as to the *in*advisability of incorporating into their designs ornamentations and features of the type known as "modernist," in view of the very conflicting opinions of eminent architects concerning the merits of these novel adornments.

Would it have been a d——d impertinence on my part to address the assessors in this manner? Indubitably it would. For this reason, I venture to express my regret that the other communication, equally impertinent, which was the subject of your leader for October 14, should have been included in the published statement of answers to questions issued by the assessors in the competition for new premises for the R.I.B.A.

A. TRYSTAN EDWARDS

Cast-Iron Pumps

SIR,—I remember some time ago being deeply interested in some illustrations you published of cast-iron pumps and such like. I enclose a photograph of a rustic fountain made of this material.

The fountain is situated in the village of Shellingford, near Wantage, in Berkshire. It supplies part of the water used in the village, and is fed from a spring, from which a feed pipe is taken up and carried through the cast-iron column.

A. SEEBE

Mitigation of Fire Risks

SIR,—I have not seen the *S.P.A.B. Annual Report* referred to by Astragal, under the heading "Mitigation of Fire Risks" in the JOURNAL for August 26, but I think that the *Report* should (if it does not) include a warning against the dangers of the modern "hearth fire" when introduced into old mansions without expert advice or supervision.

Personally, I have but little doubt that the modern "hearth fire" was in many cases responsible for the destruction of the old country mansions which went up in smoke with lamentable frequency some years back. Causes of fires are difficult and, in many cases, impossible to trace after the destruction of buildings, but one case of total destruction of a most interesting old house I can personally vouch for, as well as for the disgraceful fact that the owner relied upon the advice of an ex-Clerk of Works when altering the fireplace.

In Elizabethan and Georgian houses a certain formality of plan tended to bring floor-beams under fireplaces, the upper edges of beams over one floor coming within a few inches of the hearthstones of the floor above. The arrangement was safe enough while the *old* grates were in use, as the bars were some inches above the stone hearth, and any falling ashes grew cool without ill-effects. But local bricklayers light-heartedly installed the new "hearth fires" on the old hearthstones, and intense heat was communicated to the beams below, with the result that after many interrogatory sniffs and wondering comments about a "smell of burning" an unusually windy night fanned the smouldering beams into a blaze.

"CASUALTY"

LITERATURE

BUILDING HEIGHT, BULK AND FORM

THIS volume, the second of the Harvard City Planning Studies, embodies the results of the inquiries carried out by the late George B. Ford, in collaboration with Mr. A. B. Randall. The data collected has been digested and tabulated, and much of it finally crystallized in the form of graphs.

The book may be considered as a corollary to Hugh Ferris's *The Metropolis of Tomorrow*, for it brings the hard light of business finance to bear on the architect's dream city, and deals with the practical politics of civic planning, high buildings, and especially with the vital questions of light and air, land values and rentals, traffic congestion and the economic designs and useful life of skyscrapers. These chapters disclose some interesting facts. It has often been stated that above a certain number of stories the tall building in the United States does not, now that the zoning laws are in force, give an adequate return upon the cost of construction. The topmost floors, on account of the large percentage of floor area absorbed by lifts, stairs, lavatories, etc., could not, it was feared, be let at economic rents. But the question cannot be so simply dismissed, and many factors must be considered, the most important being the value of the site. In some cities the value is so great that no profit can be shown unless the block exceeds a certain number of stories, a condition which also obtains in London, though whether the site value produces the high building or the high building increases the site value is apparently an insoluble problem. The most satisfactory solution appears to be the building of isolated towers with wide spaces between, in place of the canyons of the earlier skyscrapers. The lower floors command less rent than the upper, which are quieter, better lit, and more healthy. Apartment blocks give, however, less return in rent for floors above the eighth, and sixteen stories is the limit of profitable height that can be built.

Many of the findings of the report confirm the theories of Corbusier, and the Frenchman's dream of the park city, dotted at wide intervals with tower dwellings, has been realized at Alden Park, Philadelphia, of which an aeroplane photograph has been included in the book. Is it better to spread upwards or outwards ? In the elimination of noise, escape from the carbon monoxide gas which is becoming a real danger to health in congested traffic jams, greater exposure to sunlight and to cleansing winds, the solution seems to lie in the tower. The electric elevator, as much as the motor car, has modified the conditions of modern life.

The book contains many diagrams, showing how the zoning laws affect the outline of office buildings and flats erected upon various types of sites. These, like the letterpress, deal exclusively with conditions in the United States, but the general conclusions of the report will be of value to all students of civic planning. LL.E.W.

Building Height, Bulk and Form. By George A. Ford, assisted by A. B. Randall and Leonard Cox. Cambridge : Harvard University Press. Price 15s. net.

THE NEW STYLE

DEHORTATIONS from the use of tradition have been the favourite topic of modern declaimers in all ages, and have been received with abundance of applause from the self-styled progressives and boos from what are generally termed the embittered apostles of conservatism. Today we have exchanged our close Victorian sitting-room, with its fussy, fabulous impedimenta, for the living-room of hygienic, disciplined severity.

In *The New Style* we are given 144 full-page plates in photogravure, all chosen, obviously with considerable care, to form a synthesis of the first phase of twentieth-century architecture and decorative design. They are intended to show what has been accomplished and from what it has been derived, with a representative survey of present-day achievement. Architects whose work is represented include Mendelsohn, Gropius, Dudok, Poelzig, Scharoun, Siclis, Mallet-Stevens, Oud, Corbusier, Neutra, Sir J. Burnet and Partners, and many others.

Generally speaking, one cannot help but agree that the battle is won and modern art now finds itself invested with certain security, even with a degree of respectability. But one must also agree that, as in every movement, there is an extremist " left wing " party who are causing some disquietude and who, observing neither time nor place, would e'en out with what came first to their restless pencils : crude, unlicked, incondite conceptions, which, like false saints, usurpers of true shrines, thrust out the legitimate occupants. But then could not as much be said against the " left wing " of the traditionalists !

E. R.

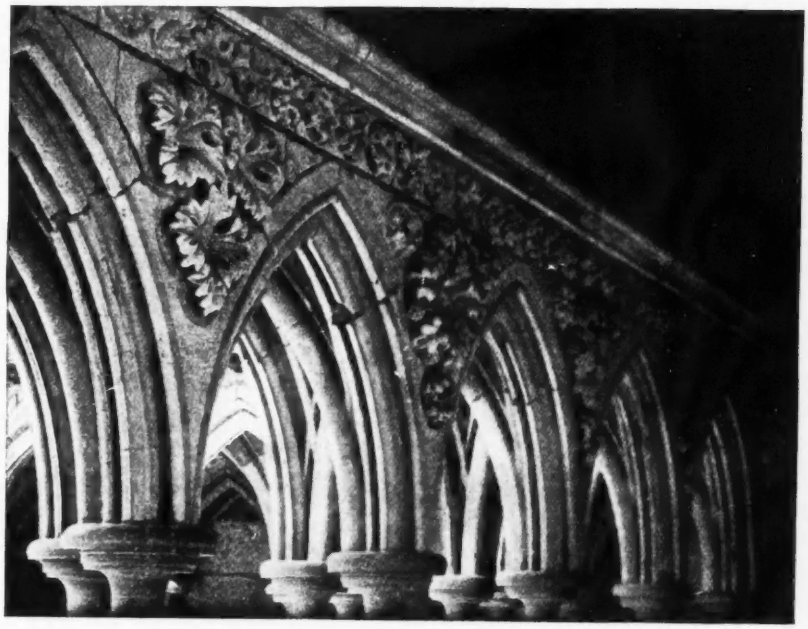
ORNAMENTATION AND TEXTILE DESIGN

PROFESSOR BARKER is well known as an authority in connection with textile industries, and the primary appeal of his book on *Ornamentation and Textile Design* is to those directly interested in the production of designs to be carried out in woven materials. But much that he has to say may be applied in some degree to architecture, and to designing for various media in association with architecture. Indeed,



[*From* Ornamentation and Textile Design.

Stone carving in the cloister of the Church of Mont St. Michel.

there is still room for a more general realization than is common at present of the intimate relation that ought to exist between fabrics and buildings. Such matters, however, are not actually dealt with in this book, but are inevitably suggested by it.

In the course of seven short chapters design is discussed in relation to the "three fundamental activities of Life—the provision of Food, Shelter, and Clothing," to natural forms and the grotesque, to tradition, and to psychology. It is wholesome to be reminded that "in the best forms of design and ornamentation the material and the tool are not limitations to the designer, but veritably his means of self-expression," producing a character that would otherwise be lacking. For too often today the seeker after self-expression treats his materials like circus animals, training them to perform unnatural and unnecessary tricks.

The textile designer is strictly limited by his material, yet by this very fact he can make texture play a considerable part in design, as he varies the combination of his crossed threads. Therein, too, is a hint for the designer in any other medium, to avoid another common fault of the present day, the vague production of patterns without any evident applicability to any particular type of material, or purpose. The author stresses the fact that along with the material and the tool must be taken into account the psychological contribution to design, a contribution ranging from the age-old religious outlook of some ancient nation, to the individual interpretation of some fleeting present-day "fashion."

The ninety-five illustrations include many from the author's own camera, and range from such an exquisite "nature study" as the dew-decked cobweb to the artist's naturalism of a Charles Sims portrait; from the simple grace of a native boat of woven reeds to the complex cubism of French designs based on skyscrapers and steamers, or on an Olympian's view of an intricate folk-dance. V. M. C.

DRAWING IN PEN AND INK

IN *How to Draw in Pen and Ink*, the author, Mr. Jasper Salwey, who is a well-known exponent of all forms of black and white art, gives a carefully-graduated course of instruction on pen and ink drawing, explaining what materials to use, how to begin and how to improve the technique once the elementary lessons have been mastered. The simplicity with which the explanations are given, together with the numerous diagrammatic drawings, should encourage many people who had hitherto thought this medium too difficult to learn. This, by the way, is the companion volume to *How to Draw in Lead Pencil*, published last year.

A feature of the book is a special chapter devoted to examples and descriptions of some of the work of prominent pen and ink draughtsmen, including Edmund New, Frederick L. Griggs, A.R.A., Frank Brangwyn, R.A., Donald Maxwell, Sir John Tenniel, Fred Pegram, R.I., Claude Shepperson, A.R.A., Herbert Railton, Claude Ferrier, and A. N. Prentice.

Regarding architectural perspectives, Mr. Salwey points out that "the preparation of perspectives for the architect's own use in judging the effect of his designs and for enabling his clients to visualize what the building will look like, is a sphere of work about which the every-day public knows little. The medium most favoured is water-colour; next perhaps wash; but when the drawings are required for reproduction in the press, pen and ink is generally considered most suitable." Taking as an example a perspective by A. N. Prentice, reproduced on this page, he further adds that "it is very typical of the kind of thing that is required. The building must be first set up in perspective by the recognized methods, and then carefully rendered. Accuracy in drawing and a confident crisp line are favoured. Attention must be paid to the intelligent delineation of detail. In addition to this, scenery and accessories must be introduced to give a sense of realism to the house and its setting. The work is exceedingly interesting and should appeal to the careful and conscientious penman. It offers a great opportunity for the development of an individual style." W. K.

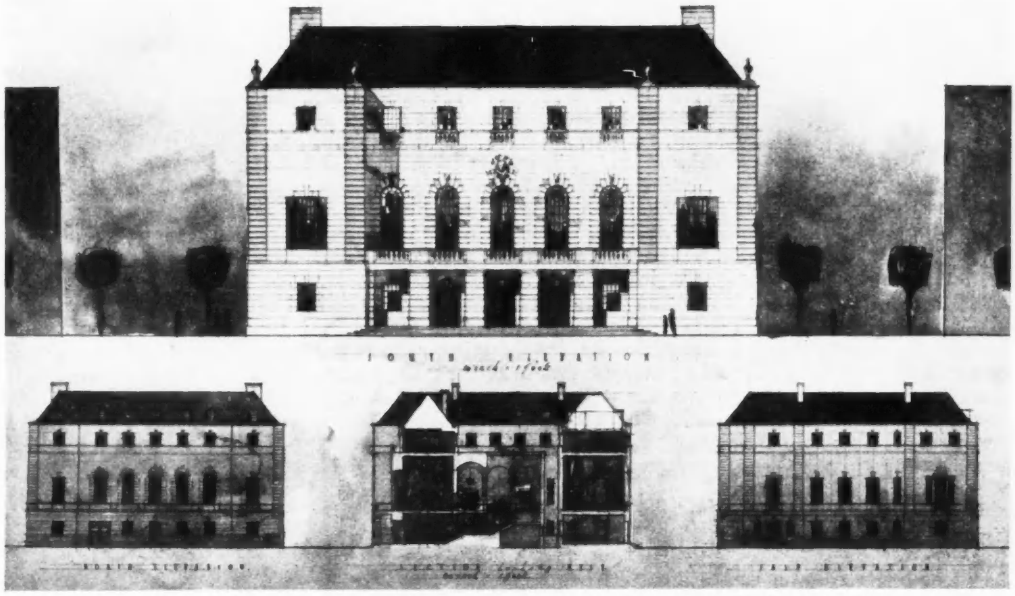
COMPETITION FOR A MANSION HOUSE

WINNING DESIGN: BY F. RUSSELL COX AND W. A. EDEN



The south (main), north and east elevation; and a section through the building, looking west.

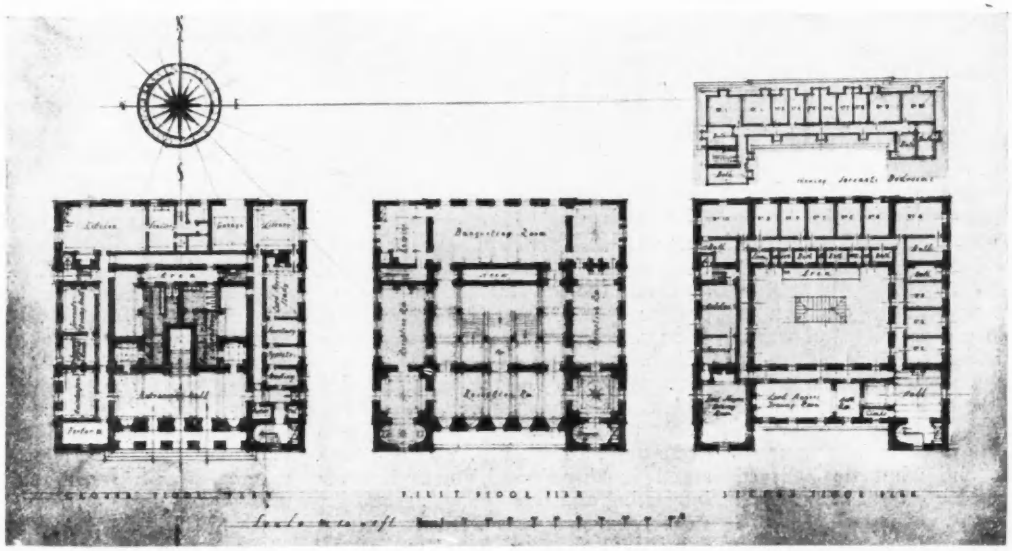
IN the competition for a design for a Lord Mayor's Mansion House, organized by the Birmingham Building Trades Exhibition, the Assessors, Messrs. A. T. Butler, F.R.I.B.A., H. B. Hobbiss, F.R.I.B.A., and J. B. Surman, F.R.I.B.A., have made their adjudication as follows:

First premium (£60), Messrs. F. Russell Cox and W. A. Eden, 3 Parton Street, London, W.C.1.

Second premium (£30), Messrs. Folkes and Folkes, 34 Hogley Road, Stourbridge.

Third premium (£20), Miss Marjorie M. Mocatta, Rosemead, School Lane, Bidston, Cheshire.

The designs submitted by the following architects were highly commended: Mr. Joseph Lea, of Timperley, Cheshire; Messrs. Batemans, of Birmingham; Mr. Charles Edward Pearson, of Lancaster; and Mr. J. Kenneth Hicks, of the A.A. School of Architecture, London.



Ground, first, and second floor plans, and plan showing the layout of the servants' bedrooms. The site is approximately 100 feet square. The main entrance hall, which is oblong in shape, is flanked by corridors running practically the whole depth of the building. The banqueting hall, on the first floor, overlooks the north front; on this floor also, are two reception rooms and a recreation room.

WHENCE INSPIRATION IS TO COME

MR. A. B. KNAPP-FISHER, F.R.I.B.A., in his presidential speech to the Architectural Association on Monday, said that since the War there had been in the world of architecture a desire to get rid of frills, of shams and shibboleths, to be frank in their work, to see beauty in honest expression of purpose, a striving to get back to first principles.

Assuming that those were perfectly right principles on which to work, let us, he said, proceed to dispose of some of the obstacles as he saw them, which hampered their attainment.

The eternal controversy of modern versus traditional, that was the first of them. Could not we reduce this stupid warfare to the level of Euclid's *Quod est absurdam?* The battle of the styles again? Not a bit of it. There was no such thing as modern architecture, any more than there was such a thing as morning coffee. There was the architecture of the moderns as they were to us—a very different thing, which, like so-called morning coffee, might be good or bad. Let us away then with this stupid label, which was so cramping and restrictive in its use.

What of tradition? That was a little different. Like the poor, it was always with us. The classics of architecture, of any art, were not there to be copied or avoided, they were a training ground for perceptions and faculties for which there was a use to be found on a much wider field—the past was, and must be, a living thing, not a fetter or a weight to original thought, but something to be naturally absorbed in a living present. We could not forget the models of the past. In the works of all great artists there were the foundations of tradition, but, like the modern surgeon, we should no more think of ignoring modern scientific discovery or scientific methods than he would think of performing an operation for appendicitis with an unsterilized clasp-knife.

In other words, while mindful of the past, a solution of present problems must be based on present facts, not on past history.

Architecture was not a question of giving way to compromise, but was a synchronization of essential factors—it depended on a proper marshalling of criteria, and the chief bugbear was the æsthetic side or element in connection with which let them remember what Voysey said, and what he believed was a profound truth, that materialism alone was a demon of unrighteousness. Architecture was an art, whatever the material needs or the economic means; we would be poor specimens if we consisted of matter only. So great were the foundations of our art that if it was to succeed as such, and to be lasting, the eternal verities must be made to mix with the applied actualities of the present day—to funk and shirk, "the grace in all simplicity," words attributed to Shakespeare in "The Phœnix and the Turtle," and to be content with the sort of building which shouted at you, "I may be stark but, thank God, I'm clean," was merely to produce an architecture of bones and skin, a skeleton of a thing, and was as bad as the building whose architectural chassis was covered with misapplied ornament, clogging its structure, like a Victorian matron with layers of thick petticoats and under bodices and other unmentionable clothing hanging round her. Let us be mindful of the past, and in this connection let us try to capture without the least shame or fear of being called a copy-cat, something of the mystery and colour of Eastern work, the light-hearted and magical touch of the baroque, the grace of the Greek, the poise of the mediæval, the air of the Renaissance and the grandeur of the Romanesque; only thus would we do great work; only thus should we get anywhere approaching in architecture what was to be found in eight out of ten slum children in any city—poise, balance, vitality and beauty of form—an architecture which was a synthesis of function and spirit, which presented us with beauty, and gave us inspiration.

Did we, he asked, remember our *Wisdom of the Ancients*—Lucre, the temptress, watching the gambler (in building in this case) opening her Pandora's box and letting loose on town and country alike a rain of architectural calamities? But if we remembered, there was Hope at the bottom of the box, and therein lay the great incentive for us. The outlook was not hopeless, but the architect of today and tomorrow must tackle this question of his field o action if he was not to be irrevocably destroyed.

DECORATING THE HOUSE

MR. EDWARD MAUFE, F.R.I.B.A., in the course of his address on "Furnishing and Decorating the House," given at the Architectural Association on Saturday last, said the records of the past all showed man reaching out to something new—that was the traditional attitude, and all the great architecture of the past was born from that endeavour. To employ past styles now was to be a revivalist, not a traditionalist, and revivals, if they had nothing of us and our time in them, were born dead; were fakes. Art had always expressed contemporary life.

He did not say discard the past—man's desires had been very much the same throughout the ages. We must learn from it, but we must not copy it. We must be sensitive to the past, but also sensitive to our new conditions. We must use our new materials—concrete, glass, steel, new woods, veneers, etc., and also our new discoveries in heating and lighting, and all the inventions to give us greater speed; these last, if we used them wisely, would give us greater leisure.

It was the lag of the English mind which had prevented our artists from being used fully. In furnishing and decorating, for instance, we were constantly looking abroad, and saying how interesting and new the work was, yet the foreign designers were the first to admit that they had been inspired by our architects, by such men as Morris, Macintosh and Voysey.

Much of the modern work of Sweden, which had rightly been so generously praised, had been directly influenced by such men as Soane and Norman Shaw. It was quite unfair to our painters, sculptors and architects to copy the past and not employ them, and much more was it unfair to ourselves—they would enrich the Nation if we let them. But if we did not give them work, they could not develop, and so we held them back and let others profit by what little they could do on their own. A nation got the architects it deserved. It was a question of demand and supply.

Man had proceeded largely by revolt, and we must realize this when considering the decoration and furnishing of our own time. Contrast with the past was desirable, but it must not be merely a revolt from the times of our grandfathers—we must not merely swing with the pendulum of fashion. We should let our furnishing and decoration be a natural outcome of our own conditions.

Mr. Maufe said he was not one of those who considered ornament taboo. "Fitness for purpose" was an excellent slogan for a beginning, but "fitness for purpose" was not enough—it was a Puritan creed, and too easy to be fundamental and for all time. We could be simple and dignified in our scheme, and be right, but we could also be the opposite of these and still be right if our human values were right—if we had proportion and contrast. One of the essentials was contrast, and a nice relation of the various parts—we needed incident and adventure, but also background.

THE SPECIFICATION WRITER

Practical Methods of Waterproofing Basements

BY THEODORE CRANE

THE term waterproofing, as used in this article, applies to treatments designed to resist actual water pressure resulting from hydrostatic head in contradistinction to damp-proofing. Although the design of the structural work, upon which a satisfactory waterproofing job largely depends, is an engineering matter, it is necessary for the architect to have a thorough knowledge of the various waterproofing systems in order that he may be aware of their advantages and limitations and be able to choose correctly when it is necessary for him to decide upon the means to be used on any particular job.

The subject of waterproofing masonry walls below ground, particularly those composed of concrete and subject to more or less water pressure, has received a great deal of attention during recent years. The problems presented by building foundations, often extending 50 ft. or more below ground-water level, have introduced conditions never before encountered in the industry, with the result that the attention of engineers has been directed to a study of waterproofing methods and a search for the most economical solution to meet any given set of conditions.

Until about twenty-five years ago it was the general practice to use the "membrane method," employing layers of felt, jute or cotton drill, with a pitch or asphalt binder, under practically all conditions where it was necessary to resist a hydrostatic head. Various other systems of waterproofing in the nature of surface applications were used principally for damp-proofing purposes; these varied from bituminous applications employed on the earth side of retaining walls to the old soap and alum method known as the Sylvester process. Prior to this time integral admixtures were used only to a limited extent for waterproofing purposes, and the possibilities of mortar applications effectively to resist hydrostatic pressures had not yet been developed.

At the present time the problem is not so much the question of making the basement dry as the choice between the various means of accomplishing this end. So many excellent systems are at present available—several of which will often serve satisfactorily to meet the requirements of any specific problem—that it is necessary to study the construction details of the work and the proposed method of handling the excavation and substructure in order to determine the most economical type of waterproofing.

Broadly speaking, for the problems encountered in building construction, the various methods of waterproofing may be classed under four main divisions: integral, surface coatings, mastic, and membrane. We might, of course, mention as a fifth method the careful grading of aggregates and proportionment of the concrete ingredients to obtain waterproofed concrete without the aid of admixtures or surface applications. But such can hardly be considered a method of waterproofing and should be a part of the normal procedure on any well-organized operation.

The function of an integral waterproofing material is to make the concrete itself impermeable. Whether in a liquid, paste, or powdered form, such admixtures may be designed either to increase the workability of the plastic concrete, thereby making the mass more dense, or to add certain other desirable characteristics which will lessen the probability of water passing through the finished surface.

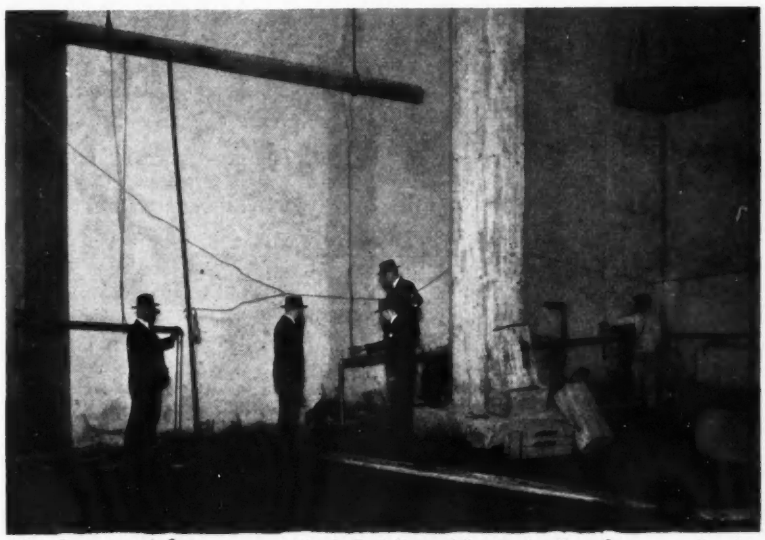
SURFACE COATINGS

Under surface coatings, we find the following methods differentiated by the material or materials used for surfacing: the mortar-coat used with or without integral waterproofing compounds; penetration surface treatments, either inert or reacting chemically with the cement; liquid or plastic bituminous coatings, used as either trowel, brush or spray applications; non-bituminous coatings, the function of which is to form a film upon the finished surface.

Of these various methods, most of which are suitable for damp-proofing purposes and have been employed extensively above ground, the mortar-coat system has probably been the most widely and successfully used to withstand hydrostatic pressure. This method has many advantages, chief among which is economy, because of the simplicity of its application and the ease with which it can be adapted to the foundation conditions on the average job. A cement surface has not, of course, the elasticity of a membrane, and should not be used where there is danger of settlement or cracks due to vibration. The system has a wide application and is equally satisfactory when applied to the inside surfaces of exterior basement walls of small residences, as on the sub-basements of office buildings where the concrete caissons forming the exterior walls often extend 60 to 90 ft. below ground water. The mixture ordinarily used is composed of one part of cement to two parts by volume of well-graded sand, with the addition of a waterproofing compound in such proportions as are recommended by the manufacturers. Two coats, giving a total thickness of $\frac{5}{8}$ in., are applied to walls; floors are also finished in two coats but with a total thickness of 1 in.

The mortar-coat method, when properly applied, is capable of resisting very heavy water pressures, provided the structural work beneath has adequate strength. Although some experts prefer thoroughly to eliminate, by means of bleeding pipes, any percolation of water through surfaces to be treated, others apply their waterproofed cement mortar to walls through which water is actually seeping.

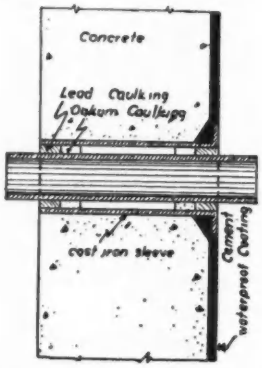
When waterproofing floors, the coating



The basement of the new Aldred Building, Montreal, Canada, treated with waterproofed cement, under inspection. D 2

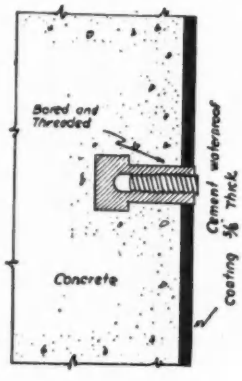
is placed upon the upper surface of the structural slab and serves the purpose of both waterproofing and wearing finish. Such floor coatings are often laid monolithic with the base. When joining new work to that previously placed, in cases where the latter has already set hard, the edges of the previously applied finish should be straight cut before continuing the work. It is also essential that a continuous seal be obtained where the waterproofing is placed in contact with structural steel. All paint should be removed and the surface thoroughly cleaned in order to provide a bond between the steel and waterproof coating.

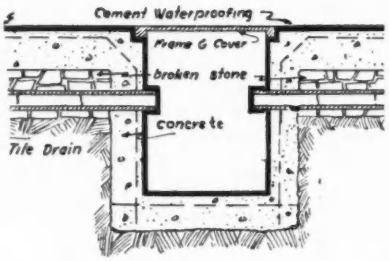
Particular attention should be given to the detailed design of waterproofing beneath boilers and machines. The foundations should be designed to form a depressed pit; heat insulation should be placed on top of the waterproofing beneath boilers and furnaces, and cork insulation or other means employed to lessen vibration beneath machines.



Sleeves designed as shown in the illustration should be used around steam pipes, the waterproofing bonded to the sleeve, and the space between the pipe and sleeve caulked as shown. Steel or cast-iron pipes not subjected to temperature variation may be bonded directly to the waterproofing.

The type of sump ordinarily used to relieve hydrostatic pressure under floors during the progress of the work comprises a steel pipe from 6 to 8 ins. in diameter, perforated at the lower end and furnished with a threaded cap which is screwed in place after the waterproofing work is completed. Sumps may also be constructed of concrete, as shown in the illustration, tile drains being led in from adjacent parts of the basement. In this case the





ends of the drains are formed by lengths of iron pipe which are also fitted with threaded caps. By the use of such sumps the expense of pumping is reduced, and the drains from any particular part of the basement may be closed when the operation is finished.

As it is not practicable to resist high hydrostatic heads by the dead weight of the concrete forming the floor slab of the basement, permanent sumps are often constructed in order to relieve water pressure throughout the life of the building. In other cases, where the uplift due to the water pressure does not exceed the load that can be economically carried by a structural slab, the basement floor may be designed as an inverted flat-slab held in place by the column loads. If the head is much over 10 ft., however, a drainage system and open sump is usually the most economical.

The first step in the procedure of applying a waterproof coat of this nature is to roughen the concrete surface in order to provide a bond. On brick or stone walls joints should be raked out to a depth of $\frac{3}{8}$ in., and all surfaces should be brushed clean in order to remove dust or loose particles. A coat of neat cement grout of a consistency of heavy paint is applied with a brush after the masonry surfaces have been thoroughly saturated with water. When wetting the walls it should be understood that the object is to use enough water so that the moisture will not be drawn out of the applied mortar coating and still leave the surfaces in a condition to exert a certain amount of suction, which will be destroyed if they are drenched to the extent that moisture is running down the surface.

The two coats of mortar are applied as outlined above and properly cured under moist conditions. The problem in work of this kind is not so much that of preventing leakage through the waterproofed surfaces as that of properly handling the construction joints, angles between floors and walls, column bases and pipe lines.

Among the various surface applications which are used for both damp-proofing and waterproofing are those of a bituminous nature largely made up of asphalts. Such are usually applied from the ground line to a point somewhat below the underside of the basement floor, with a reinforcing cove at the junction of the footing and wall on the exterior surface of the wall and across the top of the footing. The trowel applications are usually about $\frac{1}{8}$ in. thick, and follow a priming coat which is applied by fine air spray or hand brush. Such treatments have a very important use for damp-proofing purposes, but it is recommended that some other form of waterproofing be used where actual water-pressure exists.

THE MASTIC METHOD

The mastic method of waterproofing basements consists of facing the surface to be waterproofed with a layer of brick or terra-cotta tile, laid in a bituminous material. It is customary to lay the brick with a shove joint so that the mastic completely surrounds each unit. The outside course is then thoroughly mopped, and may be cleaned to receive a protective coating. This method is not widely used at the present time, but may occasionally be a desirable choice for basement work in very limited space where there is no ground water but some protection is needed against the possible breakage of a city water main.

[*To be concluded*]

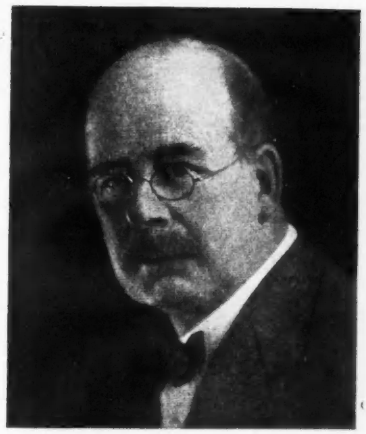
The foregoing article is reprinted from *The Contract Record and Engineering Review*, Toronto, Canada.

THE Copper and Brass Extended Uses Council records a failure of water pipes under somewhat unusual conditions. A large institution put in a service of both hot and cold water pipes in copper about 1910. The installation was happy in that it had no history until quite recently, when the water supply was chlorinated and treated with alumina-ferric. Soon after, corrosion began to occur in the horizontal lengths of the hot water pipes. The trouble was eventually traced to rust from the iron tanks, settling on the bottom of the horizontal pipes where the flow was slowest, and there, with the help of the treated water, setting up electrolytic corrosion with the copper.

The cause was over-alumination of the water, which resulted in an increase of acidity. It has been recommended that the water should be treated with soda-ash in addition to alumina or by substituting sodium aluminate for the alumina. Since other water authorities may have or contemplate this class of treatment for their water supply, it is well to point out that some sort of failure in the water services would then be probable, irrespective of the particular metal that had been used for the pipes.

SOCIETIES AND INSTITUTIONS

Mr. G. L. Pepler.



Mr. E. Guy Dawber.

At the fourth national conference of the C.P.R.E., held at Bath, both Mr. Pepler and Mr. Dawber contributed papers on "The Country Town and its Setting," reports of which are given on this page.

C.P.R.E. NATIONAL CONFERENCE

THE fourth national conference of the C.P.R.E. was held in the Guildhall, Bath, from October 15 to 17 last. The conference was devoted to a series of addresses on the preservation of the countryside, etc.

On October 15, after the reception of the delegates by the Mayor and Mayoress of Bath, in the Pump Room, Mr. Mowbray Green, F.R.I.B.A., delivered an illustrated address on "Eighteenth-Century Bath."

On October 16, the morning session was devoted to the consideration of "The Country Town and Its Rural Setting." Mr. G. L. Pepler, after quoting figures giving the possible increase in the population of a certain town he was familiar with, said the figures quoted appeared to indicate that not a great deal more land would be required for building round most country towns, and that it would be possible to prepare plans which allowed to each town a reasonable margin for new building and beyond that preserve the countryside as countryside. This was not meant to suggest that no building should be allowed in the countryside. No one suggested that a dead hand should be laid upon it. What did seem desirable was that sprawling mongrel growth should be avoided, that there should be two clearly distinguishable types of development—the urban and the rural—each fitted to the needs and suited to the style of town and country respectively. The whole problem was one for each town or group of towns to consider carefully, in collaboration with their rural neighbours and with the county council, and having come to a conclusion, to prepare a plan to give effect to it.

Mr. Guy Dawber, P.P.R.I.B.A., said the interest of our provincial towns consisted in their quiet beauty and simplicity, and in the old houses and buildings of varying dates and style. He did not suggest for a moment that our country towns, the older ones especially, should be regarded as museum pieces, and that no changes or additions should be made to them, for that would be mere folly; but what should and could be done was to see that, by these changes and adaptations to suit modern needs, we did not lose the character of the towns, and in so doing make them all alike in their dull uniformity. No one wished to keep everything as it was centuries ago, and in building only to perpetuate the old styles; but it was a grievous pity to introduce new buildings, or alterations to existing ones; which quarrelled with their neighbours and bore no relation to the spirit of the place. After all, it was in its architecture, the setting of its old buildings, its beautiful trees, its open spaces and streets, that the charm of our country towns so largely consisted.

The afternoon session on October 16 was devoted to "Traffic and Amenities." Mr. G. H. Jack, F.R.I.B.A., in the course of his address, said the adoption of the Home Office bylaws regulating the construction and layout of petrol stations should be compulsory. He had found that the mere fact of bylaws being in force had had a most salutary effect. The improvement was very marked. Unnecessary advertisements were fast disappearing and the garish pumps were now painted a subdued green in common with the other apparatus, and the station itself was of iron. There should, however, be some control over the number of stations. Two or more in one village street were clearly undesirable. The veto on such materials as corrugated iron, etc., was a great help when stations were suggested in or near beauty spots. Unfortunately, the restriction did not apply to garages. Their placing and appearance could only be dealt with under the town-planning Acts. The specifying of suitable building materials did not appear to have created any great hardship. He wished it could be applied generally to country cottages and agricultural buildings.

Other papers were read by Messrs. W. Dallimore and E. H. Fryer on "The Use of Trees on the Sides of Public Roads," and "Roadside Signs," respectively.

"National Parks" was the subject of the session held on October 17. Among the speakers were Dr. I. T. Gibbon, C.B., Sir Lawrence Chubb, Professor R. S. T. Chorley, M.A., and Mr. G. F. Herbert, M.A.

THE NATIONAL CRISIS

Mr. John Watson, F.R.I.B.A., presiding at a meeting of the Royal Incorporation of Architects in Scotland, held at Edinburgh, referred to the national crisis. It was, he said, satisfactory to know that money spent on housing schemes, and also various subsidies, were to be diminished or abolished, and they were only sorry the decision had not been reached long ere this. The incursion of the State into house building had brought into being a number of anomalies which would have been avoided had the provision of houses been left to private enterprise. When they returned to normal conditions, they should press on local authorities and see to it that they only dealt with slum areas, and they should do so with all their energy. Surely it was most important that they should do all they could to at least arouse public opinion against the tremendous sums that were being spent on housing, which he could not see had been all needed in the past. If an economic rent had been demanded for the houses, then the demand for them would not have been so great.

A source of dissatisfaction to the profession, and a danger to architecture in general, was the growing tendency of all public authorities to do their own architectural work. He knew that it was a good thing to have a good official at the head of each department run by an authority, but how often did they see that the official had to hand over his work to the staff, and be they ever so good and well trained, he

considered the system was not the proper one.

The following new members were elected :

Fellow : Mr. R. R. Mill, Edinburgh. Associates : Messrs. J. A. Donaldson, A. S. Fitzgerald, Hugh Hawson, jun., L. H. Hill, and P. E. M'Manus, jun. Students : Messrs. K. D. Miller, G. D. Hart, R. A. Macfarlane, A. D. Stewart, H. J. D. Home, W. A. Jack, N. V. Low, R. A. Webber, A. R. Whitelaw, Wm. P. Mitchell, John Bolton, L. A. M. Fraser, Robert Neil, Thos. Hall, A. A. MacFarlane, and Miss M. F. Muirhead.

THE ARCHITECT AND THE COMMUNITY

Dr. Raymond Unwin, P.R.I.B.A., speaking on "The Architect and his place in the Community," at a meeting of the Bristol Society of Architects, said specialization had certain advantages and dangers, and the only way in which specialization could take place without harm was by co-operation between different specialists. Much more co-operation was needed between the architect and the engineer, and the architect and the builder.

They were passing from an age of haphazard into an age of planning, and had been struggling through a period of civilization in which, no doubt for a very good purpose, their attention had been concentrated largely on mass or quantity.

He believed they were seeing a period of transition and emergence from a materialistic civilization, based on the power to produce quantity. They needed a period of less quantity and more quality.

They had, he thought, a right to point out to modernists that experiments in bill-posting were entirely justified, but experiments in building had to be undertaken with a sense of responsibility.

Mr. W. J. Stenner, F.R.I.B.A. (President), presided.

MR. T. C. HOWITT ON ECONOMY

At a meeting of the Nottingham, Derby and Lincoln Architectural Society, Mr. T. Cecil Howitt, F.R.I.B.A., in the course of his presidential address, said the general cry of economy throughout the country was bound to have a serious effect on the building trade if all prospective schemes were at once cancelled. The majority of building projects under discussion at the moment were of a very practical and constructive nature, with very few luxury buildings. He understood that at the present time there were approximately 1,900 men in the building trade unemployed in Nottingham and Derby, and unless normal building activities were proceeded with, this number was likely to reach a most appalling figure. It was therefore obviously sound to proceed with as many useful building schemes as possible.

Referring to the design of buildings, he said that if a building suited its particular situation, blended happily with its surroundings, expressed its purpose, and was obviously soundly built, then one had satisfied the greatest points in good architecture. He was afraid, however, those points were very little appreciated by the general public, or otherwise we should be saved from the many atrocities which were perpetuated in building materials up and down the country. In a nation such as ours it was difficult to imagine why there was not some general control with regard to the design of buildings. The local authority had its own powers to control traffic, the medical officer could deal with items affecting the health of the city, the whole of the sanitary services to the city were controlled, but, unfortunately, there was nothing to stop the epidemic of

Mr. T. Cecil Howitt, F.R.I.B.A., whose presidential address to the Nottingham, Derby, and Lincoln Architectural Society is reported on this page.

ill-designed buildings springing up amidst some beautiful English scenery, together with many vulgar advertisements.

Many local authorities had now adopted what was commonly known as the Bath Clause, but, unfortunately, this was of very little use, and in practically all cases it had proved quite ineffective where it had been adopted for some little time. In the Clause, the question of taking any action was provided for far too late in any building project. What was really required was some simple and constructive information on a development scheme both as regards general skylines and materials to be used, before any part of a particular area was developed. Unfortunately, such instruction was generally confused with the fact that elaborate designs and types of detail must be gone into for the whole scheme, rather than the broad issue of the general effect of the style and the general heights of the buildings, and the treatment of culminating points to vistas that required special features. In almost every town where street-widening operations had recently been carried out, this very simple procedure had not been taken advantage of.

R.I.B.A. ELECTION OF MEMBERS

At a recent meeting of the R.I.B.A. the following members were elected :

As Licentiates (35)

Adams, P. W.	Hawkins, J.
Askey, H. E.	Holbeche, W. T.
Bater, A. H.	Houston, T.
Blyth, R.	Ledgard, W. A.
Booth, A.	Nicol, B. R.
Bragg, G. J.	Pickup, J.
Campbell, G. C.	Potter, A. R.
Candish, H. S.	Richardson, A. H.
Davis, H. S.	Rowlinson, M.
Dotchin, F. E.	Sayers, A. D.
Fairer, T. J.	Scott, J. L. A.
Funnell, S. J.	Sharp, A. J.
Garbutt, H. C.	Stanham, Lt.-Col. H. G.
Garland, G. G.	Treacher, G. H.
Gough, W. T.	Urquhart, R. B.
Halsted, A.	Van Langenberg, T. C.
Hand, E. F.	Yendall, M.
Hardington, H. B.	

THE R.I.B.A. DIPLOMA IN TOWN PLANNING

The examination for the R.I.B.A. Diploma in Town Planning, which will be conducted by the Joint Town Planning Examinations Board, will take place in July, 1932. Candidates must make application to sit before March 1, 1932. The examination is open only to Fellows, Associates and Licentiates of the R.I.B.A.

Forms of application may be obtained, free, on application to the Secretary, R.I.B.A., 9 Conduit Street, W.1.

TOWN AND REGIONAL PLANNING

The annual country meeting of the Town Planning Institute was held at Bristol on October 9 to 11. The Lord Mayor gave a civic welcome at the opening, held at the Council House.

Professor Patrick Abercrombie, F.R.I.B.A., speaking on the Bristol and Bath Regional Planning Scheme, said that the modern growth of Bristol made it truly representative of industrial conditions affecting inward remodelling and outward growth. All the problems of the impact of the town upon the country were there seen typically.

Was, he asked, Bath England's most beautiful architectural city? That was a question for debate, but there could not be more than three other serious claimants.

The fullest compactness and completeness of town planning, he continued, could only be achieved where the guiding authority was also the developing agency. He declared that development of a wrong sort was going on.

Mr. Lessel S. McKenzie, in an address, dealt in detail with the town planning in and around Bristol.

Mr. G. L. Pepler, proposing a vote of thanks to the speakers, said their evidence of the town and regional planning activities in and around Bristol and Bath was particularly encouraging at the present time, when economy was a national necessity. The remarkable assets might be frittered away unless the situation was carefully surveyed.

ADVICE TO YOUNG ARCHITECTS

Mr. J. B. Surman, F.R.I.B.A., in his presidential address to the Birmingham Architectural Association, offered some advice to younger members of the architectural profession. It was, he said, not always easy to hold the weight of authority between the wealthy client and the small builder. Often, he was afraid, the architect's eye had been on the next job when a settlement time came, and he had given a final certificate with his eye on that future job. This would not do, for their responsibility was clear.

Architects must remember they were guardians of their clients for the time being, and must act wisely. There was a service required of all—their voluntary service to their city and country. Were they satisfied with their city—its amenities? Were they satisfied with the countryside, with the hideous structures which covered the landscape, with the illuminated signs and with all the trappings of modern civilization which we often mistakenly called improvements?

In all these matters they had a definite responsibility, and it was their duty to point out what was right and fit, and to endeavour to develop the sense of what was beautiful and fitting.

EARLY RENAISSANCE ARCHITECTURE

Sir Banister Fletcher, PP.R.I.B.A., lecturing at the L.C.C. Central School of Arts and Crafts on October 14, dealt with the Early Renaissance Architecture of Florence.

He gave an interesting comparative analysis of the characteristic features of the style, and described and illustrated, by means of lantern slides, the churches and palaces of Brunelleschi, Alberti, and their early followers, and showed how symmetry of classic origin was combined with variety and picturesqueness in detail.

Sir Banister, on Wednesday last, described the Early Renaissance buildings of Northern Italy, particularly those of Pavia, Milan and neighbouring centres.

UNIVERSITY OF LONDON ATELIER

The commencement of the thirteenth session of the University of London Architectural Atelier was marked by the opening of a new building by Professor A. E. Richardson, F.S.A., F.R.I.B.A., on Wednesday, October 7. A general meeting of members was held after Professor Richardson's inaugural address, at which the following were elected to serve on the committee:

Monitor and chairman, Mr. W. M. Goode-Smith; senior representative, Mr. W. Rowley Hall; second-year representative, Mr. M. R. Packer; first-year representative, Mr. A. G. Wise.

The original home of the atelier in Malet Street, Bloomsbury, has now been absorbed in the scheme for the new centre of the University of London.

COMPETITIONS OPEN

October 31.—Sending-in day. Proposed Tuberculosis Hospital, Sully, near Cardiff, for the Welsh National Memorial Hospital. Assessors: C. E. Elcock, F.R.I.B.A., and T. Alwyn Lloyd, F.R.I.B.A. Premiums: £400, £300, £175 and £100. Conditions were obtainable from F. J. Alban, Memorial Hospital, Cardiff. (Deposit £2 2s.)

November 23.—Sending-in day. New Junior and Infants' School, Farnborough Road, Birkdale, for the Southport Corporation. Limited to architects practising or residing in the County of Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £100, £75 and £50. Conditions, etc., obtainable from the Director of Education, 1 Eastbank Street, Southport. (Deposit £1 1s.)

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor: Sydney Tatchell, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions, etc., obtainable from F. L. Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius of Liverpool Town Hall. Assessor: A. H. Moberly, F.R.I.B.A. Premiums: £200, £100, and £50. Conditions, etc., obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

December 31.—Sending-in day. Latest date for conditions: September 31. Proposed New Town Hall and Municipal Building, for the Walthamstow Corporation. Assessor: H. Austen Hall, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Conditions, etc., obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

January 1, 1932.—Sending-in day. Proposed Church at Low Shiregreen, Sheffield, in connection with the Bishop of Sheffield's 100,000 guineas appeal (limited to architects with an office in the Sheffield Diocese). Assessor: C. C. Thompson, F.R.I.B.A. Full particulars obtainable from the Hon. Secretary, Sheffield South Yorkshire and District Society of Architects and Surveyors, 15 St. James' Row, Sheffield.

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. (Deposit £1 1s.)

THE ARCHITECTS' DIARY

WEDNESDAY, OCTOBER 28

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Palaces and Villas of Rome." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

THURSDAY, OCTOBER 29

THANET SCHOOL OF ART LECTURES ON ARCHITECTURE. At Chatham House School, Ramsgate. "The Roman Empire." By R. Goulburn Lovell, A.R.I.B.A. **7.45 p.m.**

FRIDAY, OCTOBER 30

ILLUMINATING ENGINEERING SOCIETY. At the Royal Society of Arts, John Street, Adelphi, W.C.2. Discussion on "Some Impressions of the I.I.C. Floodlighting." By Percy Good. **6.30 p.m.**

HASTINGS MUNICIPAL SCHOOL OF ART LECTURES ON ARCHITECTURE. "The Growth of Rome." By R. Goulburn Lovell, A.R.I.B.A. **7.30 p.m.**

SATURDAY, OCTOBER 31

Sunrise, 6.49 a.m. Sunset, 4.38 p.m.

R.I.B.A., 9 Conduit Street, W.1. Last of four non-technical lectures. "The Uses of An Architect." By H. B. Creswell, F.R.I.B.A. Chairman: Charles Marriott, HON. A.R.I.B.A. **3 p.m.**

MONDAY, NOVEMBER 2

R.I.B.A., 9 Conduit Street, W.1. Inaugural Meeting: President's address. **9 p.m.**

TUESDAY, NOVEMBER 3

KING'S COLLEGE, Strand, W.C.2. Fourth of nine public lectures on Gothic Art. "Symbolism and Iconography." By Rev. Dr. Percy Dearmer. **5.30 p.m.**

INSTITUTE OF LANDSCAPE ARCHITECTS. At the Royal Horticultural Hall, Westminster, S.W.1. Presidential Address. **3.30 p.m.**

INSTITUTION OF CIVIL ENGINEERS, Gt. George Street, S.W.1. Opening Meeting. Address by Sir Cyril R. S. Kirkpatrick. **6 p.m.**

WEDNESDAY, NOVEMBER 4

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "St. Peter's Cathedral and the Vatican, Rome." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

THURSDAY, NOVEMBER 5

INCORPORATED INSTITUTE OF BRITISH DECORATORS, Painters' Hall, Little Trinity Lane, E.C.4. "Contemporary Decoration." By Arthur J. Davis, F.R.I.B.A.

SOCIETY OF ANTIQUARIES, Burlington House, W.1. "Further Excavations on Macedonian Sites." By W. A. Heurtley. Also "Recent Discoveries at Vinca by Dr. M. Vassito." By Professor J. L. Myers, F.S.A. **8 p.m.**

THANET SCHOOL OF ART LECTURES ON ARCHITECTURE. At Chatham House School, Ramsgate. "Early Christian Architecture." By R. Goulburn Lovell, A.R.I.B.A. **7.45 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Hardwoods." By Alexander Howard. **7.30 p.m.**

GARDEN DESIGN

[BY OUR SPECIAL LAW REPORTER]

THE designers of many beautiful gardens throughout the country undoubtedly look upon them as both artistic and architectural works of art, and are not anxious that they should be reproduced. But few are aware that their designs are protected under the Copyright Act, though such is the fact.

Recently, Lord Justice Romer, in the Chancery Division of the High Court of Justice, had before him an action which raised the point whether a garden drawn and specially designed was entitled to the protection of the Act, and could not be reproduced by a firm who contracted to lay out a garden. The point had never been raised in the Courts before, and, although his Lordship characterized the action as a ridiculous one, he added that, like most ridiculous actions, it raised a considerable point of law.

The garden consisted of walls, terraces, a pond and round steps—in fact, an artistic design and an architectural work of art—which, it was claimed, was protected by the Copyright Act. What the designer complained of, was that a firm of builders had published a photograph of his garden in a catalogue, and claimed it as their particular design and construction, and offered to reproduce it. Under the circumstances, the designer sought the protection of Court and asked for an injunction to restrain infringement of his copyright of the design of his garden, which, he said, was an architectural work of art—defined in the Act as a subject-matter of copyright.

It was admitted that the garden had features which were common to all gardens, but Lord Justice Romer, after hearing the evidence of experts, and seeing photographs, said it contained a combination of features which were novel, and which had not been seen before. To publish a photograph of a garden was not an infringement of designers' copyright.

His Lordship expressed the opinion that the garden was a structure, as it had steps and walls, and it was impossible to say it did not possess artistic character or design. Therefore, it came within the Act, and it was an infringement of copyright to offer to construct a garden in accordance with the particular design.

The issue raised by the action was an important one, and the ruling of the Court now becomes the law, and designers of gardens, who produce structures of artistic and architectural merit, can rest assured that, though their gardens may be envied, they cannot be copied.

(The action was by H. Vincent and Sons, landscape gardeners, of Northwood, Middlesex, against Universal Housing Co., Ltd., of Rickmansworth, reported in a recent issue of the JOURNAL.)

TRADE NOTES

We have received from Messrs. Rowe Bros., of Liverpool and Bush House, London, a pamphlet describing the Sloan royal flush valve. This valve is manufactured in Canada and the United States, and is sold in this country by Messrs. Rowe Bros. Comparatively few people are aware that it is possible for a water closet to be flushed in a satisfactory manner, without the use of a flushing cistern. The principal disadvantage of the flushing cistern is the time required for it to fill up again. The noise involved in the process of filling up is also a strong objection. The Sloan royal valve has now been in existence for twenty-five years, and, during that time, the principle of its operation has remained unaltered.

This interesting valve is divided into two chambers by means of a rubber diaphragm. The chambers are connected through a narrow by-pass which penetrates this diaphragm. The slightest touch of the handle grip, which may be pulled in any direction, releases the pressure in the upper chamber, as a result of which the entire working parts are raised, allowing free passage to the water. As the water passes through, the by-pass gradually admits a small stream into the upper chamber, which is filled at the correct moment, and so interrupts the flow.

It is interesting to observe that the valve may be used for water delivered at any pressure whatsoever, without being specially regulated to suit the pressure. This is due to the fact that the proportion of water passing through the by-pass is in a fixed ratio to the water that goes through the valve. "If," says Messrs. Rowe's booklet, "the pressure is 20 lb. and the quantity that goes down through the valve does so in 10 seconds, the quantity that fills the upper chamber will go through the by-pass in 10 seconds. It follows, therefore, that if the pressure goes to 50 lb. the quantity that goes down through the valve will travel much faster, but the by-pass being subject to exactly the same pressure, the upper chamber will fill up relatively as fast, so that the quantity of water will always remain the same."

*

A girder 68 ft. long, 10 ft. 4 ins. deep, and 2 ft. 4 ins. wide, weighing 98 tons, has just been constructed by Messrs. Dorman Long & Co., Ltd., Middlesbrough, for the Cumberland Palace Hotel, Marble Arch, London. This girder was transported in one piece by train from Middlesbrough. It will be used at the first-floor level of the hotel to act as one of the main supports of the building over the Winter Garden, and carrying nine floors above. The enormity of this piece of steel can be gauged by the fact that the rivets used in its construction alone weigh 2½ tons.

We are desired by Art Pavements and Decorations, Ltd., to express their regret that, through an oversight, the names of Messrs. W. Aumonier and Sons were omitted in their advertisement in THE ARCHITECTS' JOURNAL for October 14. Messrs. Aumonier were responsible for the carving of the marble cap illustrated, which is one of the caps and columns being supplied by Art Pavements and Decorations, Ltd., for the new Cunard Building in Leadenhall Street.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Swimming Bath, Hostel for Bourne and Hollingsworth (pages 554-557, and supplement). General contractors, Higgs and Hill, Ltd. Sub-contractors : G. N. Haden and Sons, Ltd., heating and ventilation; The Turn-Over Filter Co., Ltd., filtration plant; Carter & Co. (London), Ltd., tiling; James Powell and Sons (Whitefriars), Ltd., glass tiles for swimming bath ; Birmingham Guild, Ltd., Staybrite balcony and electric light fittings; Dorman Long & Co., Ltd., constructional steelwork; Diespeker & Co., Ltd., reinforced concrete floors and roofs; Barlow Bros., electric lighting; Zeiss Ikon, Ltd., reflectors; Henry Hope and Sons, Ltd., casements and skylights; Haskins, Ltd., stainless steel doors; John Bolding and Sons, Ltd., sanitary fittings; Venesta, Ltd., bathing box partitions; John P. White and Sons, Ltd., flush doors; Yannedis & Co., door furniture; F. H. Ayres, Ltd., diving board equipment; Arthur Lyon & Co., electric clocks.

Logie Central School, Dundee (pages 558-560). Contractors : John Carnegie and Sons, Ltd., excavation, foundations, dampcourses, asphalt, concrete blocks, reinforced concrete, bricks, stone, artificial stone and terra-cotta; Charles Brand, demolition and slates; Fleming Bros., structural steel; Trussed Concrete Steel Co., Ltd., Reinforced Concrete Engineers, fireproof construction; John Youden and Son, Ltd., wall tiles and tiling; North of England School Furnishing Co., sliding partitions; Lindsay and Scott, glass; Heywood, Ltd., patent glazing; T. P. Fimister, central heating, grates and plumbing; Westwood and Son, electric wiring, electric light fixtures and bells; David Dickie and Son, door furniture; Helliwell & Co., Ltd., casements; George Stephen and Son, folding gates; A. McRitchie, plaster; Gratrix and Sons, metalwork; Charles Ogilvy, joinery; John Scott and Son, furniture; Dykes Bros., clocks.

ANNOUNCEMENT

Mr. Frank J. Potter, F.R.I.B.A., architect and surveyor, has entered into partnership with Messrs. Felix and Humphrey Goldsmith. The name of the firm will be Messrs. Frank Potter and F. and H. Goldsmith, of 1 Verulam Buildings, Grays Inn, W.C.1. (Telephone No. Chancery 7525).

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The BERMONDSEY B.C. has prepared a scheme for the provision of a municipal centre in the Silver Street area, comprising a laundry section, library, public hall and clinic, at a cost of £47,500.

The BERMONDSEY B.C. has approved plans for the erection of flats on the Silver Street area, at a cost of £11,875: and flats on the Fort Street site, at a cost of £28,000.

The BERMONDSEY B.C. has approved a revised scheme for the erection of twenty-two flats and five shops on the Rotherhithe Street area, at a cost of £14,800.

Plans passed by the FULHAM B.C.: Jam factory, Rannock Road, for Messrs. J. Lyons & Co., Ltd.: alterations and additions, "Cock" public-house, North End Road, for Mr. N. Parr: offices, workshops, etc., Lillie Road Underground Railway, for Mr. V. A. M. Robertson.

The ISLINGTON B.C. has prepared a scheme for extending the Caledonian Road baths and installing filtration plant, at a cost of £9,290.

The L.C.C. has sold two sites on the St. Helier estate, MORDEN, to the Church of England authorities, for the erection of churches.

The L.C.C. has passed plans, submitted by Messrs. Edmond Coignet, Ltd., for the erection of premises on the site of 67–9 Whitfield Street, and 8–9 Chitty Street, ST. PANCRAS.

Messrs. Maple & Co., Ltd., are to carry out alterations to their premises in TOTTENHAM COURT ROAD, W.C.1, at a cost of £125,000.

The WATFORD Corporation has passed a layout plan for the development of land at Leavesden by the Watford Gardens Estate, Ltd.

The WATFORD Corporation has obtained five acres of land at Leavesden for a housing scheme.

Plans passed by the WATFORD Corporation: Alterations, 89 High Street, for Rego Clothiers, Ltd.; post office, Market Street, for Postmaster-General; houses, Swiss Avenue, for Mr. John Goss; house, Kelmscott Close, for Mr. W. T. Simmons; two houses, Rickmansworth Road, for Mr. Gregg Cooper; alterations and additions, Harwoods Road, for West Watford Conservative Club; additions, Northbank House, Clarendon Road, for Trade Unionist and Labour Club.

Plans passed by the WOODFORD U.D.C.: Four houses, Parkfield Road: six houses, Fairlawn Drive; five houses, St. Barnabas Road: two houses, Mayfair Gardens.

SOUTHERN COUNTIES

Plans passed by the DARTFORD U.D.C.: eighteen houses, Brent estate, for Mr. W. F. Summers; two houses, Shepherds Lane, for Mr. R. B. Smith; twelve houses, Ingram Road, for Mr. G. W. Chancellor; house, York Road, for Mr. W. R. Mackney; ten houses, Brent Lane, for Mr. J. Ellard.

Plans passed by the GRAVESEND Corporation: Workshops and garages, Bentley Street, for Mr. E. W. Filkins; two houses, Dennis Road, for Messrs. R. Hopkins and Sons; alterations, "Brewery Tap" public-house, Love Lane, for Mr. R. Bennett; two houses, Fairway, for Mr. H. L. Smith.

H.M. Office of Works is considering a site in Anglesea Road, PORTSMOUTH, for the erection of a labour exchange.

The PORTSMOUTH Corporation is negotiating for land at Copnor for the erection of a stores and transport depot.

Plans passed by the PORTSMOUTH Corporation: Twelve houses and one studio, Carshalton Avenue, Cosham, for Mr. E. W. Payne; seventy-one houses, Westwood Road, for Mr. R. J. Winnicott; alterations for Acme Printing Co., Ltd., 186 Queen Street, for Messrs. King and Milne; business premises, 60 London Road, for Messrs. E. Plooard & Co., Ltd.; six houses, Merrivale Road, for Mr. J. J. Canterbury; two houses, Essex Road, for Messrs. J. E. Jones and Son; twelve houses, Pitreavie Road, Cosham, for Messrs. G. and W. Mitchell; shop and showrooms, 117-119 Commercial Road, for Landport Drapery Bazaar, Ltd.; store, Claremont and Walmer Roads, for Mr. C. Welton; three houses, Copnor Road, for Mr. A. J. Chase; four houses, Kirby Road, for Mr. W. W. E. Ekers; nine houses, Tangier estate, for Mr. G. Coleman.

SOUTH-WESTERN COUNTIES

The Paignton and District Land and Development Co., Ltd., is to develop an estate and construct a new road near Maidenway Road, PAIGNTON.

The PAIGNTON U.D.C. is having plans prepared for a smaller type of house, for erection on the Collaston estate.

Mr. E. H. Ladbury is to develop the Woodland Park estate, PAIGNTON.

Plans passed by the PAIGNTON U.D.C.: Houses, Colley End Road, for Mr. A. Maunder; seven bungalows, Barnfield Road, for Messrs. Wallis and Underhay; four houses, Colley End Road, for Messrs. L. and L. W. Payne; eight houses, Marldon Road, for Mr. W. H. Toms; extensions to lecture hall, Torquay Road, for Baptist trustees; three flats and six shops, Winner Street, for Mr. W. J. R. James; four houses, Allhallows Road, for Mr. H. Proctor; two bungalows, Maidenway Road, for Mr. A. W. Humpherson; sixteen houses, Lammas Lane, for Capt. J. E. Eastley.

The TORQUAY Corporation is in negotiation for the acquisition of land at Barton for the erection of thirty-two houses.

MIDLAND COUNTIES

The BIRMINGHAM Corporation has sold land at Weeford to the Post Office, for the erection of a telephone exchange.

The CHESTERFIELD Corporation is to submit the plans of the proposed new baths to the Ministry of Health for approval.

The CHESTERFIELD Corporation is to sell land in New Beetwell Street to H.M. Office of Works for the erection of a postal stores and garage.

The CHESTERFIELD Corporation is to negotiate for land at New Whittington for a housing scheme.

Plans passed by the CHESTERFIELD Corporation: Alterations and additions, printing works, Wheeldon Lane, for Messrs. Brayshaw and Bateman; additions, "Rising Sun" public-house, London Street, Whittington, for Scarsdale Brewery Co., Ltd.; two bungalows, Langer Lane, for Messrs. F. Irvine & Co.: store, Boythorpe Road, for Chesterfield Co-op. Society, Ltd.: two houses, Kawkesley Avenue, for Mr. W. Bargh: two houses, Newland Gardens, for Messrs. J. Collis and Sons, Ltd.; alterations, "Spread Eagle" public-house, Beetwell Street, for Chesterfield Brewery Co., Ltd.; servants' hall, Whittington House, Old Whittington, for Mr. E. D. Swanwick; two bungalows, Walgrave Road, for Mr. R. Plowright; extensions, Edmund Street school and St. Helen's school, for Education Committee; alterations, Messrs. White and Son's premises, High Street, for Messrs. Duncan Gilmour & Co., Ltd.

The Board of Education has sanctioned the plans of the CHESTERFIELD Education Committee for the reconstruction of the St. Helens and Cavendish schools.

The CHESTERFIELD Corporation has obtained sanction for a loan of £13,560 for the erection of forty houses in Dickinson Road and Walton Crescent.

The Central Electricity Board is to erect a sub-station in Ferry Hinksey Road, OXFORD.

The OXFORD Corporation is to prepare a clearance scheme for an area at St. Aldates.

Plans passed by the OXFORD Corporation: Three houses, Godstow Road, Wolvercote, for Mr. G. W. Robinson; three houses, Oxford Road, Cowley, for Miss J. A. Knott; showroom, St. John's Road, for Messrs. Stephenson (Oxford), Ltd.

Mr. A. E. G. Jones has submitted plans to the SEDGLEY U.D.C. for the erection of a cinema in Redhall Road.

Plans passed by the SEDGLEY U.D.C.: House, Robert Street, for Mr. Hickman: two houses, Wolverhampton Road, for Mr. I. Cole; house, Wolverhampton Road, for Mr. A. Jones; two bungalows, Moden Hill, for Mr. G. Sheldon.

Plans passed by the SMETHWICK Corporation: Four houses, Pitcairn Road, for Mr. J. Reece; extensions, Credenda works, Bridge Street, for Messrs. J. A. Phillips & Co., Ltd.: shops, Norman Road, for Mr. J. Reece; alterations, 42-44 Waterloo Road, for Messrs. J.W. Dugmore, Ltd.; alterations at the old Wesleyan Chapel, New Street, for Messrs. S. J. Tyler and Sons, Ltd.; parish hall, Cambridge Road, for St. Stephen's trustees; house, Pitcairn Road, for Mr. J. Barker.

The SOLIHULL R.D.C. is to erect thirty-two houses in Damson Lane from the plans prepared by Mr. W. T. Orton.

The STOURBRIDGE Corporation is to erect 186 houses on the Forge Hill estate.

The WALSALL Corporation has prepared a more economical scheme for the erection of a tuberculosis block at the Goscote Hospital, at a cost of £14,600.

The WALSALL Education Committee is to proceed with extensions at Whitehall school, at a cost of £4,400.

NORTHERN COUNTIES

Messrs. T. P. Smith, Ltd., are negotiating for land in Moss Bank Park, BOLTON, for the erection of dwelling-houses.

The BOLTON Corporation has approved proposals for dealing with the Barlow Row and Green Street improvement areas.

The BOLTON Corporation is to erect 477 houses on the Hall-in-Wood estate.

The BOLTON Corporation is negotiating for land in Lum Street for the erection of wash-houses.

The BRADFORD Corporation has approved amended proposals of Mr. J. Atkinson Jowett for the erection of 722 houses in Rhodesway and Allerton Road, and shops in Thornton Road.

Plans passed by the ROTHERHAM Corporation: Two houses, Old Wortley Road, for Mr. E. Atton; shop and house, Masbro' Street, and two cottages, Tummon Street, for Mr. O. Tummon; house, Old Wortley Road, for Mr. Grimolby; extensions, St. James's Social Club, Lister Street, for the Club Committee.

The SOUTHPORT Corporation is to erect 116 houses on the Guildford Road estate.

Plans passed by the SOUTH SHIELDS Corporation: Bakery extension, Palmerston Street, for Mr. William Howell; flats, Meldon Terrace, for Mr. Howard Hill; two bungalows, St. Peter's Avenue, Harton, for Messrs. T. A. Page and Son.

Plans passed by the STRETFORD U.D.C.: Six houses, Marston Road, for Mr. Herbert Grinshaw; two houses, Urmston Lane, for Mr. D. Franklyn; sub-station, Kings Road, for the Electricity Board.

Canon Leteux is acquiring land in Dewsbury Road, WAKEFIELD, for the erection of a junior school.

Plans passed by the WAKEFIELD Corporation: House, Eden Avenue, for Mr. W. H. Ogden; four houses, Flamshaw Lane, for Mr. Percy Frith; house, Calder Street, for Mr. H. Stewart; shop and house, Northgate, for Messrs. G. Blakey and Son, Ltd.

MISCELLANEOUS

The GLASGOW Corporation is to erect 230 houses on the Netherton housing estate.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

• In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

SWIMMING BATH IN A HOSTEL

DETAILS OF AN ADDITION IN AN EXISTING BASEMENT

[*Slater and Moberly, Architects.*

THE SWIMMING BATH, LOOKING TOWARDS THE SHALLOW END

ELSEWHERE in this issue an illustrated description is given of the swimming bath ingeniously constructed within the existing hostel for employees of Messrs. Bourne and Hollingsworth, in Gower Street, London. The photograph above and the architects' drawings overleaf supply some interesting practical details in amplification.

The problem presented to the designers was by nature many-sided. Selecting at random a constructional point and an æsthetic one, attention may be drawn to the precautions taken against condensation, and to the decorative scheme and its corollary, lighting.

A plenum plant, discharging under the balcony, and extract fans in the roof, promote the removal of damp-laden air, while panel heating is introduced under the balcony soffits as well as low-pressure hot-water heating under the windows. Moreover, walls and roof slopes are insulated with one-inch wall-boards.

The colour-scheme is generally of blue and buff. The pool itself is lined with vivid blue tiles; stainless steel is used for the balcony and metal fittings; the bathing boxes are of ebonized mahogany. The sources of light are indirect, and include powerful submerged flood-lights.

FROM THE NEW WORLD: 6

EXAMPLES OF AMERICAN COLONIAL WROUGHT IRONWORK

PORCH WITH IRON BALUSTRADES, THE OCTAGON, WASHINGTON, D.C.

AS in the case of other materials, many of the motives for wrought ironwork of the period are clearly taken directly from examples in Europe—more often in England. But the large number of successful designs indicates appreciation of the characteristics and limitations of the material itself, and there were comparatively few attempts to emulate the more flamboyant characteristics of the European style.

The photographs reproduced above and on the last page show, in position, two among the examples chosen by Mr. R. Keith Harris for his sheet of sketches given within.

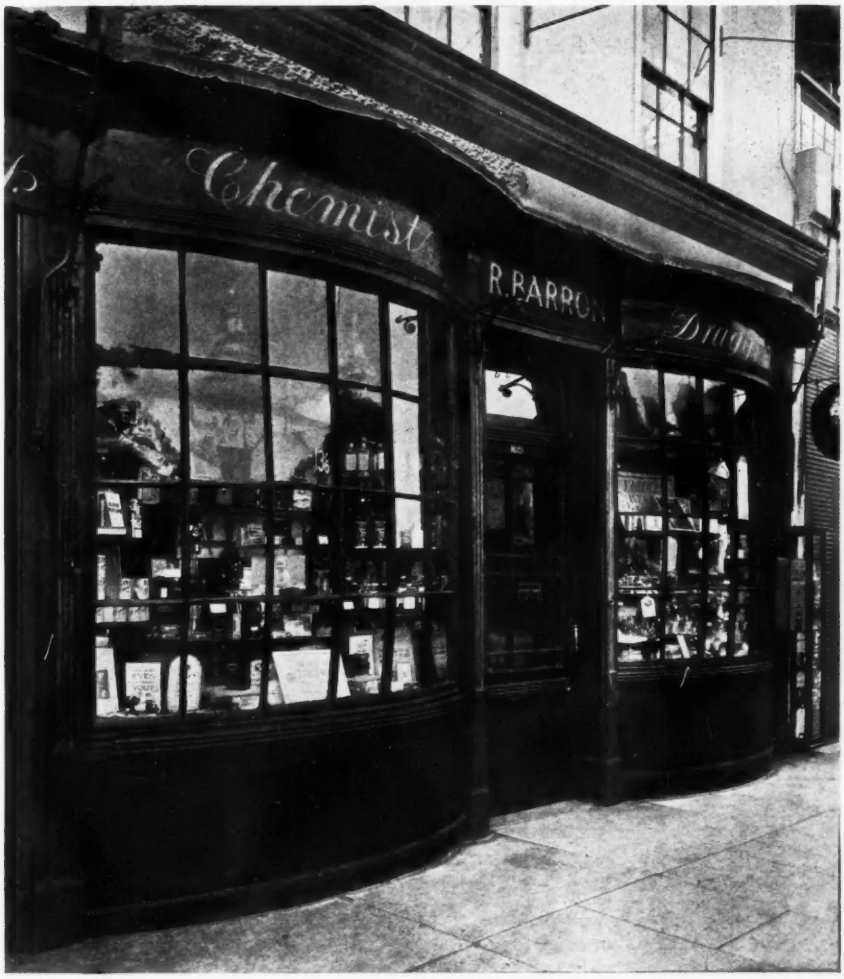
GEORGIAN SHOPFRONTS IN COUNTRY TOWNS



1. *DOUBLE BOW-FRONTED SHOP-FRONT AT EPPING.*

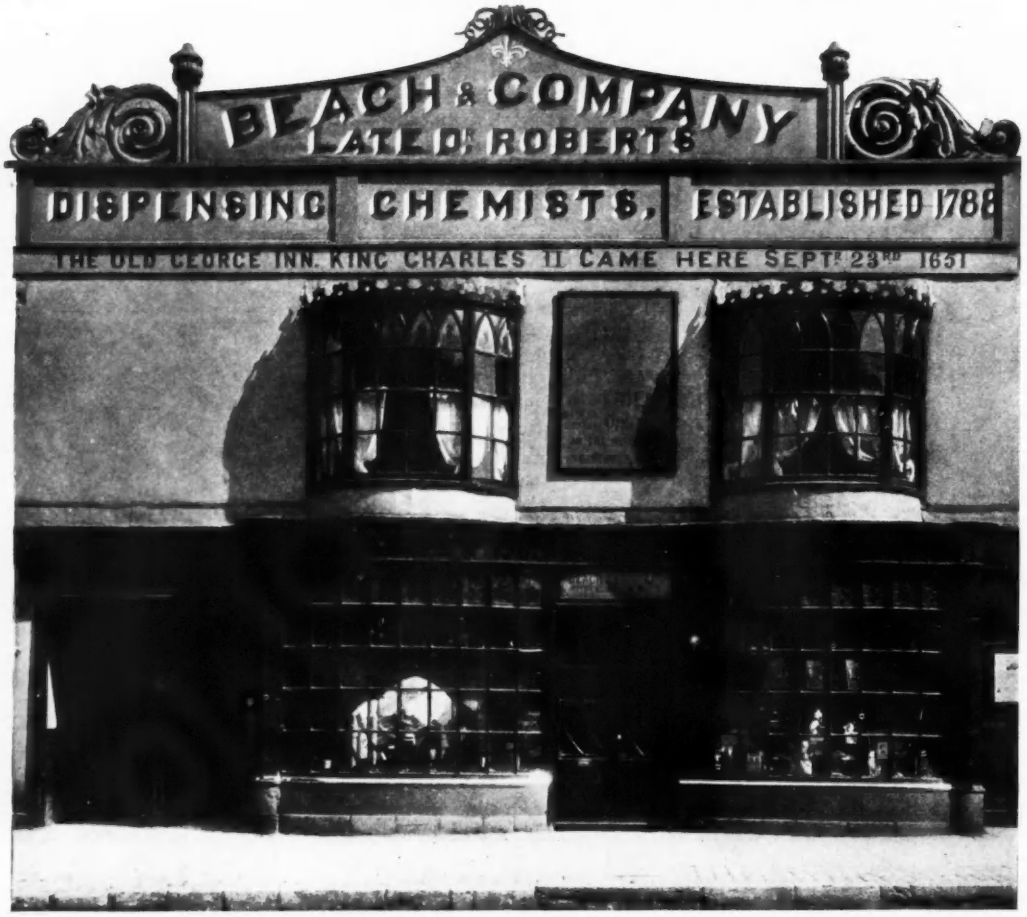
PHARMACIES tend to become hybrid. There are the traditional carboys to be kept in evidence; there are proprietary products in their tens of thousands (no mere figure of speech) clamouring for display-space; there is the professional status of the dispensing side to be preserved—all alongside the paraphernalia of quick-selling and brightly-lit showcases.

There is a call for the architect who can successfully incorporate established professional standards in designs for country pharmacies that typify modern hygiene and merchandizing methods.

Here are three Georgian pharmacy fronts (that somehow have been preserved whilst escaping the notice of the preservationists) quietly, traditionally, but nevertheless progressively pursuing their avocation. Figures **1** *and* **3** *are to be found in country towns on main London–coastal roads, overshadowed by either pompous or more clamorous neighbours. Figure* **2** *is in a Dorset seaport, where a regrettable pediment and enthusiastic sign-writing exploit the gullibility of one type of holiday-maker, while leaving the more reticent windows to tempt within discriminating visitors and residents alike.*

The Epping and Epsom shopfronts have a remarkable affinity in design. Both these shops have been in the hands of chemists for well over a century. The windows of both have a gentle curvature that indicates the transition from the oriel shopfronts of the Queen Anne period.

It should be counted unto the owners of these shops for righteousness that they have successfully resisted the tin sign invasion. On only one of the three have advertisers' hanging signs been permitted, and these, fortunately, are sufficiently far removed from the shopfront to prevent them asserting themselves at the expense of the dignity and beauty of its design. A. EDWARD HAMMOND



2. *SURVIVALS OF TWO STYLES AT BRIDPORT, DORSET.*

3. *ANOTHER EXAMPLE OF THE DOUBLE BOW AT EPSOM, SURREY.*

WEDNESDAY, NOVEMBER 4, 1931

P. R. I. B. A.

ONE of the sources of the continued vitality of the Royal Institute of British Architects is the variety of attainment which has been exemplified in its Presidents. Dr. Raymond Unwin is perhaps the first in the long list of distinguished men elected to this office who is not the designer of a number of large and important buildings. Yet, probably no former President of the R.I.B.A. has actually controlled the design of buildings totalling so great a volume of bricks and mortar as has Dr. Unwin.

As the apostle of better housing for the working classes he has, to a greater extent than any other man in this country, influenced the architectural conventions which have governed the design and layout of the small dwellings, amounting to some hundreds of thousands, erected by State assistance since the war. He has tackled architecture, as it were, from the bottom, and has concentrated his attention upon the type of building of which there is the most urgent social need. The generous instinct of service which has animated him in so doing has earned for him the respect of the whole profession.

In the opening paragraph of his presidential address (extracts from which are printed elsewhere in this issue) he tells us that his work " has lain in a humble corner of our field, among the smaller dwellings of the people, seeking to secure for them the benefits of good planning and design, trying to extend these benefits to the estates on which their houses are laid out, and to the towns and regions where the occupants pass their lives."

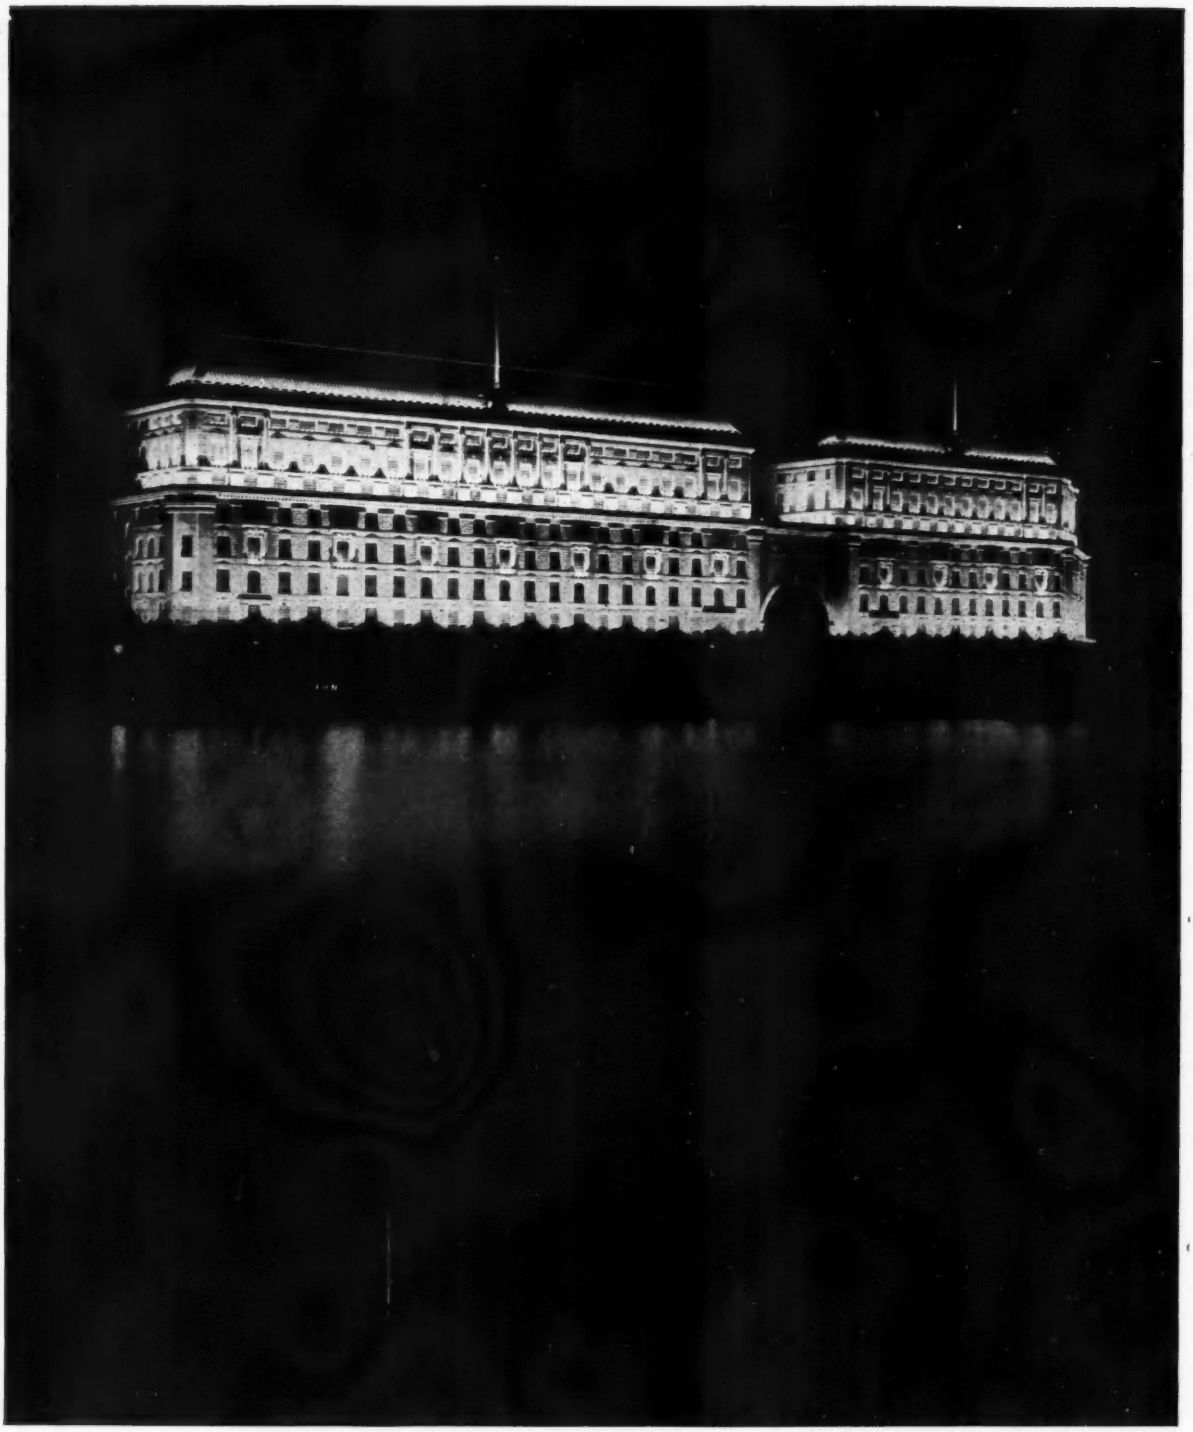
But Dr. Unwin is not only a social reformer. All his life he has been a keen student of the æsthetic element in building, and he interprets this as a harmony to be expressed between the relationship of the parts of a building. Extending this principle, he was irresistibly led to interest himself in civic design, and as one of the pioneers in the English town-planning movement, which has grown so important in the course of the last thirty years, Dr. Unwin has again not only been an indefatigable worker himself but has inspired the activities of others.

His account of how his original concentration upon the design of the small dwelling led him to extend his field of architectural vision is of great interest. He explains that the very inadequacy of the cottage as an architectural unit stimulates the mind to consider the artistic possibilities of grouping these units into larger wholes. " The designer's attention is caught by a range of new relations, which spread in widening rings from the small starting point, like the ripples round the splash of a pebble. Even the larger group, however, provides no resting place, no sufficient sense of completion or domination. It depends still on wider relations : if in a town, to other groups or buildings, to the street or the square in which it stands; if in the country, to the hillside or plain on which it is placed—even to the adjacent trees, which may well dominate in height and mass such a relatively small building."

Surely these are basic doctrines, the truth of which is incontrovertible and cannot be stated too often. As Dr. Unwin points out, the house and the life of its occupants involve relations with the garden, the school, the playing field, the factory, the shops, the theatre and many other places, and with the means of access to and from them. Thus, the architect embarked on this seemingly simple task of cottage design finds himself drawn by this double link of relations towards street design, the laying out of estates, town and regional planning.

When the Battle of the Styles seems to be resulting in ever worse architectural confusion it is of inestimable benefit to the profession that its titular head should recall us to the civic ideal. The argumentative brickbats which fly from " traditionalist " to " modernist " and back again have represented a singularly useless expenditure of energy, for the resolution of this discord can certainly be accomplished if architects would but concentrate their attention upon the street or township. If a " traditionalist " building contributes to the harmony of a street it has the principal architectural virtue, and if it fails to do this it has the principal architectural vice. And exactly the same criterion can be applied to the " modernist " building.

In Dr. Raymond Unwin the R.I.B.A. has a President who is unusually gifted as a public speaker and, moreover, the administrative experience which he has gained as chief architect at the Ministry of Health will be extraordinarily valuable just at the time when the Institute is assuming the larger responsibilities which the Act of Registration confers upon it.



[*Sir Frank Baines, K.C.V.O., C.B.E., Architect*

A SIGN OF THE TIMES IN LONDON

Thames House, Westminster, is an exceptional example of the use of new methods and materials, articles concerning which appear in this issue. It is one of the few buildings designed for architectural effect, both by day and by night.

Among the many external features are two of peculiar interest. The first is the archway and bridge over Page Street, connecting the two blocks at third- and fourth-floor levels: a feature almost unique in London and representing a very special concession by the London County Council and the Westminster City Council. The second is a more daring innovation: the construction of the steeply-pitched roof of steel framing with a waterproof covering of lead and bitumen, upon which are laid great slabs of faience with a dull surface resembling Portland stone.

Internally, there is much unusual equipment, including an automatic system to control and maintain any desired temperature in any one room, heating by hot water in winter and cooling by ice-cold water in summer.

NEWS & TOPICS

Raymond Unwin, P.R.I.B.A. Besides the first garden city at Letchworth, planned in partnership with Barry Parker, and the Hampstead Garden Suburb, he has laid out many schemes.

THE NEW PRESIDENT OF THE ROYAL INSTITUTE

I HAVE received the following letter from Sir Banister Fletcher, the immediate past-president of the R.I.B.A., in which he pays a striking tribute to his successor:

In electing Dr. Raymond Unwin as its new President the R.I.B.A. not only did honour to a distinguished leader in our profession, but gave a striking indication of the importance which the problem of planning has assumed at the present time. For Dr. Unwin may truly be described as the Father of Town and Regional Planning in this country. No one had more influence in the drafting and passing of the first Town Planning Act in 1909. As a pioneer and crusader, he may be said to have naturalized the idea in this country, and, as the chief adviser to the Government for a number of years after the war, he was a powerful influence for good in the great housing campaign. Now he is giving his energies and his vast experience mainly to the problem of regional planning, and we may look with confidence to him, in his capacity as President, to ensure that the architectural profession plays its proper part in this great movement, and is given its proper share of responsibility.

★

Dr. Unwin's name, Sir Banister concludes, is a household word in every corner of the world where town planners, housing reformers and regional planners are gathered together. He is a living demonstration of the fact that if all these movements are to progress on sound lines, the trained architect must take a lead in them, and must be regarded as the predominant figure. The R.I.B.A. is fortunate in being able to draw upon great resources of personality and varied ability in its leaders, and it was never more fortunate than when it selected as its spokesman in the vastly important tasks of the next two years so wise and eloquent and experienced a public servant as Dr. Raymond Unwin.

AN ENGLISH STUDENT'S COMPETITION SUCCESS

Dr. Unwin, by the way, has received a cablegram from the President of the Brazilian Institute of Architects, congratulating the R.I.B.A. upon the success of Mr. J. L. Gleave, who is a student of the R.I.B.A., in the international competition for the design of the lighthouse dedicated to the memory of Columbus. The R.I.B.A. Council, at their last meeting, passed a cordial vote of congratulation to Mr. Gleave on his brilliant achievement.

GOOD BUSINESS

The overwhelming majority for the National Government at the polls last week has proclaimed to the world that this country means business. If early indications count for anything, the result also means business in the more restricted, literal sense of those words. Already I hear of deep-laid plans for the revival of flagging, the capture of new, industries. And that means building and yet more building. Whatever the political views of individuals, I see the nation as a whole tightening its belt and rolling up its sleeves.

BATH ASSEMBLY ROOMS

It is good news to hear that the Assembly Rooms at Bath have been bought by the S.P.A.B. to be handed over to the National Trust. When I last saw them—the Rooms, that is—they were functioning as a rather mouldy picture-drome, and I shed tears in a foyer, the charm of which lay unguessed at by the majority of patrons, who were throwing their cigarette-ends behind the palm trees in the corner. Then there was a great fuss over the old paved space outside, which was saved from the Corporation pick and shovel by determined civic action. I can almost hear the old building sigh thankfully to know itself in safe pasture. Will it become once more a place of assembly?

FOR TOWN PLANNING STUDENTS

The Town Planning Institute have issued a collection of papers read at various meetings which is designed to be of use to examination students. These papers, covering a wide range, should find readers in plenty, besides students, since they have been collected to cover as many aspects of town planning as possible, and include articles on factory development, the design of railway terminals, airports, water supply, etc., few of which are properly treated in the text books.

"MURDER" FOR HOSPITAL FUNDS

The three-act play, "Murder on the Second Floor," which had a long run in London recently, was exceptionally well performed by members of the Architectural Dramatic Society of University College, at their headquarters in Gower Street, last Thursday. The whole of the cast and those responsible for the production are to be congratulated on the high level of the entertainment; the proceeds should help sensibly to swell the funds of the University College Hospital.

NEW MATERIALS: NEW METHODS

The makers of new materials are constantly bespeaking our attention; not always are their methods best calculated to engage our sympathies. The course recently adopted by Venesta in regard to their Plymax products was to address a questionnaire to a number of architects, inviting their criticisms and suggestions in the light of their pioneer experience of them. The results should be mutually profitable; at all events I learn from the firm that the information obtained in response to the appeal for co-operation has been turned to valuable account in the establishment of a technical service department, the function of which will be to furnish data on every aspect of the use of these new materials.

EMPIRE DECORATION

A HOMILY: BY OLIVER P. BERNARD

THERE has been an abundance of effusion about what is called modern decoration.

There has been considerable publicity concerning the latest materials and the latest designers of so-called modern decoration.

There are also people who imagine, when the stage, film studios and all other industries decline their peculiar abilities, that their last resource is: modern decoration.

Even those home-beautifiers who have prospered by imitating bygone ideas of decoration have plunged from William-and-Mary suites into exotic cocktail bars, glass dining rooms and fantastic bathrooms without worrying much about the kitchens.

Unfortunately, international industry and government have broken down. The course of both architectural and empire decoration will now be directed by conditions of brutal necessity.

Designers of country seats for retired public school boys, and apartments for those who exist on unlimited doles, are now nearly all out of work.

Our latest war memorials are beginning to crumble, and other symbols of private and public waste are done, all but a few choice banks, tasty office buildings and some desirable but apparently empty blocks of not inexpensive flats.

Adversity is now our Master Builder!

Adversity is going to teach us more about government, industry and architecture than was ever anticipated by our deluded leaders in their bygone dreams of commercial supremacy.

Adversity will call on all good workmen to show that social progress is born of experiment—genuine experiment, with honest purpose and materials.

If the expression "modern decoration" means anything at all, in future, the terms "better" and "cheaper" will prove synonymous.

The public are supposed to suffer from a craving or passion for change: change in government; in styles of architecture; methods of decoration; and so on.

Statesmen, politicians, princes, prelates, presidents and parasites are constantly talking, writing, flying and broadcasting their views on the subject of change.

But it so happens that people are not looking for change.

What they—you and I—want is not change, but improvement.

The difference between change and improvement, in government or furnishing a home, is quite astounding, in contrast and cost.

Whatever modern decoration, new decoration or the latest decoration may be, there is still unlimited scope for improvement.

Decoration can only improve by strict calculation of its necessity.

INSPIRATION FROM JAPAN

SOUND design has existed in Japan for centuries. It is an architecture which could not possibly be imitated in the European climate; it is an *inspiration*, not a *precedent*. Its principles, however (which are similar to our own), are easily apprehended.

The details on page 587 are of the "first room" (of the master of the house) in a typical Japanese dwelling of the first class. Japanese traditional dwellings are divided into the following classes: Palatial, first, second and third classes, and common dwellings, i.e. five classes in all. This room is usually at one end of the long leg of an L-shaped plan. It commands the best view on to the private garden, and is farthest away from the service and women's and children's quarters, etc. There are always two corridors leading to all rooms, one for servants, one for the owners.

The sections show the arrangements of the two special features in the "first room," i.e., the formal alcove, where, and where alone, a single painting scroll or poetry scroll is placed, and, at either side, the shelves, which usually bear one bronze or other *objet*, or a vase of very carefully arranged flowers or branches of flowering trees, with cupboards for the paintings, *objets*, etc., not actually displayed. The ceremonial window, shown in one of the sections and on plan, is there for the specific purpose of framing the picture to the formal garden beyond. The opening has a surround in ebonized wood or lacquered wood, and is not meant to provide a decorative element to the interior. The Japanese believe in leaving decoration to the individual artist, including the gardener, whose work may be displayed and changed as desired.

All the structural members are of wood, and the construction is "post and lintel," with cantilevered roof members. There are no supporting walls. The floor is boarded and covered with the standard mat, which is 6 by 3 Japanese feet [one Japanese foot (10 inches) equals $11\frac{7}{8}$ English inches], by about $2\frac{1}{2}$ inches thick. Made of compressed straw (like thatch-board), and faced with a finely woven straw matting, and edged, usually, in black closely-woven cotton fabric, the size of the mat is the same for all classes of dwellings, and determines the proportions of the plan of dwellings in each class. The screened divisions between rooms, and between rooms and corridors, vary in the different classes of dwellings. The heights of the rooms usually vary according to the number of mats.

The sliding screens are framed in wood, with usually a solid panel at the bottom, the remainder being papered with various qualities of translucent paper, which has also insulating properties. The few immovable walls (shown solid black) are two fixed screens of lath and plaster, with a cavity between. The laths, made of reeds, are usually made up to the required size of the opening into a lashed-up square-mesh mat (compare "expanded metal" lathing) and fixed on site to the wooden members; then plastered. The Japanese can make a straight plaster-to-wood joint without a cover-strip or moulding of any kind, *which will not move.*

The space above what would correspond to the transome line over the windows, or sliding screens, is usually plastered in the same way, up to the ceiling (there is no cornice), the ceiling being boarded (or coffered), but rarely plastered.

All the wood members, posts, lintels, ceiling members, etc., are actual *structure*, suited to a country where earthquakes occur, say, once a month. Nothing is "planted on"; everything does a structural job. WELLS COATES

(PREPARED BY WELLS COATES)

MATERIALS FOR ARCHITECTURE

BY WELLS COATES

". . . Building up themselves in spirit, and looking out and forward with larger ideas born from the variety of their crafts (the ancient architects) began to build. . . . Then, by the observation made in their studies, they were led on from wandering and uncertain judgments to the assured method of symmetry. When they observed that Nature brought forth profusely, and provided materials abounding in usefulness for building, they handled them with fostering care, and equipped with delights the refinements of life."—Vitruvius, *De Architectura*, Lib. II. Cap. I. 7.

". . . Yet, we must not be surprised if excellence is in obscurity through the public ignorance of craftsmanship. . . . As Socrates thought, if human notions and opinions and knowledge were manifest and transparent, neither influence nor intrigue would avail; but commissions would be entrusted to such persons as had attained the highest knowledge by their genuine and assured professional labour. Since, however, these things are not conspicuous nor apparent to the sight, and I perceive the ignorant excel in influence rather than the learned, I judge that we must not rival the ignorant in their intrigues."—*Ibid.* Lib. III. Pref. (Frank Granger trans., 1931).

§ 1

IN England, now, architecture is mostly written about. The Mistress Art has become, so to speak, the Chief Place for the Battle of the Styles: a battle waged, of course, for the most part with words (paper pellets of the brain); words, the colossal power of which is one of the major iniquities of this Age of Science.

A space must be cleared, all said and done, round this hurly-burly of words. No man can reflect and create while thus engaged. There must be a return to logic and the facts.

Concerning Architecture, what can be stated *can be stated clearly.*

All that can be stated is included in the materials for Architecture. For the rest, architecture is shown, seen and used.

Materials for architecture are, first, the whole of human activities, customs, habits, and needs—intangible raw materials !—which the architect studies most closely, circumscribes most clearly, *orders* most carefully, and (supreme function) equips with refinement and delight, as Vitruvius said. It is out of these materials—now permanent, now changed, now changeable—that the principles of his art are fashioned.

Materials for architecture are, secondly, the whole of the materials " brought forth profusely by Nature and abounding in usefulness for building."

Of the first, the " human " equations (with their Coefficients of Ignorance, no doubt) I cannot here treat. Of the second, the " material " equations (which derive their value from, and also give fresh values to, the " human " equations), my endeavour is merely to introduce the more detailed statements hereafter to be made, in this place, by various authors, upon specific materials.

Further to pursue the mathematical analogy: our statements, so far from being treated as wholesale verbal generalizations (so easily slaughtered by one little ingenious paper pellet), should be capable, I trust, of being read as mathematical equations are read. For words and phrases include their variables, and the total value of the sentence-equation is not to be assessed without reference to the specific purpose for *its* specific values. If the specific value be zero, the equation still stands, you see, for other values.

Thus, we may be bold to make statements of general validity without fear of being misunderstood in the particular case. Amongst enlightened people there should be no difficulty in assessing these values. Amongst those whose interest is to listen to, or to preach, æsthetic theories—or whose interest is in words, chiefly, for their own sake—there will be, as usual, merely the wish to prove you wrong.

§ 2

ALL that can be stated about architecture is included in the materials for it.

Materials for architecture have always been contingent upon man's discoveries: they have never been at any time fixed and settled, except by the force of Convention. (The value of Convention is that it provides a breathing space for man to reflect and create.)

Invention, which Vitruvius defined as " the treatment of a new undertaking disclosed by an active intelligence," has recently brought to the service of architecture vast resources through the discovery of new materials.

The discovery of new materials brought with it (as always) new principles of construction, *inherent in the materials.* When man discovered steel, he did not think to make bricks of it, but he *did*, later, fashion it into Corinthian columns ! Observe the Coefficient of Ignorance, *inherent in the Man.*

Craftsmanship, which Vitruvius defined as " continued and familiar practice, carried out by the hands in such material as is necessary for the purpose of a design," created *possibilities* for the new systems of construction: these possibilities in turn created newer materials, and, again, more refined principles of construction.

And finally, out of all these together, out of invention and discovery, new materials and new structure, craftsmanship, with intellect and action added, and all allied to art, there came the *new forms*, inherent in the new materials. (The new forms were " of the thing itself, never on it " as my Japanese tutor first taught me.) And the new forms made it possible to cater more perfectly for human needs. Conversely, new human needs were created, new habits, new activities were made *possible* by, the new forms.

Thus, " looking out and forward with larger ideas born from the variety of their crafts," twentieth-century architects may begin to build.

§ 3

THE forms of twentieth-century architecture are not the forms of the architectures of the past, by the nature of the logical case.

Whatever the æsthetic case for a misalliance of forms may be, I do not here inquire.

I only say briefly, and in parenthesis, that the people get what they deserve, or what they allow, or what is not completely beyond them to appreciate. They would appreciate, it is true, another Georgian Renascence even less than architects would appreciate the fatigue of it. But they are ready, they are ripe, to appreciate Science.

That appreciation, that knowledge, which the common man has often hardly come by, wherever he can get it: in theory, or in practice, by tinkering with his old motor-bike in the back-yard: *that* is the fund of interest and sympathy upon which the twentieth-century architect has to draw.

§ 4

THE invention of steel, and the elaboration of systems of construction based upon its properties, has alone created the greatest revolution in the history of architecture, affecting all its aspects, external form and internal organization, plan as well as elevation.

Large spans, with comparatively slender vertical supports, create new possibilities of freedom and economy in planning. The principle of the cantilever finds its true free form when expressed in terms of steel, steel-concrete, and steel-glass.

Most important of all, the wall, no longer an essential element of structure, becomes (truly considered) an expression of its thermal and other insulating functions—to include or exclude the light, the view, the weather, or the public—functions whose separate and relative values are to be determined by the conditions of the specific purpose of the building. Again, apertures are not so much cut out of the walls as left out of them. The light-admitting function of the walls by day will determine the choice of source—at approximately the same zone as the windows—for the media of artificial light, in order not to alter the values of the spaces of rooms.

Internal "walls," again, having no structural significance, become screens possessing thermal, acoustic or other *functions and qualities*, as may be desired. Logically, internal screens ought to become capable of much greater comparative imperviousness and/or flexibility, at will. Actually, present acoustical practice has advanced no further than excessively-contrived and expensive means of absorption of sound, which often result in displeasing and not easily maintainable interior finishes. At the moment, the desirable aim is the lessening of *unnecessary sources* of sound. The acoustical requirements of interior partitions vary according to the different parts and purposes of buildings. As an alternative to the methods which rely on special wall-finishes, it is possible to supply the deficiency of completely effective or economic acoustical treatment by using built-in cupboards as partitions between adjacent rooms.

Where interior partitions are not required to be sound-proof, they can very easily be made to serve a new purpose, by being movable. To alter the dimensions (and so the purposes) of a given room at will, has definite possibilities of usefulness which have yet to be explored in this country.

Thermal insulation has always received a much greater share of attention. In this case, the most important improvement is the economy of means, and the avoidance of waste. Of interior heat, for instance: "the simplest way without waste."

Among the new materials for architecture (affecting its form) must be included the machines, engines and processes incorporated into the modern building. Such are heating, lighting, ventilating, refrigerating and sanitary processes, and the machines for vertical circulation. Instead of being added on to the completed building, they are, or ought to be, integral with it, a part of its construction, and therefore of its form.

The same principle of integration can be extended to include furniture designed into the house as part of architecture. Here again, a modern need precedes and reinforces the innovator. Namely, the habit of moving often, indescribably costly and upsetting if it implies an accompanying trail of large pieces of furniture, creates the urgent need for the strictly more economical innovation of built-in furniture and equipment of every kind. Very soon it will be considered quite as fantastic to move accompanied by wardrobes, tables and beds, as it would seem today to remove the bath, or the heating-system, including the pipes.

In this sense, the materials which the twentieth-century architect handles are many times increased. To order them, that is, to design them into place, is the very *raison d'être* of his art.

§ 5

THE danger is that this new freedom of design, arising primarily out of the properties of steel, steel-concrete and glass, makes possible the operation of the new forces, unleashed and uncontrolled, far beyond the boundaries which sincerity and a rigid respect for conspicuous economy and simplicity must set down. It has been responsible for a number of fantastic and ill-conceived architectural fashions which (referring back to section two) can be marked down in value by the operation of the "coefficient of Human Ignorance."

"Plasticity as continuity in actual construction, flowing or growing into form, rather than cut up or built up of small-jointed pieces" is Frank Lloyd Wright's operative test of twentieth-century architecture.

Another kind of critical argument states that many of these principles of design were inherent in the older materials, and even in certain of the older architectures. In Japan, for instance, walls have been screens for centuries. And the restricted use of the cantilever principle has been the basis of many architectural forms. The point is that the new material, steel, has so far extended these principles as to create, so to speak, *a new dimension in their use*, and that the *scale* of traditional details of construction and finish has been entirely destroyed.

The forms of twentieth-century architecture are not concerned with "pencil-forms" but with shapes. A shape is achieved by clean lines, clean surfaces, clean purposes. "Clean does not mean plain, but it does mean significant." Structural features are not disguised, but fully expressed and *clothed*. All the known and well-tried architectural accents may be retained, and reinforced by a new and vigorous accent upon pure forms, proportion, symmetry, colour, and the new and invigorating properties and qualities of new materials. "It is from the plan of a temple that the effect of its design arises" said Vitruvius. Twentieth-century architecture begins from the plan as generator, and makes explicit externally the processes, functions and qualities included in it. Out of the very complications and difficulties of the task, twentieth-century architects will discover the principle of simplicity, which is the successful integration of many functions, and of the properties and qualities of the materials for architecture.

§ 6

IT is for architects to realize the possibilities of our lives, now, in an age of Science, when life *could almost immediately become free*, that is to say, ordered, and refined, for all classes. Imprisonment (with torture) in the strait-jacket of old forms, a pretence to beauty at second-hand? Or liberation (with refinement and delight) into movement, balance, harmony, *order from in outwards?*

That is the choice; the use of the new resources of materials as the prisoners—the slaves—of old habits, old social prejudices, old *visual* prejudices; or as the means to new forms, new habits of life, a new vision. The time has arrived for architects to reflect and to create.

The above notes are transcribed from the sketches for a book on the subject, "Materials for Architecture," which the author now has under preparation.

PLYWOOD, LAMINATED BOARDS AND VENEERS

BY J. MURRAY EASTON

Plywood provides a firm basis for the most daring efforts of modern designers and craftsmen, and in a few years its use has increased the scope of interior decoration in an amazing way. Its application to commercial uses has been no less widespread, but this article is concerned chiefly with its uses in building.

PLYWOOD, regarded philosophically, is one of man's best answers to Nature's instinct for self-destruction. The mulish obstinacy displayed by wood in twisting, shrinking, cracking and generally fidgeting about has been a source of annoyance to mankind from the earliest times. Seasoning drying, kiln-drying are good discipline, but time is of the essence of this treatment, and time is what the present age most lacks.

The real cure for undesirable energy in any form of life is to match it with a contrary energy of about its own weight: hence the pervasion of plywood. Beneath the veneer there is an unending struggle going on—pull devil, pull baker—and the whole art and practice of plywood-making and veneering is the maintenance of the balance of power. A veneer on the front of a panel unmatched by a veneer on the back may easily destroy that balance, with results obvious to the eye.

Thus far the term "plywood" has been taken to include laminated wood, but it is well now to consider these separately. Plywood consists of three, five, seven or more sheets of veneer cemented together with a waterproof cement under great pressure. The sheets, generally of birch or gaboon mahogany (so called), are rotary cut—that is, peeled from the log by a knife, much as a pencil sharpener works, only the knife is the same length as the log and parallel to it. Each layer of veneer, being laid at right angles to the next and firmly fixed to it, prevents its neighbour from shrinking (and is in turn prevented from shrinking) across the grain. Thus we have an unshrinkable, strong but springy material that is cheap and suitable to a great variety of purposes. Plywood is commercially available in sheets up to 84 ins. by 48 ins. and in thicknesses from $\frac{3}{32}$ in. up to $\frac{7}{8}$ in.

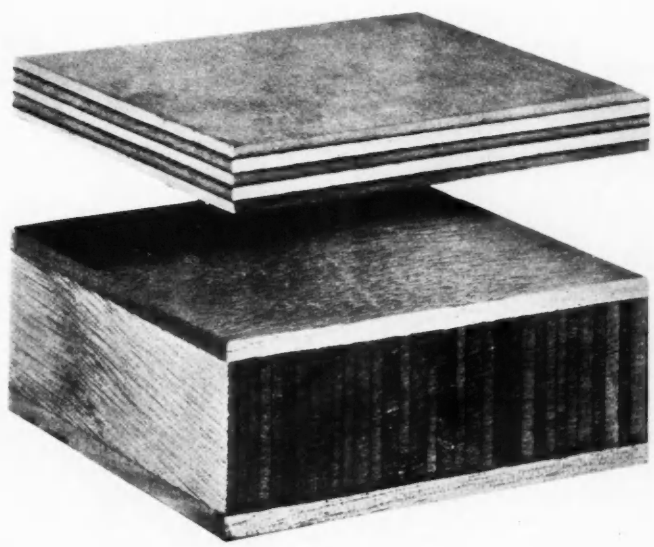
Grading according to quality of surface veneer is now common, so that birch ply can be had in several degrees of freedom from knots and flaws. The best birch panels, if carefully selected for grain, are scarcely inferior in effect to sycamore veneer. Plywood can also be obtained ready-faced with veneers of the commoner hard woods, such as oak, walnut and mahogany, and an interesting and valuable development is the application of a top veneer of thin metal sheets. The varieties and uses of this material are, however, too great to be dealt with in this article. Laminated board consists of a core of strips, most commonly of gaboon mahogany, laid at right angles to the surface of the board and encased by layers of veneer. A thick block of laminations is first prepared, sawn across the layers to the required thickness, cemented edge to edge and finally encased in the surface veneers. The cementing takes place under great pressure and the wood is previously kiln-dried to a specified moisture-content.

Obviously, this brand of formation does not lend itself to thin sheets, and though they may be obtained as little as $\frac{3}{8}$ in. thick, they are mostly sought in $\frac{1}{2}$-in. sizes and upwards. Thicknesses up to 2 ins. may be obtained, and the sheets are to be had up to 15 ft. by 5 ft.

Laminated board, though less strong, thickness for thickness, than plywood, tends to be more rigid, and is less inclined to warp, though it certainly will warp if it is carelessly stacked. A variant of laminated board consists of a core of thicker pieces of wood, frequently chestnut, dovetailed together and clad in veneer. This method of construction is favoured by several makers of flush doors.

Doors, indeed, provided the earliest field for plywood and laminated board, and before the war few of us ventured further in the use of plywood than specifying three- or five-ply panels for ordinary framed-up doors or selecting one or other of the proprietary hospital-type flush doors. Now, nearly every joinery works produces flush doors. The simplest and cheapest variety consists of a frame clad on both sides with three-ply. Such doors should not be less than $1\frac{1}{2}$ ins. thick, and the makers generally advocate 2 ins., so that they are unsuitable for such purposes as wardrobe doors. Laminated board is indicated when the door is required to be thin or fire-resisting, or where a specially veneered surface is wanted.

It is in the treatment of wall surfaces that plywood and laminated board have achieved the most striking results. The more sumptuous effects are not obtained without the application of specially selected veneers, but the better qualities of commercial plywood, either birch or gaboon, can be made to yield admirable results at a relatively small cost. The offices of Messrs. Venesta at



PLYWOOD AND LAMINATED BOARD

A special waterproof cement holds together the layers of plywood, laid with the grain alternating; shrinking and swelling are thus minimized. In laminated boards the principle is applied to larger masses. The cementing of the laminations takes place under great pressure.

Vintry House provide interesting examples of the successful use of the material, some of which have been illustrated in supplements to this JOURNAL.

The designer, Mr. Grey Wornum, has enhanced the colour of the natural wood by contrasting it with lines of vivid colour. Messrs. Venesta have kindly supplied me with the costs of the various rooms, analysed to show the expenditure on the plywood, the framing and backing, the colour and polishing, etc. These indicate (and this is confirmed by my own experience) that the expenditure on the plywood itself may be a very small part of the cost of a finished room. Breaks and returns, and everything requiring framing "hit up" cost far more than the substitution of a more expensively faced plywood.

COST OF PLYWOOD FINISHES TO OFFICES AT VINTRY HOUSE

	Plywood Used.	Plywood (Prime) Cost.	Construction Cost.	Staining and Polishing.	Total.	Approximate Cost, sq. ft.
		£ s. d.	£ s. d.	£ s. d.	£ s. d.	s. d.

Painted plywood is perhaps in most cases a too costly treatment for walls and ceilings, but in special cases, notably in shipwork, it has great advantages. Nearly all the ceilings of the *Bremen* are finished with laminated board in panels having slightly sunk margins. They are painted and varnished, and the silky finish obtained is something that I have never seen equalled elsewhere.

Although plywood is built up of veneers, the word "veneer" generally calls to mind a special skin of fine wood superimposed on the plywood or laminated board.

Veneers are classified as rotary cut, knife cut and saw cut. The first process has already been described. Rotary cut veneers do not, as a rule, give a good figure, though birch is an exception. In the process of knife cutting the log is first quartered into flitches (see diagram). The flitches, having been steamed or boiled, are placed on the slicing machine and cut into layers. Various thicknesses are advocated, but Mr. Leslie Jenkins, to whom I must make acknowledgment for much valuable information, considers that the best thickness is 1/28 in. or 1/30 in. When the layer is thinner, the glue will come through too readily. When thicker, the grain of the wood is apt to be distressed.

In cases where thicker veneers of high-grade wood are required, saw cutting is resorted to, and such veneers are generally 1/12 in. to 1/16 in. in thickness. Some high-grade woods, however, such as burr walnut, cannot be saw cut.

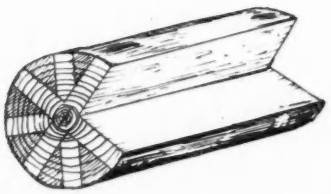

DIAGRAM SHEWING QUARTERING OF LOG INTO FLITCHES FOR VENEER

Some of the most richly-figured veneers are obtained by special cuts: "oysters" by cutting diagonally across the trunk, or by cutting special parts—"burrs" from the gnarled excrescences found in oak, elm and many other timbers. "Curls," peculiarly attractive in mahogany, are cut from the trunk just below a branch.

The variety of woods which make satisfactory veneers (whatever may be their deficiencies in the solid) is so great that it is impossible to deal with more than a few, and the commonly-used veneers need not be referred to.

Among English veneers the following may be noted: Burr oak and burr elm (the former a rich golden brown and the latter a peculiarly lovely grey with pinkish shadings); yew (a golden pink); cherry (a cheerful brown-pink); pear (somewhat like cherry but lighter in colour); holly (white).

Empire timbers provide a rich selection of veneers. Among these from Australia are: Silky oak (mottled, rather hot in colour); mountain ash (a charming rippled grain of cool light fawn colour); maple (moiré silk effect, light mahogany colour); blackwood (like a dark teak with a slight fiddle-back grain, not to be confused with black bean); walnut

(duller than English but a useful wood, and, by the way, excellent as parquet).

Among many from India are : Laurel (a rich, dark, finely-marked wood); silver greywood (ranging from brown to greyish).

Some "fancy" veneers from foreign parts may be mentioned : Angelique (Central South America : reticulated effect, dark brown and yellow, rather like snake skin); zebrano (like its namesake the zebra—the rose variety is less slightly marked and most pleasant); marblewood (rose and grey, marked like marble); bubinga (like a paler rosewood, with "roey" marking); amboyna (golden, small mottled —a favourite with the modern French furniture maker); thuya (the burr of this wood is rather like amboyna burr, but reddish brown); malapo (a golden ripple grain). The description of many of these veneers has been taken from the admirable selection of panels shown by Messrs. Mallinson.

In the almost embarrassing variety of veneers available lies, perhaps, one of the causes why so few are in general use. But I think it is probable that in the selection of timbers for interior work most architects give preference to those which are satisfactory both as veneer and as solid wood. It is rarely possible to veneer all surfaces except in furniture. Hence the pervasion of walnut, mahogany and oak. But a little more enterprise will discover combinations of rare veneers and commoner woods that are excellent.

In a city boardroom panels veneered with burr elm have been set in a framing of walnut, and the colour is lively and harmonious. Burr and pollard oak will, of course, go with ordinary oak and provide a relief from the now rather too common walnut burr. Teak, french polished to an eggshell finish, "goes" with thuya and other of the brown veneers; and mahogany with some of the reddish ones such as bubinga or rosewood. Used in small quantities for contrast, such striking veneers as zebrano and macassar yew and holly are invaluable.

What is extremely necessary in the choice of veneers, as in other matters, is to know what you want and see that you get it. This can be done only by taking a good deal of trouble, and the best way is to select a sheet of veneer and insist that the rest should be from the same bundle. Only thus will the designer avoid the disappointment, which has come to most of us at one time or another, of finding that the figure or colour of the veneer is not what one expected.

MODERN SYNTHETIC FACING MATERIALS

BY RAYMOND McGRATH

These notes have reference to the great variety of rigid facing sheets, slabs and tiles which are prominent in modern interior and exterior construction.

TO cover crude structural masses with a decorative or protective skin is by no means a new problem. Roman and Byzantine marble and mosaic are notable precedents. With the advent of concrete and steel construction, the need for such facing materials has been increased, and the modern architect finds before him an ever-multiplying array of synthetic materials. The properties of many of these are new or unknown. Many are in the experimental stage, and only a chemist-architect can pass adequate judgment on them.

These slab and sheet materials have exercised a very salutary influence upon architectural design. Pure decoration not being our present strong point, we are spared the repetition and extravagances of the decline of plaster enrichment and the crudities of average wood-carving. Greater emphasis is placed upon colour and surface finish. Simplicity invokes refinement and occasionally, as in the interiors of Mies van der Rohe, produces an abstract chastity which is most refreshing. The best modern designs are concerned with the idea of disposing and relating, geometrically, simple planes and spaces. The materials here described contribute largely to such designs.

The following materials may be grouped under the head of modern synthetic facing materials: (a) glass, (b) tiles, (c) cellulose and synthetic resin, (d) synthetic stone, marble, etc., (e) asbestos sheets, (f) wall-boards. Any sort of comprehensive technical description of each of these materials is far beyond the scope of these notes, which are offered for their general interest only. Data of a kind concerning the properties of the materials is readily obtained from the manufacturers, who, while some of them are not always scrupulously exact in their claims, are usually anxious to see the materials employed. One regrets that only a minority is also anxious to see the materials employed well. Too often the manufacturer's perfection complex embraces no more than the placing of the order. The scientist is sadly remote from his product. It is difficult to know what results to draw from the average literature which advertises building products. In rare cases manufacturers issue well-organized specifications, but genuine technical data is usually obtained at the pistol point, it being imagined that a splendid secrecy secures the faith of the lambs. My files are full of a most amazing quantity of blurb inspired by such misguided convictions. Consequently, the collection of practical data becomes the work of a lifetime, and if you want exact information the safest course is to visit the works.

Most of us are now fairly familiar with the use of glass as a wall lining. The coloured opaque varieties, polished only on one side, are manufactured for this purpose. The method of fixing varies considerably, and is of prime importance, taking into consideration the nature of the wall and the weight and size of the sheets. In London there are now a number of examples of walls faced externally with glass, and a building is under construction the entire exterior of which is to be faced with black polished plate.

Opaque coloured sheets were first manufactured on the Continent, but are now being made in England. Glassmaking, indeed, is by no means atrophied in this country. We have produced the finest reinforced glass, and valuable work has been done in the production of toughened, fire-resisting and other glass. In Germany very interesting developments have been made with structural glass bricks and tiles for walling, and in France this, with a touch of "fantaisie," has produced systems of decorative moulded glass panelling.

There is an urgent need for well-ordered technical information about glass, as well as about the other materials which I refer to. A manual should be produced, under the auspices of the glass manufacturers, containing a complete list of types of glass, photographs of them, sizes of sheets, thicknesses, weights and general information. A section of the manual should be devoted to (1) processes of manufacture; (2) technical descriptions of silvering, flashing, aciding and sandblasting; (3) glass-bending, giving diagrams of types of possible bends and the limitations of the process; (4) glass casting, giving general data as to sizes, shapes and types of moulds. A manual of this kind would be invaluable.

Entrance hall, decorated with tiles and strips of concrete; the floor is also of tiles. The ceiling and the door surround are formed of concrete.

TILES

[*Labour Exchange, Nuremberg. Otto Schweizer, Architect.*]

Two products are of interest in relation to walls before leaving the subject of glass—glass mosaic and glass silk. Where expense permits, glass mosaic still has tremendous architectural possibilities, and there are many evidences abroad that the medium has not been overlooked.

Glass silk consists of long fine threads or fibres of glass, which are very flexible and can be made up into various forms suitable for use as heat-insulators. The interesting feature of glass silk is that it is not affected by any degree of cold and withstands temperatures up to 900° F. without disintegration.

The subject of tiles (glazed or otherwise) and terra-cotta is a vast one. In this country considerable attention has been paid to the manufacture of tiles, and their possibilities and properties are familiar to all architects. Terra-cotta has received very much less attention, and is unfortunately associated with a period of architectural wickedness and decadence. The possibilities of the material, particularly in the London atmosphere, should be great; but the disadvantages of shrinkage in the manufacture of the material is a factor requiring serious consideration.

A determined search must be made for some slab material which will be an inexpensive, attractive and permanent facing for the exteriors of buildings. The problem has been seriously considered in the National Radiator Building, the Dorchester Hotel, and the new *Daily Express* building in Fleet Street. The Dorchester Hotel has been

very successfully slabbed with panels of pre-cast terrazzo, the behaviour of which over a long period of years will be most instructive. Other pre-cast slabs of a marbled or granitic appearance have been developed, and one particular variety, which is cast on a bed of polished plate and hardens on exposure to the atmosphere, has been successfully used for the façades of the chain of Nicolas shops in Paris.

At the Paris Exposition de la Société des Artistes Décorateurs in 1930, I saw one of the first successful uses of cellulose acetate wall-sheets. This was in the German pavilion designed by the architect, Walter Gropius. The

possibilities were obvious at once. The material is manufactured in sheets, 57 ins. by 25 ins. approximately, and the thickness ranges from 2 to 4 mm. It is made with a matt or polished surface, or with various cube or other surface designs.

These wall-sheets may be employed as inset panels. In the case of the Gropius interiors, the sheets, cemented to a building board base, were butted, allowance being made for expansion and contraction. The interesting point about this material is that it can be manufactured in a complete range of bright clear colours, or in the most delicate pastel shades.

It is not brittle like glass, has great elasticity, and broken sheets can in any case be permanently repaired by damping the broken edges with acetone. Furthermore, the material can be planed with an ordinary wood plane. Scratches, either on matt or polished sheets, are readily removed, and the sheets may be permanently bent by warming to a temperature of 85° F. and allowing to cool.

The sheets used for the 1930 Exhibition were intended for interior use only; but sheets suitable for exterior use have since been manufactured, but not so far employed in England.

In addition to cellulose acetate, casein and synthetic resins are manufactured in sheet form. The sizes of sheets available vary according to the process of manufacture. Casein is hygroscopic, and therefore liable to shrink and warp. It is not suitable for wall panelling, though it might be employed to advantage in small articles of furniture. Synthetic resin of the phenol-formaldehyde type, however, manufactured in laminated form, has great possibilities for wall-panelling. As usually manufactured, this material is pale amber in colour, but surface or solid colours are obtainable. The maximum size for sheets of this material is 40 ins. by 34 ins. approx. Laminated resin sheets may be mounted on ply or on wall-board. Interesting experiments have also been made with mounting on asbestos sheets. Asbestos sheet is also the base for other forms of surface veneer and decoration.

Finally, wall-boards, either as a substitute or base for plaster, are employed from considerations of damp resistance, sound absorption, heat insulation, or lightness of structure. A great many varieties are available, and raw materials of different kinds are employed. Numerous boards are made from waste timber, exploded or ground into a moss-like fibre and subsequently compressed; sugar-cane fibres are felted and compressed; and boards are also made from sterilized fibres of licorice root.

Many other miscellaneous lining materials might be noted, slate-slab products and rubber and asbestos compositions. The choice of material to be used depends entirely upon the desired qualities and the exigencies of the particular case.

THE NEW METALS

BY ALEXANDER H. HAYES

Metallurgy contributes to two distinct phases of architecture, construction and decoration, and recent years have witnessed considerable developments in each. Utilitarian equipment also tends to employ metals to an increasing extent. On the whole, however, the constructional applications of metals have undergone no outstanding changes comparable with those in the uses of metals for decorative purposes. Some recent applications of metals in architecture are dealt with in the following notes.

METALS IN CONSTRUCTION

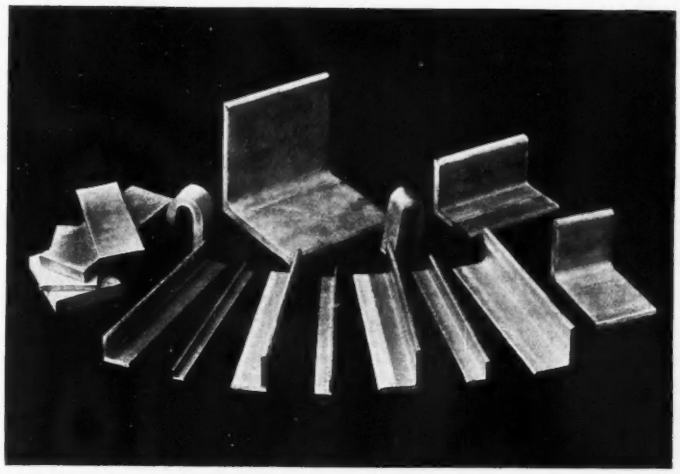
WITH the standardization of steel sections and specifications for composition and physical properties, progress in steel skeleton construction has been relatively rapid. In general, this progress has taken the direction of wider use rather than changes in the character of the material. The determining factor in deciding the class of material for purely constructional or stress-bearing purposes is cost relative to properties, and most metals other than iron and steel become prohibitive, except for special purposes, when their cost is compared with that of rolled or cast steel.

Aluminium and its alloys have found wide industrial uses during recent years, and claims for aluminium as a structural material have often been made. Despite the undoubted value of aluminium in engineering, on account of its lightness and high strength, the field in architecture is very limited. Perhaps the most spectacular development in aluminium is the well-known alloy Duralumin, which is little heavier than the pure metal and, weight for weight, has a breaking strength about three times that of mild steel. This combination of lightness and strength discounts the high cost for such uses as aircraft construction, automobile parts and the like, but for architectural uses the advantage has no considerable value. The weight of any structural member, relative to its load in a building, is small, and the factor of safety demanded in order to meet contingent stresses is so high that in all but very exceptional circumstances lightness is of less importance than cost.

The capacity of a material to resist corrosion is not so easily discounted, for corrosion is the *bête noire* of the constructor. Many attempts have been made to prevent the corrosion of iron and steel, but in the case of structural steel these have usually resolved themselves into methods of protection, as by paints or coatings of material to exclude air and moisture. The introduction of corrosion-resisting or stainless steels, however, has opened up new possibilities in dealing with this problem, and the development of Staybrite steel by the pioneers in the work, Messrs. Thos. Firth and Sons, Ltd., has brought this modern contribution of the metallurgical art within the scope of the architect.

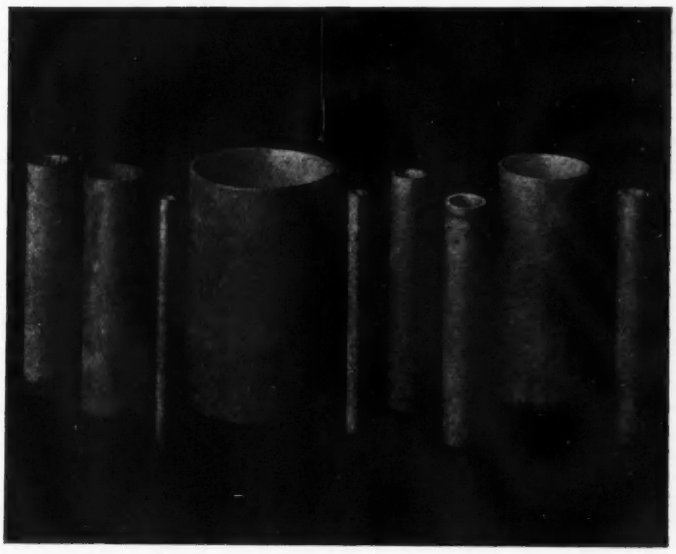
While Staybrite cannot yet be classed as a general structural steel, it has corrosion-resisting properties, malleability and ductility that make it highly valuable in special applications. It has been found a very efficient material in the restoration of ancient buildings, cathedrals and the like, where its special properties justified its cost. As an example may be mentioned the preservation work on St. Paul's Cathedral, in which Staybrite steel bars were used for reinforcing the bases of the eight piers which support the dome. Rods of the same material were also used for tying up the inner wall of the dome to the outer wall.

This introduces one application for stainless steel which justifies close attention. The metal rods in reinforced concrete may be considered as being normally protected from air and water, being completely covered with a coating of cement. In practice, however, where tension exists, hair cracks tend to develop in the concrete covering of the steel rods, and when the structure is exposed to wet a danger of moisture gaining access to the metal exists. Also, all masonry is permeable to moisture to



Bars, angles and U-sections of Firth's Staybrite, having both structural and decorative applications.

STAINLESS STEEL STRUCTURAL SECTIONS



Not only rods but tubes of Firth's Staybrite are available in numerous sizes. The metal has advantages for reinforced concrete construction in certain circumstances.

For decorative purposes non-rusting steel has obvious recommendations.

STAINLESS STEEL

This panel for a grille is an interesting example of its adaptability.

some extent, and rods inserted to reinforce old masonry may be accessible to moisture, despite the cement grouting.

Where the nature of the structure justifies the extra cost, the use of corrosion-resisting steels for reinforcement is desirable. The adhesion between the steel and the concrete, which ordinary steel allows, is not so readily obtainable with Staybrite steel, on account of its non-corroding surface. This difficulty, however, is overcome by using various types of deformed bars, as, for example, a special swaged section of alternating ovals and indents. Tests in connection with the work at St. Paul's Cathedral showed that this has the effect of increasing by more than six times the resistance to movement in the concrete. This type of deformation also appears to distribute well any movement stresses in the concrete, instead of giving local crushing stresses. The yield strength of this steel in the fully softened condition is about 17 tons per square inch, giving a working stress of at least 14,000 lb. per square inch. This compares with 16,000 lb. allowed for ordinary mild steel rods. In the higher tensile condition the working stress of Staybrite steel is 50 per cent. higher.

UTILITARIAN METALS

Under this heading may be considered metals used for fittings and equipment that are not necessarily ornamental, such as service pipes, kitchen equipment, baths, lavatory and hospital appliances, and the numerous other purposes where either the strength or hygienic value of metals is important. In many cases utility is combined with decorative effect by the use of metals in such applications.

Recent contributions worthy of attention are the ternary alloys of lead-cadmium-antimony and lead-cadmium-tin, on which considerable research work has been done recently. The intercrystalline cracking of lead through vibration is often troublesome and the addition of very small amounts of the metals named serves as a preventive. The alloys recommended by the British Non-ferrous Metals Research Association are :

1 : Lead 99·25 per cent., cadmium 0·25 per cent., antimony 0·5 per cent.

2 : Lead 98·25 per cent., cadmium 0·25 per cent., tin 1·5 per cent.

The properties of these render them particularly suitable for such uses as glazing bar sheathings, roofing sheets, guttering and probably also for domestic water service pipes. The addition, it is claimed, does not appreciably affect the workability or corrosion-resistance of the lead. Ordinary lead pipe frequently contains other impurities, such as antimony and copper, also tin, totalling about as much as the hardening elements in the alloys in question. The ultimate strength of the alloys is increased to 1·68 and 1·69 tons per square inch, compared with 1·05 for pure lead. They have found ready application in the electrical industry for cable sheathing and should be equally valuable in plumbing work, as their working properties are excellent. The cost is somewhat higher than lead, being about 4 per cent. more for alloy (1), and about 17 per cent. more for alloy (2). The latter, it should be mentioned, is definitely more resistant to alkaline corrosion, and both alloys are slightly better than lead in regard to acid corrosion.

Solid-drawn copper tubes for water and gas, in place of lead and iron, have certain advantages, particularly in regard to their smaller external diameter. The unions necessary, however, tend to be bulky, and the tubes are liable to be stressed when bent with small radii. In general, however, copper tubes can be considered definitely competitive with lead and iron, and as water conduits they appear to resist destruction by water freezing as effectively as lead.

An addition to the roofing-sheet metals which should be noted is the natural nickel-copper alloy known as Monel metal. This is highly resistant to corrosion and has the strength of steel. Its composition is approximately 67 per cent. nickel, 28 per cent. copper and 5 per cent. of other metals, but it contains no tin, zinc or antimony. In appearance it is similar to pure nickel and takes the same high finish, but is slightly softer in tone and more silvery. Since it is as ductile as steel it can be fabricated by rolling, drawing, forging or casting. Its utilitarian applications include culinary and catering appliances and hospital equipment, such as operating tables, shelves, table tops, sinks, draining boards and cupboards. Like nickel and bronze, it combines utility with ornamentation in fire-grates, kerbs, finger plates and numerous other interior fittings. Pure nickel has a distinct value for fittings where corrosive action has to be withstood and for such purposes as dairy equipment.

Similarly, stainless steel has many useful domestic applications, including kitchen equipment, fireplaces, radiators and electric heaters. In some of these, nickel and chromium plating also have become established in place of brass.

Aluminium alloys find application as stair nosings, mouldings, cases for electric lighting wires and the like, and a variety of rolled sections are available for various uses.

METALS IN DECORATION

In this category may be classed metals used in architectural constructions which do not bear stresses. Admittedly, strength is, in a degree, a requirement of many parts which serve primarily for the production of decorative or artistic effects. These, however, are distinct from applications where structural considerations come first.

Decorative effects in metal have seen many varying phases during the last decade or two. The brilliancy and warmth associated with brass gave that alloy a prolonged vogue, and its ease of manipulation led to elaborations and intricacies of decorative design which, by their very intricacy, spelled their own doom. The rapid tarnishing of

polished brass faces renders brass an unsuitable metal for other than readily accessible fittings which are not exposed to the outside atmosphere. The trouble of tarnishing gave rise to a multitude of processes for colouring and lacquering, and while these have a certain utility, the impermanence of such surfaces when subjected to regular cleaning renders them unsuitable for external use.

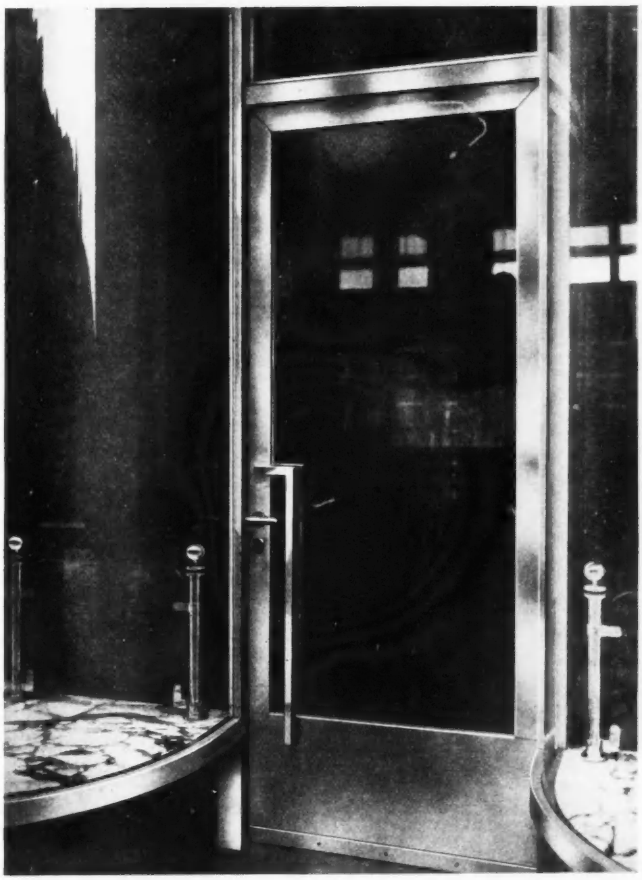
Electro-plating of brass and iron was the next development, and there is still a wide field for nickel and chromium plating for outdoor use. For internal use plating is still widely employed for producing surfaces of nickel, chromium, silver and oxidized silver and dull gilt.

The early limitations of brass and electro-plated metals turned attention to aluminium and its alloys, and extravagant possibilities were promised. Despite, however, the soft, pleasing effect of a matt aluminium surface and the brilliancy of the newly polished surface, the natural discoloration by oxidation and the difficulty of keeping the surfaces clean limits the uses of aluminium. It is unsuitable for fittings or parts in interiors which are subject to handling, as the surface rapidly becomes oxidized and dirty. Also, for exterior work, it is unsuitable where constant cleaning is required. It has, however, a field in external as well as internal decoration. It does not corrode like iron, for the patina of oxide which forms on the surface acts as a protective skin, though it continues to darken in colour. This oxide, however, is relatively soft and does not resist handling or rubbing.

Some of the aluminium alloys, as, for example, with 10 per cent. and upwards of silicon, have a distinct resistance to corrosion by sea water and find considerable use on board ship. A new aluminium-silicon, which has been recently introduced by the Metropolitan-Vickers Electrical Company, combines high resistance to corrosion with excellent working properties. Its ultimate strength is 9 to 11 tons per square inch when sand-cast and higher when chill-cast. It is notably ductile when cold, and has a close, silky texture and can be rolled into sheets, drawn, pressed and stamped.

The various aluminium alloys in sheet form, with bright, frosted, satin and mirror finishes, obtainable in sheets up to 12 ft. by 4 ft., and in coils in the thinner gauges, are effective for use as panelling and for large plain surfaces.

Polished aluminium for internal uses may be cleaned at intervals to keep up its appearance by using an ordinary liquid, non-gritty metal polish. Normally, it should be washed with clean water, dried with a chamois leather and polished with a dry cloth. Wherever aluminium is used decoratively, it should be remembered that while the frosted finish, as also the sand-blast finish, may be most effective when new, the gradual darkening by oxidation prevents the original decorative effect being maintained, and ordinary cleaning processes destroy the matt surface. In some applications, however, this darkening is not objectionable. Also, it is much less pronounced in some aluminium alloys than others.

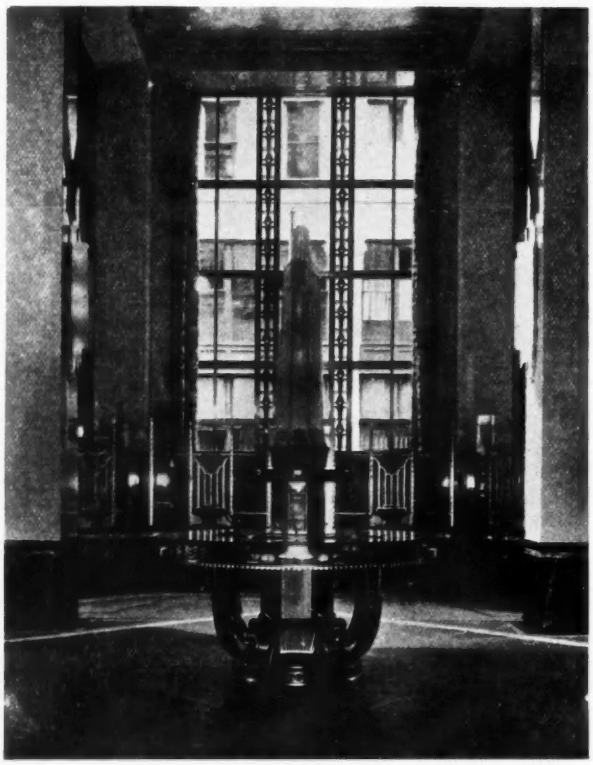


Aluminium soon becomes dulled on exposure to weather, but certain of its alloys resist corrosion and tarnishing, as shown in the case of this door. BIRMABRIGHT

The alloy known as Birmabright, which has mechanical properties very close to those of the ordinary aluminium alloys, is said to preserve its surface under internal conditions for several months, with only a slight dimming, and, even under conditions of considerable humidity, is readily rubbed bright. Under external conditions it takes on the dull patina associated with aluminium, but to a lesser degree, and anodic oxidation treatment for decorative purposes produces a tenacious protective film which can, if required, be dyed to produce fast colour effects for internal work. Birmabright is essentially an alloy of aluminium with magnesium (3.5 per cent.) and manganese (0.5 per cent.) It finds application as door and window fittings, balustrades and grilles, casements, shop fittings and similar equipment.

In the important external decorative field of shop-fitting, metals are finding a very much wider use, but the vogue is distinctly for plain, simple effects, clean surfaces and absence of intricacy. Decorative effects in shopfronts find their expression today chiefly in three mediums: the alloy known as bronze metal, which gives a rich, warm bronze effect and retains its colour throughout; nickel and Monel metal (also nickel and chromium plating on brass, steel or other base); and stainless steel. Plain running members for the windows and fronts of buildings are usually composed of sheet metal of suitable gauge drawn on to a hardwood base. Non-running members, such as caps, bases and plinths of columns, may be cast or wrought.

The malleability of pure nickel, combined with its fine lustre, renders it a very effective metal for decorative purposes. Probably more interesting to the architect is the nickel-copper alloy, Monel metal, the silvery lustre of which is, if anything, more pleasing than that of nickel. Monel metal has



Integrity Trust Co.'s Building, Philadelphia.] [*Paul P. Cret, Architect.*

The check desk in the banking hall is of bronze and Monel metal. The top and the light are of etched glass.

MONEL METAL

found a definite place in architecture and has been used with excellent effect for entrances, bank screens, elevator doors, counters, shopfronts and ornamental metalwork. It can be cast, or its malleability allows it to be worked, rolled, drawn or hand beaten, and it lends itself to various finishes. With a dull finish it can be very effective as a background to other ornamentation. Since it is non-rusting and non-corroding it is not difficult to keep bright and can be cleaned by soap and water.

Like nickel, Monel metal, bronze metal, nickel and chromium-plated sheets, stainless steel also is obtainable in a variety of sections drawn on to wood and presents the appearance of solid metal bars, mouldings, etc. By this means are obtained surfaces which, unlike the skin effects produced by lacquering and colouring, are permanent and will withstand regular cleaning. Some admirable exterior decorative effects have been produced by the use of combinations of dull or matt aluminium and bright stainless steel, both in solid, sheet and moulded on wood cores. The surfaces of the stainless steel, although initially bright, are naturally subject to a certain amount of dirt deposit from town atmospheres. Frequent washing and wiping is necessary to maintain the æsthetic effect of the bright metal, and the design should therefore avoid unnecessary detail, pockets, angles and fine corrugations. Cleaning is best done with a little soap and warm water, followed by polishing with a dry soft cloth or leather. Coarse fabrics, grit and metal polish should not be used.

Stainless steel has been used externally with notable decorative effect in some well-known buildings, such as the entrance to the Savoy Hotel, London. It is also effective in the construction of ornamental gates, lift gates and grilles, turnstile doors, counters and showcases, while other artistic applications are ornamental panels and signs. In general the effect of this material, though somewhat cold for internal domestic use, except as door and window fittings, is excellent in public buildings.

When used internally in showrooms, halls and public rooms, the clean effect produced by a combination of dull aluminium sheets and bright nickel, chromium or stainless steel can be most pleasing. The soft grey matt of aluminium for large surfaces is enhanced by frames, lettering and restrained ornamentation in the brighter metal. All parts subject to handling or liable to abrasion should be of polished metal, for once damaged the matt surface of the aluminium cannot be effectively repaired *in situ*.

A new metal introduced by the Birmingham Guild, Ltd., under the name of Silveroid, has an attractive silver colour and is malleable enough to be worked like iron into forms of great delicacy. It is strong and resistant to atmospheric tarnish and corrosion, and is suitable for all forms of metalwork hitherto made in iron or bronze.

Staybrite steel and the nickel alloys must not be considered as excluding colour effects in decoration. Vitreous enamel decoration in conjunction with it, as produced by the Birmingham Guild, Ltd., allows remarkably fine effects to be attained, that are permanent, proof against rain and weather, acid-laden atmospheres, sunshine or fog. The same treatment with vitreous enamel enrichments has a wide scope in internal decoration. Similarly, combinations of bronze and enamel can have distinctive beauty and value in creating the impression of warmth and richness.

A feature of the use of vitreous enamel with metals which is worthy of note is the possibility of expressing in flat treatment the values of light and shade of which relief work is capable. Naturally a fine artistic discretion is requisite if the combination is to give its best value æsthetically and practically. For curved surfaces and surfaces in relief, enamel is not a suitable medium and should not be used.

In connection with the use of sheet metal for both exterior and interior work, as panels and for decorative effects, mention should be made of metal-faced plywood or Plymax, which is now obtainable with a permanent face on one or both sides, formed of almost any sheet metal such as bronze, aluminium, Monel metal, nickel steel and galvanized steel, finished variously. The metal faces are thin and in some cases little more than a foil, and the sheets can be cut and worked as ordinary plywood. If required, the metal can be turned into the edges to give an edge finish. Where subject to weather or moisture the edges should be turned and sealed, even when rebated into frames. This material is particularly suitable for the construction of panels, door facings or other large, plain surfaces, where ordinary sheet metal would be difficult to fix, even when backed, without springing and buckling. It has been used for the panels of dressing-boxes of baths, lavatory partitions, kiosks, cupboards, all forms of interior panels for decorative and hygienic effects, flush doors, shop facias, balustrades, fireplace surrounds, table tops and other purposes.

MODERN FLOOR COVERINGS

BY LL. E. WILLIAMS

The range of patterns and colours obtainable in modern flooring materials is legion, but whatever substance the architect may select—marble, rubber, cork or other composition—the appearance of the finished floor will depend very much upon his choice of design; and to design a floor harmonious both in form and colour is not easy, requiring a knowledge of the limitations and peculiarities of the various materials available.

THE principal points to be considered before specifying a particular kind of flooring are: wearing quality, resilience, adhesion and abrasion, maintenance and repair.

Any division of flooring materials is bound to be arbitrary, but some classification of the various coverings is necessary for the sake of clearness. Many marble mosaic and tile floors laid in classic and mediæval times still fulfil their functions, and may be styled permanent. Compared with these, parquet, magnesite and rubber floors may be called semi-permanent, although a thirty-year guarantee is given with some of them. Linoleum, in many instances, is as permanent as rubber, and the thicker kinds have lengthy lives.

MARBLE, TERRAZZO, ETC.

The laying of marble, mosaic, terrazzo or tile floor coverings is a simple operation, requiring only a concrete foundation screeded to receive the material, the design in all cases being carried out to the architect's drawings. Mosaic floors may be of tesseræ made of sanded glass, burnt clay, or marble cubes. The addition of silica in the first gives a roughened surface to the paving and prevents slipping; the second is inclined to become slippery from wear and a non-slip material should be mixed with the cement or alundum mosaic cubes incorporated in the pattern; the third is the most common type of mosaic floor and depends for its colour scheme on the natural colours of the marbles used. Mosaic paving may be set piece by piece on to the bed, but the usual commercial method is to fix the tesseræ face downwards on to paper at the works and bed the slabs in one operation on the job, finally soaking off the paper and grouting up the joints.

Terrazzo, which is composed of crushed marble aggregate and cement, requires careful laying to obtain the best results, and much depends on the final trowelling and polishing. The material has a tendency to crack and should therefore be divided into panels with brass or ebonite strips fixed into the screeding. These strips, which should enclose panels about twenty square feet in area, may be formed into patterns. The fan-shaped divisions in the dancing space at the Hotel Jefferson, Saint Louis, are a good example of what can be done by suiting the design to the material. The colours of the marbles can be brought out still further by setting the aggregate with a white Portland cement. The design of a terrazzo floor may be varied by the introduction of panels of a material which is composed of crushed coloured enamel or glass mixed with coloured cement, and is, in fact, a glass terrazzo in which almost any design or pattern can be executed. When set hard the surface is polished in much the manner of an ordinary terrazzo. Precast terrazzo is another variety which can be laid in geometrical patterns like marble, and overcomes the somewhat monotonous appearance of large spaces of plain terrazzo, as may be seen in the entrance hall to the Bournemouth Pavilion.

All forms of terrazzo floors have a tendency to become slippery when wet, but this may be counteracted as in mosaic flooring by an addition of alundum aggregate to the cement. The same aluminous ore is incorporated in alundum tiles, which form a good floor and do not wear smooth under heavy traffic. These tiles make a safe paving for a swimming pool surround or the floors of shower baths, and they can be interspersed with ceramic tiles of different colours to form a pattern.

The majority of marbles are not suitable for very heavy wear when laid in large slabs, and it is important to choose a colour scheme combining marbles of equal hardness. There is a shopping arcade in the West End of London where the unevenness of the paving is due to the more rapid wearing away of the white slabs than the green. Marble can be very dangerous when wet, but the travertine floor in the new Underground building at Westminster, owing to its pockmarked surface, has given sure foothold to a nation in a hurry.

ASPHALT

A plain asphalt floor can be laid with good effect and is frequently the best damp-excluding material for covering an old stone or brick paving which has been laid (as so often was done) directly upon the ground. The asphalt should be carried up the walls as a skirting, and when polished forms a pleasant foil to brightly coloured rugs. Colorphalt, a rock asphalt fluxed with Trinidad Lake asphalt in which a permanent colouring pigment has been incorporated, is laid in a similar manner, and the finished surface presents a smooth and dustless surface which makes it suitable for billiard rooms, operating theatres, or hospital wards. In chemical works and laboratories where corrosive acids are likely to be spilt, an acid-resisting colorphalt is an excellent type to employ.

MAGNESITE

The various manganese or composite floorings consist in most instances of a magnesite compound combined with various fillers such as asbestos or sawdust. This material may be laid directly to concrete without a cement screed in one or two operations, and it sets ready for use in about forty-eight hours. Different firms have each their own specification, which should be followed when using their special compound. These floors are hygienic, waterproof and dustless, and the

[*Designed by S. Chermayeff.*

MARBLE

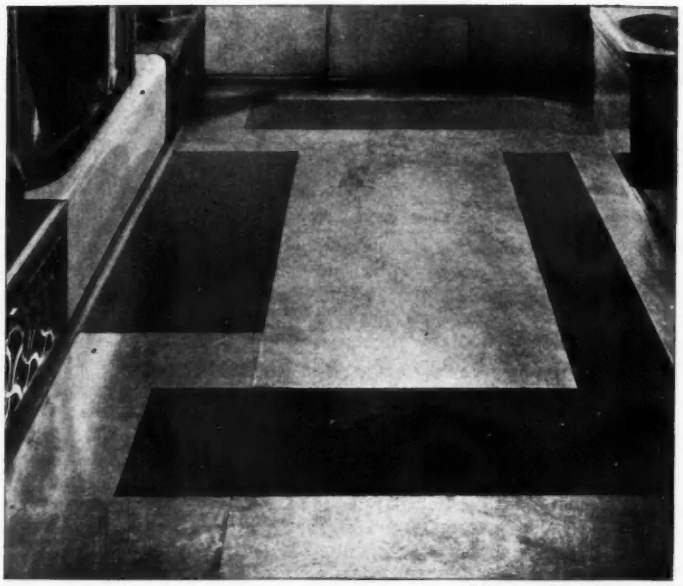
The foyer of the Cambridge Theatre, Seven Dials, London (Wimperis, Simpson and Guthrie, Architects), laid with marble to a special design by the decorative artist: pale yellow ground; motifs in brown, dark grey, Turkey red and black; the surround is brown.

omission of screeding is a considerable saving when large areas are to be covered. The most satisfactory method of laying is to spread the floor from wall to wall and to finish with a coved skirting. The compound being a plastic material, obtainable in several different colours, simple patterns and borders form the best type of design, but with some of these floors a variegated effect can be produced by sifting the second coat of the material on to that previously spread, though this requires skilled workmen and should only be undertaken by a firm which specializes in this type of finish. Some firms lay a wire mesh reinforcement between the two coats of flooring material when the sub-floor is boarded, to counteract shrinkage.

Soap and soda must not be used in cleaning a magnesite floor; if the surface becomes very dirty it may be rubbed over with steel wool or steel shavings in place of a cloth, and then polished as a linoleum with a polish diluted with turpentine. A periodical dressing of raw linseed oil is beneficial, as it feeds the floor and preserves the colour. Each firm supplying these floors usually gives written instructions for the care of its particular patent.

A new type of manganese floor has been recently introduced into this country, although already well known and extensively used on the Continent, especially in Holland. It consists of the usual magnesite (magnesium chloride and filler) but includes a patented asphalt emulsion known as Dermas. The resulting floor, which is laid in a similar manner to other manganese floors, possesses the same varied range of colours, but, on account of the asphalt which is present throughout the thickness of the compound, does not require the periodical application of oil.

RUBBER AND ALUMINIUM



[*Designed by S. Chermayeff*

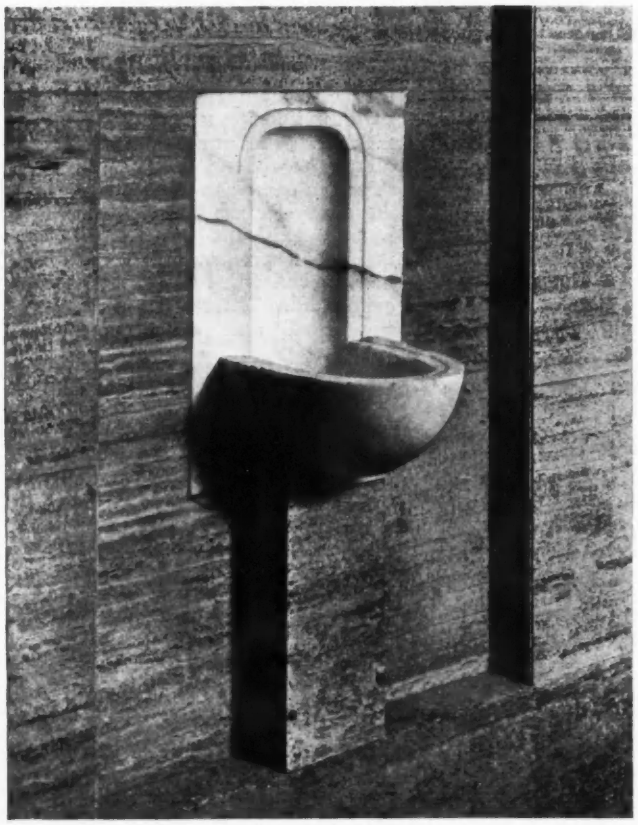
An unusual floor of blue rubber and aluminium-faced plywood, designed for a bathroom which is finished in blue and silver cellulose.

RUBBER

The materials used in rubber flooring are known as "pressed" and "drum cured" from the methods employed in the final process of vulcanization. Rubber tiling is produced by the former and made up strips of patterned flooring by the latter process. Strips are usually supplied in rolls fifty to a hundred feet long and up to six feet wide. Strip or sheeting material is supplied by the "pressed" method by a number of manufacturers.

The sheets can be plain or inlaid with any design before vulcanizing, but in the past one of the drawbacks to this type of floor for large areas has been the limited width in which it was obtainable. There now exists, however, on the Continent (but not yet in this country) a plant capable of producing sheets up to seventy-five feet by fifteen feet wide, and this is in fact a rubber carpet that can be made to any architect's design. Pressed rubber tiles are laid separately and the design worked out by the rubber tiles on the floor; this has an advantage over the rubber carpet, as worn tiles can be replaced without taking up the whole floor covering. Good rubber tiling, whether in sheets or tiles, should be smooth, non-porous, and when bent double for several hours should not break or crack. A standard has now been agreed upon by the leading rubber manufacturers in this country which is known as the R.G.A. standard, and a

TRAVERTINE



[*Underground Building, London. Adams, Holden and Pearson, Architects.*]

The walls as well as the floor here illustrated are of travertine: the deeply pitted surface gives a very sure foothold.

list of makers of standard rubber flooring can be obtained from the Rubber Growers' Association.

The thickness of sheet rubber for good work should be not less than $\frac{3}{16}$ in. and for tiles $\frac{3}{8}$ in., but in choosing a flooring that is not a standard R.G.A. material the architect must select a quality that will meet all requirements—i.e. resiliency combined with toughness.

The condition of the sub-floor is of the greatest importance for all types of rubber coverings. To ensure perfect adhesion the surface must be clean, dry, and compact. Casein cement is sometimes used for laying rubber tiles on concrete, as it forms a mechanical joint with the cement screed and when dry gives a good grip to both rubber and sub-floor, but casein has no adhesive properties until dry, and the tiles must be held in place and kept from curling at the edges by weights placed on them for some six to eight hours after laying. Tiles laid in this manner can be pushed into place, and some of the cement is purposely squeezed between the joints, thus cementing all the tiles together and making a good joint with only a hair line showing on the surface.

Rubber solution is also largely used, and, after exhaustive tests, the self-vulcanizing variety has been found most satisfactory, as in a measure it successfully withstands the attack of moisture emitted from concrete floors, which is fatal to casein.

The ordinary rubber-benzine solution adheres at once to the tile, which is practically immovable as first laid. Although this adhesive is absolutely waterproof it does not form a mechanical joint with cement screeding. Because it contains sawdust material, magnesite forms an excellent base to lay rubber upon. Curling of the corners has been counteracted by one firm by supplying the rubber welded to an asbestic base. Provided the welding between the two materials does not fail there is much to recommend this flooring. Failure of ordinary rubber floors occurs, however, very often through careless or hurried laying, so that the adhesive which is applied to both floor and tile has not had time to become dry and "tacky" before the two surfaces are brought together. None but the most reputable firms should be employed for this operation.

Rubber tiling should never be laid on new boarding, however good, until the inevitable shrinkage has taken place. If an existing wooden floor is too uneven to be planed off, a good method is either to take it up and substitute a strong plywood floor, or to cover the irregularities of the old floor with plywood sheets to obtain a level surface. Both rubber and linoleum

TERRAZZO

are best finished to a coved cement skirting having a toe the thickness of the floor covering, but where a wooden skirting exists a small rubber coving now on the market makes a neat finish.

PARQUET

Parquet flooring is a veneer of hardwood on other material laid on boarding. The "inlaid" wood parquet is usually made up into panels before laying, and any design suitable for inlaid wood can be executed, the pattern being determined by its suitability for the position. As in the case of rubber the condition of the sub-floor is of great importance; old boards should be planed smooth and new floors to be covered with parquet should be left uncramped. A sub-floor of plywood is an excellent substitute for deal underflooring for parquet. Indeed, the various uses of plywood are not nearly sufficiently exploited, and provided narrow strips are laid over the runs of pipes, etc., whole floors may well be covered with large sheets of it.

CORK, ETC.

In a pure cork parquet the tiles are composed of natural clean cork curlings. These curlings are compressed under heat until the liquefaction of the natural gums forms a cementing material without additional adhesives. The firms supplying this type of floor manufacture the tiles in a number of different shapes and sizes, but a convenient unit is a square 12 ins. by 12 ins. and from $\frac{1}{4}$ in. to $\frac{1}{2}$ in. in thickness. Abrasion tests carried out by the National Physical Laboratory show the cork parquet to be nearly twice as durable as oak.

The material is best laid in its natural colours, which give a pleasing variety of rich brown tones. A cork tile coving is also made, which forms a neat and hygienic finish to this type of floor.

For very hard traffic an American material known as J.M. floor tiling, manufactured from mineral gums, asbestos and various colouring pigments, has been used in several British commercial buildings. The tiles are exceptionally thin, only $\frac{1}{8}$ in. and $\frac{3}{16}$ in. thick, and can be laid with a special mastic on either concrete, boarding or metal. Being stain- and fire-proof, burning cigarette and cigar stubs will not injure the surface, and this renders it a good flooring for clubs

LINOLEUM

The basis of linoleum is a more or less equal mixture of prepared linseed oil and cork dust, pressed on to a canvas backing under heat. The pattern is either surface-printed by means of colour blocks, or inlaid, i.e. the powdered linoleum mixture is pressed through stencils—one for each separate colour—on to the canvas. For hard wear the latter is the only satisfactory patterned material, as the design goes right through the full thickness.

Linoleum may be glued to concrete or boarding, but the sub-floor must be level, as any unevenness will in time cause a crack, for, unlike rubber, linoleum will break "short" if bent backwards on itself. Cork is frequently laid under thin linoleums and adds greatly to the softness, resilience, and life of the floor. On wooden floors this underlay can be stuck with casein glue, but on concrete it is necessary to employ a bitumen, as moisture will disintegrate the gum which holds together the cork

This photograph of the lounge of the Stoke Poges Golf Club House was taken two years after the rubber flooring was laid; there are no perceptible signs of wear. The colours employed are mottled light and dark green, and mottled light green and white in the alternate sections.

RUBBER

particles. Linovent is a bituminous material coated with cork crumbs and has the double advantage as an underlay of protecting the linoleum from wearing on uneven joints and of allowing air to circulate over the wooden sub-floor.

From the description of the process of manufacture it is clear that individual designs entailing the preparation of special printing blocks or stencils are expensive. This deadlock has been overcome by Triolin, Linotile, Korkoid, and Lintile, patent substances of the linoleum type, the first of German manufacture, the second American, and the others British. These materials are cut into tiles of different colours and shapes which may be laid to an architect's design, in the same manner as rubber tiling. It cannot be too strongly urged that with both rubber and linoleum floor coverings it pays to deal with firms of repute and experience.

CELLULAR RUBBER, AND CARPETS

The resilience of Sorbo cellular rubber renders it an excellent underfelt to woven carpets, and far more hygienic than felt or drugget. Another Sorbo product is known as " Luxury flooring " and consists of a combination of rubber underfelting with a sheet of solid rubber $\frac{1}{16}$ in. thick, vulcanized on to the upper surface, the whole forming a rubber carpet, $\frac{3}{4}$ in. thick, of exceptional resilience. These are very suitable for hospitals and places where silence and extreme cleanliness are imperative. The spring in the felting absorbs the friction, and the top layer, although thin, has in consequence a much longer life. If this floor covering is used in domestic work the feet of large pieces of furniture should have some protection, as the constant moving to and fro of a heavy castored bed or grand piano may give trouble in the long run. Woven carpets are less imperative today in a well-furnished room than in Victorian times, and the modern impervious floorings only demand rugs for comfort and beauty. Beside the familiar pile and worsted carpets, either machine or hand-woven, hand-hooked rugs can be designed and made to harmonize with any colourings. These are in many cases preferable to Eastern carpets, which are notoriously difficult to introduce successfully into a modern scheme of decoration. The success of nearly all coverings depends upon the condition of the sub-floor. The common instinct to cover up a defective or worn floor with rubber or linoleum is a fatal mistake. A good covering must have a proper sub-floor to give satisfaction.

MODERN WALL-BOARDS

BY FREDERICK ETCHELLS

In the past the architect has been largely dependent on "natural" materials with all their delightful qualities, but with all their tendency to behave in unexpected and undesired ways. In recent years a number of synthetic products have been evolved, which also have their good qualities and their defects. It is proposed here to examine certain of these, in so far as they relate to wall-linings.

AN important aim of the present-day architect is to achieve two concurrent results that seem to him desirable: homogeneity of surface and a high degree of insulation, and perhaps also of absorption. These results are by no means easy to obtain apart, and to obtain them in conjunction is extremely difficult.

All the known forms of plaster—whether "soft" or lime plaster, or the hard gypsum plasters set on a coarse backing of themselves or on a hard backing of cement and sand—present certain difficulties. Their successful working depends on a traditional craftsmanship which includes a highly developed "touch" on the part of the individual plasterer, which it is hard to analyse and impossible to guarantee. The use of modern sawn laths, the chemical treatment by which hair for plastering is now obtained and other factors all conspire to make the plastering of his buildings a nightmare to the present-day architect.

Moreover, the insulating qualities of traditional plaster are relatively poor. Lime plaster, it is true, if left unpainted, has qualities of absorption and avoidance of condensation which are valuable, in spite of its fragile nature. The hard or gypsum plasters, on the other hand, are liable to give condensation and are resonant and a little uncomfortable to live with under ordinary conditions.

Both types of plaster demand the use of considerable quantities of water for their application. This increases the length of time necessary for a new building to "dry out," and renders it difficult to apply any permanent form of decoration until a considerable period has elapsed.

On the other hand, traditional plastering can have great beauty of texture, and it gives a nearly perfect homogeneity of surface, a quality precious to the mind of today. Any substitutes offered to us, therefore, must have a high degree of usefulness and adaptability.

We may profitably first examine what it is that we would desire in the way of *ideal* wall and partition finishings.

In spite of the fact that brickwork, whether in the form of solid or cavity walls, is likely to continue in use for many years to come (particularly in certain countries, of which this is one), the fact remains that it is fundamentally unsuitable and uneconomical in conjunction with framed buildings, whether these be of steel construction or of

WALL-BOARD BASE FOR PLASTER

post-and-beam construction in reinforced concrete.

What we need, ideally, under such conditions, are inner and outer linings composed of thin membranes, of good insulating qualities and set apart at a suitable space, say of 3 or 4 ins., in order to provide a "cushion" of air. Such "walls" would carry no weight and would perform no structural function; they would be merely protective skins between ourselves and the outside elements, and against the loss of carefully and expensively generated warmth within. One dreams of such membranes of semi-translucent glass, and of a glass less brittle than that we know; but such things are for the future. Under present conditions we are hardly likely to attain our ideal, and we must do the best we can with the materials at our disposal.

A sensible addition to comfort, and one that has been in use for many generations, is that of panelling. In the past this has taken the form of moderately small panels of oak or other woods, set in a framework of rather stouter material. Such panelling, especially since the introduction of central heating, is liable to warp and split, and is in many ways unsatisfactory, but it does at least provide an insulating vehicle between man and the elements, with a consequent increase in warmth and comfort.

Taking things as we find them, we may say that we have at our disposal a number of "modern"—and by that I mean current or present-day—synthetic materials which we can use as wall linings.

These resolve themselves into a limited number of categories. We have the well-known type of material of glass, mainly used so far for bathrooms, kitchens and larders; the metallic-faced plywoods, which are suitable for a number of purposes; and the various wall-boards, which have an almost universal use, if properly employed.

I propose to deal more especially with the last-named materials. They may be divided into four categories: the boards formed of wood-pulp (the equivalent of newsprint) and those formed of wood-fibre; the boards formed of such materials as cane-fibre or of root-fibre; the plywoods and the development of these in the form of built-up or laminated boards with a wood veneer; and also the "plaster" boards composed of a gypsum filling, with their outer surfaces of a tough paper.

The avoidance of condensation has been mentioned; this may be taken nowadays as a minor virtue. It is found that under modern conditions of centrally-heated buildings this difficulty is not a great one, and, within limits, the point may be considered as negligible.

Absorption of noise from without can be achieved by the use of acoustic plasters and of slag wool. It is of value in the case of hospitals and certain large offices. But a distinguished surgeon has told me that it takes him time to recover from the dulling effects of visits to patients housed in rooms so treated.

A more important point is that of the avoidance of transmission of noise from room to room or from floor to floor. In this connection some of the patent wall-boards are of great value, rivalling, or nearly so, the special products made of eelgrass for this purpose.

What, then, are the uses of the many kinds of wall-board put forward for our consideration today?

First of all, used in an elementary way—i.e. with cover-slips to hide the joints—they provide a warm lining to structural interiors and enable us to avoid the use of plaster of a normal thickness, with all the consequent dampness and chemical action, and regrettable uncertainty. This is a great gain, but, admittedly, it is a crude method of using wall-boards, as it breaks up the wall surfaces and, except under special conditions and with careful designing, is apt to be unsightly. This treatment seems to be the

FOURTEEN VARIETIES OF WALL-BOARD

The above photographs were specially taken for THE ARCHITECTS' JOURNAL from actual specimens of the boards indicated, under a powerful side-light from the left, in order to show up as clearly as possible the surface texture of each. The wall-boards here illustrated are obtainable in this country.

only possible one with wall-boards of a "pulp" nature, which are particularly liable to movement.

But with certain types of wall-boards, of a more fibrous nature, we can go a step farther. The joints can be covered with tape or scrim, or, better still, with a strip of fine metal gauze. These joints are then filled with a mastic or with a gypsum plaster in which the scrim or metal gauze is embedded, and the whole is set, or floated and set, with one or two coats of gypsum plaster. These coats of plaster are quite thin and the amount of moisture involved is reduced to a minimum. A further development is a similar treatment, but using a plastic paint in lieu of plaster. Quite perfect results, and a great variety in texture, can be obtained in this way, and if the work is carefully carried out, a true homogeneous surface can be obtained, as is also the case with boards which have a gypsum base. This unity of surface is of the utmost importance, for the modern treatment of interiors tends more and more to plain surfaces combined with purity of line.

The various plywoods and veneered laminated boards have more of the nature of panelling, and a large field of exploration in this direction is open to the enterprising architect or decorator. Such boards can be flush-jointed with an extremely fine and close joint, and the considerations of absolute homogeneity of surface mentioned above do not apply in this case. A wide variety of new, or hitherto little used, woods is now open to us, and the immense strides made in the built-up or laminated board of recent years helps, at least, to solve the problem of the effect of central heating on timber.

The metal-faced plywoods have played, and will continue to play, a great part in modern interior work. Aluminium-faced boards have been much used, and have their own use and value. But various alloys of a non-corrosive kind are becoming available, and we should have at our disposal, within the next few years, a variety of brilliant surfaces to play with. Delightful colour effects can be produced by chemical means on some of these metal facings.

Sheets of glass of various degrees of opacity or translucency have been employed for many years, and their use could be greatly extended. There is no need to limit them to bathrooms and lavatories.

The use of cellulose enamel on certain types of wall-boards, some of which are manufactured in various textures, can be made to produce most charming results.

In the use of these modern synthetic wall-linings there lies, therefore, an attractive field of adventure for the architect and the designer; perhaps the more so as the origin of such materials may often be found in actual needs of today.

Naturally, moreover, a new and attractive material engenders a desire to use it for its attractiveness, so that we need not waste time in arguments as to whether the need creates the material or the material the need. The lively architect will indulge his curiosity and his taste for experiment by "trying out" any or all of the materials put forward for his consideration.

MODERN PAINTS AND DECORATIVE FINISHES

BY HAROLD TOMLINSON

A few years ago, the range of materials which could be employed by architects for decorative purposes was very small indeed, and almost all the effects were obtained by means of oil paints, varnishes, distempers and polishes. Today there are so many ways of finishing both external and internal surfaces that classification is a difficult task.

BUILDINGS tend more and more to rely on their cosmetics, and even stone is applied in so frail a veneer as to suggest an affinity with paint, while stucco and other "variable disguises" are used in increasing degree to conceal the uncouthness of the utilitarian core. Rough brickwork or concrete is gradually softened by plaster, ultimately to receive paint in one form or another—sometimes merely to give a pleasing appearance to the surface, but often to simulate the colour and texture of more expensive materials. Paints are used also to conceal or to nullify defects due to the physical properties of the more refractory building materials, expansion or contraction, swelling of surface or roughness being hidden by paints which are sufficiently elastic and varied in texture to make a virtue of the blemishes which they conceal. Still, even in new products, the old essentials remain. Something must be applied which will spread evenly, adhere with certainty, and harden sufficiently rapidly to obviate disfigurement by deposits from the atmosphere, or by the accidents of early traffic.

The time factor is of increasing importance, for delay may result in costly dislocation of business, particularly in commercial buildings, cinemas, and theatres. Hence, it has come about that processes which are in themselves expensive may yet be justified if they can be rapidly carried out. For large areas, spray painting has at last come into its own. The method is by no means a new one; but it has too long been regarded with distrust, because the improvements which have been made in up-to-date apparatus have not been sufficiently rapidly appreciated.

Today, by the selection of suitable pigments and improved methods of manufacture, the settling of heavy deposits at the bottom of the container is avoided, and the component ingredients of any paint may be applied in perfectly uniform proportions. In addition to this, the thickness of the film is exactly controlled, so that delicate stippling and grading effects which were formerly achieved only with great skill and labour in brush-painted surfaces are now done with ease by means of the spray. With spray-painting, fewer coats suffice, and the method ceases to be economical only when power is not available to produce a sufficiently high pressure, and when a hand pump is insufficient for the work on hand. Spray-painting is most efficient in covering large areas, plain, graded, or stippled; but fairly complicated variations in local colour, tone, or shade, may be carried out if stripping materials are used. Stripping paints are paints of poor adhesion, and their purpose is to mask temporarily surfaces which are subsequently to receive different treatment, surplus paint from previous operations coming away with the stripping material, or surfaces already finished being protected from subsequent activities.

The recognition of the value of spray-painting is no doubt due in large degree to the increasing employment of cellulose. Cellulose is not a new material, but only comparatively recently has it proved a serious rival to the older finishes. During the war, aeroplanes were spray doped with a cellulose material, and motor manufacturers were not slow to realize the benefits which a similar process would confer on mass-production methods.

The speed with which cellulose can be applied makes it peculiarly suited to the decoration of commercial buildings of all kinds where, as previously mentioned, it is important to avoid lengthy processes.

Cellulose paint differs from oil paint in that it hardens not by slow oxidization, but by rapid evaporation of the solvent. For this reason, it is difficult to apply by means of a brush, as partial drying takes place during a single brush stroke, and marks of joins are almost unavoidable. On small surfaces, brush application is not impossible, once the knack of flowing rather than of brushing has been mastered, and as brushing cellulose is rapidly improving in ease of working, it is not unlikely that before long a really amenable cellulose brushing finish will be marketed.

Cellulose has its own peculiar merits and limitations. Owing to gradual evaporation of plasticizing agents and slow decomposition of the nitro-cellulose by ultra-violet rays, the surface tends to become more brittle on prolonged exposure. This brittleness being particularly noticeable at sharp angles, mouldings should be designed with regard for these qualities. It is not solely on account of mass-production methods that modern motor cars have their beads pressed from their panels rather than applied. Cellulose would crack at even the minute joins of metal-to-metal contact, and piano makers, who use it almost exclusively in preference to French polish, have adjusted their mouldings accordingly.

In fine cabinet work, where transparent cellulose is used to show up the grain of precious woods, a final layer of French polish is sometimes given. This, by its different refraction, prevents the thick cellulose layer from showing up on catching the light; but it also renders the work liable to the defects of French polishing, such as softening by alcohol, or discoloration by heat. To remove the finishing film and re-polish is much less tedious than it would have been if the whole process had been carried out by hand rubbing, and for particularly fine work the process is perhaps justified.

Among the chief advantages of cellulose may be mentioned its hardness, and its resistance to atmospheric conditions and to alcohol. Spilt perfume, for example, would re-dissolve French polish; but it would not affect cellulose lacquer. These make it suitable for counters, and furniture in bars and restaurants. Its hardness is so great that fairings to aeroplane fittings are being made by building up many coats to a suitable thickness on a wooden core, the core being extracted when the paint has hardened.

Recently, metallic paints have come into greater prominence. These consist essentially of metal in a high state of division, suspended in a suitable vehicle, which may be either an oil or a cellulose varnish, though the powders are sometimes added to opaque paints to give them brilliance and lustre, or to modify their colour.

Aluminium is by far the most satisfactory metal to be employed in this manner (if one excepts the rare use of pure gold). Bronze powder, "gold," copper, etc., give good results in interior decoration, provided that they are used with suitably selected vehicles; but even in external work a coating of protective lacquer provides a durable protection.

Aluminium paint, one of the most valuable of modern paints, is not so costly as it once was, and as it can now compete with oil paint on this score, its inherent virtues will become more widely appreciated. It is made from aluminium bronze powder suspended in a suitable vehicle: the vehicle varying with the nature of the work, and in order to secure tone variation. The aluminium powder behaves in a way which is peculiar to itself. The powder consists of aluminium stamped into minute flat pieces, which float to the surface of the vehicle, there being bound compactly on each other in a dense resistant layer. This metallic

coating protects the under-lying vehicle, and its opacity is valuable in hiding colours which could not be concealed by several coats of ordinary paint; moreover, the homogeneous film is a safeguard against "bleeding." A burnished surface, almost indistinguishable from polished aluminium, may be produced by applying the powder to a suitable varnish in a "tacky" condition and protecting the exposed metal with a thin coat of suitable colourless varnish. The covering of aluminium paint with tinted lacquers is not advisable, as the dyes have a comparatively short life. Whether aluminium is used for decoration or protection, it is equally important to make sure that it is free from adulterants, of which the most common is mica. It has frequently been suggested that mica in aluminium paint may be detected in a shaken sample because it remains longer in suspension than the aluminium powder; but the specific gravity of the adulterant is too near that of the metal to make the test of value, and chemical tests alone are reliable. These, unfortunately, are too complicated to be used in normal circumstances. In paints once applied, mica is not readily apparent, and rapid deterioration will probably be the first evidence of its inclusion. It is best to buy the powder from a reputable firm who will guarantee its purity, and to mix it with a vehicle recommended by the vendor.

Plastic paint is a new material which has been greatly abused. In low relief it permits of rich and varied treatments, and is capable of hiding old work of inferior quality, or of concealing blemishes in new work. When employed with an exaggeration of relief, plastic paint quickly loses whatever charm it may have had, for it harbours dust which cannot be removed with ease. Texturing is done in many ways, comb, knife, stippler, brush, crumpled paper, canvas, and even the fingers or the palm of the hand being pressed into service on the still workable surface. The material, once set, lends itself to further enrichment by simple painting, or, when metallic paints are used with glazes, by exposing the metal of the high spots before the glaze has set.

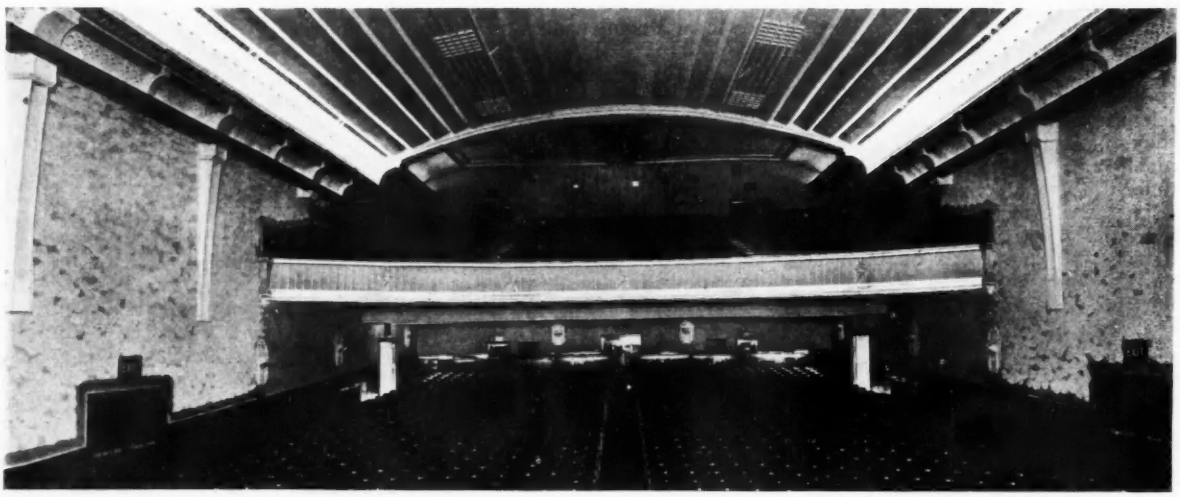
Akin to plastic paints are self-texturing paints in which mechanical action produces surface irregularities which vary in accordance with the mixing of the ingredients. Globules separate out with more or less freedom, and their behaviour during the process of drying may be controlled to some extent, thus producing changes in surface level which may either be picked out in different colours or painted in a single tone which will show up the texture.

Glazes can be manipulated to produce a variety of surfaces. They may be grained over suitable grounds to give the appearance of rich woods to baser materials, and here, as in all graining processes, restraint is the keynote of success. This applies also to the rubber stippler, a tool which is capable of producing visual illusions of great charm, though some of the forceful examples seen in exhibition demonstrations might lead the sensitive to disregard the more subtle range of a tool which is by no means despicable. In the main, broad, straightforward patterns or stipples are less irritating than those produced by twirling or super-imposition. Complication stresses the domination of the glaze and lends restlessness to all but the largest surfaces.

Much might be written on the improvements which have taken place in ordinary paints and distempers; but reference may only be made to the more important developments. Among these are satisfactory flat varnishes which are devoid of waxy stickiness, and flat enamels which are both durable and of truly matt surface. Both of these are most suitably employed in internal work, where they fill a long-felt want. In addition, it may be stated that there are now several glossy enamels made by well-known firms which dry hard in about eight or nine hours, and which, if applied to suitable undercoats, are entirely devoid of crazing or shrinkage defects. These are a great help where speed is important, for buildings painted overnight are ready for use next day.

New external finishes are legion. Most external distempers by reputable firms are reliable; but it is well to wait for a fine spell before applying them. The writer remembers with distaste the tribute which Nature once paid to the lasting qualities of one of these. Distemper overtaken by rain was washed on to a slate roof, from which nothing will remove it.

Some recent finishes give a coating which resembles stone, and may be used both externally and internally, either to disguise new plaster or concrete, or to patch up blemishes in old work. Again, these cannot be dealt with at length; but as they are not uniformly reliable, it is a good plan to insist on seeing work which has been standing for some time before specifying a similar product, a course which may be followed with profit in the use of new paint of any kind.



Capitol Cinema, Didsbury.] [*P. Cummings, Architect.*

Fibrous plaster and plastic paint were used throughout this cinema for decorative purposes. This view of the interior clearly shows the textured surfaces of the walls.

PLASTIC PAINT

NOISE AND ITS ABSORPTION

BY HOPE BAGENAL

The trend of modern materials towards lightness, thinness and surface hardness is one of the major causes of the increase in acoustic complaints. As our buildings become less massive, so they inevitably become more transparent to sound. The author surveys the expedients and materials available to combat this tendency.

LIGHTNESS of structure is often inevitable on the upper floors of modern buildings, but where rooms require special acoustic precautions, it is well to locate those rooms on basement or ground floor, and use dense bricks and mortar on their own separate foundations. It is no secret that the B.B.C., in their new building, are relying, *among other factors*, on an extremely thick brick wall to resist sound-transmission.

Modern partition-block makers should market a heavy block as well as a light block, and in a double partition wall both should be employed. I have not yet seen the principle of unequal density employed in a patent sound-proof partition, yet it is an obvious deduction from theory, since a sound capable of setting one weight of wall in motion as a tympanum is less likely so to set a different weight. In other words, unequal elements of a partition will not both respond to the same tone. Exactly the same principle holds in double windows, and advantage should be taken of it.

After the importance of density in sound insulation, experiments show that plastering a partition is an important factor; the thicker the plaster the better. When we come to plasters, there is not yet much sign of inclination on the part of ordinary plaster firms to meet the acoustic menace. The harder and more rapid setting, the worse the plaster, from an acoustic point of view; yet I am sent every week notices of plasters boasting of their diamond hardness and non-porosity. One firm only has sent me information of a cheap plaster for ordinary housing that claims to be less reflective, and therefore more comfortable to live with.

This is a matter of vital importance. Intolerable discomfort and wear of the nerves is caused every day by the wholesale use of the modern, rapid-setting, hard gypsum plasters, and a stand should be made against them. They cause "bathroom conditions" in quite small living-rooms; they cause the reinforcing of certain tones of the voice above others in dining-rooms; they make w.c.'s into box resonators; they act as thin sheath conductors from walls to floor, over the whole house. What is wanted today is the acoustic equivalent of the old thick lime and hair three-coat work.

Where gypsum plasters are used in housing schemes, they should be used on walls only, and the ceiling should be of a lime plaster or of a quilt and fibre board. A fibre board alone on a ceiling is not in my opinion sufficient defence against noises above, but there are fibre boards on the market that are guaranteed as giving a key for plaster, and a union of fibre board and gypsum plaster is better than plaster only. Generally speaking, fibre boards are more useful against sound-transmission in ceilings than in walls, because in ceilings they can also act as an anti-vibration course. A fibre board over the whole floor under the floor boards is always useful, and is inexpensive.

In modern housing at least one living-room should have a sound-absorbing ceiling, and this type of ceiling is also specially necessary in modern offices, committee rooms, and boardrooms. The gypsum plaster ceiling, reflecting 99 per cent. of the noise produced under it, *often makes impossible the locating of typewriters and telephones in the same apartment.*

For sound-absorbing purposes there are a variety of materials. First of all there are the perforated fibre slabs, the muslin-covered felt, and the canvas-screened quilt. None of these, however, can be used over panel heating, and, in a ceiling, must be located in a centre area with panel heating round the margin. On the other hand, acoustic plaster has been placed over panel heating, and, as far as I know, has been successful. Acoustic tiles and acoustic plaster are increasing in use, especially for school halls and churches. They are almost a necessity in a very large church or hall, and especially if loud-speakers are to function properly. They provide the only "masonry" absorbent surfaces. So-called acoustic paints and sprays are sold, which claim that they do not block up the pores of an acoustic plaster, but it is hard to see how they contrive not to do so; the small pores are just as important as the big interstices. The advantage of acoustic plaster is that it gives a continuous surface not broken up by butt joints or squares. Also it is fireproof. Asbestos-felt, muslin covered, fixed flat on a ceiling or wall, also gives a continuous unbroken surface and, having no air-space behind it, is permitted by the L.C.C.

A recent English sound-absorbent made of asbestos fibre, with or without perforations exposed, has also the great advantage of fire resistance, and is of a clean white colour. From a hygienic point of view a good absorbent is eel-grass behind perforated metal sheets enamelled white. The sheets can be washed or sprayed and make an absorbent ceiling for hospitals. Asbestos felt and strawboard can also be used behind perforated metal sheeting enamelled white. The perforated fibre slabs can also be distempered if the perforations are not blocked up, and, in addition, they are resonant when fixed on battens and can be used in concert halls and studios both as absorbents and resonators.

For public bath halls, where condensation has to be countered, there are two absorbents available, viz. acoustic tiles, and a new kind of sprayed asbestos used with success in dye works.

The strawboard slab of dimensions about 8 ft. by 4 ft. and about 2 ins. thick is a useful *omnibus* material from an acoustic point of view. It makes a good light double partition, especially when used in conjunction with a quilt. One element of the partition should be built first and carefully sealed by means of the quilt, then the second element of the partition should be built at a distance of an inch or two from the first. Finally, both faces should be plastered. This material can also be used as a centering for a concrete floor, and can be left in position owing to its lightness; it then presents an absorbent under-surface which can be screened either with canvas or perforated metal. The strawboard can also be laid down on a concrete floor as an anti-vibration course covering the whole floor, and can then be screeded over or can carry a wooden floor.

In cities where there is soot and dirt the problem of an absorbent surface that can be distempered and re-distempered is always presenting itself. A good solution of this problem is provided by the perforated fibre slabs already referred to. They are light and will glue up on the under-side of a screeded concrete or tile ceiling, and can be distempered and re-distempered *provided the perforations are not blocked up.* It would be well to brush the whole surface before re-distempering. The advantage of the perforated metal sheets, screening a soft absorbent, is that the perforated metal can also be

painted and repainted; it therefore makes a suitable ceiling surface for police courts, classrooms, clinics, etc.

The best "straight-line" sound-absorbents for cinema studios, wireless studios, gramophone recording rooms, etc., is 4 ins. of mineral wool behind some form of netting. This gives a curve resembling the absorption curve of an audience. Fibre boards have value for general musical purposes, but they are not fireproof and present, therefore, extra problems in connection with the L.C.C. regulations. An air-space behind is not permitted, but without the air-space they are not resonant and will not give the same absorption curve. The objection of the mandarins at the L.C.C. to an air-space behind panelling is a serious matter where concert-hall design is concerned. But would it not be possible to back a fibre board with a really efficient fire-resisting paint, fix it to narrow asbestos strips, and leave an air-space of only ½ in. behind it? This would avoid the necessity of backing the board solid on a plaster backing as now required.

Every acoustic firm should supply three things: namely, a thick absorbent having a decent appearance; a quilt or blanket for light-weight transmission purposes, and for caulking junctions of walls with floor and ceiling; and also a fibre board for use as a cheap wall absorbent and also as an anti-vibration course under floors where required. At present it is necessary to specify one proprietary article from one firm and another from another. Obviously, one article alone will not cure all possible acoustic complaints (although there are still innocent business men who believe that it will), but, instead, the various contributing causes require at least three different methods of remedy and each remedy a particular type of material.

LETTERS FROM READERS

Control of Elevations

SIR,—I have read with interest your leading article on the Control of Elevations in your last issue. The decision as to what is good and what is bad architecture is a matter of very small moment. The C.P.R.E. is a society that exists, I think, for one reason, i.e. the neglect of the look of things. As you say, cottages, factories and shops are subjects which appear to the people requiring them to be so unimportant that the ease with which they can be designed comes within the competency of the ordinary speculative builder, or a dilettante lady who says she knows what she wants, or a commercially-minded person who "doesn't care a d——n what it looks like."

I hope that in a few generations from now, culture in regard to these matters will have risen, so that discussions will be on questions of preference in artistic matters, and not whether or not thought shall be given at all to the look of things.

As you know, the town planning committees that have been set up are advised by an honorary architect. That this works well I can assure you from experience, except when unworthy proposals are made by other architects, who appear to think that this work of the preservation of the amenities of the country is all nonsense.

Until a town plan has been finally approved, it is difficult to avoid the promiscuous dumping of the odd house or bungalow in any position on any site, but where possible town planning committees should ask for a plan showing the development of the immediate neighbourhood when an odd building is proposed.

I appreciate very highly your remark that control can only be applied by the spontaneous moral force from all people desiring order. Until everybody wishes to avoid uglinesses, we shall not have approached the ideal condition. There should be no need for control; nobody should wish to neglect the look of things.

I am very glad that your JOURNAL can do, and is doing, so much to further the ends of the C.P.R.E., and to assist in producing the culture which is the only sound basis for keeping the country beautiful.

THOMAS RAYSON

Architectural Publicity

SIR,—As with Mr. Caulfield, Karshish has reminded me also of two architects who evolved schemes for cheap publicity. The first—a provincial man—conceived the bright idea of touring the town and dropping his visiting cards at 300-yard intervals in the streets. The lustre of this brilliant idea was somewhat dimmed by a frequent repetition of the manœuvre. The second gentleman habitually carried a small drawing-board and tee-square under his arm during his daily travels. It is rumoured that these objects reposed under his pillow when he slept, but the publicity value of this thoroughness is a trifle obscure.

It is with regret that I read of the sword and curtain falling together, in the last issue of the JOURNAL, on the pulsating human document of the inconsequences of a wife-driven provincial nonentity. I had looked forward to a further 500 instalments at least from the gossiping pen of Karshish.

J. R. LEATHART

Villa at Innsbruck

SIR,—Will you allow me to offer some brief observations upon Mr. Welzenbacher's "Villa in brick at Innsbruck," illustrated in your issue for Sept. 23?

The essence of this building appears to be that the designer (if that is the just expression) has built a decorated box. The mass of the building, in which design, by any reasonable canon, ought to rest, is not merely a box, but an ugly box. This ugliness is so apparent, even to the designer, that he has mitigated it with patterned bricks. Thus, how often we have seen an ugly figure smothered with ornament fondly believed to redeem that which cannot be amended.

I am moved to write these few words on the subject, and to ask you to publish them, because we have so many imitative architects, and I should not be in the least surprised to find a tee-square and set-square employed here to serve the same dreadful end. The thing is so easy to do. The New Barbarism marches across Europe, destructive of civilization, and having its origin in the same places as of old. The older Dark Ages, however, had not the assistance of the printing press.

L. CHIOZZA MONEY

Empire Timbers

SIR,—Regarding the article on "Empire Timbers," which appeared in the JOURNAL for May 27 last, the Queensland Forest Service is delighted to learn that British architects are advocating the wider use of timbers from this State, and this Department will gladly supply any information which architects might desire.

Recent experiments have shown that Queensland satinay (*Syncarpia Hillii*), red tulip oak (*Tarrietia peralata*) and rose mahogany (*Dysoxylon Fraseranum*) are excellent for parquet flooring, and have been so used in the new forest products showroom of this department.

Satinay has been specified by the Queensland Public Works Department for 63,500 superficial feet of flooring in the new Anzac Building, now being erected for the Queensland Government in this city. It was chosen on account of its close texture and hardness to withstand wear, and excellent finish. This timber is becoming very popular in Brisbane for indoor polished floorings and mouldings. Over fifty million superficial feet are available.

Rose mahogany was used for the parquet flooring of the new Commonwealth Bank, Brisbane.

Red tulip oak is a very common timber of the North Queensland jungles, and it is estimated that the present stand exceeds two hundred million superficial feet.

C. J. TRIST

(QUEENSLAND FOREST SERVICE, BRISBANE)

A NEW SPIRIT AND IDEALISM

BY S. CHERMAYEFF

OUT of the twentieth century—our times and their own particular conditions — there is growing a new spirit and idealism. The only works, therefore, and their creators, who can be classified within the term "modern" are those who have contributed to the expression of this spirit and those ideals which are peculiarly of our time.

This establishes that the work in any period tradition, excellent though such work may be, is not relevant or significant to modernism.

That such a new spirit exists can be observed in all the changes which are taking place around us, whether in the realms of science, economics or politics. Constant experiments in new methods establish beyond a doubt, even to the most sceptical die-hard, that new minds are being brought to bear on old and new problems alike with ever-increasing understanding and success.

These minds have been produced in this age all over the globe in cultured communities by the concerted influence and pressure of new conditions. They have created, in different countries with no direct social intercourse, at identical, or nearly identical, times, theories and practices in structure and arts which have a common denominator—spontaneous desires for expression have resulted in works measurable by a common standard.

These modern creations came into being in spite of obstructions and without being self-conscious contributions to this or that "ism," such and such a style. They do not come under any category other than that of "modern" in its true sense: expressing the contemporary spirit and achievement. All things in their time may have been modern.

All thinking people obviously realize that the twentieth century is but another stage in evolution. We do not claim a moral superiority, however more advantageously we may be equipped today for creative effort. On the contrary, we must live up to our predecessors' tradition of creating. The craftsmen of other days realized that this was the tradition of art.

Mr. Aldous Huxley wrote a short time ago that "tradition is the next best substitute for talent." Modesty would verge on stupidity if we believed ourselves to be unable to progress. This age cannot be satisfied to copy where conditions demand new things without precedent.

Extracts from a paper read by Mr. S. Chermayeff at Heal and Son's premises on October 26, last.

Although, measured by time, we are not far removed from our predecessors, we are not merely just distinguishable from the men of the nineteenth century; we are divided by the barrier of the Great War, and the changes it has brought about.

The post-war period can be described as the beginning of the age of applied science. Its various aspects have been developed and made appreciable and measurable by every member of the public. This development and application of science to all things to be encountered in the walks of everyday life is developing the consciousness of man and stimulating a more varied and wider demand on science to minister to his needs.

Exchange of ideas through easier international communication has established in everyone's mind, on his own particular scale, the need for an immediate solution of problems of work and leisure: the fulfilment of a desire for comfort and hygiene.

The continuous combination of these factors has stimulated scientific achievement towards expression in terms of economic and accessible productions.

This developed consciousness of man, and its increasing curiosity as to means of achievement, has stimulated invention. Increasingly subtle, we are getting a greater profusion of new materials. These, in their turn, demand new forms for expressing them.

The Coming of the Machine

Conversely, the new type of creative mind stimulates by its demands the discovery of new processes and fresh technique.

To make these accessible, man is being superseded in his average inaccuracy by machines in rationalized production in industry. These machines, accurate and fast, are mass-producing components of structure and all commodities which are rapidly raising the general standard of living.

These new implements of creation are emanating from different brains and are being controlled by different hands from those which in other times dealt with superstitions, extreme individualism and vanities. Rich patrons demand luxuries, expressed in the old tradition of handicraft.

If I may reiterate, therefore, the forces within this age have produced new talent and new channels for its expression. We cannot deny the existence of a movement all round us which is daily finding greater scope, and is gathering force with its growth.

Seen in architecture, in the interior equipment of public institutions and private dwellings, in advertising, painting, sculpture, literature and in every convenience that civilization is bringing nearer to all, these forces are finally being accepted as something which, perhaps only in its infancy in this country, can, nevertheless, not be overlooked, or, worse still, pigeonholed under some ridiculous label.

Significance of Modern Work

Those who would see the significance of modern work must see it as an expression of sanity, consciousness, mental and physical hygiene—in terms of usefulness primarily, which through architects and designers has achieved new standards of beauty in itself without meaningless borrowing of embellishments from other times, and without striving after preciousness and exclusiveness, which can only stimulate snobism.

New forms resulting from the solution of new problems are arrived at through the process of solving, and not from some preconceived idea of what the finished work should appear to be.

The designer of today, no matter what his speciality, must fulfil the requirements of all the wider demands made on him, but while having to be a conscious cultured man and technical exponent, he has a third and most important function, that of selector. This quality of selection is the undefinable quality of taste, of the artist. There are usually several equally efficient solutions of a problem. A selection has to be made.

Man has, or pretends to, an æsthetic sense. He reacts to beauty as well as to convenience. Therefore, the designer is an æsthetic arbiter.

The principal factors arising out of all these forces which give the impulse to modern creation is a general sense of organic unity of our times.

To bring down to a few simple terms or definitions the expression of these beliefs in all modern design:

a: Fitness for purpose, i.e., materials for a purpose and not for effect. *b:* Form and colour are *of* a thing and not on it. *c:* Decoration as such is desecration. Directness of expression is essential to fuller understanding. *d:* Simplicity is essential in a scientific age of complexities, if we are to retain our sanity.

The new art of simplicity, as I see it, will, in fact, produce such things and make them accessible to the average man's home, there to relieve the variety, which is itself becoming monotonous, of ingenious machinery, travel, advertising and pleasure, and their accompanying noise, which we cannot escape from outside our private lives.

Interior Equipment

To turn to interior equipment particularly, we have arrived at a point where all these considerations converge in one plain indication, which is that the furniture for today and tomorrow

must be strong, cheap and mass-produced, of good, simple and machine-dictated design. To serve the special and peculiar needs of our time a new style is evolving, a new furnishing "period" is opening before our very eyes. Small, simple, hygienic pieces are needed, and few of them: there is, today, no room for furniture that does not fulfil some real function in a way that needs least attention and work.

Parallel with these changes has been a growing respect for the machine on the part of designers and on the part of the public. They like machinery. Perhaps subconsciously, they appreciate the beauty of it. Machines are a part of their everyday life.

The old designers of furniture, fabrics and fittings were antagonistic to machinery or shy of it. It was supposed to be at war with craftsmanship. The result of their attitude was that machinery did without designers and its ghastly products ran amok over the face of the land. This encouraged the designers to stage the various period revivals and the art and crafty movement. All this is coming to an end. Modern designers are embracing machinery as a heaven-sent opportunity to multiply good design.

On the Continent, furniture of simple beauty and complete efficiency is mass-produced in standard forms by machinery. It enjoys enormous sales, and these in turn have effected further economies, so that the German and Scandinavian artisan can furnish completely, and in the best taste, very cheaply indeed. The modern æsthetic is therefore understood and established abroad. The position in England is one of transition.

In England, to a greater extent than anywhere else, the middle classes copy the rich. When the rich collected antiques, a demand sprang up among their followers for the sham antique. Now that every magazine and newspaper bears evidence that people of wealth have been converted to the modern æsthetic, the proletariat are turning as well.

Perhaps there is less sheer emulation this time and a clearer view of the practical issues involved. There remains, however, the same risk that in answer to their demand they will be fobbed off with wrong-headed imitations, unless the situation is saved in time.

We have obviously not yet achieved the final form and are only on the road to a simple direct art. We are now passing through experiments between the designers, trades, draftsmen, available machinery.

The crazes for a change which pickled, petrified, oak and limed it, forcing on old things the indignity of some grisly ritual of exhumation and vandalism, and, then, latterly, the illiterate manufacturer's fashion which has merely dressed old forms in new clothes—borrowing decorative motifs from all sources regardless of artistic or functional merit—have produced a procession of Elgin marbles dressed in top hats and petticoats all marked down as bargains.

I should like to go farther and say even that to my mind modern creation cannot be achieved any better through elimination than by additions. We are creating nothing by simplification of some classic form and adapting it to the economic necessities of our time. Those who believe that this can lead anywhere are making a vicious circle of evolution.

England seems to me to be in particular danger of not fulfilling its economic function in the work of today, by virtue of its achievement in the past. It should be justly proud of this, but not to the lengths of falling into a retrospective stupor. Unless we participate in the modern world movement and create appropriately, no tariffs or going off the gold standard will avail.

The Architecture of Today

"Modernism" has been exploited since the war like a milliner's fashion. That such significant arts as architecture and its equipment should be allowed to deteriorate and lose its significance through lack of understanding is unthinkable. Even if some ingenious charlatan in Paris persuades women back into bustles, let us, at all costs, not go back to Egyptian railway stations and Gothic petrol pumps.

AT THE R.I.B.A.

Dr. Unwin's Address

DR. RAYMOND UNWIN, P.R.I.B.A., in his presidential address at the Royal Institute on Monday, said that in the design of small dwellings there was such a close and intimate connection between the proportions of all the parts and the hourly life of the occupants as to constitute a new type of relationship, which, though not absent in the planning of more important buildings, seldom assumed there so determining and all-pervading a character as in the humble dwelling.

Co-operation of Specialists

In the widening sphere of relationships the designer became dependent on the help and advice of an increasing number of other experts: surveyors, engineers, sociologists, to mention only a few; and the success of the work became more and more dependent on their efficient co-operation. In regard to this there was still much to be learned. Specialization had its dangers as well as its advantages. It was, however, being forced upon us by the trend of progress; and we must seek to secure the benefits while avoiding the dangers. Co-operation, to be efficient and cordial, must be based on a mutual recognition of the special contribution which each had to make, and on a clear appreciation of the particular faculties and training which best qualified each specialist to play his part. He hoped it might be possible to make good progress on those lines towards cordial and helpful co-operation.

Replanning the Slums

He confessed that every visit paid to the East End of London roused in him the latent revolutionist. The time was surely ripe to tackle our slum problem on an adequate scale, to replan and rebuild our East Ends, for nothing less would be adequate. Brains and hands in excess of any requirements for the task were available, and their unemployed owners were receiving sums that would make a handsome contribution to the cost. Were we, as a people, really so devoid of resources and the power to organize, that year after year must go by with this vitally urgent task staring us in the face on the one hand, and on the other an array of available workers eating out their hearts, and consuming their maintenance in useless idleness?

One realized, in calmer moods at least, that there must be replanning before there could be sound reconstruction; that the power to plan must precede the planning; and that rehousing must be provided before there could be demolition. A few months ago it seemed that the necessary powers were to be provided; but, alas! the Town and Country Planning Bill had been lost in the recent political upheaval. He trusted the earliest possible opportunity would be taken to reintroduce it, and to give without further delay the much-needed powers to replan the old parts of towns, as well as to preserve the countryside.

The Architect and the Public

As attention passed from the individual building to more extended fields of planning, the wider range of connections brought into prominence the particular relationship between the designer and the beholder, between the architect and the public. Beauty was a very intimate and appealing quality. For its continued experience a relationship of understanding and sympathy must persist between the designer, who experienced the thrills of creative composition, and the many who might share the enjoyment which the quality radiated from those creations was

capable of kindling in the beholders. That quality, which we called beauty, we believed to be a very real thing; none the less so that it was not easy to define. Perhaps that fact need trouble us less in these days; for difficulty of definition was a deficiency now shared by many things the reality and even solidity of which all were willing to take for granted. Who today would venture on exact definition of matter or force? They remained none the less very real for all of us.

It was fully recognized that merely to speak of tradition and originality as complementary did not solve the problem of their relations, one of considerable difficulty in our time, because the continuity of tradition had been broken and its character was already confused. Nevertheless, by recognizing the complementary nature and mutual dependence of those influences, by seeking to understand the two principles, and to appreciate the points of view of those who stressed the one or the other, we were most likely to find the "Path," as the Indians called it. In learning more generally to understand the many links which connected buildings to their neighbours, or to their localities, and the mutual relations which should exist between architects and the public, we should be most likely to realize the limits within which in each case individuality or originality could legitimately let themselves go. Was not this, in another form, the great problem of our day? How to pass from the haphazard to the planned; how to secure co-ordination of effort while preserving individuality. The answer must be looked for on the lines of securing and defining by intelligent co-operation spheres within which individuality might have free play. The architect might be called to design the dominating building, or merely to plan a part of the background, to execute as it were the piano part in the concerto, or to play one instrument in the accompanying orchestra. Whichever it might be, the essential harmony or music would depend on the maintenance of a right proportion between all the parts.

The Great Emergence of Science

A most stimulating panorama of the great emergence of science had been unfolded for us recently by General Smuts, in his address to the British Association. He conveyed, even to the layman, a fascinating glimpse of that new unity which he began to discern in the universe, and to which the General in his well-known book gave the name of Holism. He described it as a tendency towards organization into ever more complete and more highly endowed wholes.

It was difficult to imagine any development of scientific thought more congenial to the artist or the designer. Instead of being daunted by the picture of a universe based on inexorable mechanistic laws, he now glimpsed a sympathetic universe, pervaded by the living principles and tendencies with which he was familiar in his life and his art.

Not only was our time inspiriting in the realm of thought, but equally in that of practice great things were doing. As planners we could hardly fail to be impressed by that gigantic adventure in planning on which the Russian people were embarked. We watched its progress with keen interest; and our sympathy for that people would not be the less because we might fear that its planning was too much based on that old mechanistic type of teaching from which we believed that science was already escaping. As architects, too, we must be thrilled by the daring character of many of the new buildings springing up around us; and fascinated by the heated discussions which they aroused. Terms like functionalism and traditionalism were flung about by the several protagonists with a vigour that proved architecture to be, if not a living art, at least a lively one!

The Uses of an Architect

IN his popular lecture at the R.I.B.A. on Saturday last, Mr. H. B. Creswell, F.R.I.B.A., said that he was speaking to the general public, and he proposed to explain what an architect was for, because there was general perplexity on the subject.

The public was bemused by architecture as represented in small houses much as inhabitants of Brixton were bemused by Regent Street shops or the owner of a motor bicycle and side car by a show-room of Rolls Royce cars. Not one in ten of the people who went to the Ideal Home Exhibition could aspire to owning the kinds of houses there shown, but many tastefully-informed magazines dealt with the subject, and it was evident there was a need for the public to understand that an architect was not a kind of colonel in the regiments of builders or a special cream of the building fraternity, but something very different.

Mr. Creswell went on to say that the question, "What is an architect?" was such a difficult one that the Royal Institute was unable to answer the question when it protested against Captain Fouke being employed to design the Exhibition buildings of 1862, and was asked it. All that could be said at this present time was that an architect was anyone who could persuade someone else to pay him for designing and directing the erection of a building, and that in two years' time, when the Architects Registration Act came into force, "architect" would mean "someone *not* qualified to design and supervise the erection of buildings."

For Mr. Creswell's purpose, however, an architect would be considered to be someone qualified to take charge of proper building—"building properly" being a good working definition of architecture. An architect was, therefore, someone who was a man of affairs, an engineer, and an artist. "Artist" did not mean someone who painted pictures. A tight-rope dancer was an artist. Mr. Creswell illustrated his point with an anecdote of an Irishman who was so imbued with the artist's impulse that when he saw an old man's bald head shining in the sun he was impelled to give it a good crack with his shillelagh.

Mr. Creswell referred to the claim made by some persons that they had been their own architects, and said that on those occasions he was always reminded—he did not know why—of Lord Kitchener. He did not know whether it was because Lord Kitchener had said, when Bantam Regiments were being enlisted, "Anyone who states that I object to Bantam Regiments is a liar"—he thought not; but he was, for some reason, always reminded of Lord Kitchener.

The lecturer spoke of the Reach-me-down house, and of Brickko, Slabbo, Coughoh and Sneezoh, and other patent materials used in its construction, and gave a word of warning against the looting of designs out of magazines, as this might lead to an action at law, and the payment of the architect's fees without the relish of having enjoyed his closer acquaintance. He said that it was usual for those who had decided to build themselves a house at once to make a plan and a picture or elevation of it, and he showed on the screen such plans and elevations, pointed out the ideas latent in the plan, but questioned the convenience of the game larder being inaccessible except from one of the reception rooms, and of having to go on all fours to get upstairs. One of the uses of the architect was to resolve these difficulties.

Mr. Creswell explained the ways in which people building houses selected their architect, and commented on them, and then went on to show on the screen the sort of house an architect might provide. The methods by which a contract with a builder was made and the house erected in accordance with the design was explained, and Mr. Creswell then said something of the responsibilities of the architect, which he illustrated by the Colonel R.G.A., who, after he had introduced the officers to the General inspecting the fort and had explained their various duties, replied to the question, "Well, and what do *you* do, Colonel?"—"I, sir, take the whole of the blame."

TRADE NOTES

MARBLE, mosaic and tiled floor coverings have been used from the earliest dates of which we are cognizant in connection with building construction. Parquet flooring may be seen in houses 400 and 500 years old on the Continent. Wood-block flooring, on the other hand, laid on a solid concrete foundation, does not date back beyond sixty or seventy years in any wide sense, and wood block flooring specialists, such as the Acme Flooring and Paving Co., of Barking, have made very great improvements in methods of seasoning and manufacture and of fixing during that period.

It will be apparent that wood-block flooring can be used where marble, terrazzo or tiled flooring cannot be considered. When the question of cost comes into consideration, it has, it is claimed, a considerable advantage as compared with cork or rubber, and if a suitable material is chosen, it is very durable and decorative. The better-class firms in the wood-block flooring trade today are specializing in home-manufactured materials, and very fine results may be obtained by the use of hardwoods, such as teak, Austrian oak, Australian jarrah, Tasmanian myrtle, Canadian maple, bagac, gurjun, etc.

The sub-floor should be of fine-screeded concrete, smooth and level. The blocks should be laid in a non-setting mastic which remains plastic at low temperatures. If the mastic is allowed to become brittle, looseness of the blocks occurs under the shock of traffic. The blocks should be bonded together by means of dowels, which ensure complete stability and evenness of surface under traffic without any loss of wearing life such as occurs with the tongued and grooved method. The floors, after being laid, are cleaned off to a smooth and level surface and, where a specially fine finish is necessary, polished. The usual thickness for hardwoods is 1 in. nominal, finishing $\frac{7}{8}$ in.

*

The question of "safety first" for the foot-passenger, where plain concrete is used as a flooring finish, arises in particular as regards stairs, the margins of swimming-baths and banking halls, to mention but three cases at random. Many non-slip materials are available for mixing with the concrete, their essential ingredients being finely-divided steel chips, carborundum or similar abrasive substances. Three specialities of approved value for the purpose are "Alundum" (The Adamite Co.), "Betonac" (The François Cementation Co.), and "Duromit" (The Kleine Co.). In most instances these also confer hardness upon the floors in which they are incorporated.

*

Ever since the introduction of reinforced concrete, the finish of concrete walls has been a subject for numberless experiments. A common method of covering the dead grey of the natural cement is to mix a pigment with a cement and sand rendering and to trowel it on, trusting for variety of tone to the intentionally uneven texture of the trowelling. Tintocrete is a new method which provides a hard, durable surface of neat cement, toned to any desired colour. It is applied by means of a high-pressure paint spray, the special preparation of the material enabling the cement to flow readily and imparting to it elastic and adhesive qualities that minimize the risk of cracking and crazing after setting. All that is required to ensure a good effect is care that the surface to be treated is reasonably free from grease or dirt. The process is equally suitable for treating either brickwork or concrete, and on the former material it gives a good texture, allowing the outline of the bricks to show through the thin cement coating, while at the same time rendering the wall waterproof. This should prove a useful treatment for buildings in exposed situations where only tar or cement stucco were really effective against driving rains. Tintocrete, with its range of colours, should be a welcome change from dull stucco or funereal tar.

The ideal backing for concrete work is a first rendering of waterproof cement and sand (three to one), finished with a wood float. With a very rough surface, a shot silk effect can be obtained by holding the spray at an acute angle with the wall and employing two different colours, one applied from the right and the other from the left. This treatment is suitable for interior decoration, and when red and blue cement sprays are used the wall will appear red on the left hand, blue on the right, and a rich purple where it is directly opposite to the spectator.

The simplicity of application and the variety of purposes for which the process may be used should render it popular with architects when it is better known.

*

Cadmium plating is an up-to-date method of protecting steel windows. It is one thing to apply mechanically a protective skin to an article, but it is quite another matter to cause that skin to be deposited electro-chemically on the article so that the two are practically alloyed together. Such is the principle of the system now adopted by Helliwells in their cadmium-plating shops. The two metals are so closely intermingled that there is no chance of cracking, blistering or peeling, as paint is apt to do. Being comparatively dense and having a highly penetrative power, cadmium, properly applied, gives a very compact coating and insinuates itself into the smallest interstices. As the metal frame is treated cold, its original state is maintained, and no warping or distortion occurs.

When steelwork which has only been painted is scratched, corrosion starts and spreads under the paint. Cadmium-plated iron or steel articles, it is claimed, remain rustless even if scratched or abraded, the deposit upon them being electro-positive to iron or steel. Cadmium will also afford protection against alkaline or saline attacks. It will readily receive paint, especially if allowed to weather slightly.

It gives a pleasant appearance and is becoming increasingly popular as a protective agent in many directions, especially in the motor-car and aeroplane industries. Its use in the manufacture of metal windows is growing. Helliwells are one of the first of the makers of better-class steel windows to lay down their own plating plant. Before adopting it, very severe tests were made for them by an eminent London firm of consulting and analytical chemists, who reported that, in their opinion, a properly plated casement should remain free from rust in a normal atmosphere for at least five years. The extra cost of this plating is slight when compared with the advantages gained.

*

One of the most popular decorative materials for external and internal use is Lap panels, which can be seen in three of London's newest theatres—the Cambridge Theatre, the Phœnix Theatre and the Victoria Cinema. Lap is a permanent material. It is not an imitation marble, but a pre-cast substance whose superficial characteristic resembles that of polished stone. It possesses a slightly translucent surface, which is claimed to be unaffected by atmospheric conditions, or any normal stain or bruise, and can be obtained in almost any colour or combination of colours, and can be produced in unique textures by incorporating powdered or leaf metals. It can be cast in many moulded forms—the process will produce or reproduce almost any pattern, colour and technique desired, and can be supplied in slabs of any size. The material has been used by such prominent architects as Sir John Burnet, Tait and Lorne, Messrs. Wimperis, Simpson and Guthrie, and Mr. Oliver P. Bernard. Lap is manufactured in England. The head office is at Palace Wharf, Rainville Road, Hammersmith, London, W.6.

*

An ingenious new wall covering, comprising an extremely thin veneer of choice cabinet woods, such as walnut, mahogany, oak, etc., on a backing of canvas—the whole no thicker than a stout wall-paper—is now available in Flexwood. Like wall-paper, it can be applied to a variety of wall surfaces—plaster, metal, wood, or tiles—making nothing of small irregularities; moreover, it will round any corner, provided it is laid with the grain. Among the claims advanced for it are an economy of one-half to one-tenth as against the cost of ordinary wood panelling, and immunity from warping, shrinking and cracking. The surface is indistinguishable from solid woodwork, and, like all veneers, it lends itself to matching, by means of which rich decorative effects are attainable. It is prepared in lengths of 8, 9 and 10 ft., and widths varying, according to the wood, from 8 to as much as 36 ins. (walnut, plain mahogany and maple). Flexwood is marketed by the Merchant Trading Co., 52 Bishopsgate, E.C.2.

*

Readers of the last issue of THE ARCHITECTS' JOURNAL (October 28) may have

noticed on the outside of the back wrapper of the paper the reproduction of an aerial view of the new "Britco" factory at Rothervale, by means of which they were advised that these works have just gone into the production of British-made doors. The announcement was very opportune on the eve of the appearance of an issue devoted particularly to new materials, which will, in effect, in the near future, for economic reasons, largely mean British or Empire materials. Britco is an all-British enterprise, engaged in the manufacture of Columbian pine doors on an extensive scale. Every door sold under this trade mark carries a full guarantee of replacement in the event of its developing any defect due to faulty material or manufacture. The factory has been laid down expressly to compete with the best imported mass-produced doors. The equipment includes a large battery of modern insulated drying kilns, and an initial output, susceptible of increase, of 300,000 doors per annum is contemplated.

The firm are to be congratulated upon the issue of an attractive first catalogue, giving admirably clear photographic illustrations of typical doors, of which no less than thirty-five sizes are listed, twelve of which are held in stock, the remainder being manufactured to special order and delivery. Architraves can be supplied to standard or special designs. The catalogue also gives particulars and constructive diagrams of redwood exterior doors, garage doors and gates; also of Britco stain, which is available in a range of shades. The Merchant Trading Co., Ltd., are the wholesale distributors.

*

A record, it is claimed, in rubber-floor laying was recently set up at Madame Tussaud's, London. Beginning at ten o'clock sharp on Saturday night, October 17, fifteen workmen of Macinlop, Ltd., of Manchester, working in relays, completed the 375 square yards of flooring in the restaurant by half-past one on Sunday afternoon.

*

Malenite Industries, Ltd., are marketing a new veneering process by means of which unique patterns can be readily produced by combinations of various woods. The possibilities of the process, as applied to fireplaces, furniture and panelling, can be seen in their showrooms designed by Oliver P. Bernard, at 21 Suffolk Street, Pall Mall, S.W.1.

*

A pamphlet describing Marbolith, the new process floor incorporating Dermas asphalt emulsion, has just been issued by the Marbolith Flooring Co., Ltd., of 104 High Holborn, W.C.1.

It is stated that it had been realized for many years that if the twin problems of cracking, and the necessity for oiling, could be overcome, the usefulness of magnesite floors would be much increased. The solution was found, in great part, by the Shell-Mex Company. They produced in their research laboratories an asphalt emulsion which would mix with the ingredients of a magnesite floor, improving it in certain definite directions. This emulsion was patented under the name of Dermas. The emulsion, which is derived from asphalt, is present throughout the floor; of itself, it oils the surface, thus eliminating the only upkeep cost of jointless floors—constant oiling—and reduces to a minimum the risk of cracking. Other advantages claimed are (1) that since the surface is permanently oiled it will not "dust off" or powder, and (2) that the colour of the floor is maintained by the oil at its original freshness.

Marbolith flooring incorporating Dermas emulsion can, it is further stated, be treated and specified exactly as an ordinary jointless floor, i.e. it is laid *in situ*, on concrete, flagstones, brick or wood; it is claimed to be plastic in laying, and can be coved to walls and carried partway up them as a coved skirting or to form a dado; it is obtainable in a wide range of plain colours, mottled patterns and variegated effects, and it can be laid, if desired, with borders, insets and designs of contrasting colours.

The company, from whom samples of the flooring may be obtained, have opened a new branch office and works at Third Avenue, Trafford Park, Manchester.

*

In order to demonstrate the adaptability of Fosalsil partition blocks, the four-page inset advertisement, in colour, of the Moler Products, Ltd., in this issue, is devoted to descriptions of their use in four very different buildings, namely, Claridge's Hotel, Brook Street, W.1 (Oswald Milne, Architect); Cable House, Victoria Embankment, E.C. (Grace and Farmer and Sir Herbert Baker, Associated Architects); Southend General Hospital (Adams, Holden and Pearson, Architects); and a Hunting Box in Leicestershire (P. D. Hepworth, Architect). Fosalsil partition blocks, which are manufactured and supplied direct by Moler Products, Ltd., of 42 Kingsway, W.C.2, are claimed to be the lightest on the market — one-third the weight of ordinary blocks—with a crushing strength of no less than sixty-four tons per square foot.

*

Messrs. Mouldings Developments, Ltd., of 34 Victoria Street, S.W.1, are now marketing a new form of decorative sheeting under the registered name of Textamur. Made from pure, odourless materials, it is supplied in sheets, 55 ins. long by 24 ins. wide, and is 1 mm. thick. Owing to its unlimited range of colours, it can, it is claimed, be incorporated in almost any decorative scheme as a permanent panelling, either solus or faced on plywood or Celotex. The surface of Textamur can be washed and cleaned, and is also claimed to be fireproof and waterproof, unaffected by heat or frost, steam or damp, and immune from the attacks of vermin.

Triolin, the cellulose flooring, also supplied by Moulding Developments, Ltd., has, of course, been on the market for several years. It has been used for hospitals, cinemas, ships, restaurants, etc., and among the advantages claimed for this material is that its durability permits an extremely thin gauge to be used; that it goes down smoothly, and lies flat; joints are practically invisible, and soon after laying weld together, making one complete surface; and also that it will not buckle or creep, even on cement floors.

*

Among the many interesting specialities of Messrs. Nettlefold and Sons, Ltd., of Nettlefold House, 163 Euston Road, London, N.W.1, are Semprax cast stainless steel and the Marbelle water tap. Semprax is the name given to solid castings in stainless steel. The castings are naturally durable and take a high polish. Practically any article which can be cast in brass can also be cast in Semprax, provided it is not of too ornate a description. The Marbelle water tap has been devised by Messrs. Ebonestos Insulators, Ltd., of London, who are sole manufacturers under licence, from a moulding and not from a tap manufacturers' point of view. The mouldings consist of three parts—the handle, the top cover and the bottom cover and outlet, the latter part being moulded in one piece. By a special process, the bottom cover and outlet part is permanently fixed on to the brass cock in a manner which definitely prevents any leakage between the brass cock and the moulded exteriors. The top cap and capstan are easily removable to facilitate the replacement of washers, etc. The brass cocks upon which the moulded parts are fitted are manufactured by a leading tap manufacturer, and the whole tap is manufactured in accordance with the specification issued by the British Water Association. Messrs. Nettlefold and Sons, Ltd., have the sole selling and distributing rights, and all inquiries must be sent to them. The taps at the moment can be supplied in white, black, black mottled and green mottled, and are made in two sizes—$\frac{1}{2}$-in. and $\frac{3}{4}$-in. pillar.

*

From the Pyrene Co., Brentford, particulars are to hand of interesting patented processes for providing iron and steel articles with (1) a rust- and corrosion-proof surface ("Parkerizing"), or (2) a bonding surface for the subsequent application of paint or enamel ("Bonderizing.") Whereas in many rust-proofing processes zinc is the active agent, reliance is here placed upon the formation upon, and actually penetrating within, the surface of the article to be treated, of a coating of insoluble phosphates, which are, it is claimed, practically impervious to all the ordinary agents of corrosion.

The method of working both processes is similar. The proprietary powders, "Parco" or "Bonderite," are made up into solutions with boiling water, in which the articles to be treated, after being de-greased, are immersed for periods of about sixty or ten minutes, respectively. It is noteworthy that

as the temperature applied to the iron or steel is only the negligible one of boiling water, no change whatever affecting the temper of the metal can occur. It is claimed, in addition, for Parkerizing that the process is a conversion of the original surface rather than a building up of an additional outer skin; the limits and tolerations of machined surfaces are not sensibly affected, so that fine screw threads, for instance, can be processed without impairing the accuracy of their fit. Magnets, too, retain their magnetism; in fact, none of the physical properties are changed. The process gives a variety of attractive satin finishes, black.

Bonderizing is essentially a method of priming steel and iron. The effect of the treatment is said to be so complete that even if the surface so treated, and subsequently painted or enamelled, sustains scratches, rust will not spread from the injuries beneath the final finishing coats, and cause them to flake off. Exceptional cohesive properties and a chemically clean surface for the application of the final enamels are among other advantages offered.

*

It is stated by Messrs. Redalon, Ltd., of Regent House, Regent Street, London, W.1, that the inclusion of the words "Supply and fix Bull Dog Floor Clips" will make the difference between a floor comfortable and silent to walk on, or one liable to buckle and creak. The "Bull Dog" method is claimed to be quick, simple and efficient. To place the clips in position, a plank is laid over the green concrete across which the workman walks, using it as a guide for the alignment and spacing of the clips. The ears of the clips lie flush with the concrete, leaving the floor unobstructed and free for the trucking or storage of goods until the wood floors are ready to be laid. The floor fillets are dropped into position between the ears of the "Bull Dog" clips. (This holds them secure while the carpenters are levelling up.) A few wedges under the low spots, two special friction tight nails through each ear of the "Bull Dog" clips, and the job is done. It is also the contention of the firm that a plaster or cement rendering should be "part and parcel" of the concrete to which it is applied—not a separate coating keyed here and there. They claim that hacking or otherwise mechanically roughing the concrete provides a key over 25 per cent. of the area at the most, and that the process of hacking jars the concrete and may loosen the surface aggregate, making the bond of even less value than represented by the 25 per cent. of bonded area. To overcome these difficulties, the firm recommend the use of "Redalon" liquid, which is claimed to provide a natural key over the whole surface without damaging or weakening the concrete.

*

Messrs. J. H. Sankey and Son, Ltd., whose head office is at 124 Barking Road, S.E., inform us that they have been appointed selling agents for Maftex insulating board in London and the southern counties.

*

"Norusto," manufactured by Solignum, Ltd., 205 Borough High Street, S.E.1, is primarily a metal preservative paint, and is specially manufactured for the protection of all metal surfaces such as iron, steel, corrugated sheeting, etc., against rust. It is stated to have a covering capacity of about 900 square feet per gallon, and therefore to be very much more economical than ordinary paints, a comparatively small quantity being required to cover a large area. In view of this high covering power and its low cost, it is said to be considerably cheaper in actual use than most paints. Elasticity, durability and special preservative properties are claimed for it. Norusto, while being primarily a metal preservative paint, is also ideal for use on walls, concrete, cement, asbestos sheeting and similar surfaces, and is, it is stated, excellent for the treating of damp walls of houses. It is available in a range of colours, including black, white and aluminium; there are also special varieties of black for rapid-drying, dipping, heat-resisting and tanking uses.

*

To meet cases where modelling in comparatively high relief on walls, etc., is desired, Messrs. Winsor and Newton, Ltd., of Rathbone Place, W.1, have recently introduced "Wallart." This plastic medium is stated to be capable of being modelled to a thickness of 4 ins. without cracking, and to dry quite hard—hard enough, in fact, to be freely carved without chipping—while retaining sufficient elasticity to safeguard it against changes of temperature. Among other advantages claimed for it are acoustic properties, non-conductance of heat, and ready applicability to such surfaces as wood, plaster, glass and suitably prepared brickwork. It readily takes oil paints, and thus lends itself to varied decorative and colour schemes.

*

Messrs. Venesta, Ltd., are getting together technical information on methods of using Plymax in the building industry. This information they are sending out periodically in the form of photographic reproductions of work done with Plymax, and technical diagrams regarding fixing methods together with data on costs and so forth.

They are also forming a special department that will be organized to give technical service on all Plymax and Plywood buildings and decorative problems. The organization will be known as the Venesta Technical Department.

*

To deaden noise and to maintain an even temperature in their new premises, the Thompson and Norris Manufacturing Co., Ltd., decided to line the interior with insulating wallboard. An interesting feature of the scheme was the treatment of the pilasters on the side of one of the rooms. The wallboard used was Treetex, which was fixed to the walls on battens. The work was carried out with great rapidity.

THE ARCHITECTS' DIARY

WEDNESDAY, NOVEMBER 4

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "St. Peter's Cathedral and the Vatican, Rome." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Exhibition of members' holiday sketches and photographs.

THURSDAY, NOVEMBER 5

INCORPORATED INSTITUTE OF BRITISH DECORATORS. At the London School of Hygiene and Tropical Medicine, Keppel Street, W.C. 1, "Contemporary Decoration." By Arthur J. Davis, F.R.I.B.A.

THANET SCHOOL OF ART LECTURES ON ARCHITECTURE. At Chatham House School, Ramsgate. "Early Christian Architecture." By R. Goulburn Lovell, A.R.I.B.A. **7.45 p.m.**

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The BATTERSEA B.C. proposes to proceed with the erection of the second block of tenements on the St. John's College site, at a cost of £35,700. Fifty tenements are to be provided.

Mr. Gervase Bailey is to reconstruct 18–20 Cullum Street, CITY OF LONDON.

The CROYDON Corporation is to erect a pumping station for the drainage of the Ham Farm estate, at a cost of £5,000.

The CROYDON Corporation proposes to proceed with the new fire-station scheme in Long Lane, at a cost of £20,000.

The CROYDON Corporation has prepared a clearance scheme for the Old Town area and agreed upon re-housing for 526 persons in 100 houses on the Waddon estate, and for fifty-four persons in two blocks of flats in Windmill Road.

The CROYDON Corporation has approved plans for the erection of eighty houses on the Ham Farm estate.

Plans passed by the CROYDON Corporation: Nine houses, Orleans Road, for Mr. M. D. Wilde; two houses, The Glade, for Mr. F. S. Pym; alterations and additions, 9–11 London Road, for Mr. H. F. Bailey; two houses, Warminster Road, for Messrs. W. A. Telling, Ltd.; church and vicarage, Bingham Road and Sefton Road, for Messrs. W. Downs, Ltd.; four houses, Devonshire Way, for Mr. E. A. Parks; three shops, Selsdon Road, for Mr. R. K. Kruse; two houses, Haling Park Road, for Mr. S. H. Palmer; ninety-five houses, Stanford estate, for Messrs. Truett and Steel, Ltd.

The COULSDON U.D.C. has passed amended plans, submitted by Mr. R. Cromie, for the erection of a cinema and café in Brighton Road, Purley.

Plans passed by the COULSDON U.D.C.: House, Coulsdon Road, for Messrs. J. Kent and Sons; house, Stonetfield Road, for Messrs. Chittenden and Simmons, Ltd.; house, Woodplace Lane, for Mr. W. Farmer; house, Coulsdon Common, for Mr. S. G. Rudd; extensions and alterations, 152 Brighton Road and Valley Road, for Messrs. Hooker and Rogers; five houses, Byron Avenue, for Mr. C. L. G. Morgan; house, The Wend, for Messrs. Thomas and Son; two bungalows, Shirley Avenue, and two houses, Homefield Road, for Mr. T. C. Sales; eight bungalows, Wyncote Road, for Messrs. James and Woodworth, Ltd.; house, Caterham Drive, for Messrs. H. Turnbull & Co.; premises for Woolworths, Chipstead Valley Road, for Mr. Edgar R. Taylor; four houses, Hartley Way, for Mr. F. A. Freeman; house, Bradmore Way, for Mr. H. C. Dodrell.

The EAST HAM Corporation has obtained sanction to proceed with the erection of a nursery block at the children's homes, at a cost of £21,000.

The Rev. Canon Leteux is to erect a junior and infants' school on the Lupset estate, WAKEFIELD.

The WAKEFIELD Education Committee has selected a site on the Eastmoor housing estate, for the erection of an elementary school.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices of materials are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

SELECTED PRECEDENTS:

INSIDE AND OUTSIDE THE POWER HOUSE (continued)

"ORDER is heaven's first law." The vandals of the nineteenth century, much preoccupied with heaven in other respects, will be remembered for the titanic scale on which they violated it. Their fatal heritage of chaos and meanness, which is eating into civilization like a canker, was the result of uncontrolled industrialism. It is the mission of our age to civilize industrialism, and to transform those degraded mining-camps, for which the description "manufacturing areas" is a derisive euphemism, into exemplars of "order where disorder stood."

Most of our "super-power stations" are superlative in their ugliness. There is no reason why they should be, as a glance abroad shows; nor why almost all English examples should be cautionary ones. The Central Electricity Board has immense imaginative opportunities and immense architectural responsibilities. So far it cannot be said to have risen to either.

Applied science is not enough. The engineer does not suffice. Human decencies can no longer be ignored with impunity. The architect must be called in every time—not to add sentimental trimmings as an afterthought, but to plan at the very beginning. Every building illustrated has been "signed" by an architect. Only those suffering from cataract can fail to perceive it.

[O. O. Kurz, Architect.

1. GALLERY OF OIL-SWITCH COMPARTMENTS, SEIDL-STRASSE TRANSFORMER STATION, MUNICH.

Figures 2 and 3 show master switchboards at the principal transformer station in Munich, and an important thermal power house on the Lower Elbe, respectively. The former steps down the high-tension voltage received from hydro-electric works in the Bavarian Alps to industrial and domestic frequency. Figure 1, another interior view of the same building, is a corridor in which each cubicle contains an oil-switch controlling a street sector. The succession of bridge-like concrete tie-beams in this gallery is rather reminiscent of the masonry struts which cross-buttress the narrow alleys of the harbour quarter of Genoa.

Figures 4 and 5 are good examples of the way in which modern English and Austrian forms so often unconsciously approximate to each other. Both have a certain aristocratic distinction—evinced by the former in its absence of ornament and in the latter by the nature of it—which is traditional in the best sense of the word.

AN ENGLISH ACHIEVEMENT

ALTHOUGH progress on the Bank of England is slow because of the exigencies of the site, a considerable amount of Sir Herbert Baker's new building is now visible behind the "Old Lady."

Whilst New York has piled up a chaos of cliffs, a confusion of crowded precipices, London has quietly realized the half formal beauty of the plan of her streets which meet at the Bank.

The date of this layout is much too old and uncertain to hazard a guess. We expect several "rolling English roads" met here in the dark ages, and that the special providence which has made the type so delightful watched over these tracks till they formed, seen from above, the figure of a starfish with radiating tentacles.

To this figure the many fine buildings owe their appearance of a rough unity. We believe that the Bank will soon be third to Westminster Abbey and St. Paul's as a place of pilgrimage, not only for the initiate, but, what is much more important, for the public. As well as Baker, Lutyens, the Burnet firm, Cooper, Newton, Mewès and Davis, Cockerell, Hawksmoor and Wren contribute to the effect.

The number of the defiles which lead from the centre gives an openness to the view which lets in slanting sun rays, and prevents the buildings from seeming to imprison the spectator. The light and shade makes, therefore, a gay effect. At the same time, relief is given to the buildings which occupy the salients. In the distance, down the defiles of the streets, can be seen windows, doorways, columns and figures in diminished size, and chiselled by a delicate perspective to the scale of silversmith's work; so appears the pylon of St. Mary-le-Bow, antiquely chased to become a tabernacle for the ancient sun, and pierced with openings whose glass is sky; and in middle distance the low rock-hewn gem of St. Mary Woolnoth matches in sooted gold the entombed regalia of some dead queen. To the east there lingers the spirit of Greek art, revived by Cockerell's keen pencil and clear vision.

The temples of the Mansion House and the Royal Exchange keep in their pillared porticoes the memory of old Rome, her laws and her magnificence. Of the walls which, fronting, frown over the streets, none inspires greater awe than the jagged cliffs of the Midland, by the proportions of its caverned openings, by their depth and the huge arches which in imitation of imperial aqueducts crown its supreme story, and by the domes which through their modest size exaggerate the scale of the stones beneath them; by all these the mind is convinced of power. With equal force the eye takes the impression of security and strength from Lloyd's, though here a smoother dignity is shown, as it were a rock-face polished by the tide and too hard to be moulded on its lower stories by the massage of the waters, but, above, cramped and beaten into vast columns, and fretted into the imagery of flowers and boskage and half-human heads, as high as where the topmost beams bear along the wall and leaning fearfully out uphold the sky.

The new part of the Bank of England rises also and answers to these others on the same plane of the upper air. The Old Lady of Threadneedle Street herself is the greatest personality of this drama of building. She has a dark beauty which has grown like a spell, more powerful with time. Though she has snatched, as she passed by, the Temple of Vesta at Tivoli to be her wreath, none can find the birthplace of her inspiration or what seer foretold the horoscope of her nativity. None has dared to become her flatterer and copyist. We only know her to have a many-sided variety in her single existence, and the freshness of something most old, coming from Soane's mind and charged with beauty and pride.

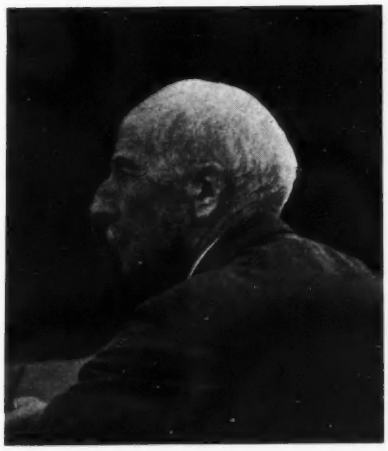
She is the life-cell in the midst of the starfish, and from her run all those tentacles, straight and curled, which are the matrix of so great an aggregate of grandeur surrounding her.

THE NEW BANK OF ENGLAND

The new Bank of England, designed by Sir Herbert Baker, A.R.A., is now becoming visible behind Soane's screen wall. The view shows the central feature of the Threadneedle Street façade.

As our leader writer remarks on the previous page, whilst New York has piled up a chaos of cliffs, a confusion of crowded precipices, London has quietly realized the half-formal beauty of the plan of her streets which meet at the Bank. "We believe that the Bank will soon be third to Westminster Abbey and St. Paul's as a place of pilgrimage, not only for the initiate, but for the public. As well as Baker, Lutyens, the Burnet firm, Cooper, Newton, Mewès and Davis, Cockerell, Hawksmoor and Wren contribute to the effect."

NEWS & TOPICS



Nathaniel Lloyd, O.B.E., F.S.A., F.R.I.B.A., whose book, *A History of the English House*, is about to be published by The Architectural Press.

THE IMPORTANCE OF BEING MR. ERVINE

EACH Sunday I expend the sum of twopence on a copy of *The Observer*, wherein (as everybody must surely be aware) Mr. St. John Ervine dispenses wisdom weekly in a highly dramatic and invigorating manner. On actual acquaintance, it is said that famous men commonly prove disappointing, even to their most ardent admirers. I have never seen Mr. Ervine in my life, and would prefer, therefore, to retain my own visualization of him as a steely-eyed Hercules, of immaculate speech and defiant mien, with fists permanently clenched and encased in boxing gloves. Beneath the shelter of a column (headed, most appropriately, "AT THE PLAY"), Mr. Ervine gives each Sunday his redoubtable display of journalistic shadow-boxing, challenging all comers, dealing terrific blows at imaginary opponents, acting as referee and counting them out, throwing bouquets and catching them himself, and, week by week, posing magnificently as undefeated champion in the art of robust controversy.

*

Although the supply of antagonists for use in exhibitions of this particular branch of pugilism is practically unlimited, the best results are recorded when their selection is restricted to a type that is unlikely to hit back. Architects, as a class, are among the mildest of men, and when they are chosen by Mr. Ervine as his sparring partners he is always in fine fettle.

*

In case anybody conversant with the writings of Mr. Ervine has not yet heard of the Larder Window Incident, I will recount it in his own words. ". . . Two decades ago," announces Mr. Ervine briskly, from his private corner in *The Observer* of November 1, after clearing everybody out of the ring, "when I remonstrated with an architect who had provided my flat with a larder which had a large window with a south aspect and was, therefore, unfit for the storage of food, he blandly remarked that to have done otherwise would have spoiled his outside elevation! I then violently informed him that I could not live on his outside elevation, that I objected to having my food tainted through his incompetence and that, as far as I could see, the block of flats had been designed by him, not for the convenience of the inhabitants, but for the pleasure of the passers-by. I would have said more than that to him, but, unfortunately, he had fled . . ." For twenty years Mr. St. John Ervine has been looking out upon the world of architecture through this larder window, and although the window was large his view has been permanently obscured. I have never seen any of Mr. Ervine's plays, but I should not be at all surprised to learn that in every one the central feature in the most important act is a larder window. In any love scene dramatized by Mr. Ervine, I feel sure that the hero only wins the heart of the heroine after an impassioned outburst on the inefficiency of architects in the matter of larder windows. I do not know whether Mr. Ervine specializes in tragedy, but it is clear that in future productions of his plays provision should be made for the introduction of lots of disillusioned, miserable-looking supers who could wander about the stage, wearing false noses and red beards, and keep on asking the audience what architects are doing about acoustics and electric light and smoky chimneys and smelly drains and damp walls and the echo in the Albert Hall.

*

Mr. Ervine is so concerned with such matters that, on occasion, even his dramatic criticisms are enriched with the technicalities of building construction. Thus: ". . . There was a scene, performed in electric-blue moonlight, in which Sir Charles leant against a lintel while 'John Peel' was sung off. . . ." I have no idea how Sir Charles managed to perform this remarkable feat, but if Mr. Ervine can himself, in his own home, lean comfortably against lintels without the aid of a step-ladder, he must be a very much taller Hercules than even I, his admirer, had visualized. On the other hand, it is of course possible that Mr. St. John Ervine's unsuccessful attempts to lean against the lintel of that large larder window are really responsible for his distorted outlook upon architects and their place in life.

ARE BUILDING REGULATIONS FETTERED BY RESTRICTIONS?

What is the real truth about building regulations? The Ministry of Health, through Mr. Shelley, has told us how mistaken we are to suppose ourselves fettered by restrictions which exist only in our imagination; but imaginary or real, our grievances continue to be aired, now by one body, now by another. Finally, Sir Owen Williams trumpets his complaint through the columns of *The Times*, maintaining, and maintaining again even under official reproof, that the restrictions upon the methods of using concrete are indeed obsolete and wasteful. Now, who out of these contesting and protesting parties is right? The Ministry should know their own rules and regulations, and one would be bold to challenge statements issuing from that quarter. But do they know as much of concrete as Sir Owen Williams? And what sort of slaves are we that do not know when the shackles have been struck? Or what sort of shackles are they?

THE HOME OF LONDON'S CHIEF CITIZEN

The Mansion House was designed in 1739 by George Dance. Since then it has suffered by time and use. Familiarity has bred contempt, and the original proportions of many of the best apartments have been worsened by handy little alterations making for convenience, and little else beside. Those that Mr. Perks, and later Mr. Tatchell, have been effecting are in part a restitution of these damaged proportions, and in part a definite modernization of antiquated planning and equipment. The restoration of the original gallery in the Egyptian Room is of the first order, and is perhaps the most important piece of work undertaken; but of the second order there is no lack. The kitchens, entrances, lifts and other services have been remodelled to a considerable extent, and new accommodation has been added in an upper story hidden away behind existing roofs. Most interesting is the creation of roof gardens for the mayoral staff.

ASTRAGAL

NOS. 120—121 PALL MALL, S.W.

DESIGNED BY SIR EDWIN LUTYENS, R.A.

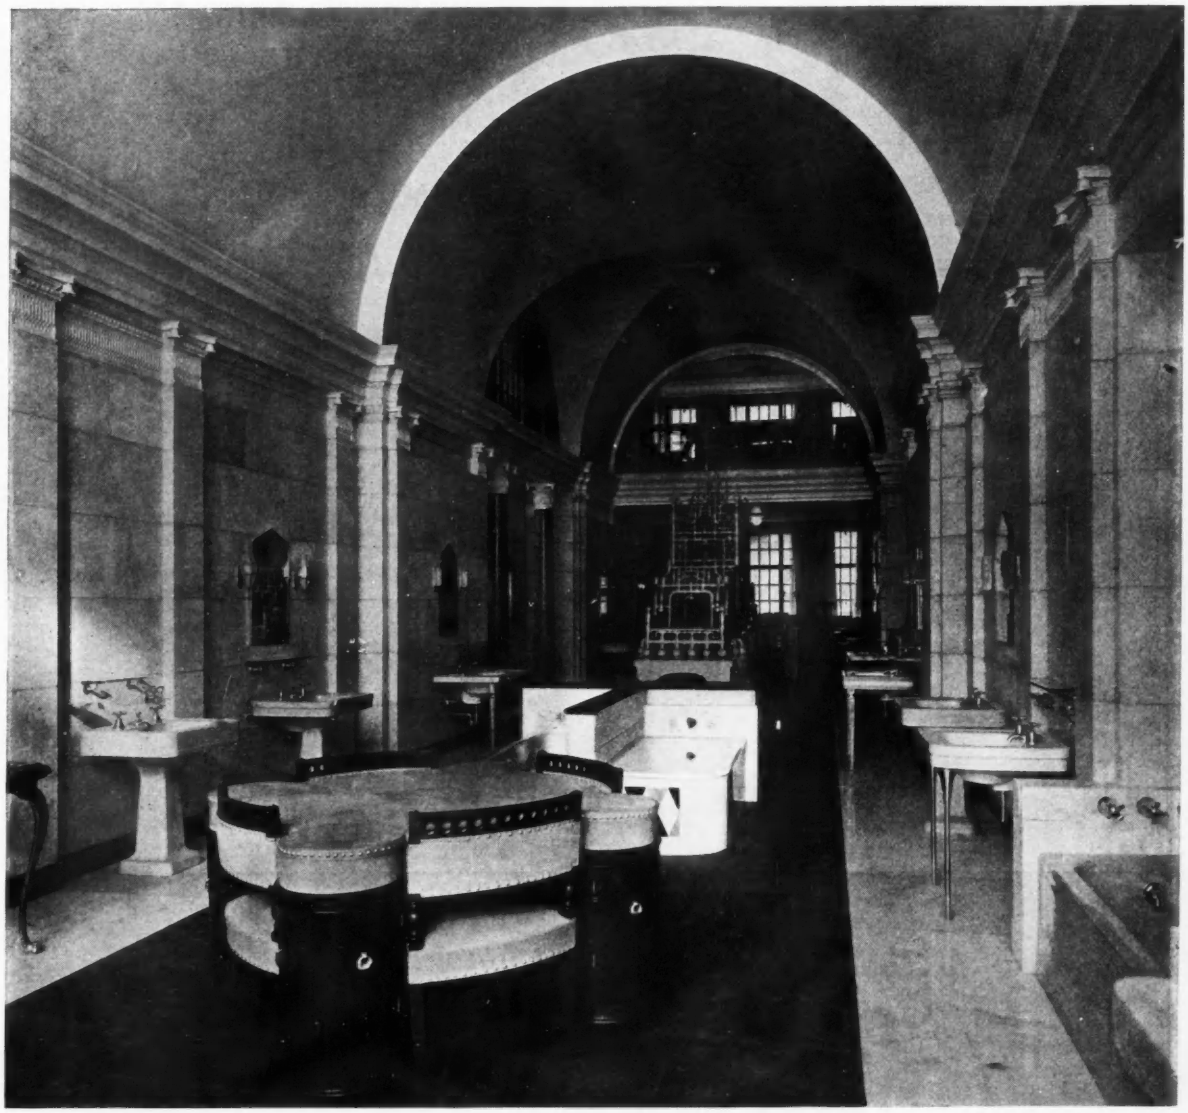
IT is to be hoped that the whole commercial world will entertain the same notion of architecture that Messrs. Crane-Bennett have displayed in their new showrooms and offices, opened on Wednesday last, in Pall Mall. Then we shall achieve something of a spirit of consistent gallantry; and no longer witness the anomaly of a useful building accessory, a pattern of gracefulness in itself, treating with cold contempt or rudeness the architectural surroundings in which it is exhibited. Crane-Bennett stand upon architecture as upon a foundation; and whether one is a traditionalist or a modernist—even whether one likes the building or not—one cannot but admire the uncommon strain of courtesy existing between the settings for the exhibits, the decoration, the furniture, and the main structure.

The building comprises a ground floor and basement for the display of sanitary fittings, and a sub-basement devoted to the exhibition of heating equipment, including radiators. In the sub-basement also is the boiler-house, which forms a model showroom for the firm's automatic oil-fired and gas-fired boilers: these are shown in actual operation. Above the ground floor are a mezzanine containing a lounge, bureau, refreshment annexe, dressing-rooms and lavatories for the use of visitors, and five stories devoted to offices.

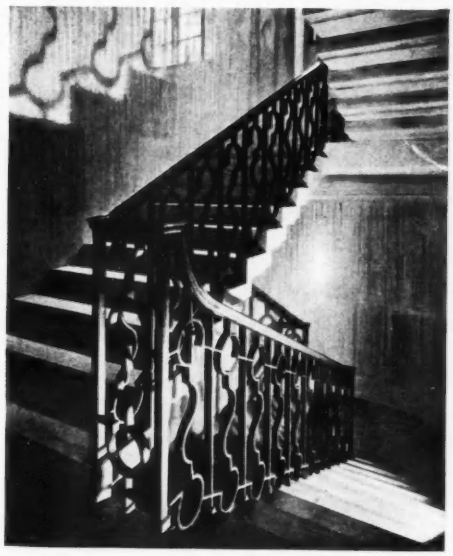
Internally, there is much to interest the visitor. There are the main showroom, with two magnificent bathrooms adjoining, and with all the walls, floors and settings for the sanitary exhibits—many with gold-plated fittings—in marbles of different hues. There are the visitors' lounge, with its walls of limed pine, the marble lined and floored lavatories with their ivory-tinted fixtures and chromium-plated fittings and radiators. Then there is the furniture, hand-made and carved to the design of Sir Edwin: tables and chairs that join together to form one piece, tables and chairs in limed pine and in walnut. And then there are the cosy easy chairs, of most unusual shape, where one could sit dreaming for hours.

E. R.

The main front is faced with Portland stone, and the roof is of solid concrete, covered with cast lead. The semicircular window to the showroom is of bronze, and those above are of wrought-iron.



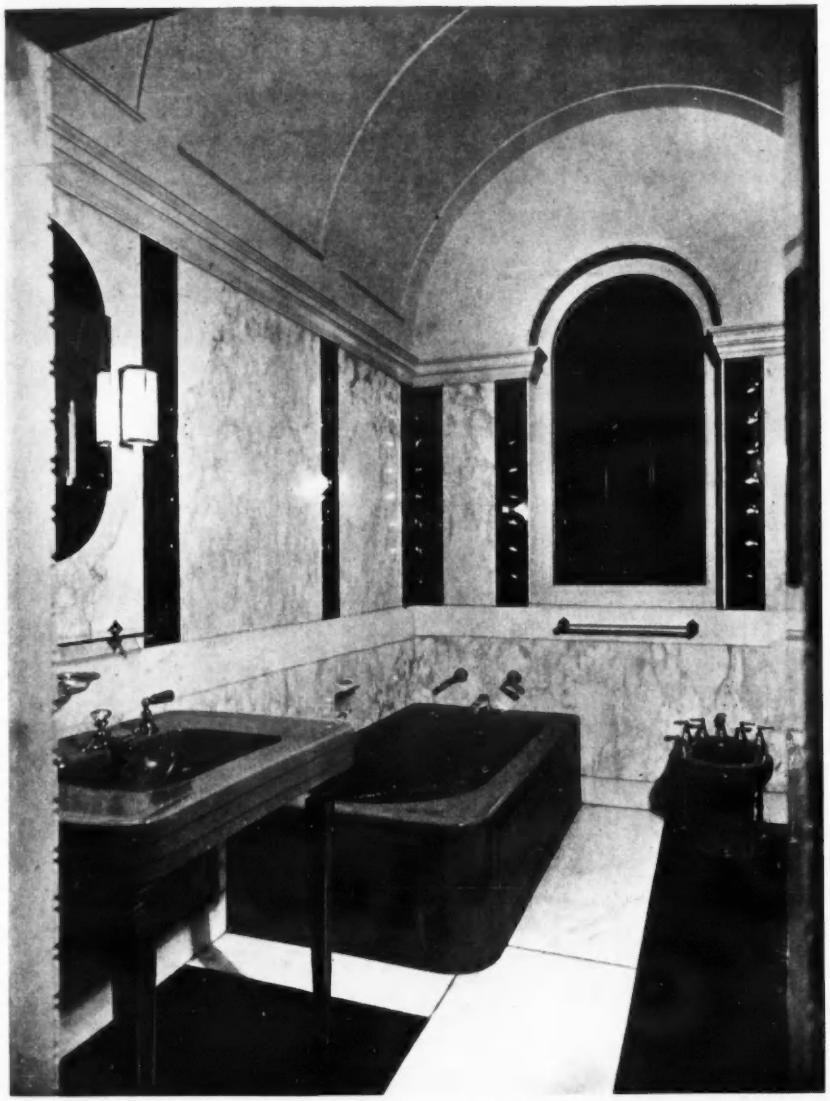
Nos. 120–121 Pall Mall, S.W.] [*By Sir Edwin Lutyens, R.A.*



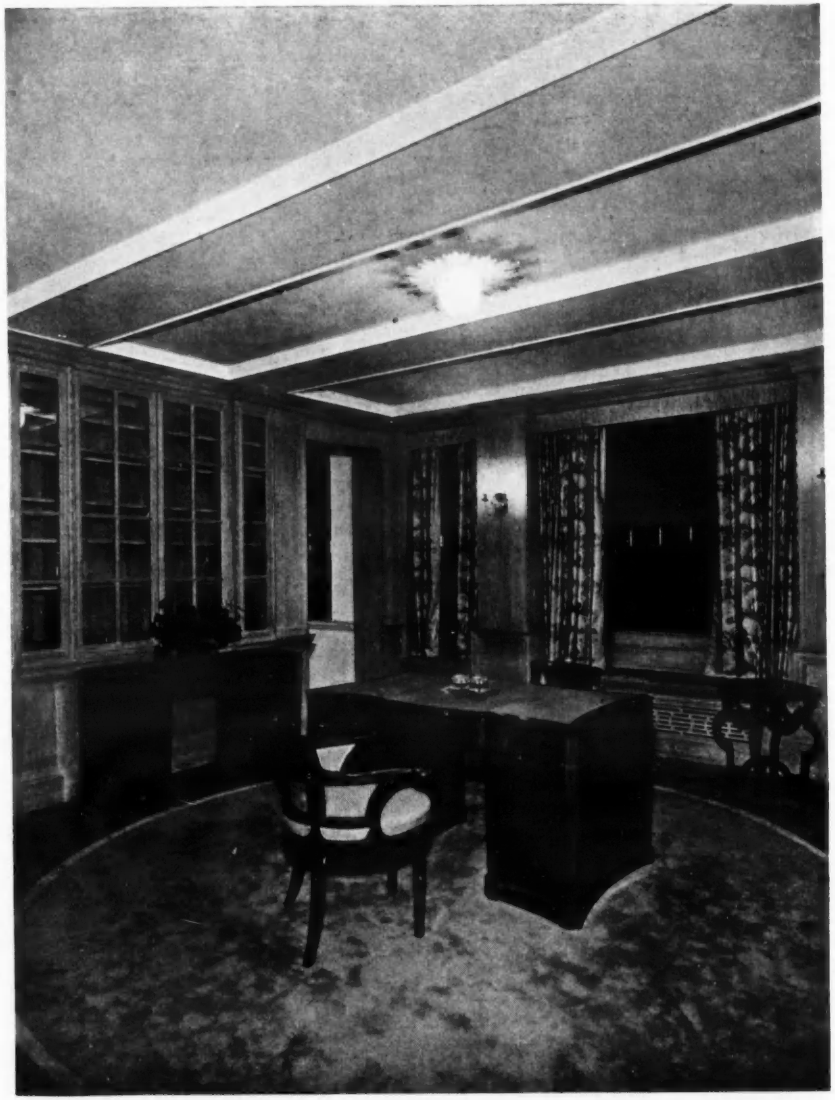
In the principal showroom, on the ground floor, looking towards the balcony to the visitors' lounge.

The principal staircase is lined and floored with travertine marble. It has a wrought-iron balustrade and a mahogany handrail.

The secondary staircase leading from the main showroom up to visitors' lounge and down to exhibition rooms in basements.



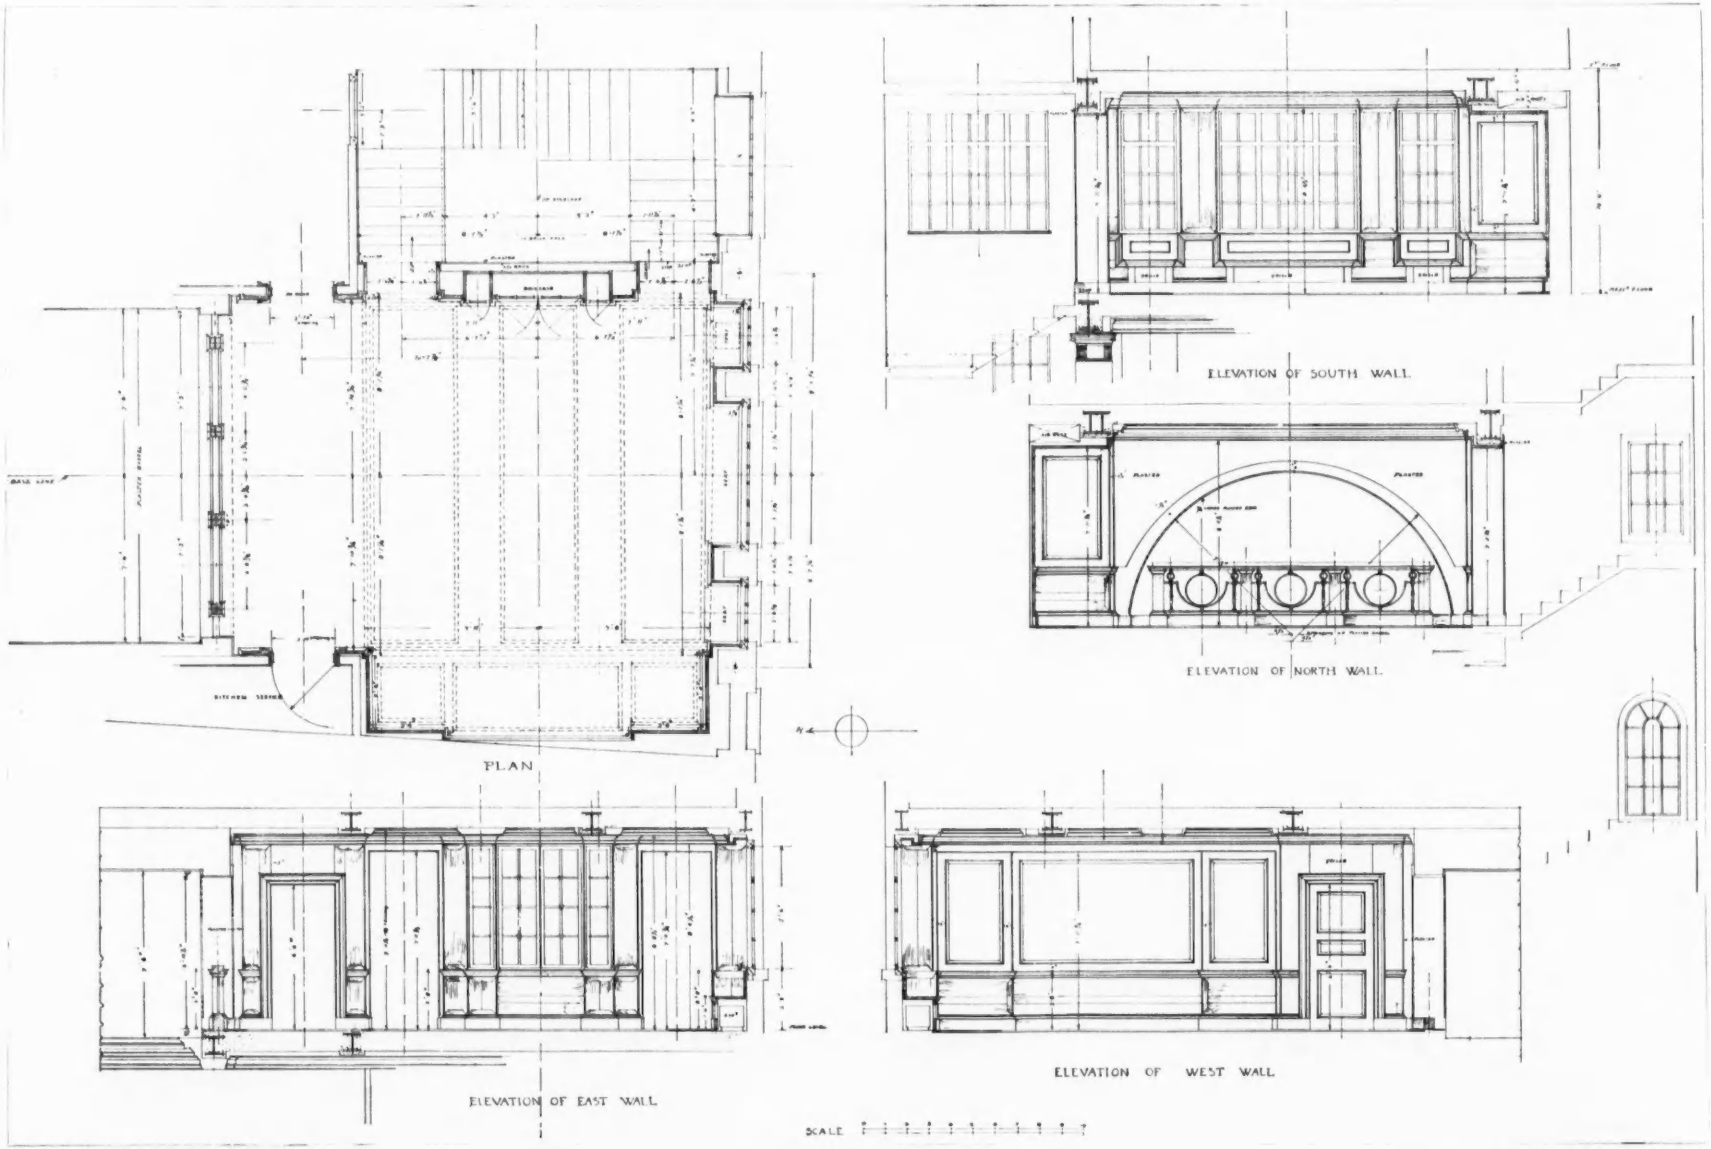
One of the two bathrooms adjoining the principal showroom. The walls and floor are of marble; the bath is in pale green porcelain with chromium-plated fittings.



The visitors' lounge, a drawing of which appears on the facing page. The furniture, designed by Sir Edwin Lutyens, is of walnut, red Niger leather, and hand-split cane.

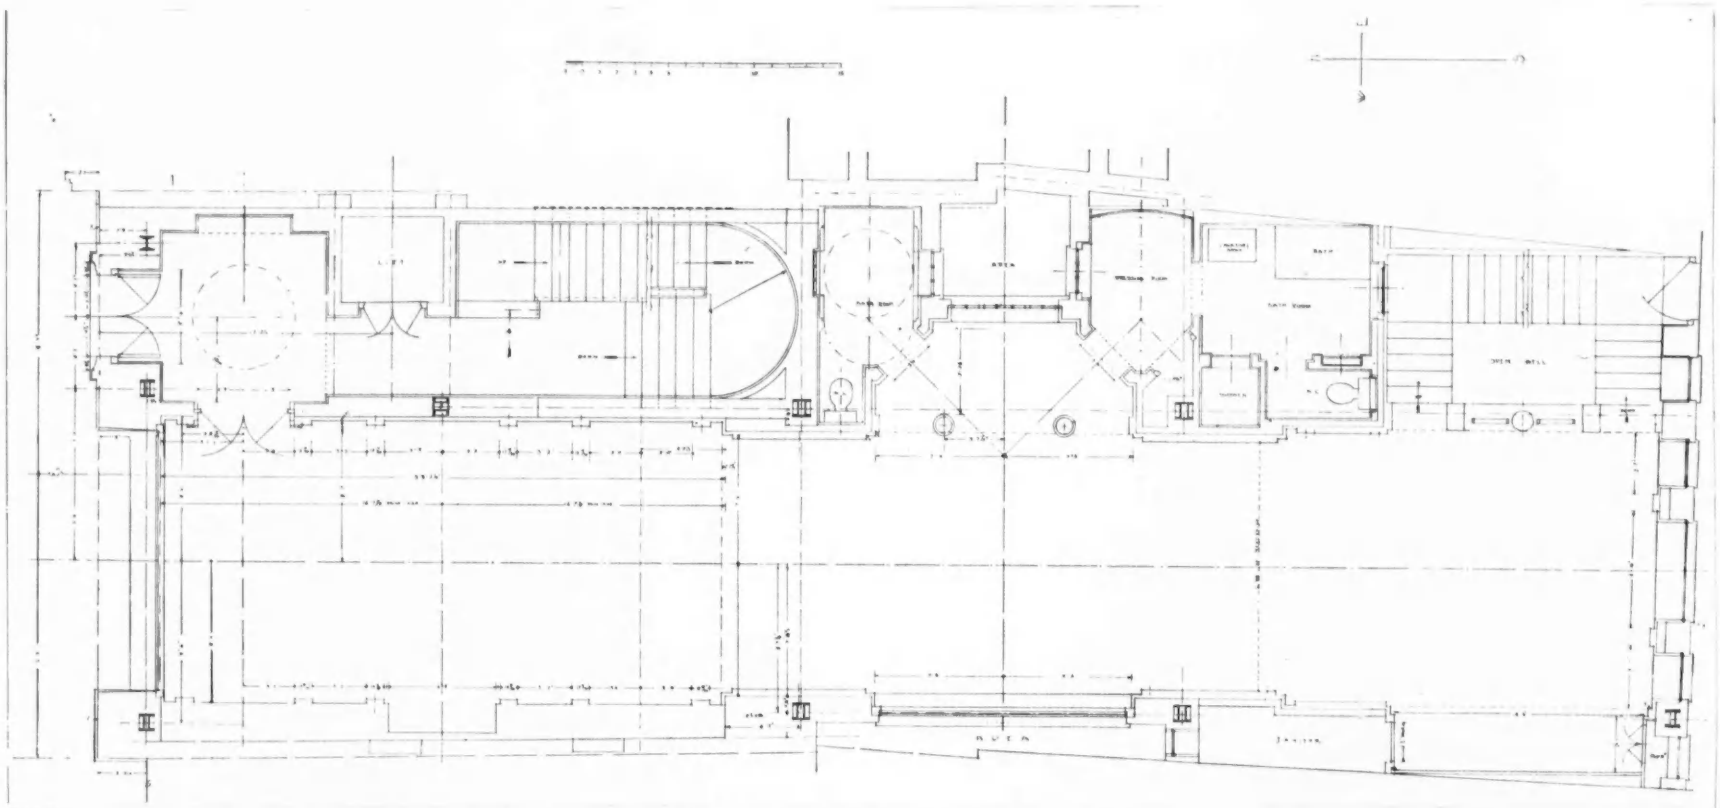
are of marble; the bath is in pale green porcelain with chromium-plated fittings.

designed by Sir Edwin Lutyens, is of walnut, red Niger leather, and hand-split cane.

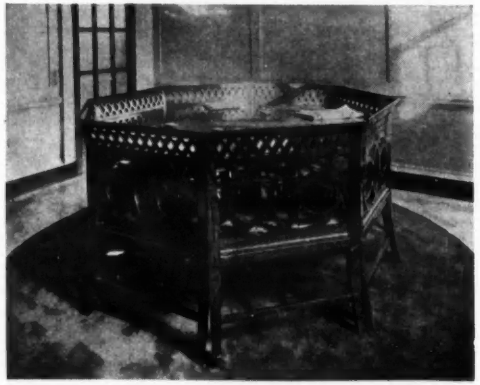


Nos. 120–121 Pall Mall, S.W.] [*By Sir Edwin Lutyens, R.A.*

The architect's working drawing of the visitors' lounge. The walls are panelled in limed pine, and the floor is of oak boarding. The wrought-iron railing to the balcony is painted red. A cupboard, also in limed pine, for the accommodation of books, is built into the east wall. Adjoining the lounge are an information bureau and dressing-rooms.



On the ground floor are the principal showroom, and two bathrooms, with all the walls, floors and settings for the exhibits in marble of various tints. There are also showrooms in the basement and sub-basement.



In the boardroom the octagonal table and the chairs can be put together to form one piece of furniture.

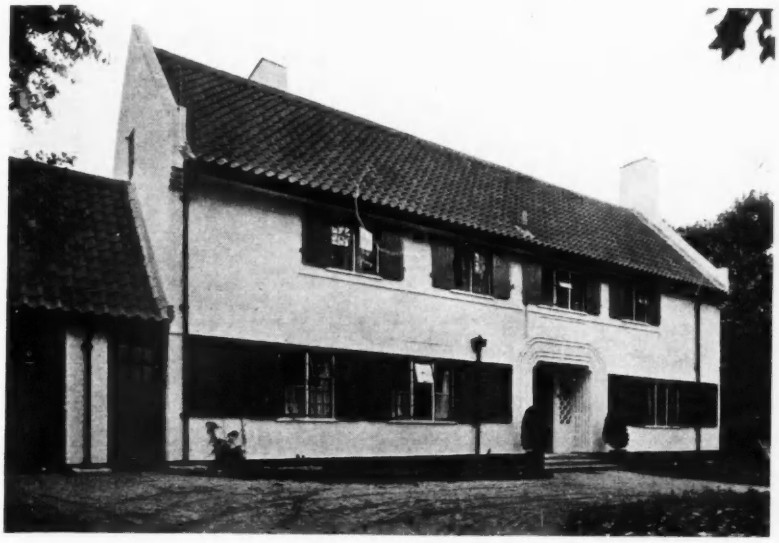
HOUSE IN WOODSIDE AVENUE, NORTH FINCHLEY

DESIGNED BY WELCH, CACHEMAILLE-DAY AND LANDER



The main front. The walls are faced externally with rustic Fletton bricks, lime-whitened.

Looking along the garden front. The washing space for cars is seen on the extreme right.

THE site of this house was originally part of the garden of the adjoining one. It is very well wooded, and one of the problems that faced the architects was to place the house in a satisfactory manner upon the site, in order that a minimum number of trees would have to be felled.

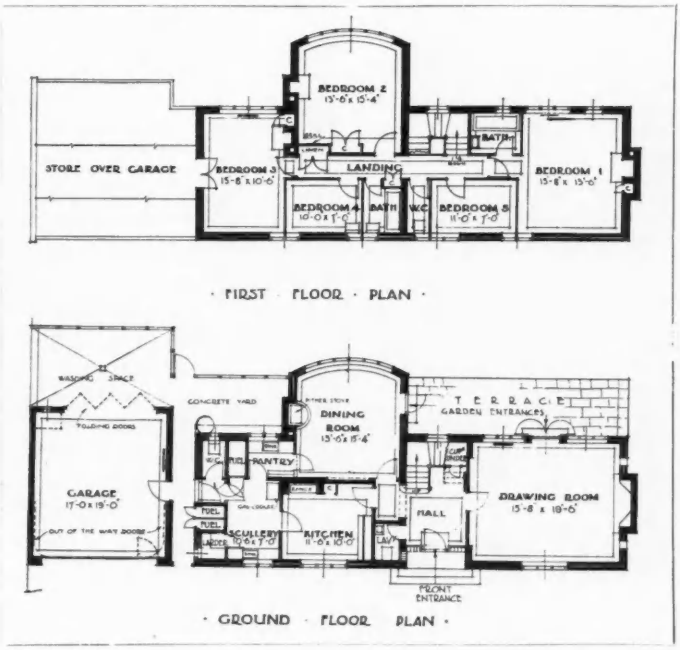
It was essential to run the house with as few servants as possible and it was therefore planned with this end in view. The dining-room is fitted with a stove, which heats the radiators in the drawing-room, hall, garage, and bedrooms Nos. 1 and 3 shown on the plan. There is a particularly large cylinder in the linen cupboard, with a radiator grille and sliding doors at the back of it, opening into bedroom 2, which accordingly receives a certain amount of warmth. The domestic hot water is supplied from a heating range in the kitchen. By this means the house is adequately warmed in normal weather.

The garage is planned for two cars and has folding doors at the back and "out-of-the-way" doors in the front. By this means it is possible for cars to go right through the garage to the washing space at the back; thus the front of the house is not spoilt by a paved yard.

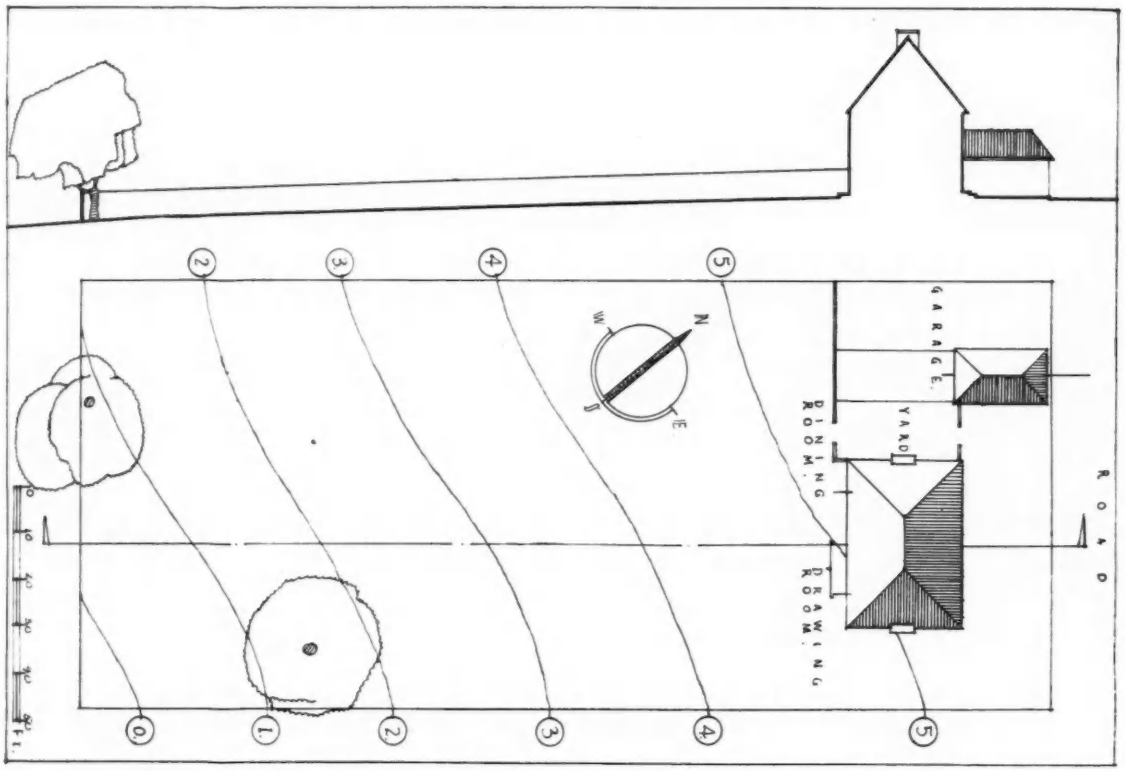
The house is faced externally with rustic Fletton bricks which have been lime-whitened; and the plinth is tarred. The roof is covered with sand-faced red pantiles.

A photograph, detail drawings and a description of the main entrance door and surround will be found in one of the supplements accompanying this issue of the JOURNAL.

The drawing-room, showing the large open fireplace, which can be used for supplementary heating during particularly cold weather, in addition to the radiators.



Ground- and first-floor plans. The garage provides accommodation for two cars, and has "out-of-the-way" and folding doors at front and back.



Site plan to illustrate the existing conditions that have to be met.

THE THEORETICAL PLANNING OF GARDENS

BY
E. A.
JELLICOE

i : The Half Acre

THE area of the ground is about half an acre, in a residential district where land is valuable. The house is small but well built, and the owner wishes to have a garden in keeping with his own formal method of living. There must be a lawn of sufficient size for a tennis court, a summer-house and, as his wife says, "lots of flowers." The ground slopes gently north to south, and there is a good outlook at the end of the site.

FIRST AND OBVIOUS SCHEMES

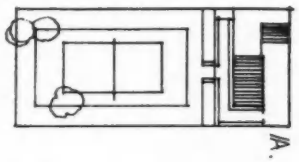
THE first sketch plans "A" and "B" place the tennis court in the centre of the site. The symmetry thus given to the garden is emphasized and enhanced by the position of the trees. The court is laid out on the centre line of the dining-room window, and either of these schemes appears so obvious that we might be tempted to accept one without exploring further.

The view of the whole garden from the windows of the house, with the trees framing the outlook beyond the lawn, is especially promising.

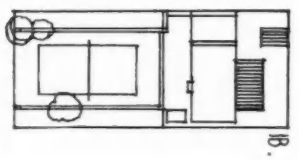
AN ELEMENT OF DISCOMFORT

If house and garden are, however, to be considered as a unit, the discomfort of the plan is clear. House and garage are unsymmetrical on the site, and plans "A" and "B" suffer from confusion of ideas. Half the scheme is symmetrical and half asymmetrical.

To the untrained eye this would not be consciously noticeable in actual fact; the owner would only feel after a while that "something was not quite right," that the sense of repose was disturbed. While enjoying, too, the view from his windows, he would realize that all his eggs were in one basket, and that much of the charm of a garden (that it should not be seen all at once) did not exist.



A.

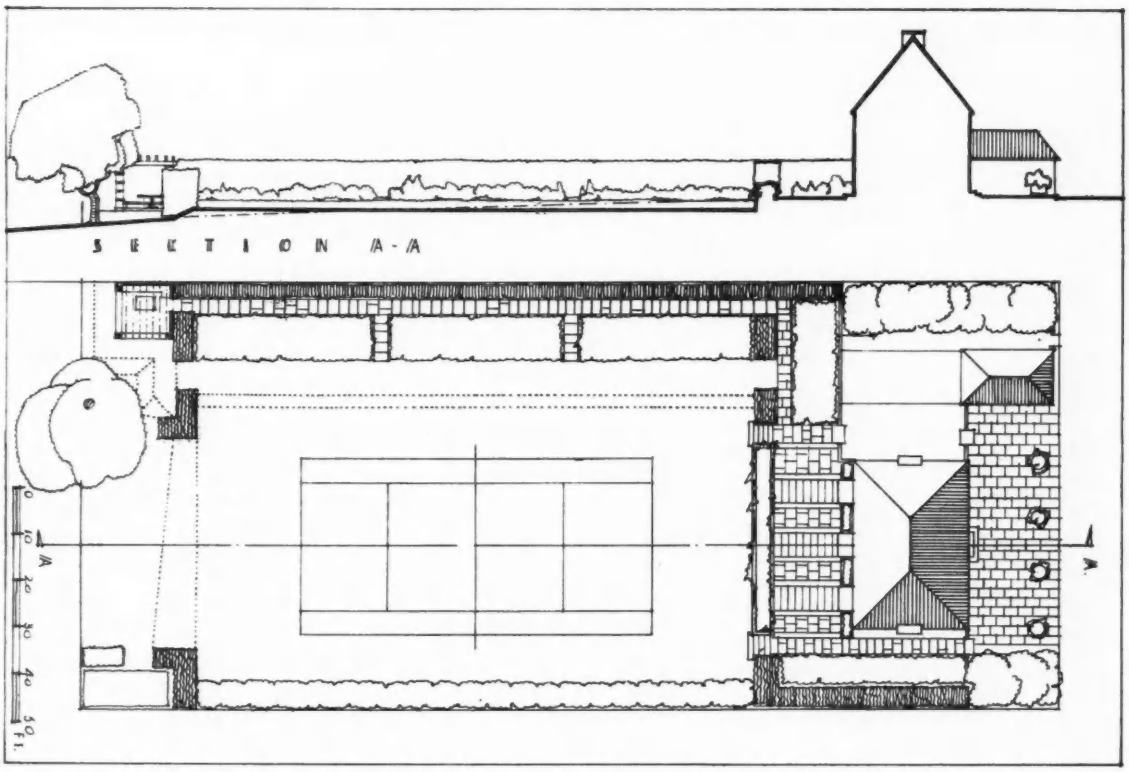


B.

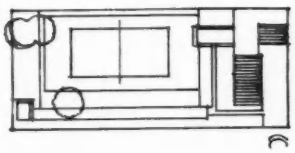
NOT ENOUGH "MYSTERY"

Dissatisfied, therefore, we pass on to schemes "C" and "D." Here is an arrangement where the layout of buildings and garden on the whole site is consistent. There is a direction or "flow" given to the garden; there is a feeling both towards the cross fall of the site and to the rectangular shape itself.

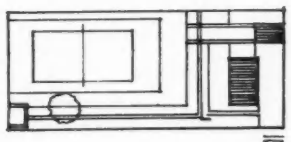
Though not well placed as regards aspect, the flowers are concentrated instead of being spread on each side of the court. Since in "D" one of the



The final plan adopted in the light of the considerations described.



C.



D.

trees has to go, "C" is clearly the better of the two schemes.

Once more, therefore, we might choose this design (and not do so badly) were there not still somewhere a sense of discomfort.

CLOSER RELATIONS OF HOUSE AND GARDEN

In reviewing broadly the elements of the composition, two appear more important than the others. These are the house and tennis court, and on so small a site they must undoubtedly be more closely related than has so far been considered.

SACRIFICING A TREE

This suggests schemes "E" and "F," both of which eliminate one of the trees. Probably it would be difficult to convince the client that these schemes are better than "C," because he will protest that a tree once cut down cannot be put up again.

This dilemma of the preservation of natural features as opposed to the claims of design frequently occurs. We should, however, be wise to sacrifice the tree, for the first need of a garden is harmony of thought.

The layout has become a faint echo of the original group of buildings, and since "E" is less pretentious than "F," this is the scheme upon which to decide.

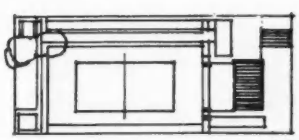
UTILIZING THE CONTOURS

In developing the block plan, the levels are arranged to make use of the contours, both to add interest and economize the shifting of material. The herbaceous border and grass walk are slightly raised above the lawn, and, in connecting the terrace upon which the house stands to the only other high elements of the site (the tree and the summer-house), suggest that the scheme has form as well as pattern on plan.

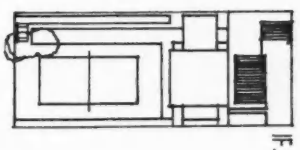
The evergreen clipped hedges help to spread what would otherwise be an isolated block of house. They also provide a foil to the flowers, a frame to the view, and break up the garden so that all cannot be seen at once. The paths are confined to one line of circulation, and the effect from the terrace where none could be seen would probably be one of spaciousness.

The disappearance of the farthest boundary, owing to the level of the tennis court, would also add to the sense of size, and, after the manner of the historical ha-ha, extend the garden beyond the confines of the rectangle. The summer-house is purposely secluded at the extremity of the site, while at the more public end the entrance forecourt, as if in contrast of idea, is open to the road.

Despite these plausible arguments, and the apparently limited scope offered, there might be at least half a dozen rearrangements as good as, if not better than, the one suggested.



E.



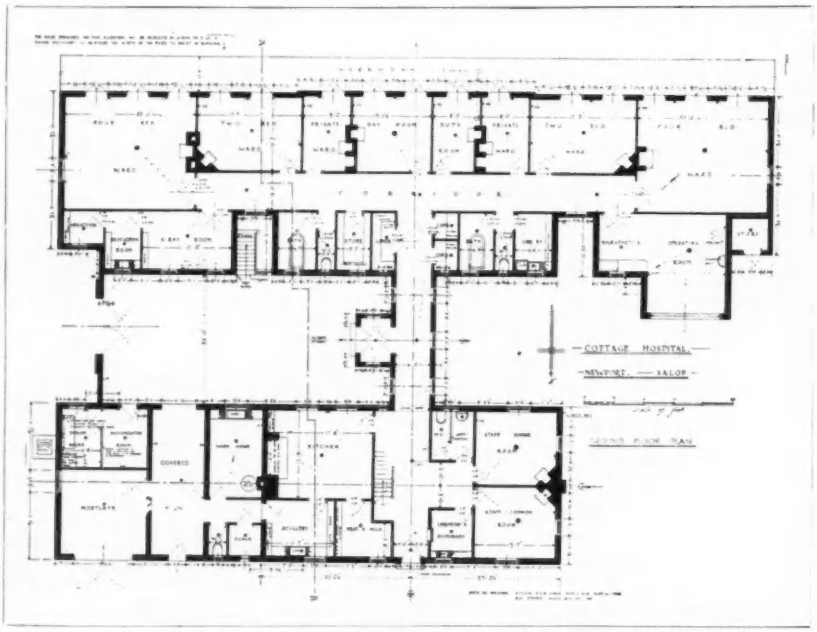
F.

The ward block. The materials are multicoloured bricks and grey roofing slates.

COTTAGE HOSPITAL AT NEWPORT, SALOP

DESIGNED BY EDMUND KIRBY AND SONS

THIS hospital was built about two years ago from money left in trust for the purpose by the late Annabelle Lady Boughey, Aqualate, Newport. The site is on the west side of the main London road and about a quarter of a mile north of Newport station. The blocks are set back about a hundred yards from the frontage. They are constructed mainly of local multi-coloured bricks from Lilleshall and are roofed with grey French slates.



The ground plan is roughly of H-shape. The south side has a veranda.

The buildings are arranged roughly in the form of an H with a short and long side. The long side, which faces south, includes the ward block, a room for minor operations, and the X-ray department, and has an external veranda, with sun blinds, to which there is direct access from each ward. The north or short arm of the H consists of the administration block, and accommodation for staff, kitchen, mortuary, etc.

The main entrance is through an archway surmounted by a stone tablet on which are inscribed the name of the hospital and donor. This gives access to a small courtyard, at the other end of which is the entrance to the corridor connecting the ward block and administration block.

As the ward and administration blocks are necessarily of one and two stories, respectively, some difficulty was experienced, the architects state, in obtaining symmetrical balance from the point of view from which the hospital is mainly seen, viz. the road. With a view to this, the brick walls are kept on the same level throughout and the extra story of the administration block is formed in a steep mansard roof.

The entrance archway from London Road.

The administration wing, operating room, etc.

LETTERS FROM READERS

"The Architecture of Rugby"

SIR,—With regard to Astragal's note on "The Architecture of Rugby," which appeared in the JOURNAL for October 28, it might interest you to know that my partner, Geoffrey C. Wilson, distinguished himself as a Rugby footballer. He was captain of the famous Richmond Rugby Football Club in 1909–10–11, and also played for, and was captain, on many occasions, of the Surrey County XV. In 1908–9 he was a member of the London XV which met the Australians, and was perhaps unlucky not to get an international cap, as he was chosen to play for England in all three trial games, 1909–10. Unfortunately, in the final trial, England were beaten by the Rest, and it was his fate to be numbered amongst the scapegoats which such a fiasco was sure to demand.

Astragal's reference to the A.A. as an excellent nursery of the game reminds me that when "G. C." first started the A.A. Rugby team, H. P. G. Maule, himself an old Rugby footballer, being then in charge of the A.A. day school, I became the first hon. treasurer, with Wilson as hon. secretary of the new athletic club.

SYDNEY TATCHELL

"Bernard Whistlow, F.R.I.B.A."

SIR,—Now that "Bernard Whistlow, F.R.I.B.A.," has reached a sad but inevitable end, I would like to offer Mr. Creswell my doubtful appreciations. His artfulness in telling a story delights me, his literary skill is beyond all reproach, but his realism has had the unwanted effect of convincing me beyond every hope that Bernard was a poor sad lot.

The illusions I had as to architects and the architectural profession are now completely deadened. Bernard may not be typical, but such is Mr. Creswell's skill that he stands for me as the F.R.I.B.A. of all time, a poor, palpitating, curmudgeonly, tuft-hunting worm.

Perhaps he is a satire, perhaps a severe lesson, but there he is, and I feel that I am getting more like him every day. But Lord save me from the hunting-field, and the tennis parties at Nollingborough, where the mistress art is bred.

Is the profession of architecture in England really as bad as that? I can't believe it. Surely there are some purposeful, cut-throat, take-it-or-leave-it fellows who do not have to spend half their lives "poodlefaking" round the ladies' choir or toadying to the "county"?

Surely there are in existence bold, bad bounders who can draw up plans and supervise works without knowing the meaning of "love-forty" or "honours easy"? If not, then thank goodness we have the speculative builder who takes his afternoon tea out of a can in the company of sweating workmen.

Mr. Creswell is too hard on us. He leaves us in such doubt as to whether Mr. Whistlow is a satire, a trick of fate, or a living picture of you or me. Bernard seems too pathetic and too affectionate to be a satire, too real and commonplace to be a trick of fate, and too socially sodden to be you or me.

I give him up.

FREDERIC E. TOWNDROW

"Wafer-Oven" in a Small Church

SIR,—I live about one mile away from an extremely interesting Parish Church, dedicated to St. Maurice (the Patron Saint of Generals, from the Romish calendar).

I have spent some interesting half-hours in this church looking around, and have discovered what I believe to be a "wafer-oven," in the small side chapel.

No flue is visible externally, except a narrow slit in a stone, with two iron bars across, high up on the wall on which the "oven" occurs.

I am wondering whether this is a common occurrence in mediæval churches—it is certainly the first I have seen.

I totally forget the name of the book in which I have seen a description of these "wafer-ovens"—but have read somewhere that "only one of these ovens is now in existence, and that at the Abbey Church of Malmesbury."

Before the Reformation, the officiating priest himself baked the wafer used at the Mass.

I have looked through Cox's *Norfolk Churches*, but in his description of Briningham Church (the one to which I am referring), no mention is made of this oven.

J. L. WILLIAMSON

GARDEN DESIGN

MR. G. A. JELLICOE, A.R.I.B.A., began his lecture on "Designing the Garden" at the Architectural Association on Saturday last by saying he proposed to emulate the *Time Machine* of H. G. Wells, and to transport his audience first into the past and then into the future. In between he would survey present-day gardens.

The English school of landscape gardening, which developed at the end of the eighteenth century, was an English phase related to the English landscape. It was the age of the painter; views from the house were as pictures on the walls of a room; and for a human being to enter was to shatter an illusion. The period from which this one had reacted was altogether different. The seventeenth and eighteenth centuries abroad were the age of the actor, and in showing views of Chantilly, Versailles and some Austrian and German gardens, the lecturer drew attention to the number of richly dressed people, as well as the pageants and festivals, which the gardens were designed to hold and be an effective foil for. He then passed into Italy, and said that a great value of the Italian garden lay in its sympathy for the individual. He explained that although to English eyes the gardens might appear austere, his audience must remember the climatic conditions. These precluded flowers, and the light called for the cool tones of green hedges and grey stone, and the sound of water.

Passing over gardens showing the essential relation of the Italian garden to landscape, the lecturer returned to the traditional garden of England. Step by step he showed how the beautiful materials, trees, grass, and flowers, had combined with the naturally blunt character of the Englishman to resist the rich garden shapes of the Continent, when these shapes were influencing the architecture under the Renaissance. He touched on the Victorian era, and showing gardens of the revival, he suggested that Sir Edwin Lutyens was the most versatile garden designer England had known.

The lecturer then returned to the present time, and remarked that the place of the grand gardens of the past was taken today both by an innumerable number of small gardens and by the municipal or communal garden. In the former, in which his audience would be most interested, he deplored the small sense of scale.

The planning of the garden was as much a matter of science and logic as that of the house. The garden, in effect, was an extension of the house; it was a blending of man and Nature. He expected to see the parts of the garden related to parts of the house. He stressed the element of surprise, that of not seeing the whole garden at once; but this could only apply to a garden of reasonable size.

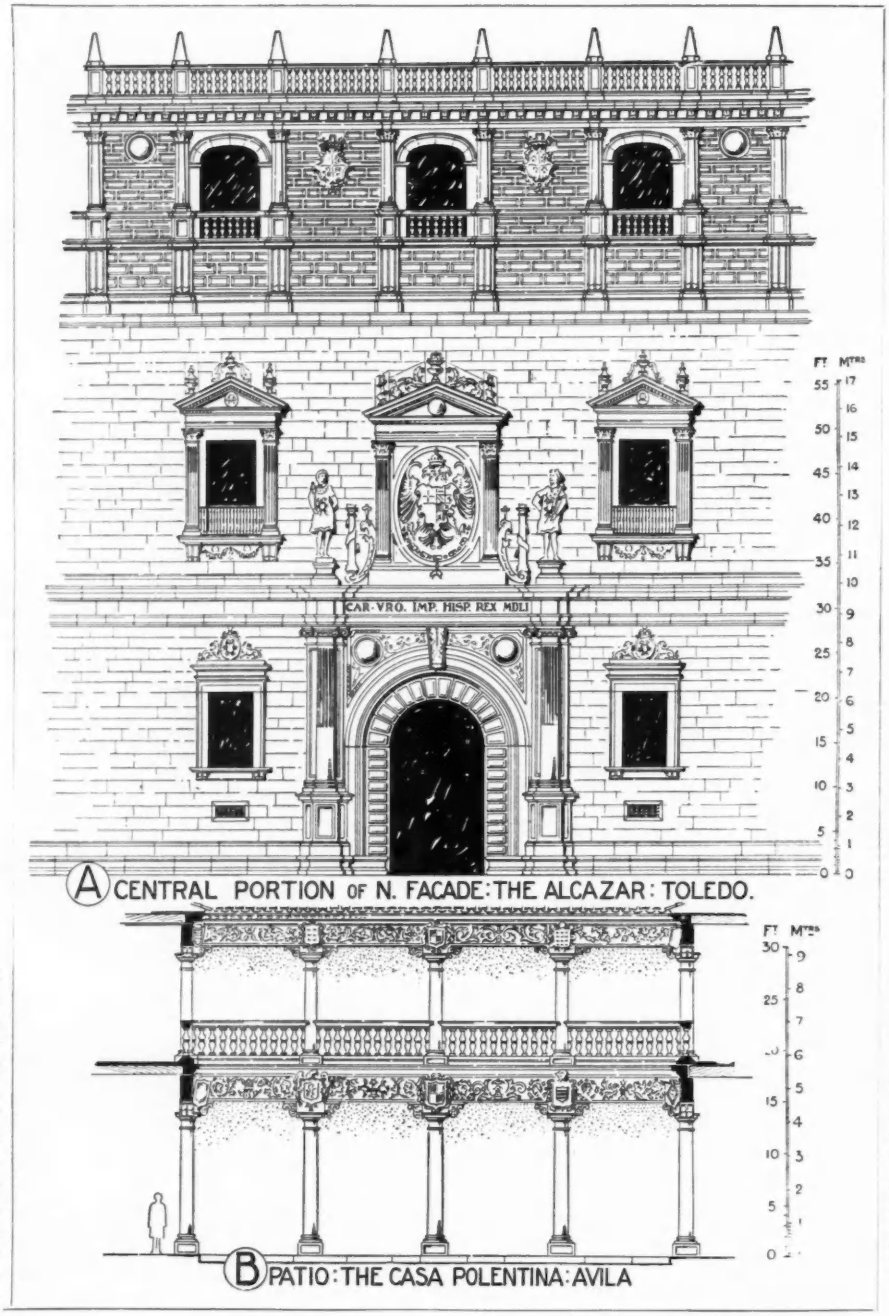
[On pages 640–1 is published the first of several articles on "The Theoretical Planning of Gardens," by Mr. Jellicoe.—ED. A.J.]

LITERATURE

THE "BIBLE" OF ARCHITECTURE

IT is interesting to note that an increasing interest is now being taken throughout the civilized world in all things appertaining to architecture, and more especially that with the advance of democracy the people as a whole are beginning to recognize the value of the art in national and civic life. The reason why architecture has not hitherto been assigned its proper place in education is, no doubt, the erroneous idea that the principles governing architectural form are in the nature of a highbrow subject divorced entirely from ordinary everyday life. It is, therefore, pleasing to note that professional societies and other bodies, both in this country and abroad, are affording the younger generation an opportunity, such as they have never had before, of obtaining at least a working knowledge of the mistress art by lectures delivered by well-known practitioners. There is, however, still much to be done in this respect.

Sir Banister Fletcher is, as readers of this JOURNAL are well aware, from the reports which appear weekly in its pages, a special lecturer at the L.C.C. Central School of Arts and Crafts. The fruits of Sir Banister's brain, however, have not only whetted the appetites of students of architecture these many years, but his *History of Architecture on the Comparative Method* is, without doubt,



From A History

The central portion of the north façade, The Alcazar, Toledo; and the "patio" of the Casa Polentina, Avila, Spain. The former is a castle of mixed Moorish and Gothic character, and is built entirely of granite. The north façade was added in the Plateresque style (in 1548) by Charles V, when he converted the Alcazar into a Royal Palace. The panel above the door is carved with his arms. The "patio," below, is reminiscent of a Roman atrium, in which the columns have bracket capitals to support the architrave.

known throughout the world. If he had done nothing greater in his life, this book alone would serve to carry his name down to posterity as one of the most outstanding personalities of our age.

It was, I think, at the close of the nineteenth century that the first edition of Architecture.

Some typical examples of the inns of the Middle Ages which are still in existence. Sir Banister Fletcher states that "these inns, as well as monasteries, provided accommodation for travellers, while many inns were used as posting houses. The George Inn, Glastonbury" (letter J), he continues, "is a substantially built structure, with mullioned and traceried windows. The Feathers Inn, Ludlow (letter N) is a delightful bit of half-timber construction and a pleasant reminder of the local style of building."

was published. Since then, no fewer than eight editions have seen the light of day, each becoming more corpulent than its predecessor, with the result that the ninth volume contains over 1,000 pages, and is copiously illustrated by over 4,000 photographs and drawings, forming an unrivalled panorama of the world's finest buildings, as produced by man in every age. The subjects of these have been classified and arranged with such obvious consistency and uniformity, that the appreciation of the differences between the various periods in the evolution of architecture is reduced to a matter of perfect simplicity.

In the new edition, published a few weeks ago, the main features of the earlier issues have been preserved, Sir Banister's aim being not only to describe the characteristic features of the architecture of each people and country, but also to consider those influences which have contributed to the formation of each particular style.

In order to bring out the effects of these influences, and also the qualities of the styles themselves, the author has retained his comparative and analytical method, so that by the contrast of qualities the differences may be more easily grasped by the reader.

The book has been divided into five sections. The first is divided into six

The Palazzo Giraud, Rome (1503), one of Bramante's later works.

The Palazzo Pandolfini, Florence (1530); one of Raphael's most famous designs.

From A History of Architecture.]

The Municipal Building, New York, designed by McKim, Mead and White.

The Merchandise Mart Building, Chicago, designed by Graham, Anderson, Probst and White. It is twenty stories high, and houses more than twenty thousand people.

[*By Sir Banister Fletcher, PP.R.I.B.A.*

Waiting hall of the Pennsylvania Station, New York, designed by McKim, Mead and White.

leading influences that help to shape architecture. The first three are physical conditions : geographical, geological and climatic ; the civilizing forces—religious and social conditions; and the last the historical background.

The second section explains the character of architecture, with various theories of origin and evolution.

The third, probably the most interesting of all, is devoted to examples of the chief buildings which are the result of the various influences, supplemented by brief but admirable descriptive notes.

The fourth comprises the comparative analysis of the essential features of each style; and the final section is a comprehensive survey of the principal works for readers who may wish to pursue the study of any style in further detail. A glossary of architectural terms, which should be of special service to the student, has also been added.

The above is the merest *résumé* of Sir Banister's book. There is not sufficient space here to go into it in more detail, but his opinion on the influence of the World War on architecture is extremely interesting " There is no doubt," he writes, " that the World War has influenced every aspect of human life and affected the character of modern architecture, and that the happiness, comfort and well-being of the great mass of the community have now become predominant in determining the direction of future architectural developments."

The value of a sound knowledge of bygone architectural styles is stressed in a chapter on the United States. Sir Banister points out that the novel forms that are being evolved there arise from new conditions, materials and possibilities in design, and these must result in that originality that is much sought after in the modernist school of thought which has set itself against the architecture of precedent and tradition. Architects should not be led astray, however, into thinking that they are better able to produce something original without a study of the best examples that have gone before, for there is real value in tradition, and the architect who is thoroughly conversant with it is more likely to produce original designs than one who has not been so trained.

The Masonic Peace Memorial, London. H. V. Ashley and Winton Newman, Architects.

It was, I think, Victor Hugo who wrote that " Architecture is the handwriting of the human race—the Bible of Stone." Here, then, is the " Bible of Architecture," the most essential book both for the student—a term, alas ! which must include nearly every practising architect—and for the layman.

PERSPECTIVE SIMPLIFIED

THE author of this book is the teacher of industrial drawing at the Peabody High School, Pittsburg, Pa., and formerly principal of the Hackley Manual Training School, Muskegon, Mich.

His method is based upon the unit cube. This unit is one of the three dimensions of the object, usually the vertical dimension. " The little child playing with his cubical blocks, before he has language to express the idea, knows intuitively when he places the second cube against the first that his structure has become twice as long; likewise, the young student, when he adds the second unit cube to the first, knows that he has represented perspectively a distance twice as great as the first."

This unit cube is the true perspective of a cube drawn under actual conditions, and by its use the learner gets the distances and the proportions of the drawing, without the necessity of at once committing to memory the several definitions involved in the general method of perspective.

The author believes that after diligent use of the unit cube the learner will have acquired the " perspective sense," and thus be able to sketch truthfully without the necessity of this aid.

CHEMISTS' SHOP AT NEWCASTLE-ON-TYNE

DESIGNED BY PERCY BARTLETT

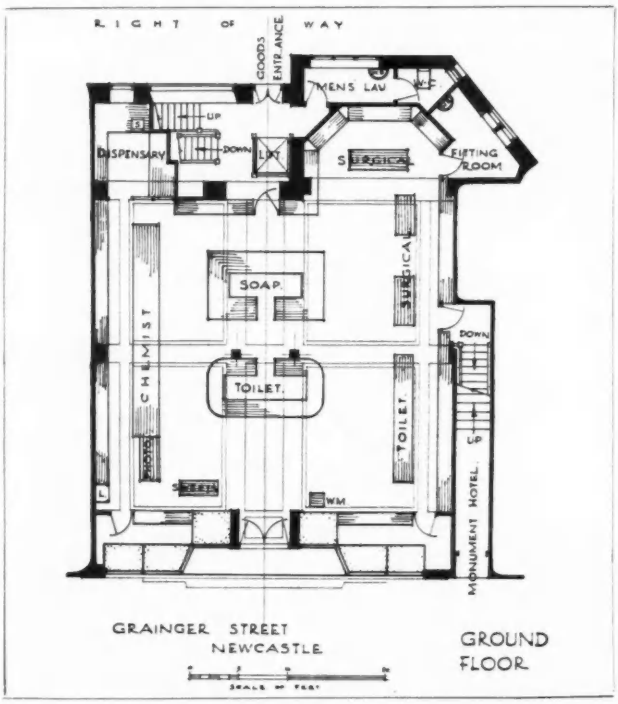
The shop as it appears in daylight. The surround is of German travertine, framing a fascia of glass, with doors and window frames of stainless steel.

THESE premises have recently been modernized for Messrs. Boots, the chemists, and particular consideration was given to the effect of the design of the shopfront after daylight hours, as it is one of those branches of the firm which are never closed, the chemist's and dispensing departments being kept open day and night.

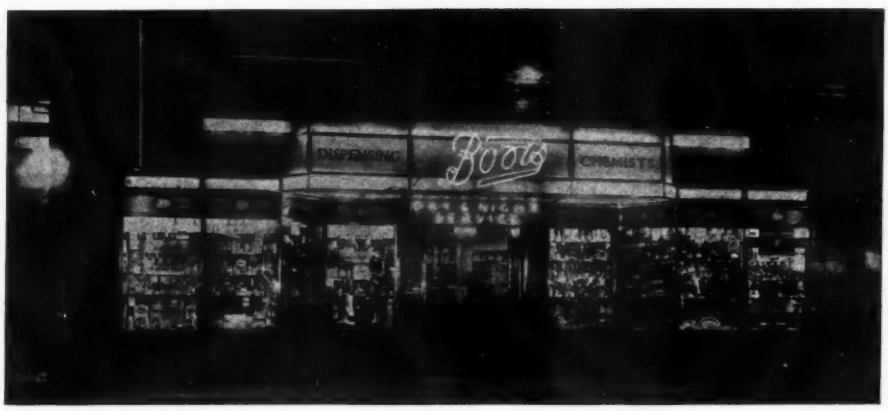
The exterior of the shopfront, the doors, etc., are constructed of stainless steel, which is calculated to catch and reflect every light that plays upon it; the surround is formed of German travertine, and includes a housing for the blind, which is operated by winding gear from the inside.

The fascia is of glass, bearing medallions of the proprietary name, which is also given prominence, together with the words "Day and Night Service" outlined in the familiar bright red of neon signs.

The interior of the shop is carried out in Tasmanian oak, with zebrano veneer enrichments, and the lighting is by means of specially designed "V"-section lighting fittings arranged in groups in the ceiling. The floor is laid with rubber composition flooring.



The ground plan, showing the arrangement of the counters allocated to the various departments. In view of the lack of daylight windows, special light fittings are incorporated in the shop ceiling.



The shop front by night. As this branch is kept open always, special consideration was given, in designing it, to its appearance under conditions of night lighting.

THE SPECIFICATION WRITER

Double "Silence" Window Glazing

BY C. W. GLOVER

THE use of double windows for silencing street noises is quite effective provided the windows are not opened, as it is essential in sound insulation to render the construction reasonably air-tight. Furthermore, in order to prevent direct transmission of noise through the diaphragm-like vibration of the windows, it will be necessary to ensure very rigid construction and to use small panes of comparatively heavy glass.

To prevent the sympathetic vibration of the inner and outer glazing, the outer glass should be heavier than that used in the window on the inside.

Street noises are invariably brought down into the room by reflection from the ceiling, and if a highly-absorbent acoustic material is applied thereto, the noise will be considerably reduced. Opening the window for ventilation may increase the sound by as much as 50 per cent., and a silencer as shown in figure one may be used with advantage.

The noise entering from the street suffers inter-reflection between the absorbent baffles, and is enfeebled by absorption, with the result that the entering sound is reduced by some 80 per cent. The objection to such a silencer is that it is unsightly, dust-collecting and obstructive of light where this is most effective. On the other hand, these silencers have the advantage of portability and are comparatively cheap.

For use in bedrooms at night the sound-proof ventilating window masks shown in figure two are very effective, inasmuch as they permit of continuous ventilation without admitting noise. The air, in passing through the vents, is made to take a tortuous route through sound-absorbing baffles, and a silencing effect is therefore produced.

Figure three (page 650) shows an arrangement of continuous sound-proof windows which are double glazed and fixed, the ventilation being provided through silencers situated between window cill level and the ceiling. The advantages of this form of window are :

1 : Rigid construction, which minimizes diaphragm vibrations.

2 : The provision of double glazing of different weights.

3 : The provision of the maximum glass area.

4. The admission of light near the ceiling, where it is most effective.

5 : The extraction of vitiated air at ceiling level.

6 : The admission of fresh air through

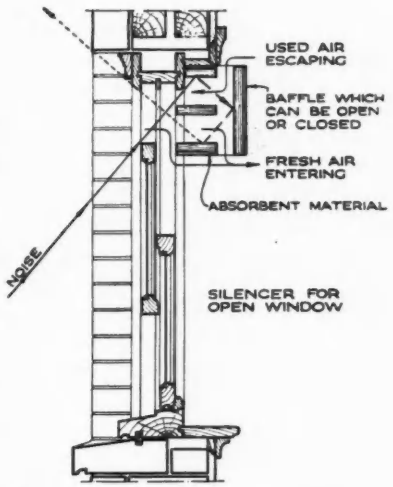


Figure one. Type of silencer for use with open window.

a silent ventilator under the window board behind the radiator.

Figure four (page 651) shows alternative elevation treatments : A is a vertical treatment with fluted continuous windows; B, a horizontal treatment with flat windows, in other respects similar in detail to those shown in figure three.

In each case, of course, the louvres can be of the interlocking snowdrift-preventing type, and can be of metal.

Practical Methods of Waterproofing Basements

BY THEODORE CRANE

(The first portion of this article appeared in the issue for October 28)

MEMBRANE WATERPROOFERS

THE membrane system has been very widely used for many years, and is still a popular choice where high hydrostatic heads are encountered and it is feasible to gain access to the outside of the wall to be waterproofed. There are many cases where this method has been used as an interior application, but the excessive cost of providing a proper seal without puncturing the membrane has resulted in favour of the mortar-coat application where work is to be done from inside.

As in the case of any waterproofing surface, complete continuity is essential; this requirement often results in complicated problems where the membrane must be carried either beneath column bases or up the sides of interior column shafts. Before applying the first layers of felt, jute or cotton drill, which materials are usually used for this purpose, the concrete surfaces are carefully pointed, removing any projection or fins. Various methods are employed for laying the membrane and the number of plies is designed to meet conditions. Of the three kinds of membrane mentioned above, a treated felt is usually the cheapest, but has less elasticity than the other materials. Both the cotton drill and the jute are specially prepared by being saturated with a bituminous mixture, generally used with a very elastic binder, and often being laid in small squares of about 9 sq. ft. and lapped a minimum of about 2 ins. on each side. Most jobs require from three to six plies.

Each layer of felt or other material is pressed into the binder as it is placed; when laid in strips, each ply is lapped 4 ins., with a total minimum lap of 12 ins., irrespective of the number of plies. A mesh joint is generally made at the line between a wall and a floor or between new and old work. The mastic should not only be plastic and stable at all normal temperatures, but should also possess elasticity and be both adhesive and cohesive. Particular care is necessary where pipes pass through

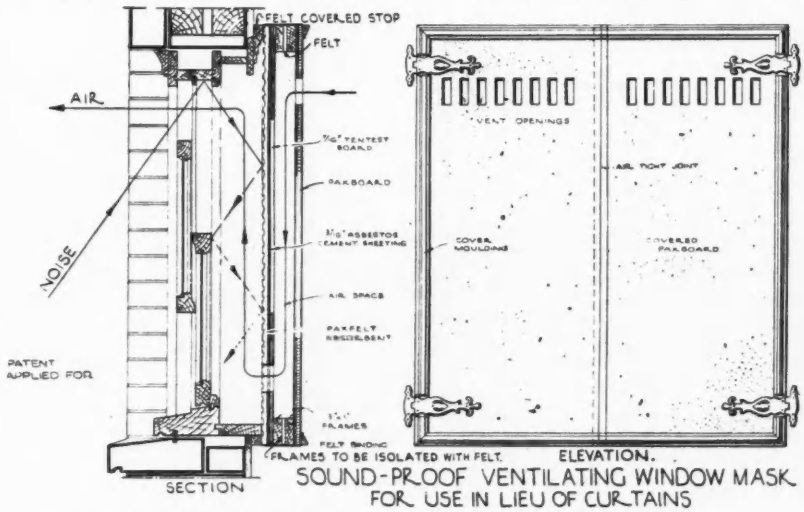

Figure two. Details of sound-proof ventilating window masks.

the membrane, copper or lead flanges being used, extending a distance of 12 ins. into the waterproofing. Where steam pipes pass through a waterproofed wall, a special detail is necessary to provide for heat radiation in order that the pitch or asphalt will not melt.

One of the most widely-used methods of waterproofing concrete surfaces is the application of pulverized iron which, in the form of a powder, is chemically treated to expedite its oxidation. Mixed with Portland cement to a creamy consistency, it is applied by hand brushes. This system is employed for waterproofing the inside faces of foundation walls, swimming pools, and similar structures. The material is usually applied in thin coats worked thoroughly into the surface; from three to five applications are customary, allowing sufficient time between each coat for fairly complete oxidation. A sand-finished appearance may be obtained after the completion of the waterproofing coats by mixing sand with the pulverized iron and Portland cement for the final application. As the efficiency of this method depends upon the completeness with which the iron oxidizes, and the curing of the cement, it is essential that each coat be kept moist until thoroughly hardened. On floors, the finished wearing surface is placed over the waterproofing which, however, needs no protection on side walls, columns or piers.

The same care should be exercised in preparing concrete surfaces to be treated by the iron method as in the case of the cement-mortar coat applications: rock pockets or voids should be filled with mortar, tie wires, or spreaders cut back 1 in. from the surface, laitance removed, and all surfaces thoroughly cleaned twenty-four hours before the start of the operation.

INTEGRAL WATERPROOFING COMPOUNDS

Certain integral waterproofing compounds increase the workability of concrete, thereby assisting toward making the work water-resistant. Some compounds also shorten the time required for hydration. Others, such as the stearates, are of distinct value in lowering the absorption of concrete, stuccoes, or mortar applications. The effect of properly chosen integral waterproofing compounds is to retain the uniformity of the mixed concrete during the process of transportation and deposition, thereby lessening the tendency toward segregation of aggregates or the formation of laitance. Porous concrete, as too often constructed on the average job, readily absorbs water. By capillary action moisture will often rise in a concrete wall considerably above the water level to which it is subjected. In order to overcome this condition the first problem is to obtain as dense a concrete as possible, which not only means a properly graded aggregate and an adequate cement content, but also a strict limitation upon the amount of water used in the mixture.

Reference to any of the well-known charts showing the relationship between the strength of concrete and its water content will indicate that less than one-half of the amount of water used to gain the consistency required on the average job is used by the cement in the process of hydration. The remaining water serves as a lubricant in making the concrete workable and later evaporates, leaving what are generally termed "water voids." Whether we are seeking strength, durability, or

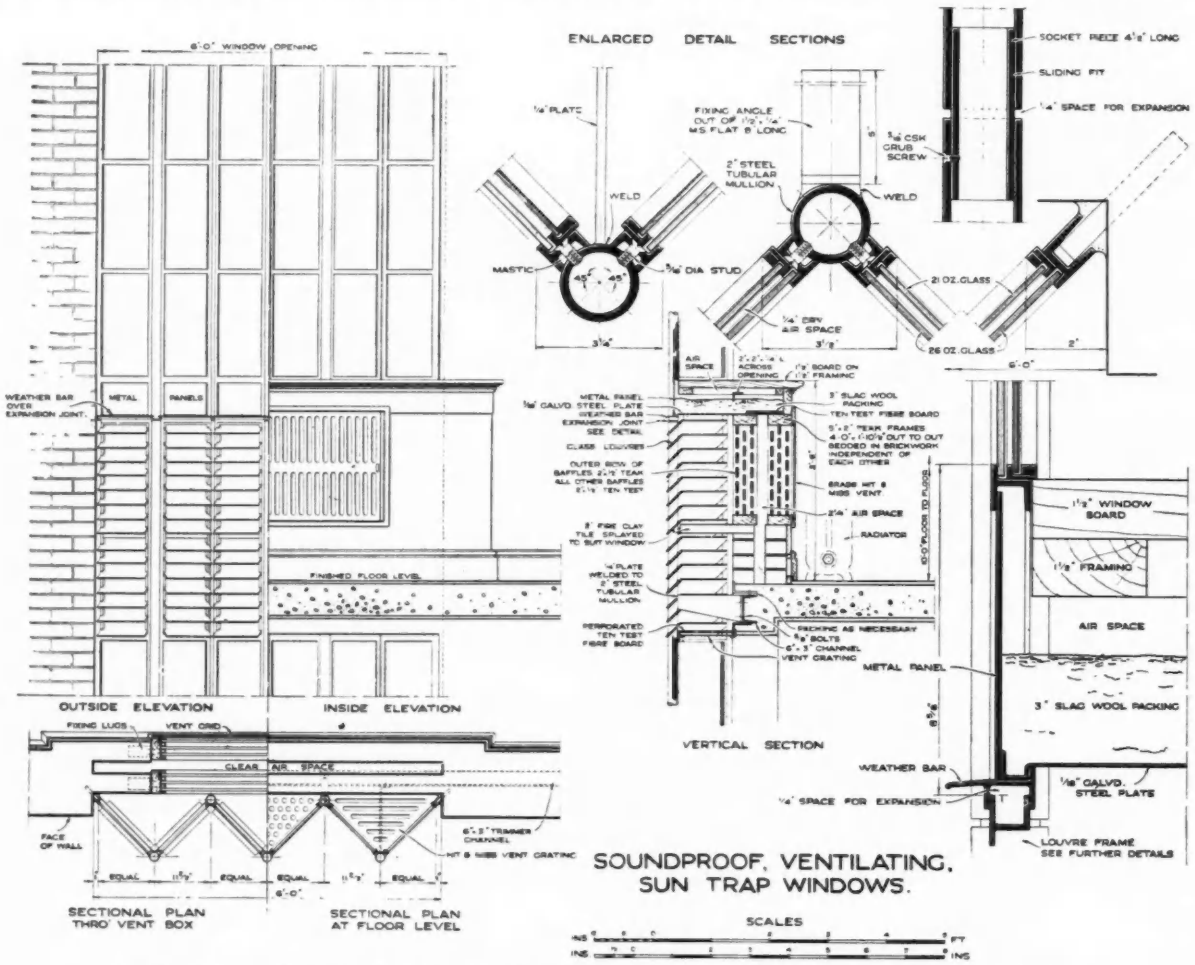

Figure three. Continuous sound-proof windows, double glazed and fixed, ventilated through silencers.

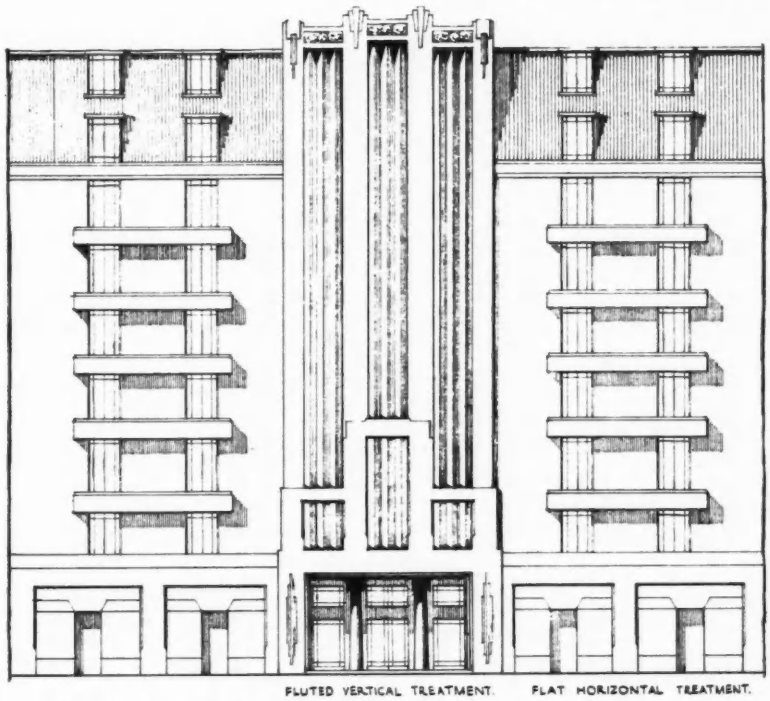

Figure four. Alternative vertical and horizontal treatments of continuous sound-proof windows.

imperviousness to hydrostatic head or the destructive influences of climatic changes, the first requisite is to reduce as far as may be possible, under any specified job conditions, the sum of the air and water voids in the concrete.

As it is necessary to accept an excess of water in order that the plastic mass may be placeable, there appears to be a real function for certain waterproofing compounds which tend to destroy the capillarity of the hardened concrete; in other words, to render the minute pores of the mass less capable of absorbing water through capillary action. For this purpose both the ammonia and calcium stearates are used. In the liquid state such chemicals are held in suspension in the mixing water; when used as a powder they are mixed dry with the cement.

One of the most successful methods of waterproofing is a combination of the cement-mortar coat with the iron process. The latter, when used alone, is applied upon a smooth concrete wall without the necessity of chipping, and is largely dependent upon the character of the concrete beneath or the care with which repointing is done. The writer has found it absolutely ineffective against moderate pressure when applied over structural walls composed of honeycombed concrete. Where the two methods are used together the surfaces are thoroughly chipped, carefully cutting out and repointing all defective concrete, tie wires, spreaders, laitance, or other imperfections. The repointing is done with a mixture of iron, sand and cement, and the surfaces coated with this same mixture immediately prior to the application of the first plaster coat.

Whatever method of waterproofing may be chosen it is essential that the work be done by experts, as success is dependent upon knowledge of the workmen, their care and thoroughness. Generally speaking, the membrane method is of particular application where the structure is subjected to vibration or volumetric changes due to fluctuating temperature. On building foundations the cement-mortar coat, applied on the interior, will be equally effective, much less costly, and more easy to repair in case of local failure. The iron method is of general application where water pressures are not excessive, and can be used to advantage in more difficult situations as a valuable adjunct to the plaster-coat applications. Integral waterproofing compounds are of value in lowering the permeability of poor concrete, but are less effective when used with rich mixtures. As plasticizing agents certain types are of value in increasing workability and act as a form of insurance for obtaining a better quality of work.

[The foregoing article is reprinted from *The Contract Record and Engineering Review*, Toronto, Canada.]

THAT coal cooking apparatus is falling out of use in America and is now only used for country places and for central stoves in hotels and restaurants where French chefs are employed, is the conclusion of Mr. Stanley J. Benham, in a paper read before the Institution of Heating and Ventilating Engineers. On the other hand, there has been an undoubted advance in the use of oil fuel for cooking. Gas-cooking apparatus is a different thing altogether from what it was ten years ago, and almost all large kitchens are partly or wholly so equipped. The average cost of the coal range in fuel, in an English hotel, was £36 10s. per quarter, whilst the average cost of the gas worked out at £37 18s. per quarter. On the other hand, the saving in labour has considerably outbalanced this difference, and there are great advantages in the absence of dirt and saving in coal storage. In America, the great feature in most kitchens is the use of bright Monel metal for all sorts of purposes.

QUESTIONS THAT ARISE

Horizontal Sundials

R. S. W. writes : "*Could you inform me what variation there would be in the setting out of a horizontal sundial for use in Belfast? Would the variation be too great to justify a standard sundial presumably based on Greenwich?*"

The expression "standard sundial" is not understood. For ornamental purposes, at times not more than two or three hours from noon, a dial graduated for the latitude of Greenwich might be regarded as satisfactory, though it would read, of course, local time at Belfast (not Greenwich time). But if the indications of the sundial are to be regarded as anything more than of the roughest, the stylus must be set to point accurately to the celestial pole, and the graduations of the dial (which depend partly on the elevation of the celestial pole as well) must be calculated for the latitude of the place at which the dial is to be erected (Belfast: 54° 35′ N.).

Your correspondent should be referred to the article "Dial and Dialling" in the *Encyclopædia Britannica*.

D. J. R. EDNEY (SECRETARY, ROYAL OBSERVATORY, GREENWICH)

Sound Deadening

C. and S. write : "*We have a client who proposes to use dried seaweed for sound deadening. We fancy we have read in* THE ARCHITECTS' JOURNAL *of the use of this. Is it at the B.B.C.? Can you kindly enlighten us?*"

Eel grass in the form of a quilt or blanket is frequently used both as a sound insulator in walls, floors and ceiling, and also as a sound absorbent on walls and ceiling for the reduction of reverberation. It has been used in hundreds of buildings in London. B.

Horace Trumbauer, C. C. Zantzinger, and C. L. Borie, Junior, architects.]
A night view of the Philadelphia Museum of Art. The architects have aimed at restoring to classic architecture its original brilliant colouring. The roof of the above building is of turquoise tiles; and the pediment groups, of polychrome faience, are being worked out with the greatest care.

FAIENCE IN ARCHITECTURE

THE five examples of the uses of faience for modern buildings illustrated on this page are reproduced from an article by Mr. Christopher Hussey, in the current issue of *The Architectural Review*, entitled "The Æsthetics of Faience Architecture." Mr. Hussey points out that faience "enables pure and permanent colour to be introduced into architecture for the first time in modern history. For any kind of repetitive work, whether plain or decorated, it is the proper and most economical material. It is about two-thirds cheaper than any masonry that can approach it in durability. And of all building materials it is the most pliable.

SOCIETIES AND INSTITUTIONS

R.I.B.A. COUNCIL MEETING

FOLLOWING are some notes from a recent meeting of the R.I.B.A. Council :

R.I.B.A. Statutory Examination for the Office of District Surveyor in London, October, 1931 : The Board of Architectural Education reported that four candidates had sat for the Examination and on the recommendation of the Board the following two candidates were passed : Messrs. Robert Rodolph Sorrell Dean and Walter Albert Scott.

R.I.B.A. Examination for the Office of Building Surveyor under Local Authorities, October, 1931 : On the recommendation of the Board, the following candidate who sat for the examination was passed : Mr. Norman Smith.

Amendments to the R.I.B.A. Regulations for the Conduct of Architectural Competitions : The amendments to the R.I.B.A. Competition Regulations, which were provisionally approved by the Council on July 6, were duly ratified.

Revision of R.I.B.A. Bylaws : (A) It was officially reported to the Council that the Privy Council had approved the amendment to the Licentiateship Declaration which had been adopted at the general meetings on June 1 and June 15.

(B) It was agreed to take the necessary steps to amend the Forms of Declaration to be signed by members on their election by the omission of the words " in consideration of my having been elected."

Group Pension Scheme for Architects : The group pension scheme for architects, prepared by the Insurance Committee of the Architects' Benevolent Society, was approved, and the Council agreed to accept the trusteeship of the scheme.

Committee on Regulations for Reinforced Concrete : The President reported that as a matter of urgency he had nominated Mr. Maxwell Ayrton, F.R.I.B.A., and Mr. A. Alban H. Scott, F.R.I.B.A., to represent the R.I.B.A. on the Committee set up by the Building Research Board of the Department of Scientific and Industrial Research on the use of reinforced concrete in building. The President's action was approved.

Proposed Panel of Consultants on Building Materials : The President reported that he had accepted the invitation of the Advisory Council of the Department of Scientific and Industrial Research to serve on a Committee appointed to advise on the selection of consultants on building materials. The President's action was approved.

Membership of the Council : The Council accepted with regret the resignation from membership of the Council, due to ill-health, of Mr. E. T. Johns, representative of the East Anglian Society of Architects, and directed that a letter of sympathy be sent to Mr. Johns.

The Fellowship : The Council, by a unanimous vote, elected the following architects to the Fellowship under the powers defined in the Supplemental Charter of 1925 : Messrs. John F. Matthew, L.R.I.B.A. (Edinburgh); J. Alistair Ross, L.R.I.B.A. (Inverness).

Reinstatement : The following ex-members were reinstated : As Licentiates : Messrs. Walter W. Bull and John G. D. Hoets.

Transfer to Associateship : The following architect was transferred to the Associateship under the provisions of the Supplemental Charter of 1925 : Leslie M. Evans.

Transfer to the Retired Members Class : The following members were transferred to the Retired Members Class : As Retired Fellow : Walter Dewes (F. 1925). As Retired Associate : Henry T. Fowler (A. 1904). As Retired Licentiate : Henry S. Benison (L. 1911).

Election of Students : The following Probationers were elected as Students of the R.I.B.A. :

MR. WORTHINGTON'S PRESIDENTIAL ADDRESS

In the course of his presidential address to the Manchester Society of Architects, held on November 4, Mr. J. Hubert Worthington, F.R.I.B.A., said there was, at this time, a danger that panic measures might have a very serious effect on the building trade. It was natural and inevitable that many building schemes would be held up, at any rate for this winter, but in any scheme for national regeneration the building trade must have consideration. The Ministry of Labour stated that on September 21, 174,000 insured building trade operatives were out of work. Many of these were highly skilled tradesmen, and even these were only a proportion of those allied workers in the making of materials for building who were in the same condition. One must add to this architectural draughtsmen of skill and training. Of forty students passing out of the Architectural Association School in London last session only two had got jobs in offices.

A vigorous appeal for a sane view in the matter should be made to all possible building owners, above all to public authorities and those who controlled housing, education, and public health. No industry should be allowed to stand still. If so, the whole nation would suffer.

HANTS AND ISLE OF WIGHT ARCHITECTS

The first general meeting of the 1931–32 session of the Hampshire and Isle of Wight Architectural Association was held at Winchester, on October 16.

After the general business had been dealt with, Mr. Ingalton Sanders, F.R.I.B.A., in his presidential address, said he had been asked to make a few remarks about the trend of modern architecture. Much in modern architecture bore the stamp of revolution, harsh, unbending, sternly utilitarian, divorced from all tradition. But might we not welcome it; might we not see in it architecture in the pangs of travail in the birth of a new style which should evolve from the crude forms we now saw?

He thought the thing we had to fear was that spirit which some people displayed when they mistook rudeness and abuse for strength of character, or that type of architecture which claimed to be a work of genius because it was *outré* or an outrage to artistic taste. Someone had written—he believed it was Carlyle—that genius was the art of taking infinite pains, and in modern work one could call to mind many

[Richardson and Gill, architects. Bury Court House, St. Mary Axe, London.
[Sloane and Robertson, architects. Chanin Building, New York, showing ornamental hand course.
W. A. Johnson, architect.] The Sheffield and Ecclesall Co-operative Society's Stores.

instances where such genius was apparent. He knew no better instance than the noble work of Sir Giles Gilbert Scott in Liverpool Cathedral. It was not, like many buildings, an inspiration of last night, transferred to paper this morning and erected in six months.

That building, which was only half completed, had been in progress for some thirty years, and a lifetime's work had been consecrated to its structure. If we had enjoyed the privilege of studying it, we would be struck by the evolution in the mind of the architect. The early part of the work (he referred, of course, to the Lady Chapel) was itself a beautiful structure, but it was essentially traditional, and in that respect differed from the main structure. It was in the latter work that his true genius appeared in a building essentially modern in its style. Not modernity in the crude form in which we sometimes saw it—bald, naked, ruthlessly divorced from all that was gentle (merely because that happened to be traditional)—but modernity, clothed, majestic, beautiful.

He believed that in such buildings as that lay the true destiny of modern architecture.

Mr. J. Arthur Smith, F.R.I.B.A. (past-president), proposing a vote of thanks to Mr. Sanders, said they all had their views on modern architecture; he agreed to a very large extent with what the President said, though he was certain many would differ on various points.

Mr. T. D. Atkinson, F.R.I.B.A., seconded the vote of thanks, and among the other speakers were Messrs. A. J. Sharp, J. Harrison, H. S. Sawyer, and A. L. Roberts.

ARCHITECT AND ENGINEER

Professor Patrick Abercrombie, F.R.I.B.A., in his presidential address to the Liverpool Architectural Society, on October 28, asked: Was there an alternative to the mechanical mixture or chemical compound of architect and engineer? A Spanish writer, Tuduri, propounded one which the lecturer suggested was worth careful consideration, namely, a separation into two camps of architecture: the liberal, imaginative art of harmony and stability and the mechanical art of building based on necessity and utility. For the latter art he had invented the name "actar."

Tuduri's argument was that at present architects and actarians were stultifying and destroying each other's art by producing hybrid forms—the architect straining towards mechanical movement and the actarian still hampered by vague architectural ideals. The error of the age, in Tuduri's opinion, was the mixture of architecture and mechanism, the union of proportion with essential mechanical form.

There were, suggested Professor Abercrombie, definite advantages in making this distinction. He thought it would enable us to take a broader view and avoid a battle between the architect and the engineer, each of whom had a distinct sphere. They must, however, zone for architectural and actarian building. Much that was now done as a sort of shamefaced architecture would be much better in every way as simple actar—a great deal of housing, for example. Let them go in wholly for the elementary solution, but keep the results segregated in zones.

Under this system we should lose much of our confusion of thought, and there would be a regrouping of the camps, some who now called themselves architects finding a more congenial atmosphere among the designers of aeroplanes and motor-cars.

CHANGING ENGLAND

The public which has enjoyed, week by week, Mr. Hanslip Fletcher's impressions of many and various buildings, ancient and modern, on a page of newsprint, is probably content to view those sketches as of a transient value. But such sketches are of inestimable worth as a record, not simply of what some part of London or some other spot *was* in such and such a year, but of what it *looked like*, and what it *felt like*. The impression received by the camera, or even by the eye, of the etcher or painter who is primarily a building-portraitist, does not produce quite the same sort of record as Mr. Fletcher's sketches. Some of these were recently shown on a series of lantern slides when he gave a talk at University College, Gower Street, on the subject of "Changing London."

The lecture in the main may have suffered somewhat from being nominally addressed to students of the School of Librarianship; but it gained thereby in the fact that several charming sketches of Oxford and Cambridge college library interiors were included in the series on the screen. An otherwise equally irrelevant reference was made to the importance of the "architecture" of books themselves—their binding and protective covering requiring sound foundation and construction and good materials, as well as presenting opportunities for beauty of external design.

Another reference, more applicable to changing England as a whole than to London in particular, concerned the advantages of the present-day multiplicity and efficiency of public libraries; and a timely word of commendation was given for the use of fine old buildings, otherwise threatened with decay or demolition, for the housing of public collections of books, as in the case of Panshanger and Old Charlton. Such utilization of our unemployed mansions is, of course, both a double economy and a double benefit, and the buildings provide an atmosphere of quiet dignity and peace—a valuable adjunct to study not seldom absent from our super-efficient up-to-date warehouses of information.

C.

ARCHITECTS' AND SURVEYORS' VISIT TO TILBURY DOCKS

A combined visit to Tilbury Docks, arranged between the West Essex Chapter, Essex, Cambridge and Herts Society of Architects, and the Rural Essex Sub-Area Branch of the Chartered Surveyors' Institute, took place on October 29.

About seventy members and guests of the two societies met at Tilbury Station at midday, and were greatly interested in the new station, embankment and ferry approach of the L.M. and S. Railway.

The party was officially received by Mr. B. E. Daniel, Superintendent of the Docks, who conducted the party over the new Baggage Hall, designed by Sir Edwin Cooper, A.R.A., and the landing stage.

An adjournment for luncheon was made to the Tilbury Hotel, owned by the Port of London Authority. The chair was taken by Mr. A. S. Belcham, F.S.I., supported by Mr. T. P. Pratt, F.S.I., representing the survevors, Mr. T. H. B. Scott, F.R.I.B.A., Chairman of the West Essex Chapter, and Mr. S. Phillips Dales, F.R.I.B.A., President of the Essex, Cambridge and Herts Society of Architects.

A vote of thanks was enthusiastically given to Mr. B. E. Daniel for all he had done in making the visit a success, and he was asked to convey the appreciation of the company to the Port of London Authority for their kind invitation. Mr. Daniel replied.

After the luncheon, a tour was made of the docks generally, and especially the new dry dock, under the guidance of Captain Course, the assistant dock-master, who described the work of the docks, the technicalities, and the enormous amount of goods and other traffic dealt with.

Captain Course, after this; conducted the party over the s.s. *Cathay*, and again showed himself a very competent guide in describing the very intricate working of the vessel. The party broke up about 5 o'clock.

The arrangements and organization of the visit were made by the hon. secretaries of the two societies, Mr. W. M. Balch, P.A.S.I., for the surveyors, and Mr. Arthur C. Russell, L.R.I.B.A., for the architects, aided by Mr. S. A. Hill-Willis, Surveyor to the Tilbury Council.

MODERNISM

Mr. C. A. Harrington, the president of the Architectural Association of Ireland, lecturing at the opening meeting on "This Modernism," said there was no doubt that the use of reinforced concrete had largely influenced the development of the modern style of architecture. Cost was the dominating factor, and the necessity of providing inexpensive and hygienic buildings was an additional problem the architects had to face.

In Germany, Austria and France, churches had been built so far removed from general principles that it was almost difficult to visualize their sacred purpose. The new Catholic church at Prague had all the appearance of the entrance to a factory. In Cork, a church had been built to the designs of an American architect, which was so far apart from anything yet attempted in Ireland as almost to take the breath away.

No matter how the modern movement in architecture might progress, there were architects of the old school who held that it was only a passing phase. Little had been done as yet in Ireland towards the advancement of the new architecture.

THE GOTHIC REVIVAL

At a meeting of the Hull College of Art and Crafts, Mr. G. Dudley Harbron, F.R.I.B.A., lecturing on "The Early Days of the Gothic Revival," stated that Gothic was deemed to be typically British, and the genuine later periods to represent the date when architecture had declined under foreign influences. It was patriotic, and it promised a return to the condition of a "Merry England." It was scientific in that its graces arose from construction. A Frenchman, Augustus Pugin, saw the need for accurate drawings of genuine Gothic architecture, and gave the movement its first antiquarian trend. His son, Wilby Pugin, spent his life in furthering the revival by his writing and through his works. Wilby Pugin abandoned the reference to the last Gothic as examplar and selected that which he deemed the best. He died at forty, after a life of unparalleled exertion for Christian art. With his death in 1851, the early history of the revival closed.

At the close of the lecture, Mr. Allanson Hick proposed a vote of thanks to Mr. Harbron. Amongst those present were the following:

The Principal, Mr. E. Sallis Benney, A.R.C., Mr. F. J. Horth, F.R.I.B.A. (who presided), Mrs. Dudley Harbron, Mr. and Mrs. Allanson Hick, Mr. A. O. V. Pearson, Mr. Harold Horth, A.R.I.B.A., and Miss Verdier.

I.H.V.E. EXAMINATIONS

Examinations for admission as graduates and associate members of the Institution of Heating and Ventilating Engineers are held at suitable centres in January, May and September each year. Intending candidates should apply to Mr. H. B. Watt, Secretary, 12 Russell Square, London, W.C.1.

PUBLIC WORKS EXHIBITION

The Public Works, Roads and Transport Congress Exhibition is to be held at the Royal Agricultural Hall from November 16 to 21, 1931.

COMPETITIONS OPEN

November 23.—Sending-in day. New Junior and Infants' School, Farnborough Road, Birkdale, for the Southport Corporation. Limited to architects practising or residing in the County of Lancashire. Assessor: Francis Jones, F.R.I.B.A. Premiums: £100, £75 and £50. Conditions were obtainable from the Director of Education, 1 Eastbank Street, Southport. (Deposit £1 1s.)

November 24.—Sending-in day. New School on a site at the corner of Hill Lane and Bellemoor Road, Southampton, for the Governors of the Girls' Grammar School. Assessor: Sydney Tatchell, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions were obtainable from F. L. Freeman, M.A., Secretary to the Education Committee, St. Mary's Road, Southampton. (Deposit £1 1s.)

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius of Liverpool Town Hall. Assessor: A. H. Moberly, F.R.I.B.A. Premiums: £200, £100, and £50. Conditions, etc., obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

December 31.—Sending-in day. Latest date for conditions: September 31. Proposed New Town Hall and Municipal Building, for the Walthamstow Corporation. Assessor: H. Austen Hall, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Conditions, etc., obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

January 1, 1932.—Sending-in day. Proposed Church at Low Shiregreen, Sheffield, in connection with the Bishop of Sheffield's 100,000 guineas appeal (limited to architects with an office in the Sheffield Diocese). Assessor: C. C. Thompson, F.R.I.B.A. Full particulars obtainable from the Hon. Secretary, Sheffield South Yorkshire and District Society of Architects and Surveyors, 15 St. James' Row, Sheffield.

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. (Deposit £1 1s.)

ANNOUNCEMENT

The Rudolf Mosse Buchverlag (Jerusalemstrasse 46, Berlin, S.W.19) will shortly publish the latest work of the well-known architect, Erich Mendelsohn, *Neues Haus: Neue Welt* (*The New House: The New World*), in which will be shown, from an erected example of a country house, the radical changes in the habits and living accommodation of modern people. This outstanding subject is considered in all its characteristics, from general arrangements down to technical details.

THE ARCHITECTS' DIARY

WEDNESDAY, NOVEMBER 11

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Exhibition of members' holiday sketches and photographs.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Palaces and Churches of Venice." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "The Planning and Lettering of Public Notices and Signs." By George Mansell. Chairman: The Mayor of Westminster. **8 p.m.**

LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. "Hereford Bridges." By G. H. Jack, F.R.I.B.A. **6 p.m.**

THURSDAY, NOVEMBER 12

SCIENCE MUSEUM, (Lecture Theatre), South Kensington, S.W. 7. "Sheet and Plate Glass." By R. S. Taylor. **4.45 p.m.**

GEFFRYE MUSEUM, Kingsland Road, Shoreditch, E.2. "Ancient Coffers and Cupboards." By Fred Roe, R.I. **7.30 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Hardwoods." By Alexander Howard. **7.30 p.m.**

THANET SCHOOL OF ART LECTURES ON ARCHITECTURE. At Chatham House School, Ramsgate. "Early Christian Architecture." By R. Goulburn Lovell, A.R.I.B.A. **7.45 p.m.**

FRIDAY, NOVEMBER 13

HASTINGS MUNICIPAL SCHOOL OF ART LECTURES ON ARCHITECTURE. "The Early Christian Architecture." By R. Goulburn Lovell, A.R.I.B.A. **7.30 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS. Midland Counties Branch. At the Birmingham Chamber of Commerce, 95 New Street, Birmingham. "The Design of Column Bases in Single-Story Buildings." By G. J. Voce. **7 p.m.**

SATURDAY, NOVEMBER 14

Sunrise, 7.13 a.m. Sunset, 4.15 p.m.

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS. London and Home Counties Branch. Visit (afternoon) to the Grand Priory in the British Realm of the Hospital of St. John of Jerusalem, Clerkenwell.

MONDAY, NOVEMBER 16

R.I.B.A., 9 Conduit Street, W.1. "Modern European Architecture." By H. S. Goodhart-Rendel, F.R.I.B.A. **8 p.m.**

TUESDAY, NOVEMBER 17

LONDON HAMPSHIRE SOCIETY. At the R.I.B.A., 9 Conduit Street, W.1. "Abbeys and Monasteries of Hampshire." By Arthur J. Mason. **8 p.m.**

WEDNESDAY, NOVEMBER 18

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Later Renaissance in Italy." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "The R.S.A. Competition of Industrial Designs, 1931." By P. H. Jowett, A.R.C.A. Chairman: Arthur J. Davis, F.R.I.B.A. **8 p.m.**

LONDON SOCIETY. Visit to the Pre-Fire Church of St. Andrew Undershaft, corner of Leadenhall Street and St. Mary Axe, E.C.3. **2.30 p.m.**

THURSDAY, NOVEMBER 19

THANET SCHOOL OF ART LECTURES ON ARCHITECTURE. At Chatham House School, Ramsgate. "Evolution of Gothic." By R. Goulburn Lovell, A.R.I.B.A. **7.45 p.m.**

SOCIETY OF ANTIQUARIES, Burlington House, W.1. "The Temple Tomb of the House of Minos and the Private Chapel of its High Priests." By Sir Arthur Evans. **8 p.m.**

GEFFRYE MUSEUM, Kingsland Road, Shoreditch, E.2. "Decoration the Background for Furniture." By C. A. Hindley. **7.30 p.m.**

FRIDAY, NOVEMBER 20

INCORPORATED INSTITUTE OF BRITISH DECORATORS. At the School of Art, Aberdeen. "Lettering and Scriptwriting." By Principal Fraser.

TOWN PLANNING INSTITUTE. At Caxton Hall, Caxton Street, Westminster, S.W.1. Presidential address by Dr. R. C. Maxwell, O.B.E. **6 p.m.**

LONDON SOCIETY. At the Royal Society of Arts, John Street, Adelphi, W.C.2. Discussion on "New Houses for Old." The new all-British Housing Film will also be shown and described by Miss A. M. Lipton and Miss K. England. Chairman: The Rt. Hon. Lord Balfour of Burleigh. **5 p.m.**

HASTINGS MUNICIPAL SCHOOL OF ART LECTURES ON ARCHITECTURE. "Evolution of Gothic." By R. Goulburn Lovell, A.R.I.B.A. **7.30 p.m.**

SATURDAY, NOVEMBER 21

Sunrise 7.26 a.m. Sunset 4.5 p.m.

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Fourth of five non-technical lectures on Present-Day Architecture. "Places for Recreations." By J. Murray Easton, F.R.I.B.A. **3 p.m.**

LONDON SOCIETY. Visit to Fulham Palace. **2.30 p.m.**

MONDAY, NOVEMBER 23

LONDON SOCIETY. Visit to the works of Chappell & Co., Ltd., 19 Ferdinand Street, Chalk Farm Road, N.W.1. **2.30 p.m.**

LAW REPORT

Application by Mrs. A. E. H. Menke re Law of Property Act—Chancery Division. Before Mr. Justice Maugham

THIS application by Mrs. Menke, the owner of certain freehold premises and land known as Sunnyfield, West Heath Road, Hampstead, raised a very interesting point of law under section 84 of the Law of Property Act, 1925.

Mr. Gavin Simonds, K.C., for Mrs. Menke, explained that under subsection 2 of section 84 of the Act, the Court had power to declare on the application of any person interested, whether or not in any particular case any freehold land was affected by restrictions imposed by any instrument, the nature and extent of the restrictions, and whether the same were enforceable and by whom.

In the present case his client was seeking a declaration that no part of her property, Sunnyfield, was now affected or bound by any of the restrictions imposed by a conveyance of the Ecclesiastical Commissioners of April, 1873, which she held.

Here, a large part of the property came under the restrictions, with the result that the premises were prevented from being used otherwise than as a private residence. His client had been unable to find a purchaser for the property as a private dwelling house, owing to its size and cost of upkeep, and the restrictions.

Mr. Waite, for the Ecclesiastical Commissioners, said they no longer claimed that the covenants were enforceable.

Mr. Simonds said there was no opposition to the application.

With regard to the point as to whether there had ever been a building scheme, counsel said he was in a position to satisfy the Court that there never had been any such scheme affecting this property which entitled anybody to enforce the covenants. Neither could anyone be discovered who could say that they had an interest in enforcing the covenants.

His client was desirous of dealing with the estate in the market and developing it, and he therefore sought the declaration of the Court binding all persons, so that his client might not be apprehensive in the future.

His lordship said he would exercise his power under the Act, and declare that this freehold property was no longer affected by the restrictive covenants contained in the Ecclesiastical Commissioners' conveyance of April, 1873.

In the course of his judgment, his lordship said it appeared to him that every effort had been made to bring before the Court any person who had any probable interest in opposing the declaration now sought. Further, he did not think he ought to refuse the application because some person not communicated with was not before the Court. In his opinion there never had been a building scheme affecting the property, of which the applicant's house and grounds formed part. Here, in the absence of any express assignment or benefit of the restrictive covenants to purchasers of adjoining land from the Ecclesiastical Commissioners, there was nobody to whom that benefit could pass, and under these circumstances he saw no bar to his acceding to the application of Mrs. Menke.

TRADE NOTES

Messrs. Holophane, Ltd., of Elverton Street, Westminster, S.W., have recently issued a booklet illustrating and describing the Hedralite system of fitting construction. This Hedralite fitting, it is claimed, embodies an entirely new and original method in the construction of lighting fittings. The principle involved is the adoption of a series of geometrically-shaped prismatic glass panels, by means of which fittings of various designs and sizes may be built up. The system employs four distinct geometrical figures — squares, rectangles, right-angled triangles and equilateral triangles, the dimensions of each bearing a definite relation one to the other. Coincident with the Hedralite system of prismatic glass panels, the firm has also developed a new method of metal fitting construction. This embodies a jointing lock, consisting of die-cast corners with specially constructed metal straps of standard lengths, by the combination of which metal fittings of various designs and sizes may actually be built up from the finished parts. The Hedralite system can be adapted in myriad shapes and sizes. It can be used not only for pendant fittings but also for close ceiling and wall fittings, etc.

*

Messrs. W. T. Henley's Telegraph Works Co., Ltd., have recently opened a new stores depot at 31-33 Gwyn Street, Bedford. Mr. J. M. Faulkes will act as the firm's Bedford District branch manager. The telephone number of the new stores is Bedford 3566, and the telegraphic address Henletel Bedford. Stocks of cables, wires, flexible cords, jointing materials, engineering dept. supplies, etc., are now obtainable from the new Bedford stores. Mr. E. J. Pond, who, as Birmingham branch manager, has had control of the firm's business in the Bedford district for the last thirty-one years, will continue to supervise in the capacity of Midland Area Superintendent.

*

Mr. N. E. Thompson, who was a member of the advertising staff of THE ARCHITECTS' JOURNAL for the past two years, has now joined the India Rubber, Gutta Percha and Telegraph Works Co., Ltd., of Aldwych House, W.C.2, as their architectural London representative for their "Silvertown" rubber flooring.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

New Showrooms and Offices for Crane-Bennett, Ltd., 120–121 Pall Mall, S.W. (pages 634–638). General contractors, Holloway Bros. (London), Ltd., who were also responsible for the foundations. Sub-contractors : Redpath, Brown & Co., Ltd., steelwork; Nine Elms Stone Masonry Works, stonework; Crittall Manufacturing Co., Ltd., metal casements; E. R. Broadbent, carving; H. T. Jenkins & Son, Ltd., marblework; Art Pavements and Decorations, Ltd., terrazzo; Birmingham Guild, Ltd., wrought-iron balustrades; Waygood-Otis, Ltd., electric lift; the Neon Sign Co., illuminated sign; Higgins and Griffiths, Ltd., electrical work; J. Jeffreys & Co., Ltd., hot water, heating and ventilation; Stitson, White & Co., Ltd., plumbing; Acme Flooring Co., Ltd., wood flooring; Morris-Singer, Ltd., bronze name plate; Nicholls and James, Ltd., special furniture; Johnson, Poore & Co., Ltd., office furniture; Comyn Ching & Co., Ltd., door furniture; Thomas Elsley, Ltd., metal grilles and special furniture; Salter, Edwards & Co., Ltd., asphalt; Berry and Roberts, Ltd., wall paper; Luxfer, Ltd., pavement lights ; London Brick Co. and Forders, Ltd., slotted bricks ; Brookes Ltd., white glazed bricks ; Standard Cork Co., cork slabs ; Thomas Elsley, Ltd., bronze work.

House, Woodside Avenue, Finchley (page 639 and supplement). General contractors, Chessums, Ltd. Sub-contractors : Roberts Adlard, Ltd., tiles; Jos. F. Ebner, wood-block flooring; Pithers Radiant Stoves, Ltd., central heating; Bratt, Colbran & Co., Ltd., grates; T. Clarke & Co., Ltd., electric wiring; City Iron Co., Ltd., sanitary fittings; A. E. Davis, door furniture; Crittall Manufacturing Co., Ltd., casements.

Boots Shop Premises, 67–9 Grainger Street, Newcastle-upon-Tyne (page 648). General contractors, F. J. Hepple, Ltd. Sub-contractors : Redpath, Brown & Co., Ltd., structural steel; F. F. Docking & Co., central heating; General Electric Co., Ltd., electric light fixtures; Matthews and Yates, Ltd., ventilation; Artistic Blind Co., patent blind; John F. Shackleton & Co., Ltd., German travertine; Ruboleum, textiles; Boots shopfitting dept., shop-fittings and Staybrite front ; W. J. Furse & Co., Ltd., goods lift; Claude General and Neon Lights, Ltd., signs.

Article on double "silence" window glazing (pages 649–650). The silencers first referred to are obtainable from Heat and Sound Insulation, Ltd.; the window masks from Messrs. Buchanan Acoustics (European), Ltd.; and the sound-proof windows from Messrs. Mellowes & Co., Ltd.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Mr. Hardman has lodged plans with the BARKING Corporation for the erection of a cinema and sixteen shops in Longbridge Road and Upney Lane.

The Roman Catholic authorities have acquired a site in Hewett Road on the BARKING section of the Becontree estate for the erection of a church and school.

The BARKING Education Committee has obtained sites on the Barking section of the Becontree estate for the erection of two elementary schools.

Plans passed by the BARKING Corporation: Additions to factory, Bye Pass Road for Messrs. Scoffin and Willmott; extensions to factory, for Messrs. Gross, Sherwood and Heald, Ltd.; fifty-one houses, Thornhill Gardens, for Mr. J. R. Leftley; factory, River Road, for Messrs. Orrock & Co.; two blocks of houses, Ripple Road estate, for Messrs. Lord and Mellowdew; eighteen houses, Tanner Street, for Eastern Development Co.; house, Rippleside, for Mr. S. Vanables.

Plans passed by the BRENTFORD AND CHISWICK U.D.C.: Alterations and additions, 282 High Road, for Messrs. Boots, Ltd.: eight houses, Grove Park Road, for the Kinnaird Park Estate, Ltd.

The Herts Education Committee is purchasing a site in Blindman's Lane, CHESHUNT, for the erection of an elementary school.

The Green Line Garages, Ltd., have acquired the building lease of land at the junction of Creek Road and Lamerton Street, DEPTFORD.

The L.M.S. is to erect shops at Kilburn railway station, Edgware Road, EDGWARE.

Mr. J. Neilson is erecting a factory in Great Cambridge Road, ENFIELD.

The Middlesex Education Committee is purchasing a site in Carterhatch Lane, ENFIELD, for the erection of a secondary school.

The FINCHLEY U.D.C. has prepared a scheme for the erection of eighty-seven houses and forty-two flats on various sites.

The FINCHLEY Education Committee is to erect an elementary school on a site in Summers Lane.

Plans passed by the FINCHLEY U.D.C.: Thirty-nine garages, Walfield Avenue, for Mr. P. D. Walker; two houses, Hill Top, for Mr. G. Ramsbottom; two houses, Gurney Drive, for Mr. A. Reast; tennis pavilion, Creighton Avenue, for Mr. E. N. Cansick.

Plans passed by HAMMERSMITH B.C.: Additions, 1 St. Peter's Square, for Messrs. W. Curtis Green and Partners; four blocks of flats, Cathnor Road, for Mr. F. Witt; three shops, Goldhawk Road, for Mr. D. Lewis.

Messrs. T. F. Nash, Ltd., are to develop the Tithe Farm estate, HARROW.

The Middlesex Education Committee has purchased a site on the Pinner Wood estate, HATCH END, for the erection of an elementary school.

The Middlesex Education Committee is to acquire a site on the Grange Park estate, HAYES, for the erection of an elementary school.

Plans passed by the HORNSEY Corporation: Additions, Smithfield Works, Cross Lane, for Mr. W. H. Partridge; workshop, 30 Oxford Road, for Mr. H. E. Askey; alterations and additions, 106–8 High Street, for Mr. M. K. Matthews; studio, 67 Muswell Hill Place, for Messrs. G. Knight & Co.; alterations, 59 High Road, Wood Green, for Messrs. Hamblin Fox and Bailey.

The Middlesex Education Committee has purchased a site in Bushey Road, ICKENHAM, for the erection of an elementary school.

Messrs. Edmond Coignet, Ltd., are to erect a building at the corner of High Street and Myron Place, LEWISHAM.

Mr. Bernard Geen is to erect premises in Martell Road, NORWOOD.

The L.C.C. is to erect a school for 400 pupils in Leigham Court Road, STREATHAM HILL.

Mr. S. Boothman has purchased a building site from the L.C.C. at the junction of Leigham Court Road and Mountearl Road, STREATHAM.

Messrs. Kennards (Wimbledon), Ltd., are to erect premises in Victoria Crescent, WIMBLEDON.

SOUTHERN COUNTIES

Plans passed by the EASTBOURNE Corporation: Four houses, Longlands Road, for Mr. W. R. Hamblyn; two houses, Decoy Drive, for Mr. F. C. Benz; additions, bakery, Lottbridge Road, and house, King's Drive, for Mr. A. Ford; house, Watts Lane, for Mr. H. Hubbard Ford; forty-eight houses, Kingston Road, for Messrs. P. D. Stonham and Son; three houses, Dacre Road, for Mr. A. J. Fellows.

Messrs. Bobby & Co. are to erect premises on land in Pevensey Road, EASTBOURNE.

The EASTBOURNE Corporation is making an offer for the acquisition of property in Market Square, Hailsham, for purposes of electricity showrooms.

Plans passed by the HERNE BAY U.D.C.: House, Central Avenue, for Mr. F. J. Line; bungalows, Fleetwood Avenue, for Messrs. Goodwin and Russell, Ltd.: house, Fernlea Avenue, for Mr. H. Pettman; bungalow, Sandown Drive, for Mr. A. J. Godfrey; house, Albany Drive, for Mr. R. Messenger; six houses, Southsea Drive, for Mr. C. J. Jordan.

Plans passed by the PORTSMOUTH Corporation: Twenty-one houses, Butts Road, for Messrs. McCormick and Son; thirty houses, Hawthorn Cross, Cosham, for Messrs. G. and W. Mitchell; twelve houses, Kenyon Road, for Mr. J. McDermott; twenty houses, Kirby Road, for Messrs. McCarthy Bros.; additions, 56 Chelsea Road, for Messrs. Jordans, Ltd.; three bungalows, Stanley Avenue, Copnor, for Mr. C. V. Thorpe; warehouse, 54–56 Oyster Street, for Messrs. Crouchers, Ltd; eight houses, Stride Avenue, for Mr. E. Kidd; twenty houses, Elmwood Road, Hilsea, for Mr. R. J. Winnicott; eighteen houses, Stanley Avenue, Copnor, for Mr. V. Dye; twelve houses, off Tangier Road, for Messrs. Westbrooke & Co.

SOUTH-WESTERN COUNTIES

The DORCHESTER Corporation is to have plans prepared for the erection of twenty houses on the Victoria estate.

Plans passed by the DORCHESTER Corporation: Shop, Great Western Road, for Weymouth and District Co-operative Society; additions, bottling stores, Dorchester Brewery, for Messrs. Eldridge Pope & Co.; two houses, Edward Road, for Mr. R. S. Joffs; bungalow, East Parade, for Mr. A. J. Parry; house, Monmouth Road, for Mr. W. I. Taylor.

MIDLAND COUNTIES

The LEICESTER Corporation is to provide orthopædic accommodation at the City General Hospital, at a cost of £9,840, from plans prepared by Mr. A. F. Duke, of Messrs. Giles, Gough and Trollope.

The SMETHWICK Corporation has decided to purchase thirty-five acres of land at Perry Hill, for a housing scheme.

The SMETHWICK Corporation is to purchase property in Windmill Lane, for the provision of a branch library and clinic.

The STOKE-ON-TRENT Education Committee has selected a site on the Meir housing estate for the erection of an elementary school.

NORTHERN COUNTIES

The BRADFORD Corporation has approved the plans of the city architect for the erection of four shops and houses on the Chellow Grange estate.

The Ribble Motor Services, Ltd., is to provide a central bus station at CARLISLE.

The HULL Education Committee has now arranged to erect, by direct labour, new junior and senior departments at Hall Road school, at a cost of £47,034.

The MANCHESTER Corporation is to acquire land in Stokes Street for the erection of sixty-two houses.

The MANCHESTER Education Committee has approved plans for extensions at Didsbury boys' central school.

Plans passed by the PENRITH U.D.C.: Fourteen houses, Victoria Road, for Messrs. Hitchen and Atkinson; workshop, Brunswick Road, for Mr. J. Thompson.

The SHEFFIELD Corporation has leased land on the Manor estate to the Brightside and Carbrook Co-operative Society, for the erection of shop premises.

The SHEFFIELD Education Committee has acquired a site at Sycamore House Road, for the erection of an elementary school.

Plans passed by the SHEFFIELD Corporation: House, Prince of Wales Road, for Mr. L. Osborne; house, Glebe Road, for Mr. F. Lamb; four houses, Bents Road, for Mr. J. A. Wragg; house, Abbey Crescent, for Mr. J. V. Auckland; two houses, Cartmel Road, for Mr. J. Enock; house, Marshal Road, for Mr. C. W. T. Scott; four bungalows, Hutchille Wood Road, for Mr. W. Bingham; two houses, Halesworth Road, for Mr. D. Hurrell; 484 houses, Shiregreen estate, for Corporation Estates Committee; two houses, Marlcliffe Road, for Mr. B. F. Glossop.

The TYNEMOUTH Corporation has sold building sites on the Balkwell estate to Messrs. Woodall and Shepherd.

The TYNEMOUTH Corporation is to interview the Ministry of Health regarding a proposed clearance scheme for the Liddell Street area.

WALES

The SWANSEA Corporation has leased lands in Townhill Road, to Mr. A. E. Wright, for the erection of nine houses.

Plans passed by the SWANSEA Corporation: Two houses, Clydach Road, for Messrs. Powell and Hopkins; two houses, Penmaen Terrace, for Mr. A. J. Marks; two houses, Llangyfelach Road, for Mr. D. A. Rosser; alterations, 4 Union Street, for Messrs. Thomas, Son and Harris; three bungalows, Dunvant Road, for Mr. W. L. Simons; eight houses, Hadland Terrace, for Mr. Geo. Symons; four houses, Lon Coed Road, for Messrs. Rogers and Davies; five houses, Lon Cldwym, for Mr. A. Wright.

SCOTLAND

The following figures show the progress that has been made in State-aided housing schemes in Scotland to September 30, 1931: 1919 Act, completed 25,129; 1919 Act (by public utility societies), completed 421; private subsidy schemes (1919 Additional Powers Act), completed 2,324; slum clearance schemes, completed 13,881, under construction 1,352; 1923 Act by local authorities, completed 4,033; 1923 Act by private enterprise, completed 20,260, under construction 2,069; 1923 Act by public utility societies, completed 80; 1924 Act by local authorities, completed 52,544, under construction 6,262; 1924 Act by private enterprise, completed 3,095, under construction 641; 1924 Act by public utility societies, completed 127, under construction 16; 1930 Act by local authorities, completed 64, under construction 2,931; unallocated houses, under construction 44; demonstration houses, completed 17; steel houses erected on behalf of Government by Scottish National Housing Company, completed 2,552; total completed, 124,527; total under construction 13,315; total 137,842.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

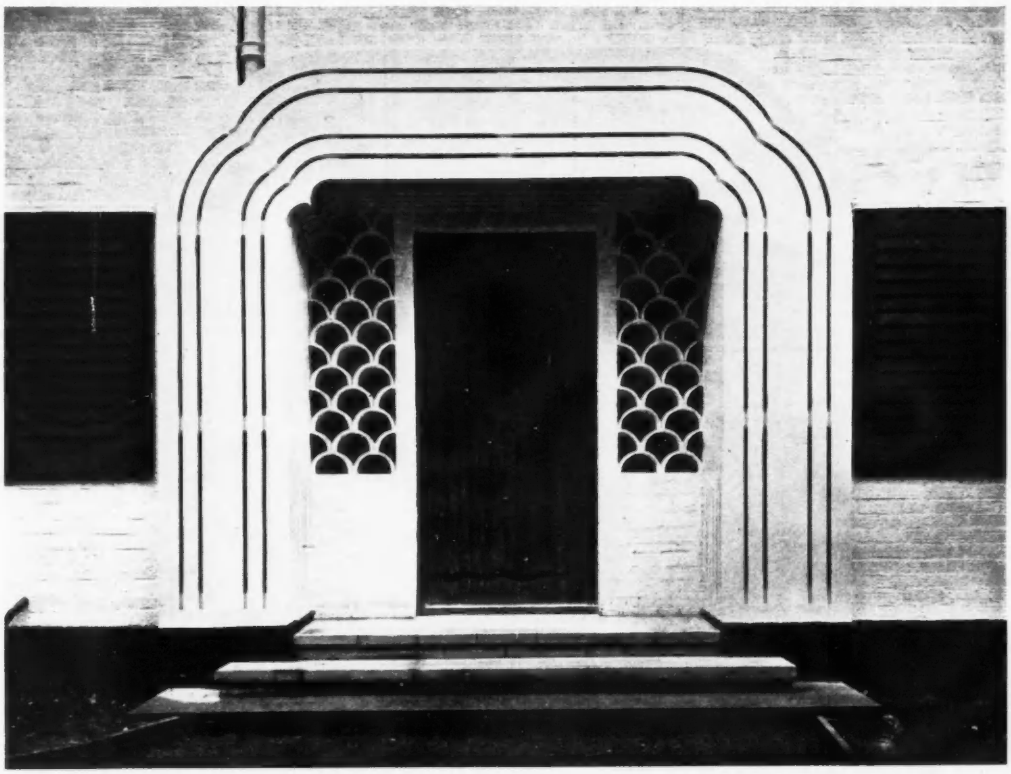
RECESSED PORCH AND WINDOWS

DETAILS FROM A HOUSE AT FINCHLEY: BY WELCH, CACHEMAILLE-DAY AND LANDER



THE ENTRANCE, SHOWING FRONT DOOR AND HONEYCOMB WINDOWS

ELSEWHERE in this issue photographs and a description appear of the house at Finchley from which details of the porch have been selected for illustration here—above, photographically, and in drawings, overleaf.

The main constructional materials are brick and ridge tiles, both of which are whitewashed. The ridge tiles are arranged in a honeycomb pattern on either side of the front door, and the windows thus formed have opening glass casements on the inside. The surround of the recess is in painted deal trellis, behind the slats of which, on the left-hand side, is concealed the window of a lavatory that opens off the hall.

The entrance door is carried out in limed oak, with wrought iron hinges, bell pull, etc. Its back is covered with a plywood panel, faced with Oregon pine, stained to match the interior joinery of the house.

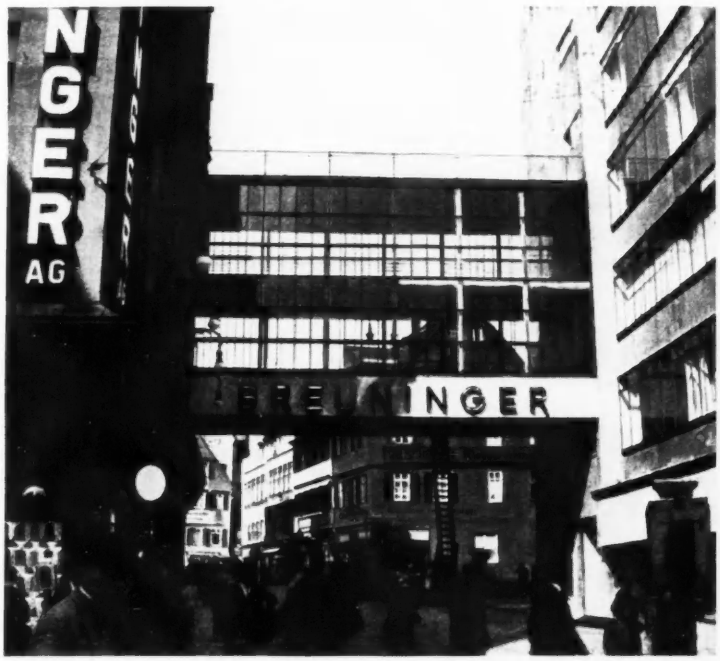
TWO-STORY BRIDGE

AT THE BREUNINGER STORE, STUTTGART, GERMANY



[Eisenlohr and Pfennig, Architects

THE BRIDGE, AS SEEN BY THE CAMERA FROM THE STREET

THIS two-story bridge links the existing Breuninger Store with the new wing, the staircase of which was the subject of a supplement in the July 15 issue.

Two beams, spaced 17 ft., centre to centre, span the 46 ft. road, and carry five stanchions spaced equally, which in turn support the upper floor and the roof.

Between the glazing and the upper floor is a 10½-in. space, which enables the window to continue unbroken through the full height of the bridge.

The rigidity of the windows is dependent on the seven horizontal channels, which are held to each stanchion by bolted brackets, and secured at their ends to vertical channels fixed to the walls. The vertical glazing bars serve only to subdivide the glass.

The joinery and floors are of jarrah, stained to a deeper shade of its natural colour. The iron balustrade to the upper floor is painted a bright shade of green.

Metal-covered doors give access at one end to the existing building, whilst the other opens direct on to the staircase of the new block.

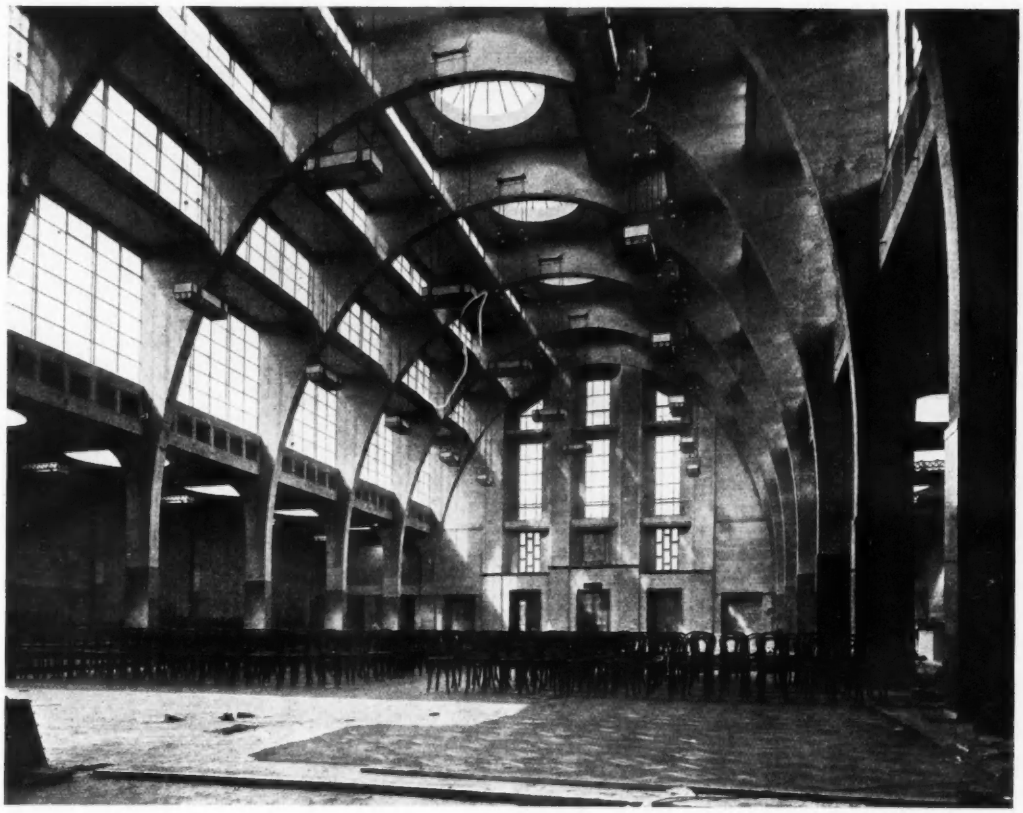
ARCHED CONCRETE ROOFS



[Easton and Robertson, Architects.

1. THE HORTICULTURAL HALL, WESTMINSTER (1928)

CONCRETE has done far more than steel to liberate us from the choice of domed or flat roofs for large structures, though, paradoxically enough, most architects who employ that material make it an excuse for imposing the latter on domestic buildings. Thanks to concrete, types of ellipsoidal arches never before possible now present no particular difficulties, and the widest spans and loftiest vaults are relatively simple and cheap to construct. Roofing and walling have ceased to necessitate the use of different materials. Designs in which the side walls curve over to form the roof have proved particularly suitable for buildings like covered markets, exhibition halls, swimming-baths, large railway-stations, big machine shops, and certain types of factory.

The famous twin airship sheds at Orly, near Paris, constructed by Freyssinet in 1916, with a single centering, moved forward from rib to rib, were the prototypes of the parabolic arched hall. A modified form of the same method, which obviates the need for infillings because each arch is conterminous with its neighbour, was employed in the new market-hall of Rheims.

Non-aeronautical application of this principle was made in the great hall of the Gothenburg Exhibition of 1923: a design strikingly similar to the new Horticultural Hall in Vincent Square, Westminster (figure 1); and the Heslach swimming-bath at Stuttgart. In all three the round-headed arches are spaced some distance apart, and clerestories for lighting the vault are notched into the exterior curves of their ribs.

The two parallel halls of the permanent exhibition buildings at Brünn (figure 2), which have arches much more oval, are lit by windows in the walls (from which the ribs break away), and continuous roof skylights.

Figure 3 is an example of the so-called "butterfly roof," in which one row of columns is superimposed on a gallery supported by another. It is one of the few American examples of original design in concrete: these trusses are not ramifications of the main stanchions, but spring from beams supported by them at wide intervals. The central nave, like the nearer of the two side aisles on either side of it, is lit by oblique-angled clerestories.

THE ARCHITECTS' JOURNAL

WEDNESDAY, NOVEMBER 18, 1931

THE NEWEST SPECIMEN

ONCE again, the R.I.B.A. is inviting nominations for the London Architecture Medal. Members everywhere are being asked to suggest a building for consideration by the jury. This building should be within a radius of eight miles from Charing Cross, and should have been finished between January 1, 1929, and December 31, 1931. The forms are to be sent to Mr. MacAlister by February 29 next. We hope all readers of the JOURNAL who have had forms will, when they buy their office diaries for 1932, at once make an entry reminding them to fill in this form. Four months is very long notice : time enough, indeed, to forget concerns even more immediate than the R.I.B.A. medal. There must have been a very weighty reason for circulating the forms so long in advance; whatever the reason, we hope as many people as possible will make it their business to vote. One or more reminders will appear in these pages in due course.

The inauguration of the medal came at an opportune moment. There were quite unmistakable signs of a growing interest—not before it was due—on the part of Londoners in their city. Editorial comments and letters in the daily Press, criticism in the weeklies, and the increase in the number of books dealing with London and with architecture generally, addressed to the general public, all testified to this welcome fact. London is so vast that a civic consciousness and pride such as are to be found in certain provincial towns, notably in Birmingham, with its Civic Society and its gold medal, are quite impossible. It was therefore all the more desirable that there should be some recognition of good work where conditions render public opinion so inarticulate.

How far is the existence of the medal known to the public at large ? We should like to see the Press give the award even greater publicity than it receives at present. For after all, this is something that they can understand; it is a straightforward issue. This is the street frontage in London which the architectural profession considers to be the best that has been erected in the course of the given period. There is nothing ambiguous about that. The award has a message, for what it implies is this : " We, the architectural profession, are of the opinion that the appearance of the streets in London would benefit if more frontages of this kind were built; do not, therefore, demand of us that we should design buildings which acknowledge other and less worthy standards than this one." Later, it might not be too much to hope that the building owners themselves should take a vicarious pride in the medal; that the honour should be shared between the architect and his clients.

With a view to increasing public interest in the event we think the decision that a building which has received the award shall carry some mark of distinction an excellent one. Think, too, what interest it will have added to the streets of London in the course of fifty years, what a chronicle of the changing tastes of half a century. Should not we ourselves like to know what was deemed the best design in, let us say, the famous year 1851 ? Our comments might be harsh; so, too, may be those of our successors.

But in the artistic chaos among which we live it is necessary that here and there at least a few signposts should be set up. What manner of building was thought good and desirable in 1931 ? The fashion-papers of 1931 will show our descendants exactly what sort of examples were generally followed in the matter of clothing for men and women. The political papers will accurately reflect our attitude towards government at home and abroad. In our architectural journals no similar evidence will be available. For the year 1931 there will appear a jumble of buildings, belonging to every conceivable fashion that has ruled during the last two or three decades, and it would be a hazardous job to try and form a balanced historical view from such a farrago as this. The dated medal building will be a surer sign. Here our future historian may really see what the bulk of architects were thinking. Here he may find a genuine specimen of the years' architectural growth.

A MODERN TEMPLE OF PLEASURE IN BERLIN

The Lichtburg cinema theatre, Berlin, of which the main entrance is shown in the above view, is one of the German examples chosen by Paul Zucker and G. Otto Stindt for illustration in their book on cinema houses, reviewed in this issue.

The work of Rudolf Fränkel, it is, the authors state, typical of modern tendencies in its planning: the cinema itself is blended with the surrounding premises, which are designed for rental purposes. This diversity of aims is made immediately comprehensible to the eye by the contrast between vertical and horizontal components.

Internally, the problem of reconciling, in the one auditorium, the by no means identical characteristics demanded by a variety theatre and a talkie-cinema, has been solved with the help of carefully-calculated wall spaces, special panelling and floor coverings, and much else besides—notably the form of the ceiling, which consists of a number of concentric rectangular lighting troughs of a particular profile adapted not only for optical purposes but for breaking up the sound and preventing echoes. The house has seating for 2,000 persons.

The doors lead into a circular vestibule at ground level; above, part of the same curve becomes the end of an oval salon for balcony patrons, set at an angle to the main axis of the auditorium.

By night the front presents a striking appearance. The sign is in neon lights; the whole of the deep vertical windows are illuminated from within; and searchlights play from the top gallery.

NEWS & TOPICS

THE ENGLISH HOUSE

THE appearance of Mr. Nathaniel Lloyd's *History of the English House*, published today by the Architectural Press, is an interesting sign of the times. Its 888 illustrations, running, together with the text, into close on 500 pages, give the author a chance to cover every possible aspect of the subject. And yet the book, priced at the astonishing figure of three guineas, is obviously intended to appeal to a very wide public indeed. That amateurs of architecture, here and abroad, will make a rush for the book may, I think, be taken for granted. Before the war no publisher would have thought it possible to plan a single volume of this scope at such a price. Folio monographs on single periods of architecture, issued in two or more parts and costing four or five times as much, were then demanded by the small expert public interested in genuine scholarship. But these are the days of outlines and omnibus books, and to Mr. Lloyd must be given the credit for making the riches of architecture equally interesting and accessible to the general reader.

CIVIC-MINDED BIRMINGHAM

The correspondence between the Secretary of the Birmingham Civic Society and the officials of the Corporation and other such generally unapproachable and unbendable persons, which is reproduced in the Annual Report, makes invigorating reading. So many societies with similar work to do are accounted well-wishing faddists that to find one that is listened to, and whose advice is quite often taken, sets one wondering exactly how it comes about that some towns are civic-minded and others are not. Such names as Cadbury and Chamberlain, among vice-presidents of this Society, suggest one line of surmise, but I believe myself that here you have an example where taste is steadied and controlled by architects actively working for the good of their city. Collaboration with city engineers and architects can only be possible where the lesser body is respected for its good sense and superior knowledge.

A CONFIDENCE TRICKSTER "WANTED"

The Editor has shown me a letter from a well-known member of the Institute, which arrived too late for inclusion in this issue, relating an account of a confidence trick practised upon him last week. This confidence trickster, Mr. T——, called upon, shall we say, Mr. F.R.I.B.A., armed with a site plan of a large estate. He stated that the purchase of the land had only been concluded the previous evening at the offices of Messrs. ——, solicitors. After the fees for the layout and houses had been arranged, Mr. T—— proposed to meet Mr. F.R.I.B.A. next morning in order to visit the estate. Just as he was going, Mr. T—— found he was short of cash; and the banks were, of course, closed. Would the architect "lend" him ten shillings? Needless to state Mr. T—— did not keep his appointment. In case he tries his wiles on any of the readers of this JOURNAL, I quote the following from our correspondent's letter:

This man calls himself Mr. H—— T——, of Messrs. H. and J. T——, Victoria Park, Manchester. He is about 5 ft. 4 ins. tall, forty years old, clean-shaven, with horn-rimmed glasses and a mop of brown hair brushed straight back from the forehead. He was wearing a blue suit, light overcoat and light trilby hat. Should he call on any reader, the police should be sent for, as there is a warrant out for his arrest at Bow Street.

THE UMBRELLA HOARDING

What can be the state of mind of the councillor of Chapel-en-le-Frith R.D.C. who urged, against the removal of certain advertisement hoardings in the Peak District, that another councillor described as "dreadful," and about which the C.P.R.E. had written a letter to the Council, the quaint plea that they were a shelter in bad weather? The rain it raineth every day, and remarkably straight, as a rule. And most hoardings I have seen have a negligible horizontal projection. The protection even of trees I have found to be largely illusory. It is an effect of suggestion. If it were to be taken seriously we might expect to see new terrors along the countryside—hoardings cut to the outlines of umbrellas and Burberrys. The oilskin and sou'wester pattern should be popular. Mercy, deliquescent heavens!

THE SEVEN SISTERS RAMP

Happily for lovers of Sussex coastwise amenities, the Seven Sisters cliff-lands were rescued not long ago by the National Trust from the threat of speculative building. Unhappily for the guileless motorists among them, they have now become the site of one of those mean little ramps with which a body so public-spirited as the Trust can hardly afford to have itself associated. The area is large, and I doubt if the car-folk, who for many years have left their cars here and there about it, while they took a walk over the sea-downs, did any more harm than does the mere pedestrian.

★

That, however, is for the Trust to decide: they have acquired the rights common to property-owners. Deciding upon prohibition, however, their straightforward course would have been to spend a few shillings in erecting warning boards on the access roads (there are only two). Instead of which, the local authorities have lent themselves to the wholesale trapping of unwary motorists, under a little-known clause of the new Road Traffic Act—that which makes it an offence to take a car more than fifteen yards from a public highway. The local policeman, whose time would be better spent dealing with the regulation of the heavy traffic on the main road, devotes his week-ends to lurking in hiding and then foot-slogging after unwitting malefactors; and the Bench fines 'em in droves out of hand, at every petty sessions. Thus is fair play set at naught and, incidentally, public and private time and money squandered in a time of national economy.

ASTRAGAL

Competition Result

Messrs. C. E. Elcock, F.R.I.B.A., and T. Alwyn Lloyd, F.R.I.B.A., the assessors in the competition for the proposed tuberculosis hospital at Sully, near Cardiff, for the Welsh National Memorial Hospital, to be erected at an approximate cost of £150,000, have made their award as follows:

First premium (£400), William A. Pite, Son and Fairweather (London); second premium (£300), Lanchester and Lodge (London); third premium (£175), Stanley Hall and Easton and Robertson (London); fourth premium (£100), Todd and Thompson (Bristol).

It is hoped to publish the winning design next week.

Emblems borne on the bridge which connects the north and south blocks across the roadway. Between the flambeau and the winged staff are the coats of arms of the Port of London, the City of London, and the City of Westminster, respectively.

The keystone of the semicircular bridge-arch, above Page Street, is carved with a presentment of Father Thames.

THAMES HOUSE

DESIGNED BY SIR FRANK BAINES

THAMES HOUSE, Grosvenor Road, Westminster, has been designed in harmony with its older neighbour, Imperial Chemical House, of which Sir Frank Baines was also the architect, in a modern rendering of English Renaissance. Steel-framed and fire-resisting throughout, the buildings are clothed in white Portland stone, rising from a base of polished grey granite, and are finished with a steeply-pitched roof covered with slabs of faience. A notable feature is the great archway spanning Page Street and connecting the two blocks at third- and fourth-floor levels, which will be crowned by a group of statuary in bronze, representing the commerce of the British Empire, by C. S. Jagger.

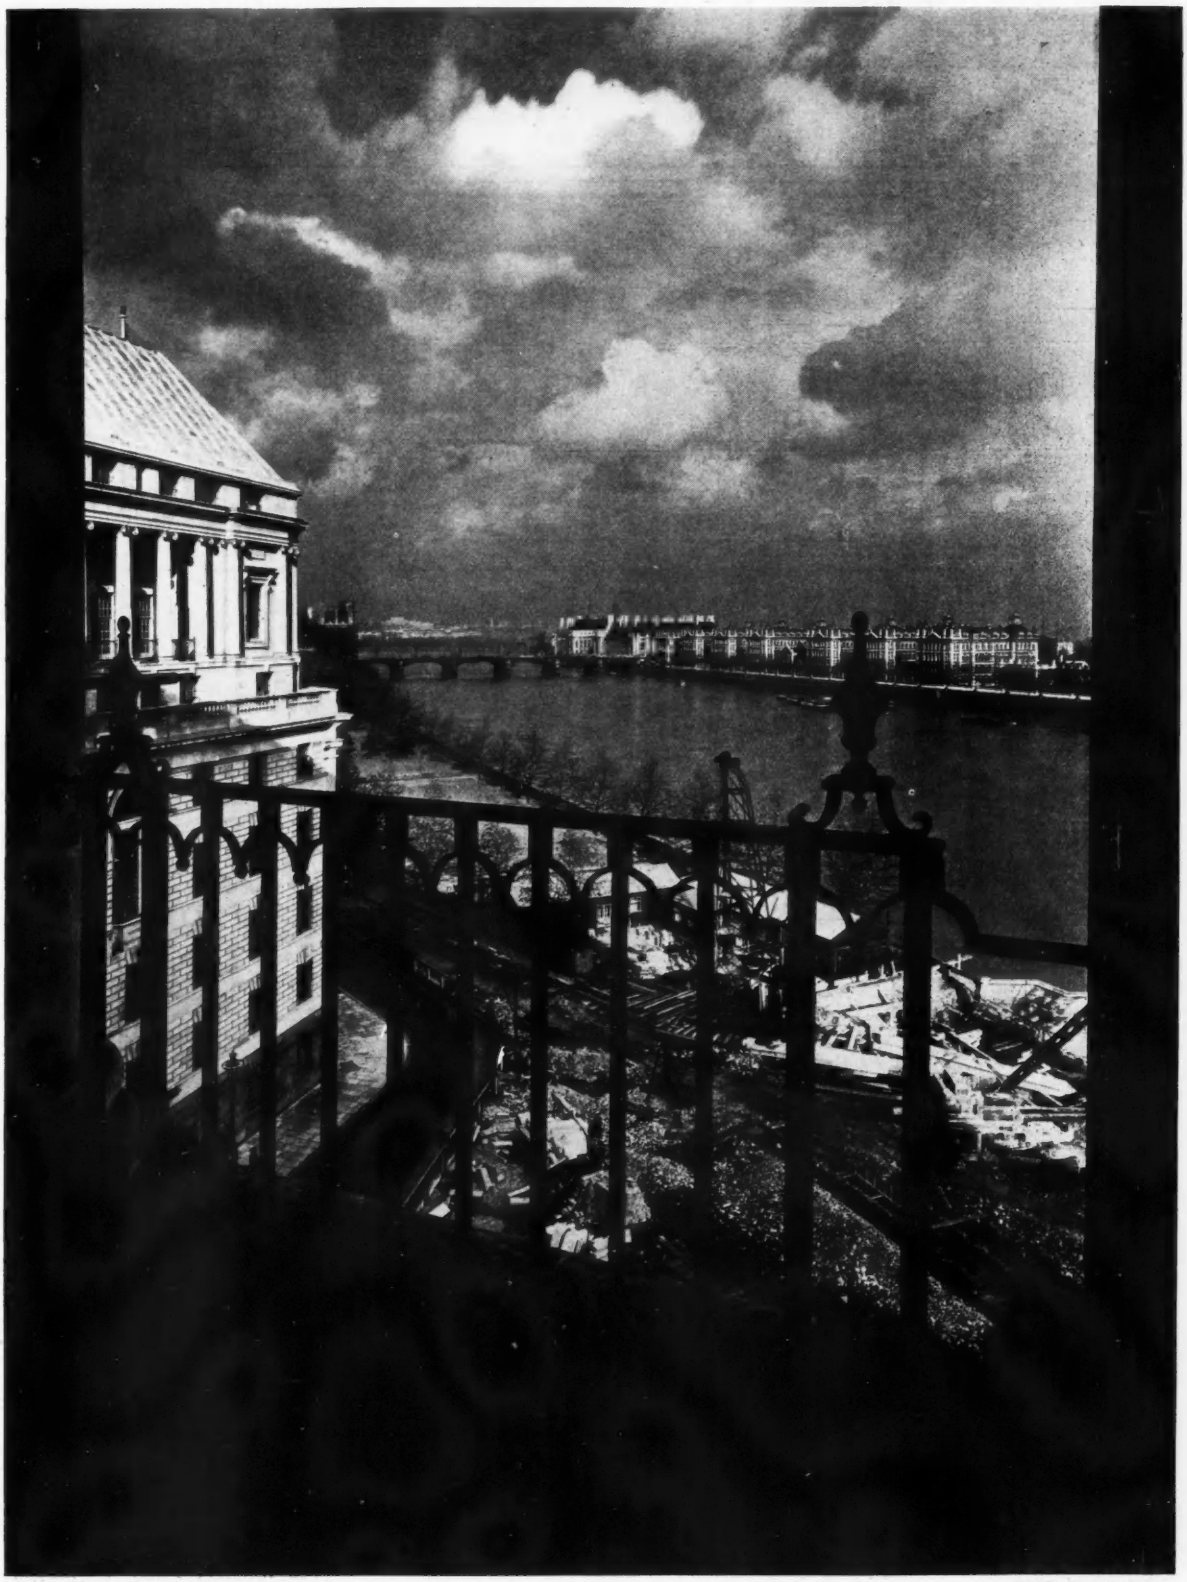
Each block comprises eleven floors, the two lowest of which are below ground, and are carried through under Page Street, thus occupying the whole area of the site. It is claimed that they form the largest basement stories in London, and they are specially designed to be perfectly dry. As the floor level of the lowest, or sub-basement, is some eighteen feet below high-water mark, very special measures had to be taken to withstand the percolation of water from the river. To this end, the whole site, including that part of Page Street which passes between the two blocks, is enclosed in a massive retaining wall, the construction of which was carried out in sections behind a double wall of steel sheet piling. Excavations were then made for the massive grillages destined to carry the stanchions.

The final step was to cover the whole site inside the retaining wall with a thick bed of waterproofed concrete, which, together with the heavy retaining wall, forms an enormous tank, entirely impervious to water, in which the whole building stands. On the foundations so constructed arises the steel frame of the building. Pipes, conduits and similar engineering requirements were installed concurrently with the steelwork, so saving much of the time and labour that would be expended in putting them in later.

Following closely upon the steelwork come the hollow tile reinforced concrete floors, which are built in as soon as possible, both to stiffen the steel frame and to serve as working platforms for subsequent operations.

There is nothing haphazard in the way parts of the structure are used to help in the erection of other parts. On the contrary, every operation throughout the work is carefully timed, both for beginning and completion, with close consideration of simultaneous and following operations, so that there may be no overlapping on the one

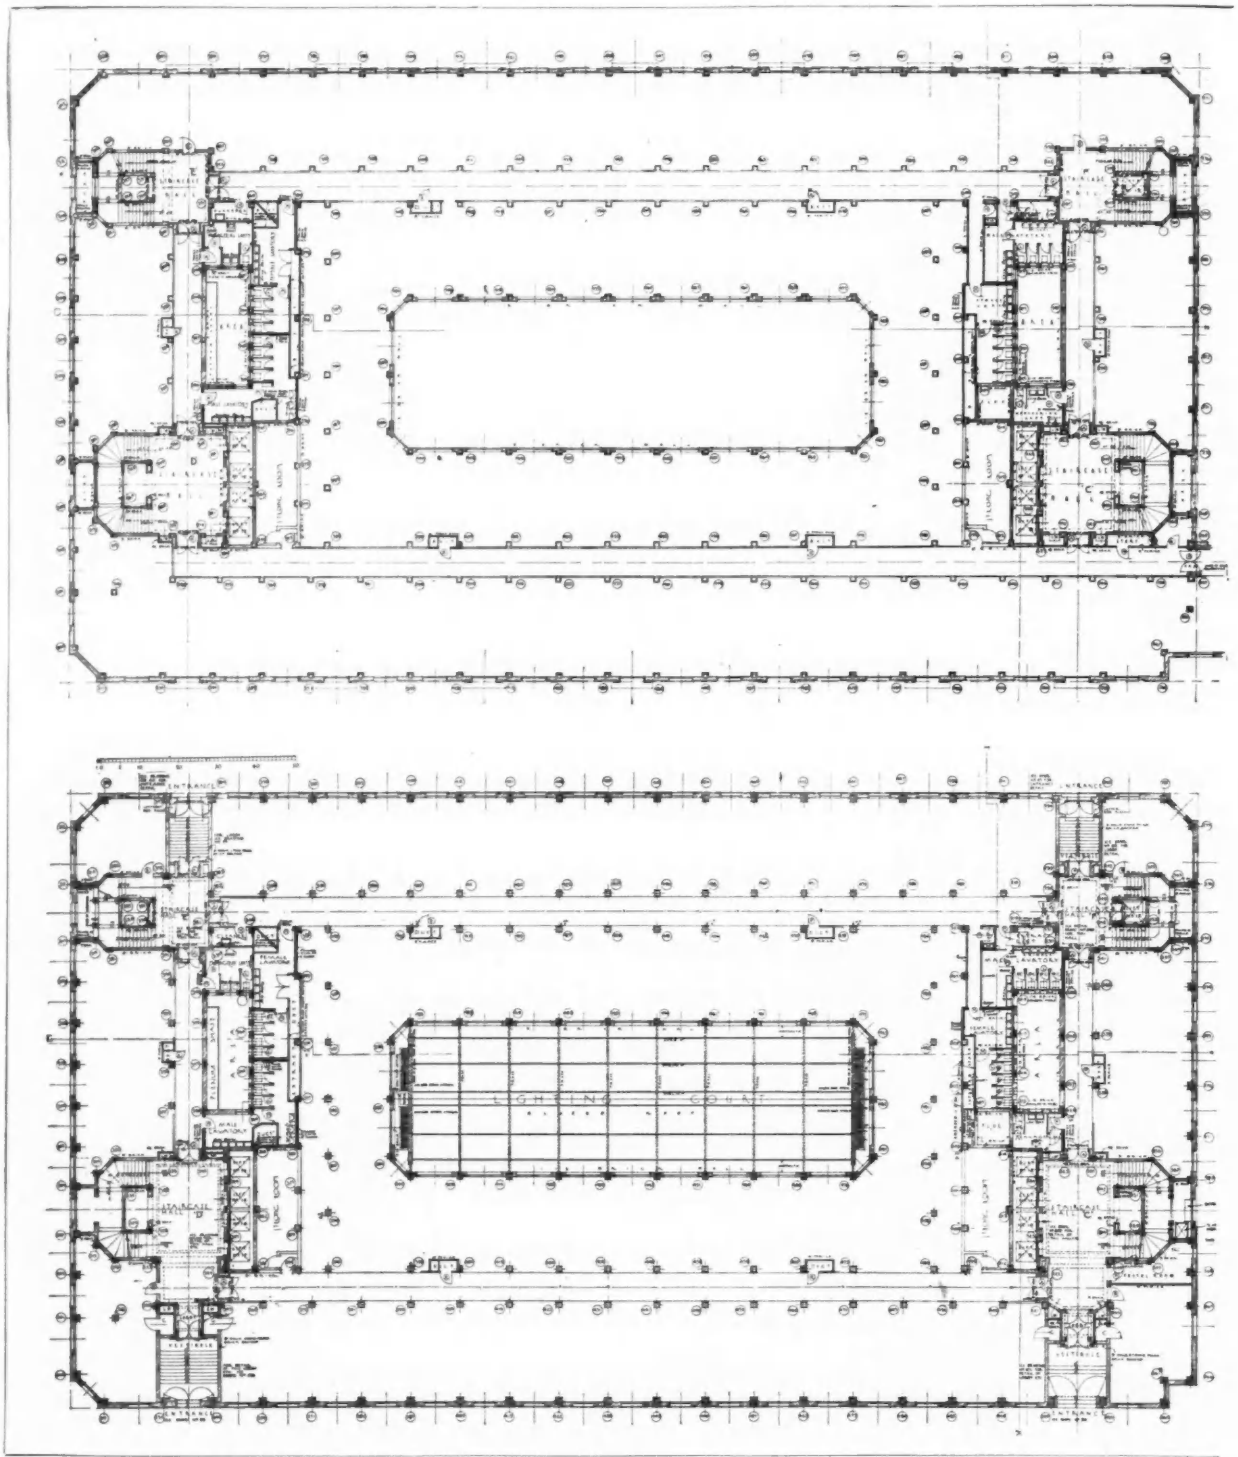
A general view of Thames House from across the river, showing its relation to Sir Frank Baines's slightly older building for Imperial Chemical Industries, and to the new Lambeth Bridge, still only in process of erection. Traditional though they may be in style, the new group embodies the most modern methods of building, materials and services of all kinds; in fact, it is thought to be the biggest, most conveniently fitted office building in two hemispheres.



Thames House, Grosvenor Road, S.W.] [*By Sir Frank Baines.*

A pageant of Thames-side at Westminster is spread for a spectator on the colonnade at sixth-floor level. The course of the river at this point is almost due north, and Westminster Bridge spans it from west to east. On the right, beyond the orderly piles of St. Thomas's Hospital, may be seen the London County Hall, its completing wing hardly yet out of the scaffolding. Nearer below is the new embankment roadway in the making.

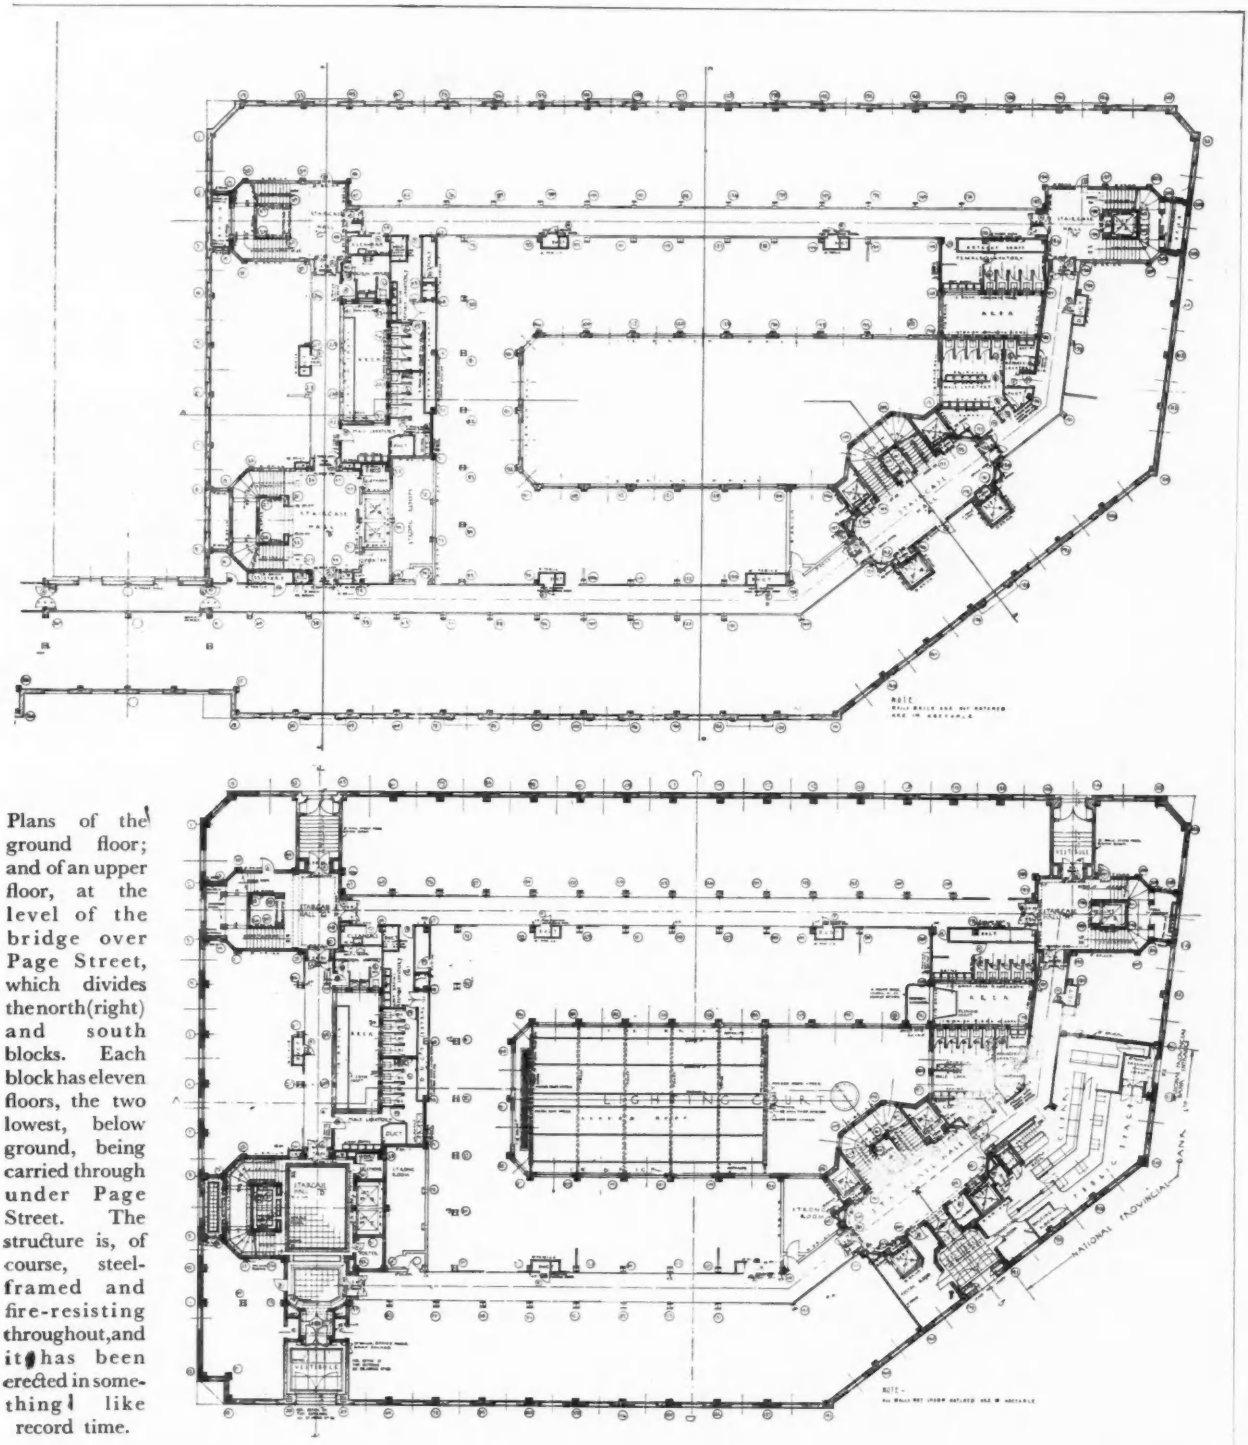
D



Thames House, Grosvenor Road, S.W.]

hand or loss of time on the other. The whole series of operations is carefully charted, before work actually begins. For instance, the precise order in which the steel members are to be erected and the cranes moved from section to section is all determined beforehand, and the programme of work drawn up must be rigidly adhered to. It is only thus that work has been speeded up to an extent hitherto unknown in this country, so that steelwork up to 800 tons has been erected in one week and floors up to 30,000 square feet laid.

The roof is a daring innovation : it was necessary to use a roofing material to harmonize with the stone slabs laid on the roof of Imperial Chemical House, and yet it was desired to avoid the great weight of the latter. So, after numerous experiments, it was decided to use faience, made in long slabs, with a dull surface very closely resembling Portland stone, but one which will withstand the worst efforts of the sulphur-laden atmosphere of London : they are laid over a waterproof covering



Plans of the ground floor; and of an upper floor, at the level of the bridge over Page Street, which divides the north (right) and south blocks. Each block has eleven floors, the two lowest, below ground, being carried through under Page Street. The structure is, of course, steel-framed and fire-resisting throughout, and it has been erected in something like record time.

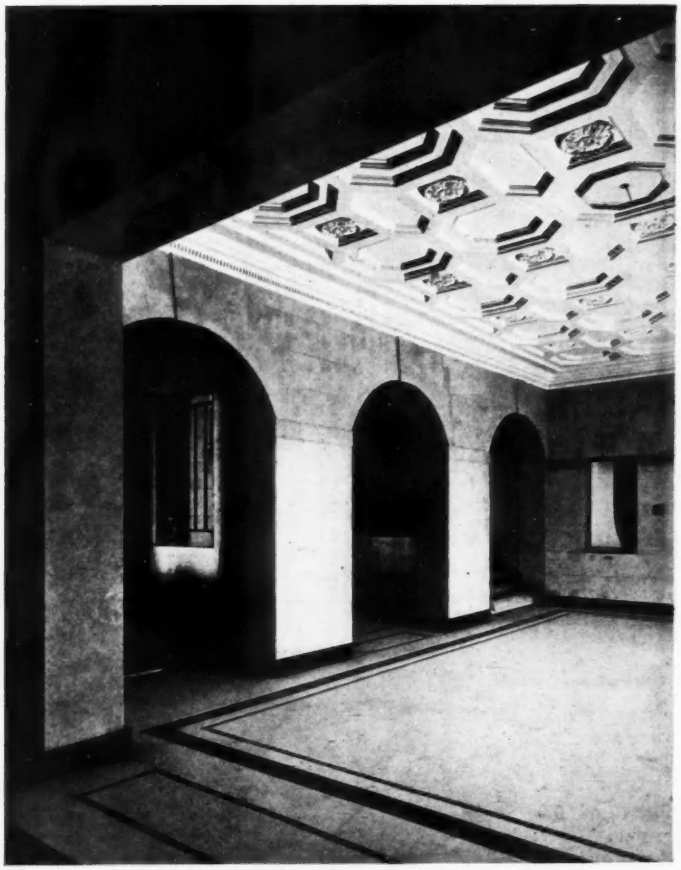
[*By Sir Frank Baines.*

composed of lead and bitumen.

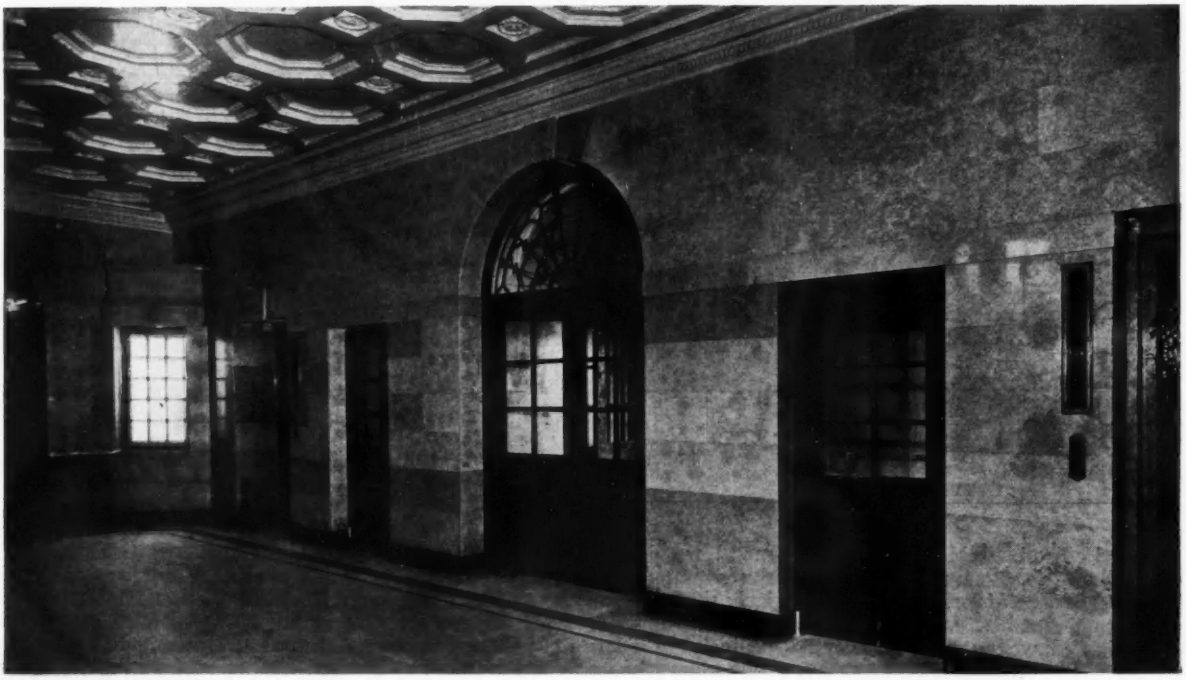
The offices in these two great blocks present more points of interest than can be catalogued here. Lofty, abundantly lighted, well warmed and ventilated, fitted with every device making for convenience, comfort and efficiency, they are ideal working places. All rooms on the main river fronts command wonderful panoramic views of the river and the metropolis, particularly those on the seventh floor, which can be finished, with lofty barrel ceilings, to form magnificent suites, high above the noises of the street.

From the very inception of the new buildings the most meticulous attention has been given to every detail of the equipment and operative services. To name but one, a unique feature of the heating installation enables the temperature of any room to be maintained automatically at any temperature desired by the occupant: a pointer on a small instrument on the wall of the room is rotated until it indicates the desired temperature—that is all!

The sixth-floor colonnade, from which the study reproduced on page 667 was taken.

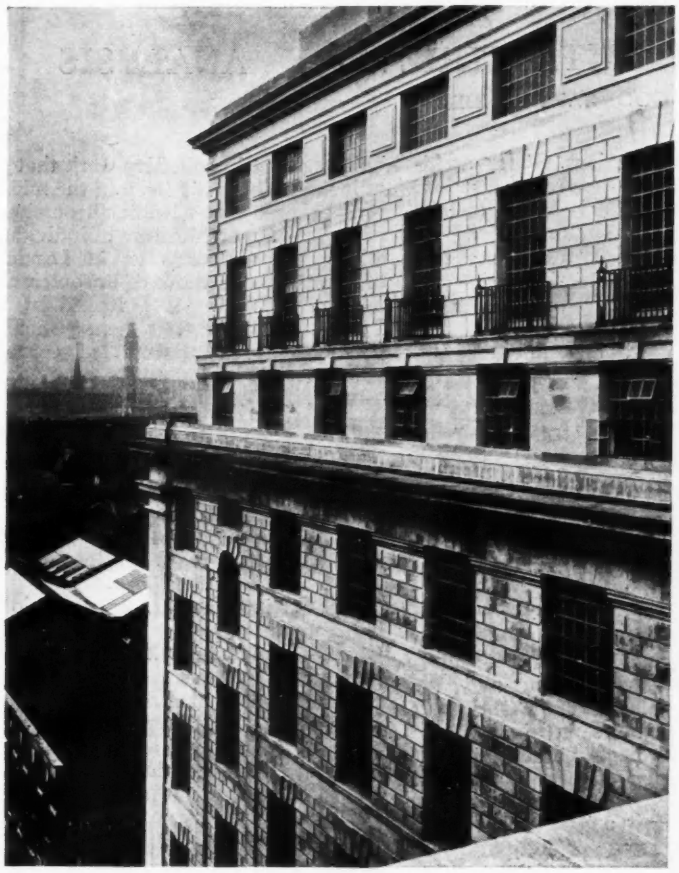


Staircase hall B (see ground-floor plan, page 669). On the left are the staircases; on the right the lifts; behind the camera the street doors.

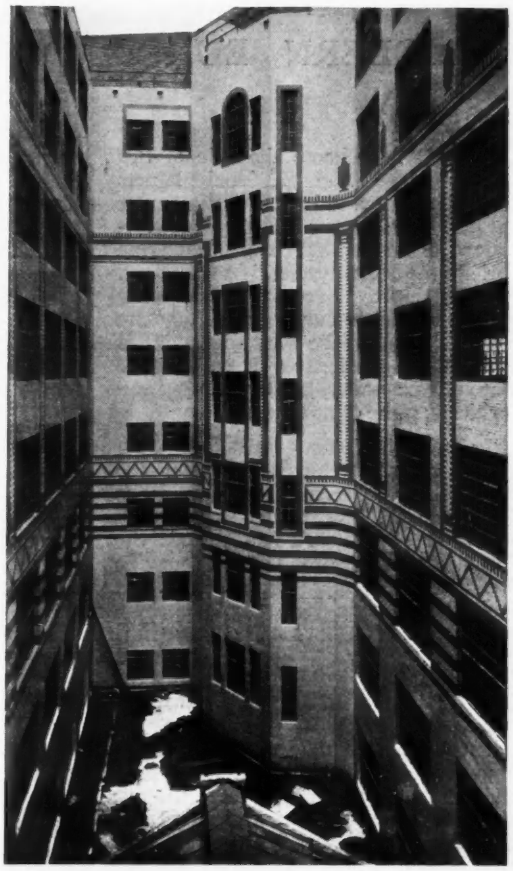


Thames House, Grosvenor Road, S.W.]

The north entrance to the north block. This is, so far as the term is applicable, the main entrance, being the principal feature of the splayed end facing the traffic-circus-to-be, now under construction at the west end of Lambeth Bridge.



From the connecting bridge there is a panorama of the parts of London about Victoria. A feature is the campanile of Westminster Cathedral.



The north lighting court, showing the decorative use of glazed cream and mauve tiles.

[*By Sir Frank Baines.*

The seventh-floor staircase hall, above the entrance facing Lambeth bridgehead. The staircase halls are illuminated by "artificial sunlight" windows, giving a novel effect of sunshine. The office floor space available for tenants totals 617,334 square feet.

MODERN EUROPEAN ARCHITECTURE: AN ANALYSIS

BY H. S. GOODHART-RENDEL

I DID not choose the title of this lecture. The Sessional Papers Committee did that. I remember at my preparatory school a general-knowledge paper that began, "Describe briefly the Solar System." I had a try. I am going to have a try now, not to describe Modern European Architecture (since I imagine we want to get out of this building before we have to move into our new one), but to analyse, and criticize, some of its tendencies.

The Art of Architecture

The art of architecture is not the same thing as architecture, any more than the art of speaking is the same thing as speech. Architecture is the production of the architect, who may be an artist, but more often is not. If this sounds rude, it is because people misuse the term "artist" so ridiculously. They call cooks artists, and photographers artists, and trapezists artists; and if an architect wants the same appellation in the same sense, then I am sure that all chartered or qualified or registered architects, or whatever we are at the moment, are entitled to it. But architecture is an art upon a different footing from that of cookery, of photography, or of acrobatics, and to maintain that a large proportion of the men that make an honourable living by providing the design of buildings and supervising their erection must be artists in the sense that painters and sculptors should be artists is to demand an impossibility. For one thing, the public would never stand it. Also, artists do not grow on every tree, and there never could be enough to go round. There never have been; if you look at the buildings of any good period you will see that the great bulk of them is the work of sound designers using other men's inventions in a sober, reasonable way.

The great bulk of the buildings of today is the work of doubtfully sound designers using other men's inventions in a way that is neither sober nor reasonable. Much of it is definitely flagitious and is supposed not to be the work of architects at all, a supposition that inquiry too often upsets. Even if we could bring the perpetrators to book, I am not sure that architecture is simple enough any longer to be produced satisfactorily on the old system of a few leaders and a great many followers. For one thing, the followers refuse, in this individualistic age, to keep to heel, and do a good deal of damage on their independent excursions. The architectural profession needs reorganization.

This reorganization is bound to take place soon in Europe, and it may be that it is already under way.

Individualism and Collectivism

It would be so natural to pick out a lot of buildings of one period and country, find their greatest common measure, if any, and present the result as modern French or German or Italian architecture; it would be so natural if I did that, that I should not blame you if you let me get away with it. I take it, however, that the only adequate excuse for talking any more about a subject that has been so very much described and discussed lately must be a serious attempt to get below the surface, and very near below that surface we find a bitter conflict between the forces of individualism and collectivism. In England you find the idiosyncratic buildings of Sir Giles Scott being built at the same time as the almost standardized building of the Office of Works; in France you find the Ecole des Beaux Arts trying to swallow and digest a good deal of rather peppery new food; in Italy you find clever and provoking modern decorators refusing to be crushed by the stereotyped grandeurs of the traditionalists; in Germany you find expressionism waging solemn war with functionalism to the probable amusement of some delightfully unrepentant experts in Baroque; in Spain I fancy that you do not find much, and in Denmark and Sweden you find some of the most personal and emotional and some also of the most impersonal and unemotional architecture in Europe. I have no idea what you find in most of the countries I have left unmentioned, but I imagine it would not be remarkable for homogeneity.

I do not like the word collectivism that I have opposed to the word individualism, but I cannot find a better. What I mean by it is well exemplified in the design of most of that enormous output of post-war German architecture that has been illustrated in our architectural press. Such architecture, which is not without merits, is the sort of thing that I believe anybody sufficiently intelligent and painstaking could be trained to do. What it owes to impulse it owes to the sort of disciplined impulse of which a mass is capable. I find it generally decent and reasonable and prosaically expressive of its purpose. I never can remember which architect did which building, but in collective work that is as it should be. If I lived in the midst of it I should soon become unconscious of it; and the architecture of individualism that surrounds us in London often makes one think of unconsciousness as a boon. If I looked at it I should be bored, but then, I should not look at it. Except, of course, where it was trying to be impressive—one would notice that because everything would be so large. It would make much pleasanter surroundings for one's daily round than the collective architecture of America, which is covered with dead bits of things that one was fond of when they were alive. But I do not know what more for it one can say.

I do not imagine that any conscious effort upon our part can determine whether we have this kind of thing for our future European architecture or we reform but retain our individualism. I have said that our profession needs reorganization, but I am not sanguine enough to think that the reorganization can be brought about by Act of Parliament, or even by concerted action among architects. I fancy that the decision between collectivism and individualism will depend upon how the individualist meets the advance of the Machine—the Machine that grows in power and cleverness every day, and that takes more and more work from our hands and needs more and more control by our brains. The Machine and the collectivist are excellent friends already—they are rather like each other, and fit in with each other's ways.

The "New Architecture"

Journalists are apt to write nowadays of our latest building fashions as the New Architecture, and I have nothing to object to in the description except that the thing described often isn't architecture and generally isn't new. That it isn't architecture may be a serious defect if it is displayed on occasions when architecture is required, on occasions when to use only simple engineering would be stupid and uncivilized. That it isn't new can matter to nobody except to the journalists, to whom, if it isn't new, it isn't news.

If we may reasonably doubt the existence of a "new architecture," or its possibility, we cannot disregard the great desire for it that underlies all the efforts we see to bring it into being. That desire must spring from discontent with the old, a discontent deeper and more respectable than any idle wish for change.

[Extracts from a paper read before the R.I.B.A. on Monday last.]

STAND AT OLYMPIA

(Commercial Motor Show)

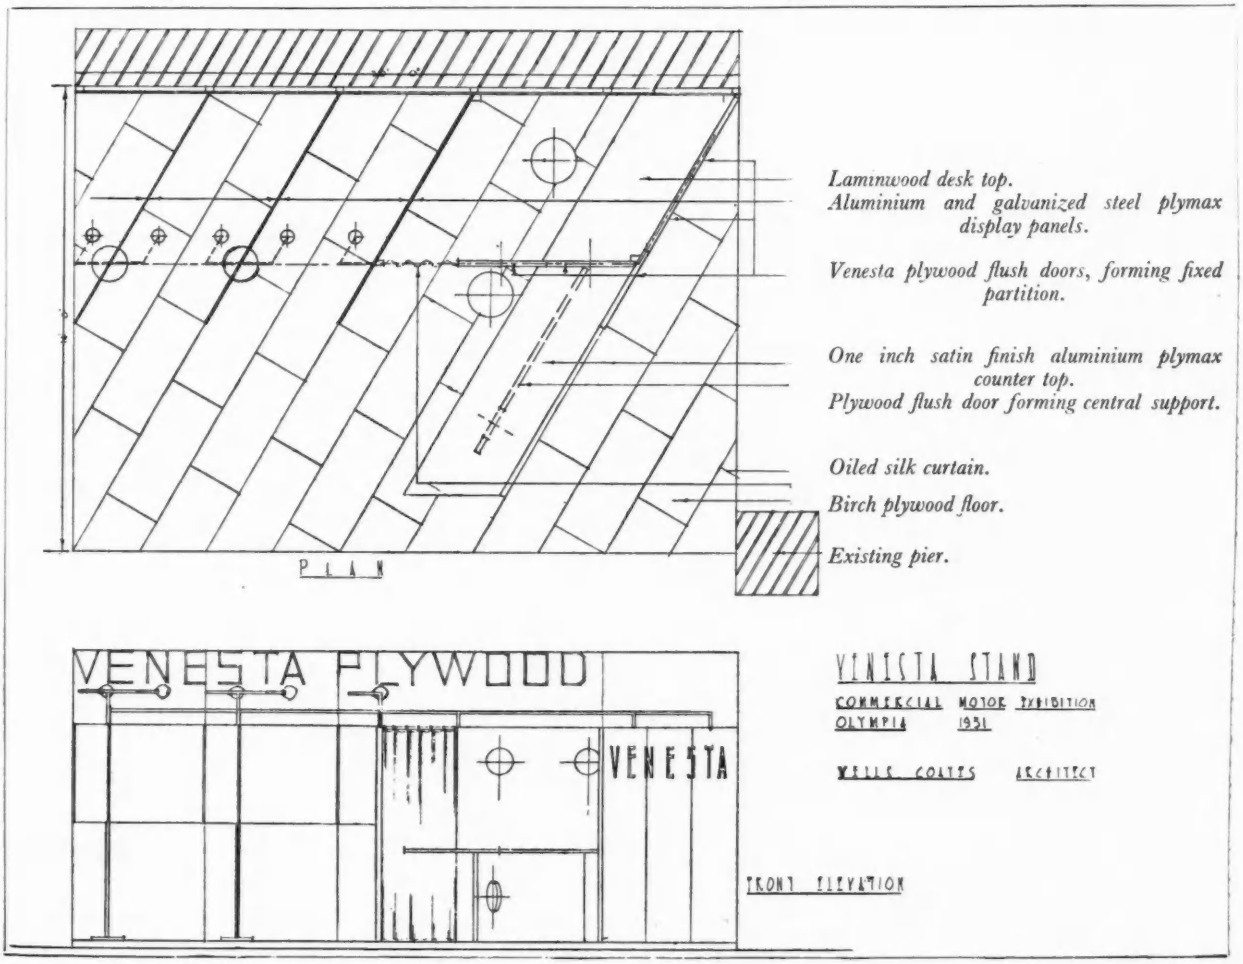
DESIGNED BY WELLS COATES

A photograph of the stand under its own illumination. The curtain to the office compartment is scarlet oiled silk; the steel framing and certain panels, and the faces of all lettering, are cellulosed pillar-box red.

THE site of this stand, in the area between the Empire Hall and the Main Hall, had many advantages from the point of view of isolation, and of traffic passing by, but a very large column of the Exhibition Building (shown on the accompanying plan) had to be reckoned with.

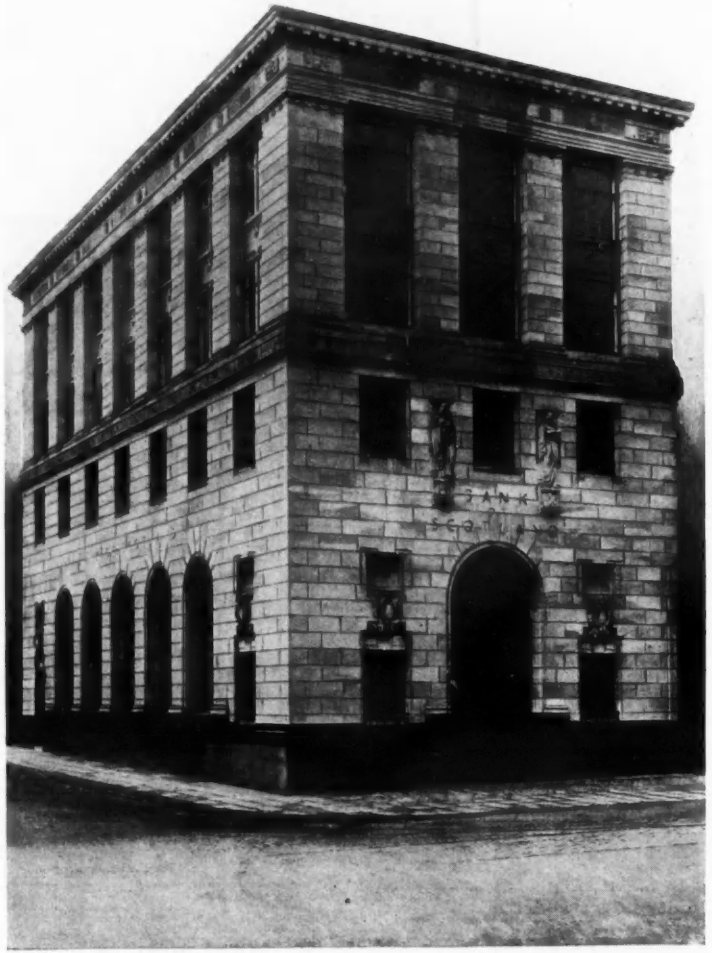
This column, in fact, together with the clients' requirements, which included the provision of a relatively large public space for salesmen, etc., determined the rather unusual plan-form of the stand. It will be seen that it is possible to view the whole of the display and the lettering at a glance from a great number of sight-lines.

The partition forming the office enclosure is made up of standard plywood flush doors, fixed with light framing. The counter has a top of 1-in. double-sided aluminium plymax, the top satin-finished. The display panels —all plymax—are supported by a light steel frame, which carries, in addition, the illuminating equipment, and forms a sort of "eyebrow" to the stand. The stand is also floodlit from the top of the column. The floor is constructed of birch plywood.



THE BANK OF SCOTLAND: Branch Office, 235 Sauchiehall Street, GLASGOW

DESIGNED BY JOHN KEPPIE AND HENDERSON



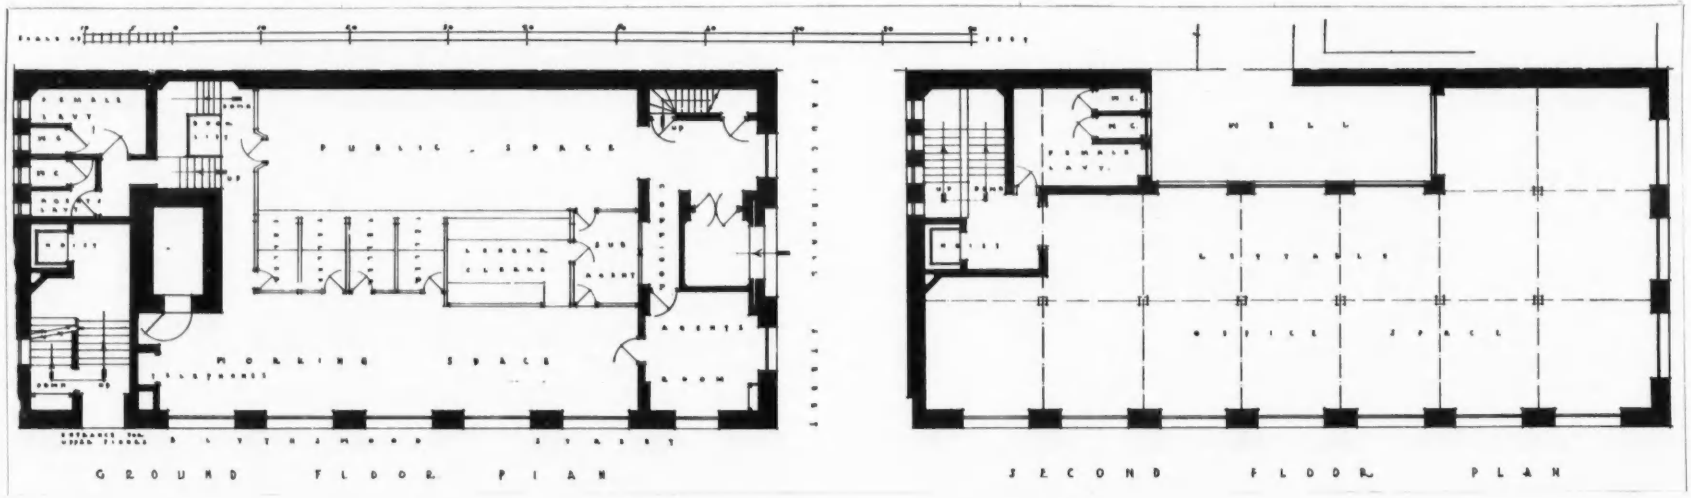
THIS building takes the place of old premises previously occupied by the Bank. The whole of the ground floor is occupied by the banking hall and other bank accommodation, the upper floors being let as offices.

The structure is steel-framed and fireproof, the external walls being of white sandstone, from Auchenheath Quarry, with granite base. The bank windows and door are bronze, the upper windows being of steel.

The walls of the bank are lined with Napoleon marble up to the level of the coved plaster ceiling. The fittings and furnishings throughout are of Spanish mahogany.

The main front to Sauchiehall Street, and the return to Blythswood Street (left of picture).

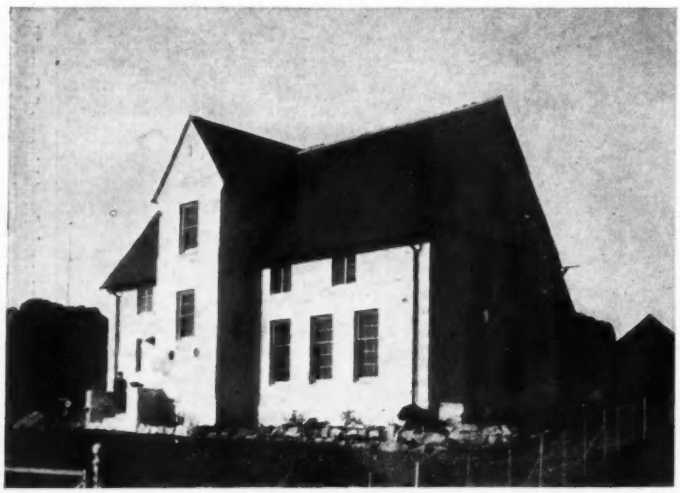
The figures, "Prudence" and "Security," and the bronze coat of arms, are modelled by Benno Schotz.



Plans of the ground, and of a typical upper floor, designed for letting off; and views from either end of the banking hall. This has a coved and coffered plaster ceiling, above walls of Napoleon marble, and fittings and furnishings of Spanish mahogany; the public space is floored with marble, the working space with oak blocks.

A STONE HOUSE IN ARGYLLSHIRE

DESIGNED BY POWYS AND MACGREGOR



The main front, facing south. The five large windows on the ground floor light the holiday-room. The staircase is in the central gable.

The house from the south-west, showing the main and side doors to right and left, respectively.

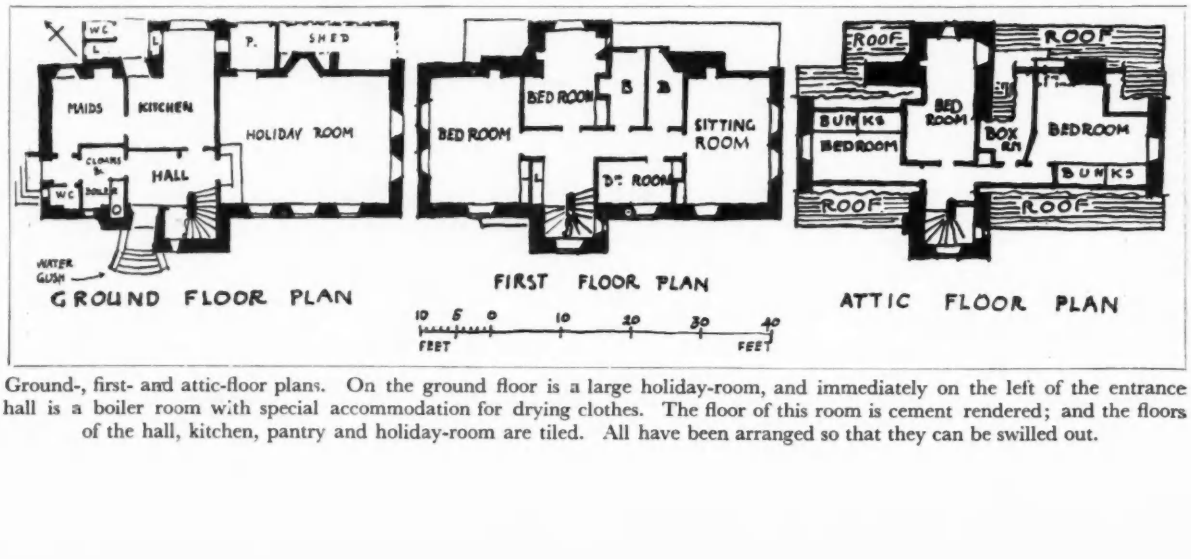
A view from the north-west. The walls are of stone, quarried on the site, and whitened; and the West Highland tiles used for the roof are almost black.

"DUN A' BHUILG" is situated on the wild, rocky promontory of Kintyre, and its remote and exposed situation naturally influenced the planning and construction.

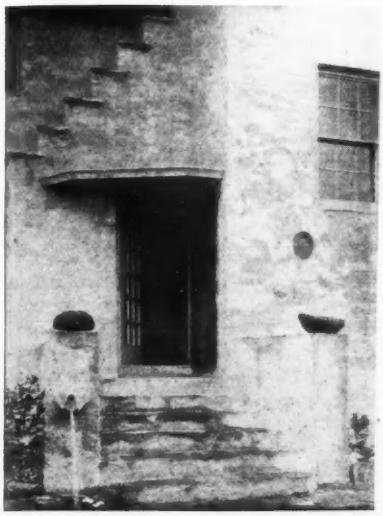
The interior of the house was the main consideration, and the elevations have nowhere been allowed to impose themselves on the plan.

The walls and chimneys are of stone quarried on the site, the partitions being of brick on the ground floor and lath and plaster on the upper floors. The walls are whitened on the outside, the inside being lined with wallboards for greater warmth, and also to hide any signs of damp that might be forced through the stone walls by the winter gales. The bylaws of the district stipulate that this method should be used, with an alternative of plaster on wall battens.

The house is covered by a main ridge roof and by a subsidiary cross ridge roof which is much narrower, but



Ground-, first- and attic-floor plans. On the ground floor is a large holiday-room, and immediately on the left of the entrance hall is a boiler room with special accommodation for drying clothes. The floor of this room is cement rendered; and the floors of the hall, kitchen, pantry and holiday-room are tiled. All have been arranged so that they can be swilled out.



The main entrance. The water supply is by gravity from a burn. The flow is continuous, and the overflow gushes out of the wall on the left of the steps.

rises from plates some 7 ft. 6 ins. higher than those of the main roof. Thus the tie ceiling rafters of the subsidiary roof are level with the collars of the main roof, and the subsidiary roof masters the main one by 12 to 18 ins. West Highland slates have been used.

The water supply is by gravity from a neighbouring burn. The flow is continuous, and there is no ball valve to regulate it. The overflow is taken in pipes to the side wall of the front steps, where it gushes out. As the owners of the house spend much of their time yachting and fishing, and have several children, this running water outside the house is useful in many ways.

The staircase is placed in the central gable by the front door. The stairs are of solid Scotch fir baulks, built into the walls around a central pillar, which has a rope in the place of a handrail.

Looking from the entrance hall into the living or holiday room. The window shown overlooks the south-east front. The staircase is on the right of this door.

House in Argyllshire.] [*By Powys and MacGregor.*

One of the two bedrooms on the attic floor, which are fitted with bunks, planned in tiers, one above the other, for the use of the children.

LETTERS FROM READERS

Rubber Flooring

SIR,—While our particular interest is in floor coverings, your special issue for November 4 must appeal to all connected with the building industry, and in particular to firms concerned with modern materials.

In his article, Mr. Williams, due no doubt to restricted space, does not deal fully with this material. British manufacturers could prepare rubber in large sheets equally as well as a Continental preparation, but is there any advantage in employing such a type? First, a soft quality is necessary to ensure unbroken joints in vulcanization, but a soft quality is entirely unsuitable for a rubber floor if permanency is required. The slightest breakage of bond between the rubber and sub-floor will enable the rubber to stretch, when trouble and dissatisfaction are inevitable. Apart from this undeniable fault, the colours of the Continental flooring are not fast.

A reference is made in the article that tiles for good work should not be less than $\frac{3}{8}$ in. thick. Although it is obvious that such a thickness will supply longer life than $\frac{1}{4}$ in. thick, an instance of satisfactory service has recently been brought to notice where over fourteen million people have walked over a tiled floor, $\frac{1}{4}$ in. thick, and the wear is yet negligible.

It should be emphasized, however, that there is a difference between drum-cured flooring and press-cured tiling. While generally the quality is similar before vulcanization, the resultant finished article is different in wear-resisting properties. It is desirable, therefore, that tiles should not be cut from flooring, not only on account of the superiority of press-cured tiling, but the latter, being cured flat in a press, will not curl, a recognized fault with flooring when cut into tiles.

No rubber will be satisfactory for a prolonged period if laid on an unsuitable base. If not smooth, irregularities will obviously show on the upper surface of the rubber, irrespective of its thickness.

The sub-floor must not only be dry, but permanently so; therefore, it is a waste of money and good material to lay rubber on a cement-rendered concrete floor when the concrete is direct on earth.

G. C. SUMMERFIELD,
(THE LEYLAND AND BIRMINGHAM RUBBER CO., LTD.)

Lintels and *Lintels*

SIR,—In the JOURNAL for November 11 I noticed that Astragal, under the paragraph heading, "The Importance of being Mr. Ervine," quotes, rather sardonically, a portion of one of Mr. Ervine's dramatic criticisms. I refer especially to the part which reads "Sir Charles leant against a lintel."

Is Mr. Ervine not entertaining a very popular author's misconception? So eminent a literary stylist as the late Joseph Conrad repeatedly refers in his novels, *Nostromo* and *Almayer's Folly*, to men who "lean against lintels." But there may be some excuse for Mr. Conrad, as he was essentially a seaman, and lintels are notoriously low in ships! ALEX. CULLEN

Specialists and Sub-contractors

SIR,—The negotiations between the R.I.B.A. and the National Federation of Building Trades Employers in connection with the New Form of Main Building Contract, have revealed the necessity and desirability of having a properly constituted federation representative of sub-contracting interests generally.

An *ad hoc* negotiating committee was formed at the end of 1928 to protect the interests of sub-contractors and specialists in general. This negotiating committee was supported by two groups of sub-contractors:

(*a*) The Federation of National Associations of Sub-Contractors (Building and Allied Trades), covering master plasterers, master painters, master plumbers, and master slaters and tilers;

(*b*) The Joint Committee of specialists associations, covering twenty-eight important associations, and by the Builders' Merchants Alliance as representing the suppliers of goods.

This *ad hoc* committee was invited to meet the representatives of the R.I.B.A. and the National Federation of Building Trades Employers, and, after many conferences, the New Form of Main Building Contract was finally agreed upon and published.

Outside these large groups there are numerous associations of sub-contractors in no way federated so as to be in a position to deal with questions (apart from wages) which arise from time to time affecting the interests of all. For example: at the present moment, following the publication of the New Form of Main Contract, a standard form of sub-contract for building work has to be negotiated with the builders. For this purpose, another *ad hoc* committee has been formed to carry on such negotiations. Furthermore, the interim report of the Building Industry Council of Review makes it clear that the whole question of the employment of specialist firms is under consideration by the R.I.B.A., and that any developments, probably of far-reaching character, should be watched in the interest of specialists and sub-contractors by some properly federated and constituted body representative of all.

The question is being considered by a group of sub-contracting interests who make the following proposals:

1: That an association with headquarters in London should be formed, entitled "The National Federation of Associations of Specialists and Sub-Contractors."

2: That membership should be restricted to associations of trades interested in sub-contracts and specialists' work of the building and allied industries.

3: That the subscription should be nominal to cover expenses. (It is possible that such secretarial services as may be necessary, including the use of a suitable room for meetings, would be obtained in London at comparatively small cost to the Federation.)

4: That the objects of the Federation should be to deal with all questions affecting the interests of sub-contractors and specialists in general (excluding wages); to formulate and to recommend for adoption by the constituent associations courses of action consistent with the general policy agreed upon by the Federation, and in particular to consolidate the good relationship and understanding between specialists, sub-contractors, architects, surveyors and builders.

It is necessary to emphasize that the Federation would in no way interfere with questions of wages nor usurp the functions and work of the constituent associations, but would deal only with questions where concerted action may be necessary and desirable.

Sufficient support is already assured the Federation to make it possible to summon a meeting to be held in London in January next to take further necessary steps. T. A. MACINTYRE

(FINSBURY COURT, E.C.2)

Composition for Roofs

SIR,—I have had occasion to use a composition on roofs where the cost had to be seriously considered, and have tried several advertised compounds. My experience, however, has not been altogether satisfactory, as I find that (1) the life is too short owing to an early evaporation, or (2) that the material remains too tacky on the surface, especially in warm weather. May I ask if any of your readers have found a composition that gets over these objections? F. H. B.

[The Editor invites letters from readers who have experienced the same trouble as the above correspondent.]

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

PARLIAMENT was opened by the King on November 10. In the course of the debate on the Address in reply to the Speech from the Throne, Mr. McEntee, a Labour member, raised the question of housing.

He said that by building on a large scale, by mass production and standardization, prices could be reduced by 15 per cent. There were many thousands of men in the building industry out of work, and there was no earthly reason why they should not be employed except the lack of organization in the industry itself. He asked the Government if it was not possible for them to go particularly into the question of housing and to see if it was not possible to get mass production introduced and standardization, and to reduce costs. They could get by organization reductions in price that would mean the employment of 200,000 men, and it could be done within a year.

Rent Restriction Act

At question-time Sir E. Hilton Young, Minister of Health, said that the future of the Rent Restriction Acts and any amendments of the Acts would be considered by the Government in the light of the Report of the Departmental Committee which was recently issued. In the meantime it was proposed to prolong the operation of the present Acts by means of the Expiring Laws Continuance Bill.

Town and Country Planning Bill

Asked if it would be possible to re-introduce the Town and Country Planning Bill, Sir E. Hilton Young said that careful consideration would be given to this matter with a view to an early decision as soon as circumstances permitted.

Lighting of the National Gallery

Mr. Campbell asked the First Commissioner of Works whether he was aware that the lighting scheme of the lately erected western rooms at the National Gallery, containing early Italian pictures, had proved to be a failure, as the public could not see the pictures owing to lack of daylight; and would he obtain expert advice as to whether the structure of the rooms should be remodelled, or whether the daylight lighting of these rooms could be brought up to the standard of the rest of the National Gallery.

Mr. Ormsby-Gore said that he was aware that the lighting had been criticized, but the illumination of art galleries was a difficult subject and there were various opinions as to what constituted proper lighting. The gallery was erected in accordance with plans and a model approved by the Trustees and the donor, Sir Joseph Duveen. The decorative treatment also was settled directly by the donor in consultation with the Trustees. He regretted that he was not in a position, having regard to the need for national economy, at present to authorize further public expenditure on altering the gallery.

LITERATURE

THE ARCHITECTURE OF PLEASURE

THIS book consists of a number of photographs of modern cinemas, accompanied by plans, architectural and technical descriptions and details of the recording apparatus, prefaced by a short series of articles on the architectural, optical and acoustic problems of the modern cinema.

The English and American examples are particularly disappointing, and their inclusion gives a totally wrong idea of cinema construction here and in the United States. The compilers protest that the English and American does not realize, or, at any rate, carry out in his design, the elementary fact that the cinema is essentially a closed box with requirements entirely different to any other type of building and necessitating a style of its own. Certainly, judged from the examples chosen, their criticism is justified. One of the English examples looks rather like a city hall or public library, another is a glorification, if such term can be used, of mock half-timber work and entitled "The Tudor"; the American examples are all of the "atmospheric" type, mostly the work of John Eberson; one, the Palace at Canton, Ohio, is a monstrosity compared with the excellent German examples. In this particularly ill-assorted collection the work of Mr. Robert Cromie stands out, to quote Kipling, "like a sunflower against a tarred fence or a mustard plaster on a sack of coals."

Surely, however, this is not fair to English or American designers or architects. It is very possible that German cinema architects have, on the whole, better taste and a better conception of what a cinema essentially is: more probably they are less hampered by their clients. Certainly no one wishes to say anything to detract from their excellence. But, in a book entitled *Cinema Theatres*, without qualification, the reader is surely reasonable in expecting to find England,

[*From* Lichtspielhäuser und Tonfilmtheater

The stalls foyer of the Capitol Cinema, Breslau. Friedrich Lipp, Architect.

It is, on the whole, a disappointing book. The photographs are certainly extremely good, and the accompanying material makes it useful as a work of reference, but as a résumé of any particular style or technique it is too diffuse, and as a description of the modern style in cinema construction, too limited. Surely some examples from Paris and Stockholm might have been added.

SOCIETIES AND INSTITUTIONS

ARCHITECTURE OF THE FUTURE

MR. JOSEPH EMBERTON, A.R.I.B.A., lecturing on "The Influence of Modern Material in Architectural Treatment," at a meeting of the Birmingham Architectural Association, held on November 6, said the times in which we lived seemed to be out of joint. We found ourselves in a situation in which the scientific inventions and mechanical improvements of the last quarter of a century necessitated fundamental changes in our social existence. Public authorities were building houses which cost in rent from 12s. to 15s. a week, while the people who lived in them could only afford from 8s. to 10s. Architecture affected this sad state of affairs in two ways: (1) the houses were costing too much, and (2) we were not obtaining the full value from mechanical devices used in manufacture on account of heavy overhead charges, created to some extent by out-of-date methods of building in factory, office and shop.

Generally, the houses which were being built did not give to working people the comfort to which they should be entitled in these enlightened days. We were still building more or less the same type of accommodation which had been provided for the last 300 years. We were not taking advantage of the mass-produced and scientific building materials which were so plentiful. The reason for this was that to obtain economy by the use of these new materials and services the unit dwelling must be larger than the cottage or a pair of cottages. We could not advantageously employ the steel frame or reinforced concrete, nor instal central heating economically in so small a unit as the cottage.

Another aspect of the present policy which provided accommodation for the masses by small detached or semi-detached cottages was the extravagant use of land and the destruction of potential food-producing areas or pleasure grounds, at the same time forming large scattered suburban areas, making it necessary for people in the centres of towns to pass through miles of dull and uninteresting regions in order to enjoy the pleasant conditions of the open country. The obvious solution was to house the people in towers with large open spaces around them, which could retain the existing trees and be formed into gardens for pleasure or the production of food.

Dealing with the influence which modern materials should have in the towns, Mr. Emberton said traffic was one of our most urgent troubles, and something more drastic than roundabouts and one-way streets would have to be done if people a few years hence were to move at all. The first thing which would have to be removed was the sentimental attitude which insisted that buildings of doubtful antiquarian interest should be retained long after they had ceased to perform any useful function and stand in the way of economical development. Our cities should be considered as efficient workshops. The present method of widening streets by a few feet and restricting the height of buildings to 60 or 80 ft. would only delay the traffic crisis, perhaps for a generation, but not more. By then, aeroplane traffic would have to be considered, and the street would be out of date. The city of the future would be a city of towers, probably a quarter of a mile apart, in pleasant gardens, with plenty of room for all sorts of traffic and a tube station at the bottom of each tower. Vertical travel by means of lifts was obviously more efficient than horizontal travel, with present congestion.

Buildings, he concluded, should be designed as efficient machines rather than monuments to ourselves, and then perhaps we should evolve forms of beauty—related to our own times—such as had been achieved in other fields of construction, such as aeroplanes, ships and railway engines. Yet none of these things had been designed from an æsthetic point of view.

WEST YORKSHIRE ARCHITECTS

Mr. Norman Culley, F.R.I.B.A., in his presidential address to the West Yorkshire Society of Architects, held at Leeds on November 9, said that amidst our present-day civilization, with its complex of expression in architecture, well equipped was he who in his student days had learned the fundamental principles underlying all good expression in all styles and all methods of construction of the past.

The many new materials of architecture might quite properly give a nomenclature of synthetic architecture.

The full architectural development in materials in which colour was inherent had not been achieved. The psychological effect of colour was tremendous, particularly in the form of artificial illumination. One could almost anticipate an architecture of light and the ultimate realization of the psychological effect of colour in the flooding of our churches and chapels with a beautiful golden light immediately preceding and during the time of taking of collections.

Materials of inherent colour might reinforce the structural functioning. The admirable cry that form should follow function would appear to have been in many cases misinterpreted and resulted in manipulation of form, and not articulation of form. It would claim to be functional whilst its real category would be pseudo-functionalism, false to the very nomenclature claimed.

The whole dominant motive might be horizontal: man certainly moved in a horizontal direction, he was not naturally a climbing animal; but this was an age of machines, and machines could assist man's aspirations to movement in a vertical direction.

Architectural rhythm was not confined to a horizontal plane; but was expressed in a vertical plane also. One recollected two architectural design maxims of Professor Donaldson: (1) Unity without variety produced insipidity; (2) variety without unity produced confusion and distraction.

In rhythmic design the dominant motive might be horizontal or vertical, but whichever was dominant, the other would intensify and render satisfactory the desired effect.

Bereft of a superfluity of historical trappings, as it was, with the development of a system of just ornamentation for added virtue of grace, and as an aid to expression; with a rhythmic appreciation in design, one could see the "goose" of his last year's presidential address becoming the "swan" of this; a building achieving the requirements of beauty in elements which must be primarily structural.

Consideration of the subjectivity and objectivity of all art perception showed that it was the goose which had changed and not the swan.

Every true architect saw life as a matter of ideals in addition to bread and butter. It was Browning who wrote:

Man's aim must always exceed his grasp, else what's a Heaven for?

Of the competitions instituted by the society, open to its associate members, the following were the results:

Halden Prize (£4 4s.) for Essay: Mr. Fred Butterworth Walker, of Luddenfoot.

Measured Drawings and Sketches. Mr. Hubert Henry Castle, of Ackworth, Doncaster.

DEVON AND CORNWALL ARCHITECTS AT DINNER

Dr. Raymond Unwin, P.R.I.B.A., responding to the toast of the "R.I.B.A.," proposed by Mr. B. Priestley Shires, at the second annual dinner of the Devon and Cornwall Architectural Society, held at Plymouth, urged the desirability of preserving what was still preservable in that old part of Plymouth from which so many of our forefathers went forward to establish our reputation throughout the world.

The district, Dr. Unwin said, had done extremely well in regional planning, but one of the things that most

architects had to learn was to harmonize their buildings with the settings to which they belonged. They should be like jewels set in that wonderful silver and golden setting which Nature provided in Devon and Cornwall, with their wonderful amount of variety and beauty.

THE PHOTO-THEODOLITE

In the course of a paper on "Easements of Light," read before the Institution of Civil Engineers, on Thursday of last week, Mr. John Swarbrick, F.R.I.B.A., M.I.STRUCT.E., described his invention of a Daylight Factor Theodolite. Devised in order to obtain data for light-measuring calculating sheets, it consists, he said, of a theodolite stand, with the usual means of adjusting the level and reading the angle of azimuth.

Above the theodolite there is a camera, in place of the usual telescope of the transit theodolite. This camera can be rotated either in the horizontal or vertical planes, and it is so fixed that the centre of the iris of the lens or the nodal point of the lens is always in the centre of rotation. In this way, it is possible to obtain any number of photographs, showing the effect as the eye would see it from exactly the same point. By using a fixed focus, it has been possible to construct a series of angular grilles, corresponding to the various directions from which photographs have to be taken. By superimposing these grilles over the photographs, it is possible to ascertain with accuracy the exact extent and the position of the portion of the dome of the sky visible from the point in question.

It will be seen that, by taking photographs of a whole series of windows, in this way, from one point, it is possible to measure the exact amount of light that would be contributed by each of the windows to the point under consideration. A patent has been granted to me in respect of this instrument, which was found to be entirely novel and distinct in principle from any other invention.

It is practically impossible by means of a purely mathematical calculation to obtain the data required in an average easement of light case. Even the geometrical method, without the aid of photography, is a very long and troublesome business. The obstructing buildings are frequently at various angles, and the features upon them in a series of receding planes. This necessitates the preparation of a trigonometrical survey of the adjacent sites and the preparation of elevations and roof plans of the surrounding buildings. These have either to be obtained by measurement or by borrowing drawings from the architects or owners of the buildings in question. Sometimes the owners are unwilling to supply the data.

By means of the photo-theodolite, continued Mr. Swarbrick, I can now obtain as much information as I require, in the case of each view, in a matter of of a few seconds. The process of measuring all the points around the varying skylines by means of a transit theodolite is exceedingly tedious. Quite frequently dozens of points have to be dealt with on each floor. There are cases in which the expense incurred by proceeding in the old-fashioned way has been altogether out of proportion to the amount of the claim. By proceeding photographically it is possible to do a considerable part of the work at a fraction of the cost hitherto incurred.

Although the new instrument has not yet been long in use, it has already come to be employed extensively in cases in various parts of this country. My belief is that, in the future, the courts will prefer to utilize the photographic method of dealing with right of light cases to the fullest extent possible.

ST. PETER'S AND THE VATICAN

Sir Banister Fletcher, PP.R.I.B.A., lecturing at the Central School of Arts and Crafts on November 4, gave a vivid history of the building of St. Peter's Cathedral and the Vatican, illustrated by a splendid series of lantern slides.

Sir Banister, in his lecture on "Architecture of Venice," on Wednesday last, passed a number of encomiums on the great city of the Adriatic, which we Londoners, with certain necessary reservations, might with pardonable pride, appropriate to ourselves.

He said that, like Venice, our city was sea-born, and dependent for centuries on its sea traffic. But besides the sea we had the river, and if "water was the chief town-planner of Venice, and gave her the finest curved street in the world," the same might be said of the Thames as it swept round from Blackfriars Bridge to Westminster. We, too, had the finest street in the world. "Earth hath not anything to show more fair" was the poet's feeling as he crossed Westminster Bridge in the early morning. Venice introduced the horizontal lines suitable to a sea site; we had done the same in Somerset House and the County Hall, and were doing the same in a hundred other rising buildings. While the Doges "tore down buildings" to make a great piazza a fitting frame for the glowing picture of the façade of St. Mark's, we allowed our own St. Paul's, built on a far finer site than any Venice could show, to be confined within towering warehouses, which robbed it of much of its grandeur.

THE WORLD'S CEMENT PRODUCTION

Mr. Hal Gutteridge, A.M.I.MECH.E., lecturing on "The Manufacture of Portland Cement," at a meeting of the Institution of Structural Engineers, held on November 12, stated that in 1929 the total capacity of all cement plants in the United Kingdom was 6·75 million tons, with a production of 4·7 million tons, compared with the capacity of the United States plants of 43 million tons, and a production of 28 million tons. Canada, during the same year, had a capacity of 2·5 million tons, and produced 2 million tons.

Belgium exported the greatest quantity of cement of any country, amounting to 1·6 million tons, which was 58·3 per cent. of its total production, as compared with Germany with 1 million tons. Then, in descending order, came the United Kingdom (20 per cent. of total production), France, Denmark, the U.S.A., Canada, Sweden and Italy.

The U.S.A. imported the greatest quantity of cement of all countries, the United Kingdom being next. All countries had an excess of exports over imports of cement except the U.S.A., where there was an adverse balance of about a quarter of a million tons.

A STRUCTURAL STEEL FEDERATION

At a meeting of the steel structural industry it was unanimously decided to form a new organization called the National Federation of Bridge and Structural Engineers. Mr. James Halliday, of Messrs. Francis Morton & Co., Ltd., was elected the first chairman, and Mr. E. A. Willson, of Messrs. Archibald D. Dawnay and Sons, Ltd., vice-chairman.

The new federation has a wide field of work before it in the conditions affecting the supply and delivery of steelwork for all classes of public and private contracts. Its formation represents a keen desire on the part of this section of the steel industry to be ready to deal with every phase of economic policy with which the industry may be confronted. At the meeting a programme of work was decided upon and an executive committee, representing every district in England and Scotland, was elected.

The members of the Executive Committee are as follows: J. W. Baillie (The Horseley Bridge and Engineering Co., Ltd.), R. S. Benson (Head, Wrightson & Co., Ltd.), T. Booth (John Booth and Sons), A. J. Burgess (John Lysaght, Ltd.), H. B. Denton (Joseph Parkes and Son), J. R. Dixon (The Cleveland Bridge and Engineering Co., Ltd.), T. R. Miller (Motherwell Bridge and Engineering Co., Ltd.), A. Robson (Fairfield Shipbuilding and Engineering Co., Ltd.), J. D. Stitt (Redpath, Brown & Co., Ltd.), Grahame H. Thomson (P. and W. MacLellan, Ltd.), W. T. Thornhill (Rubery, Owen & Co., Ltd.), F. G. Woolley (Joseph Westwood & Co., Ltd.).

The secretary of the National Federation is Mr. C. J. Kavanagh, Artillery House, Artillery Row, S.W.1.

QUESTIONS THAT ARISE

Walling of Scottish Houses

"G. B." writes: "*Could your expert please inform me whether the following statement is correct:*

"'*The surface of an old Scottish house is not roughcast. The walls are built of rubble, and the successive coats of whitewash give a beautifully undulating surface which catches the light and sparkles with sunshine.*'

"*The above remarks are contained in a description by the architect, Mr. J. W. Laird, of Glasgow, of the house erected in Kelvin Hall, Glasgow, the winning design in* The Daily Mail *competition.*

"*The word 'harling' has been used in Scotland for generations, and is still used. I have always understood, after forty years' experience of the Scottish building trades, that this is an alternative for rough casting. I cannot imagine how anyone knowing Fyvie Castle in Aberdeenshire, part of which dates back to the eleventh or twelfth century (the Meldrum Tower), could make such a statement, and there are scores of old buildings in Scotland finished in the same manner, although in most of the older houses lime was used instead of cement.*"

The walling of Scottish houses of the sixteenth and the seventeenth centuries was generally built with rubble-stone and plenty of good lime mortar. Into the mortar filling, between the stones, on the outside and the inside faces of the wall, stone pinning and small chips of different sizes were firmly stuck, and the surfaces flushed with mortar; these operations were done, I believe, at the time of building. Such craftsmanlike work may still be found intact in a sheltered situation. That these rubble walls were not intended to be harled is clearly seen from the nature of the dressings, usually "picked" and finishing flush with the rubble wall-faces.

It appears that when in course of time the "pointing" required re-doing—probably early in the eighteenth century—the cheapest and readiest way was adopted, of covering the rubble surfaces, and very often all the dressings and corbelling also, with a uniform coating of "rough-cast," or "harl," as it is called in Scotland. To have picked out the mortar and the chips or "cocking," and to have done the work again as at first, would have been much too costly an operation. Anyhow, close-harled walling became the ordinary thing from early in the eighteenth century; a horrible variety, called "sneck-harling," came in fashion much later.

Rubble-built castles in the north-east of Scotland have been in the way of being harled—and reharled—for at least two centuries; but it is distinctly to be understood that the older castles, although now harled, were not meant to be so summarily (? ill) treated.

Limewash on outside rubble-walling of any date is practically unknown in the north-east of Scotland north of the Grampians—of old, "the Mounth." South of the Mounth, however, limewashing houses is common; but whether the practice goes back to the seventeenth century I do not know. Lime-washing *inside* walls was, of course, common everywhere. In this district, outside limewashing seems to be confined to coastguard stations and such buildings, and perhaps to some cottages in fishing villages. W. K.

Magnetic Variation

"Query" writes: "*Could you inform me as to the present variation of the true north point from magnetic? Some years ago I came across an easy method of making the calculation, but have lost the record. I believe a certain amount of deflection was allowed each year until a certain degree, either westerly or easterly, was reached, and then the amount of variation was reversed.*"

The magnetic variation, i.e. the angle between the true and magnetic north, is 11° 50′ W. in London in 1931—i.e. the magnetic needle is Wd. of the true north. The annual change is 13′ decreasing; this change is due to the magnetic poles of the earth changing their position with regard to the geographical poles. The condition of the variation of the world for 1927 can be seen on the Admiralty Chart No. 2598 (obtainable from H.M. Stationery Office). R.

Suspended Concrete Floor

"Grano" writes: "*I am building a rather large suspended concrete floor with light joists at 18-in. intervals encased in 6 ins. of concrete. It is to be finished in granolithic paving 1 in. thick. I am now wondering whether it is necessary to make expansion joints to prevent cracking of the topping. If your expert thinks expansion joints are necessary, at what intervals should they be used and of what material?*"

It will certainly be advisable to provide expansion joints, to allow for cracks which will inevitably arise in any granolithic floor laid in such circumstances. Generally, the floor panels should not exceed 6 ft. square, and if the first to be laid are set out checker-fashion between 1-in. fillets secured to the concrete, which serve as guides to the rule, and, when the squares are set and the guides removed, strips of tarred paper are set against the free edges and the intervening checkers are filled in, that gives a practically successful result. Brass strips are sometimes used, or lines of paving tiles or tesseræ, by which a structural necessity may be converted into a legitimate decorative device.

It is preferable to get granolithic flooring laid by a specialist firm, which is generally an economy in the long run. E. G.

LAW REPORTS

ARCHITECT'S CLAIM FOR FEES

Poley v. *Fey. King's Bench Division. Before Mr. Justice Hawke*

THIS was an action by Mr. Edwin W. Poley, of Geraldine Road, Chiswick, against Mr. Albert Bennett Fey, of Stamford Hill, to recover the sum of £1,824 odd, fees alleged to be due on the erection of two blocks of flats in the North Circular Road, Golder's Green.

Mr. Batt, counsel for the plaintiff, stated that his client prepared the plans in 1929 and the flats were erected, but plaintiff had only been paid £20. Plaintiff's fees were in accordance with the usual scale. Defendant now alleged that the plans were rejected by the local authority.

Giving evidence, the plaintiff said the flats were erected in accordance with his plans, with one slight variation. The plans represented a month's work, and his charges were on the R.I.B.A. scale. The cube cost of the buildings was £47,700.

Cross-examined, plaintiff denied that he agreed that if the plans were rejected by the local authority he would not be paid.

Were not your plans rejected?—No, they were used.

Mr. Albert E. Poley, an architect and son of the plaintiff, said he was employed to supervise the work, and the plans used were prepared by the plaintiff. The building cost £25,000.

Mr. Thomas, counsel for the defendant, said the plans finally approved by the local authority bore the name of another architect who was now making a claim on the defendant.

The defendant gave evidence, and said the contract price for the building was £23,500, and he understood that the proper charge by the architect was 4 per cent. on that sum. He understood that the plaintiff's plans were rejected.

After further evidence, Mr. Thomas said that the point was whether plaintiff was entitled to 4 per cent. on the estimated cost of the building or the contract price. He said he was prepared to admit that there was no substantial difference between plaintiff's plans and those actually used. His contention was that the plaintiff's claim should be reduced to cover the cost of altering his plans, which was necessary because of his omission to make them comply with the Town

Planning Scheme in operation in the district.

His lordship, after hearing the arguments, gave judgment for the plaintiff for £1,400 with costs.

LIABILITY OF LANDLORD

Cooper v. *Double. King's Bench Division. Before Mr. Justice Macnaghten and a Common Jury*

This action raised important points in regard to the liability of landlords in the matter of injury to a tenant due to alleged negligence of the landlord to keep the premises reasonably fit for habitation within the meaning of the Housing Acts.

Mr. Martin O'Connor appeared for the plaintiff, and said his client was Mr. Geo. William Cooper, a plater, and he resided at 27 Latchmere Road, Battersea, and he sought to recover from the defendant, Mr. Double, his landlord, damages for personal injuries sustained through the alleged negligence to keep the premises in a proper state of repair. His client occupied the basement flat in the house, paying 7s. 6d. per week. Plaintiff's case was that, on February 8, 1930, whilst walking in the passage leading from his front room to the back of the flat, a floor board in the passage, on which he stepped, tipped up and collapsed, with the result that he was thrown down and, falling against a bicycle, sustained injuries which included the loss of sight of the right eye.

Counsel's contention was that the accident was caused by the negligence of the defendant to keep the premises in a reasonable state of repair. Water had percolated through the passage, with the result that the joists were rotten. He further submitted that defendant had committed a breach of his statutory duty under the Housing Acts.

Plaintiff gave evidence and declared that he had given notice of the need of repair to the premises.

Evidence was also given to the effect that the joists supporting the floor boards were rotten.

Mr. Eastham, K.C., appeared for the defendant, and denied that the defendant had been guilty of any breach of agreement, or breach of any statutory duty or any negligence. Plaintiff, he submitted, had proved no liability on the defendant at all. The accident was not caused by a defective floor board at all, but he suggested that it was due to the plaintiff going along the passage in the dark and, slipping, falling against the bicycle. His case was that no notice had been given the defendant as to the need of repairs.

For the defence, evidence was given by Mr. E. Thompson, builder, of South Norwood, that the passage was repaired in March, 1928, when new floor boards were put in, and by Mr. J. J. Burgess, a Battersea Borough Council inspector, who said that he had received no notice of any defects in the floor boards and that he had seen nothing the matter with them prior to the accident. The inspector added that he had seen the floor boards since and found that one had not been properly nailed to the joist.

The rent collector for the agents of the defendant stated neither plaintiff nor his wife had ever complained about the floor boards prior to the accident.

The jury returned a verdict for the plaintiff, and assessed the damages at £614.

His lordship entered judgment accordingly and granted a stay of execution pending an appeal on terms, on the application of Mr. Eastham.

COMPETITIONS OPEN

TUESDAY, DECEMBER 1

INCORPORATED INSTITUTE OF BRITISH DECORATORS, Painters' Hall, Little Trinity Lane, E.C.4. "The Artist in Relation to Industry, with particular reference to Decoration." By H. H. Holden.

TRADE NOTES

The new Britco mass-production door factory of the Merchant Trading Co., Ltd., reference to which has been made from time to time in THE ARCHITECTS' JOURNAL, is now operating one full shift. The firm hope, however, shortly to commence two shifts, or alternatively to carry out their original idea of single unit plants at Bristol and London, for which they have already laid all plans. Some six years ago the firm took in hand the marketing of Celotex, and it is generally conceded throughout the country that owing to their persistent efforts they have been most successful in the handling and distribution of this product. In conformity with the policy of marketing English made and Empire products they have taken a further step. As the agreement with the Celotex Co. expired on November 11, they have decided to discontinue marketing this product. Instead, the firm have consummated arrangements with the Anglo-Colonial Trading Corporation, Ltd., an associated company of Messrs. Balfour, Williamson & Co., whereby the Merchant Trading Co., Ltd., are to represent as sole importers and wholesale distributors throughout England, Scotland, Wales, Northern Ireland, the Irish Free State, and for certain other territories, the Insulation Wallboard "Donnacona," which is a product of Messrs. Price Bros. & Co., Ltd., of Quebec, Canada. Arrangements have also been completed for the transference of several members of the staff of the Anglo-Colonial Trading Corporation, Ltd., to the Merchant Trading Co., Ltd. Mr. Cory, the general manager of the former company, joined the Merchant Trading Co., on November 15, as sales manager for the product.

*

Messrs. D. G. Somerville & Co., Ltd., of 35 Grosvenor Place, S.W.1, have recently produced a new artificial precast stone, marketed under the trade name of Durus. This new building material is, it is claimed, obtainable in finishes similar to most natural stones now in use, and can be moulded and cast to practically any requirements. For facing purposes, it is stated, Durus has special advantages, whether from the point of view of economising over natural stone or adding the finishing touches to an otherwise unattractive building. It is manufactured at D. G. Somerville's own works at New Cross. Among the contracts for artificial stone now in hand by the firm are the following: The Royal Institute of Public Health (Gunton and Gunton, Architects), the Willesden Education Committee, and also the supply of kiosks for the Postmaster General and the Receiver of the Metropolitan Police.

This girder, 68 ft. long, 10 ft. 4 in. deep, by 2 ft. 4 in. wide, weighing 98 tons, will carry 9 upper floors at the Cumberland Palace Hotel, Marble Arch, London. It was constructed by Messrs. Dorman Long & Co., Ltd., and transported in one piece from Middlesbrough to the site. The rivets alone weigh 2½ tons.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

Thames House, Westminster, S.W.1 (pages 666–671). General contractors, John Mowlem & Co., Ltd., who were also responsible for the floor construction and private roads and sewers. SCOTLAND

The GLASGOW Education Committee has acquired a site in Anworth Street, Tollcross, for the erection of a Catholic school.

The GLASGOW Corporation is considering a scheme for the erection of houses on the Blackhill golf course.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

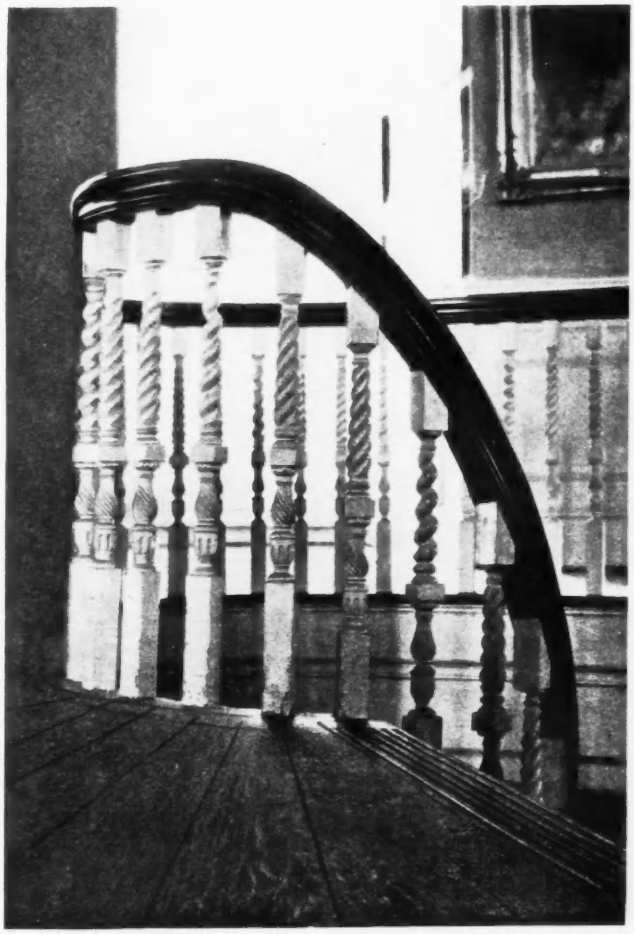
Hanging ordinary paper from	,, 2 9

FROM THE NEW WORLD: 7

MEASURED DRAWINGS OF AMERICAN COLONIAL DETAILS



BALUSTRADE IN OLD STATE HOUSE, BOSTON, MASS.

A NOTICEABLE feature of most of the American Colonial work is the restraint shown as regards elaboration. With few exceptions the exteriors were simple and of good proportion—not only as a whole, but also as regards the shape and disposition of the voids. Ornamentation was generally confined to the entrance, and, occasionally, to the cornice.

The same reserve was shown internally, where plain walls or simple panelling was the usual treatment. The fireplace and staircase gave opportunity enough for interest, and whether the building was a simple cottage or a mansion, both these features were frequently of exceptional merit.

In the staircase both the balusters and newels were occasionally excellently designed and frequently elaborately turned—the latter often having a double spiral. An excellent example figures above, and among the drawings within, prepared by R. Keith Harris.

The bottom (square) member of the baluster in many instances carried on the line of the next tread, while in several examples that of the succeeding tread was also picked up by a second square member, so that the sense of horizontality was emphasized throughout.

GAZEBO IN PORTLAND STONE

ERECTED IN STOCKGROVE PARK, NEAR LEIGHTON BUZZARD, BEDFORDSHIRE

[W. Curtis Green, A.R.A., and Partners, Architects.

LOOKING OUT OVER THE PARKLANDS FROM THE TERRACE

THE gazebo at Stockgrove is one of a series of architectural embellishments recently undertaken upon a beautiful Bedfordshire estate. One of them —the lake-side chalet—was illustrated in a supplement to the issue for September 16 last.

The present little building, of which detail drawings to ¼-in. scale and one-quarter full size, are given overleaf, stands at a corner of the terrace of the large house, which is only lately completed, and overlooks the garden, park and surrounding country.

As shown in the photograph reproduced above, the terrace itself flanks a walk secluded within the brick piers and overhead timbers of a pergola ; it presents thereto a retaining wall of Daneshill bricks. The other materials are : Portland stone, York stone paving, copper roof and panelled plaster soffit.

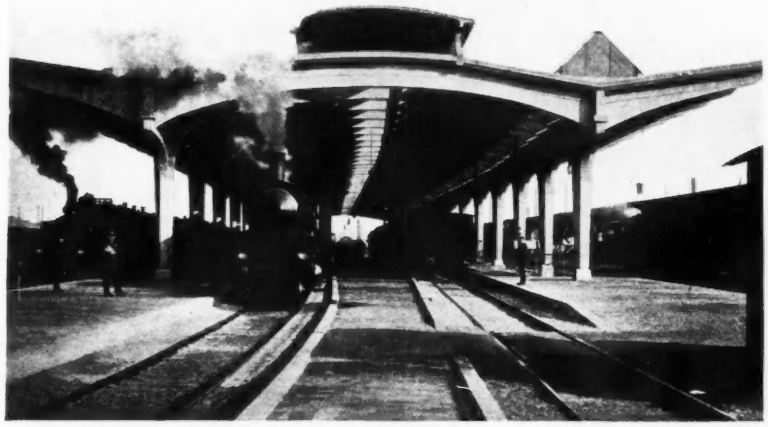
SELECTED PRECEDENTS:

MODERN RAILWAY STATIONS



1. *THE CONCRETE CANOPY OF THE MAIN PLATFORMS, NUREMBERG STATION.*

[By courtesy of Bauunternehmung Dyckerhoff und Widmann, A.-G., Wiesbaden-Biebrich.

RAILWAYS have been with us for close on a hundred years, but, except on metropolitan and suburban lines, we are still far from anything approaching a standardized design for railway stations. In nearly every case where a grandiose monumental effect was aimed at—as in St. Pancras, London, or the Gare de Lyon, Paris—the result has been infinitely more lamentable than in the merely mean or negligible structures which generations of railway directors have thought good enough for the public and their purpose.

America has so far been unable to provide any better models than colossal imitations of Roman baths. The railway station has no precedents in antiquity. Attempts to adapt it to classical forms, so as to perpetuate reproductions of classical decorations, are foredoomed to failure. All that it calls for is the proper fulfilment of technical requirements, with due regard to co-ordination and proportion. It is only during the last decade that the station has been allowed to evolve rationally along its own lines, unhampered by irrelevant considerations of "style."

Figure **1**, *a straightforward solution of the problem of the isolated platform canopy, is a good example of how the substitution of reinforced concrete for fabricated steel often results in simplification of shape as well as increased homogeneity. The whole gains by the reduction in the number of its parts. Figures* **2** *and* **3** *show recent reconstructions of important stations in large cities. Both achieve fine breadth of scale with a minimum of incidental detail—the former in granite, and concrete with an exposed granite aggregate; the latter by a superstructure of vast steel-framed window-bays supported on massive brick piers. Figure* **4** *illustrates what has become the standard type of street entrance for London Underground stations: a purely functional design that it would be hard to improve upon.*

Figure **5** *(included for purposes of contrast, though not, strictly speaking, a railway station) is an interesting example of functionalism assimilated to the essential structural features of the domestic architecture native to the Bavarian Alps. The great portal of this cableway terminus achieves an almost Egyptian dignity, and is yet perfectly in harmony with its surroundings.*

THE ARCHITECTS' JOURNAL

WEDNESDAY, NOVEMBER 25, 1931

DUMPING—AND DUMPING

IT seems that politics, as they are purveyed to and understood by the patient British public at large, proceed by a series of slogans, catchwords and wise cracks.

Prominent among these at the moment is the economic problem so ably and satisfactorily summed up in the one word DUMPING.

Dumping, if one accepts the word at its type face value, would appear to consist in the flooding of an already well-provided-for market with products which no one really wants and most will hesitate to buy. Thus, we are commanded to understand, the Russians, dishonest rabble of slave drivers, are *dumping* their rotten butter and worse wheat into our beloved country, while some unspecified bodies are being so unpatriotic as to buy it, others even to eat it !

This, or any other form of dumping, it would not be our business to discuss were it not that the word, like so many of Fleet Street's irresponsibilities, assuming a life of its own and swelling with each edition passed, has included within its orbit every form of manufactured importation which, through one cause or another, touches the insular Briton in a sensitive place; and once the yellow press takes it as its duty to revile in general all successful foreign competition, we see another, no less clear, in attempting to find out why so much of foreign manufacture finds a ready sale with us, even when, it may be added, its price is not competitive.

Generally speaking, foreign goods compete in price, but seldom in price alone, and we can think of several examples—enamelled ironware, unbreakable crockery, to take but two—where to the competition of price is added that of design and colour; and we know that of the two, the latter is the more important. Superiority in design and the use of good colour has sold thousands of pounds' worth of Swedish enamelled ware. And if we go on to discuss items of greater value which are definitely not competitive in cost, we pay respects once more to Sweden, whose refrigerators, vacuum cleaners and cookers, being models of logical thought and tempered design, can regard the English market as peculiarly their own.

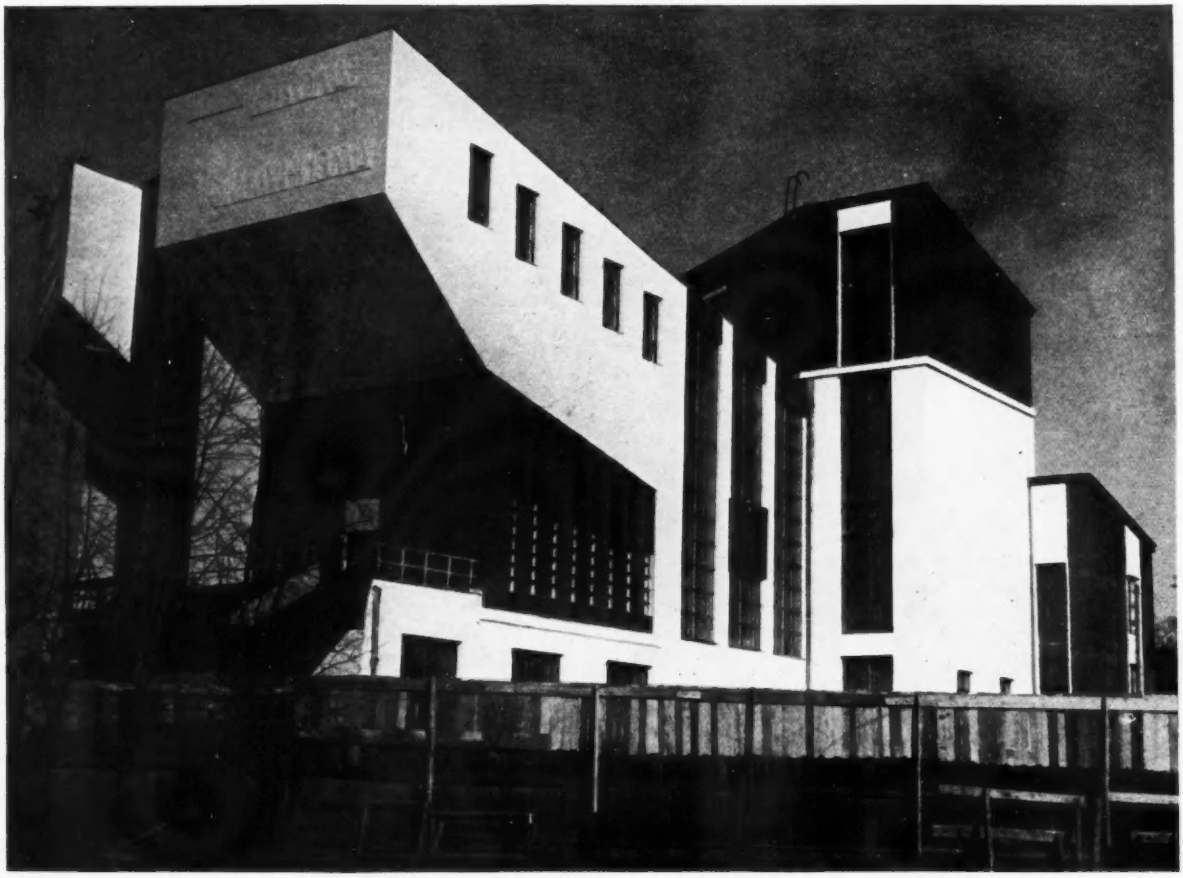
Now, this international competition, which bears of course no relation to any form of dumping, goes deeper than pure commercial rivalry. Mr. Frank Chitham, of Harrods, at a recent luncheon, spoke of the new risks which had entered into what were once regarded as *stable lines of merchandise*. His phrase is significant because it seems to us, as it must also to many other architects, that the continued recognition of *stable lines* as things of satisfactory permanence is the first cause of the subjugation of English goods by goods of Continental origin, and that not until every thing we make is surveyed in the spirit of fitness for purpose by men of cultured intelligence can we hope for real superiority in those commercial fields where design counts for as much as price.

This may not be thought to be an architect's job, but in truth it is, and the more architects see fit to concern themselves with the design of manufactured products of all kinds the sooner will our kings of commerce be shown the way along which, in the middle distance, we may see our rivals in their joyful progress.

Culture is a much-maligned word. It was once spelt KULTUR, and gave us infinite amusement, the German seeming to us, in those days, to be so comically serious over what came to us gracefully and as if by natural right.

But it seems as though we may have been wrong to laugh, because it is now natural that Germans and Swedes should design better, more beautiful and more logical buildings than we can—and so we go over there rather seriously to see how they do it.

The point of which is that we might as well face the truth, be serious, and learn as quickly as we may the attitude of logical thought and sensitive appreciation of material and form which make our Continental friends the cultured people they are. That is part of our mission as architects to this brutal and vulgar civilization in which we find ourselves. Quite clearly it is up to us.



THE NEW RUSSIA: A WORKERS' CLUB AND THEATRE, MOSCOW

Mr. Clough Williams-Ellis answered, for the benefit of the Architectural Association, on Monday, his self-posed question: "What did I see in Russia?"

"Well," he said, "the far-sighted, co-ordinated, town and country planning of a whole continent . . . . vast new works and housing schemes, great office blocks and public buildings, schools, hospitals, crèches, clubs, theatres, cinemas. . . . The scale of the thing is just fabulous. . . .

"All the new building is in the Modernist vein, some good, some indifferent, a great deal rather dull, but (and what a relief to an Englishman!) nothing anywhere that is vulgar. Everywhere one perceives a ghostly German Svengali behind the Russian architectural Trilby. They have swallowed, but not quite digested, the Functionalist technique, and a good deal of their stuff won't function."

The lecturer had something to say about the five-year plan. His paper is summarized, together with a further illustration, on page 704 of this issue.

NEWS & TOPICS

UGLY LONDON FEATURES

MR. GEORGE MANSELL has been criticizing London, or parts of it, at a lecture at the Royal Society of Arts. Mr. Mansell first passed strictures upon ugly street signs; and he should be supported quite solidly in this if he really means business. He next criticized the hospitals, whose impoverishment is gradually turning their façades into charitable hoardings; and in this again his complaint should be taken with seriousness, because if the outsides of hospitals suffer in this way, their insides will one day follow suit. The remedy is public ownership and no more begging, though that is beside our point. Finally, he criticized Ludgate Circus, which is fair game, though no less useful as a target for being the most hopeless hotch-potch imaginable. Mr. Mansell must be congratulated on crowding so much effective invective into the short time at his disposal.

THE R.I.B.A. JOURNAL

The November 7 issue of the *Journal* of the R.I.B.A. is the first of a new series printed in a new type and bound in a cover of an entirely new design. The Sub-Committee of the Literature Committee responsible for the scheme is to be sincerely congratulated on its work, and Mr. Martin Briggs, the Chairman, and Mr. E. C. Carter, the Editor of the *Journal*, in especial, are deserving of gratitude. The cover is now printed in black ink on a light coloured paper, thus giving a clean, bright effect, which was lacking before. On the front page, the principal item of interest is the badge of the R.I.B.A., newly drawn and cut in wood by Mr. Eric Gill. As pointed out in an editorial note at the beginning of the issue, Mr. Gill's design discards a number of variations introduced during the course of the nineteenth century, and goes back to the original blazon of 1835. Mr. Stanley Morison, the well-known typographer, was called in as a consultant, and it is doubtless on his advice that the beautiful eighteenth-century Baskerville type was adopted. (THE ARCHITECTS' JOURNAL, incidentally, changed over to this type face at the beginning of 1926.) The old form of *Journal* was apt to give one the impression of being a survival from other times. This is no longer true, and without being in any way blatant about it, the new series definitely proclaims itself as a product of the post-war period.

VALUE FOR MONEY IN TOWN-PLANNING

It speaks highly for the intelligence of local authorities that national economy has not been made the excuse for a reduction in expenditure upon town planning. It is true that town planning is carried out largely by experts whose agreements are for long terms, but there has not been, in fact, any diminution in the programme. We may take it, therefore, that the complaint from a member of the Axbridge Rural Council that town planning was costing Axbridge too much and giving Axbridge too little was due in the main to the unenlightened attitude of one recalcitrant councillor, and did not represent the considered views of the rural council. This attitude belongs indeed to the pre-planning age.

MR. KEEN'S VILLAGE SKETCHES

A remarkable set of illustrations of the interesting twin villages of Oxted and Limpsfield was exhibited privately at Oxted on Saturday. The artist is Mr. Arthur Keen, the well-known architect, who told me in his own words how he came to make these sketches. "The history of the matter is that there has been a great deal of talk lately about the need for collecting all kinds of records of villages, because of the danger that before long they may be changed out of all recognition. So I decided that I would devote my spare time during the past summer to drawing the two Surrey villages, in one of which I live, as a record of their actual condition at the present time. I intended at first to make a continuous drawing of each side of the village streets in a kind of pictorial elevation, but there were difficulties in doing this, and in the end I did a series of perspective sketches, showing successive groups of cottages and other buildings. Then I made two or three drawings of each of the churches, and finally drew the old houses and farm cottages in the district around—altogether some fifty or sixty pencil drawings showing exactly the present conditions. I then got them mounted to a uniform size. At the same time I made a good many notes on the history of the houses as far as one could find it out."

★

At the exhibition, Mr. Keen spoke about the matter of village records generally, in the hope that it would be taken up and something of the same kind done in other places. As he said, there are many very charming old villages in this district, all of them menaced by housing schemes, arterial roads, new railway stations and developments of all kinds. Village museums are, of course, wanted, and if some permanent store place could be got it would seem not difficult to make very interesting and valuable collections of all kinds of things relating to the village; books, prints, antiques, maps, manorial records and so forth—certainly photographs and pictures. It is hoped to hold a public exhibition a little later, at which all such things as these will be put on view.

SIR MARTIN CONWAY'S BARONY

The conferring among the dissolution honours of a barony upon Sir Martin Conway, "for political and public services," is an event most welcome to all who have a regard for civilization in the wide sense. It is thirty years since he became Slade Professor of Fine Arts at Cambridge. That appointment was only the prelude to the particularly versatile career of an adept in the art of living. Many of his adventures in that art have been recorded by his own fluent pen; and his influence for good taste has been widespread.

MR. COUNCILLOR GUY DAWBER

I have always held that it is most important that architects of high standing who have the inclination to public-spirited self-sacrifice (and the time to give) should interest themselves in local government affairs. It is, therefore, with particular gratification that I receive a note from Mr. E. Guy Dawber, acquainting me that he has been elected a member of the Marylebone Borough Council for the Hamilton Terrace Ward. Congratulations to him; and to the Council.

THE "WANTED" CONFIDENCE TRICKSTER CAUGHT

My readers will be interested to know that the confidence trickster referred to on this page last week is now safely under lock and key. I should like to be able to say the JOURNAL had lent a hand in his arrest; but the fact is, he was recognized in the street and apprehended from the description already otherwise circulated. At all events, he will trouble us no longer, for a stretch; but there are others abroad.

ASTRAGAL

The new wing provides accommodation for sixty-five private patients. Designed as a complete unit, it offers all the advantages of a general hospital.

AT THE ROYAL

St. David's Wing for

DESIGNED BY

THIS building, erected through the generosity of Sir Howell J. Williams, occupies the site in Manor Gardens between the casualty block and the nurses' home, facing south, and is carried out similarly in red brick and Portland stone.

The central entrance doors, of teak, lead into a spacious hall. On the right is a large reception room, with, beyond, consulting rooms, while at the end of the corridor is a covered entrance way for ambulance cases. On the left are the secretarial offices and temporary light department. In a central position opening off the hall is the staircase, constructed of teak, with a balustrade of teak and wired glass for easy cleaning.

The first and second floors have twenty rooms for private patients, each fitted with a lavatory basin and exchange

The entrance hall has a floor of marble laid in black and white squares; plaster-panelled walls; and teak joinery. Beyond the central doors are the staircase and lift.

The sun room : interior. Situated on the top floor of the wing, this spacious apartment is flooded with light and warmth. It is fitted with an electric fire, wireless, etc.

NORTHERN HOSPITAL

Private Patients

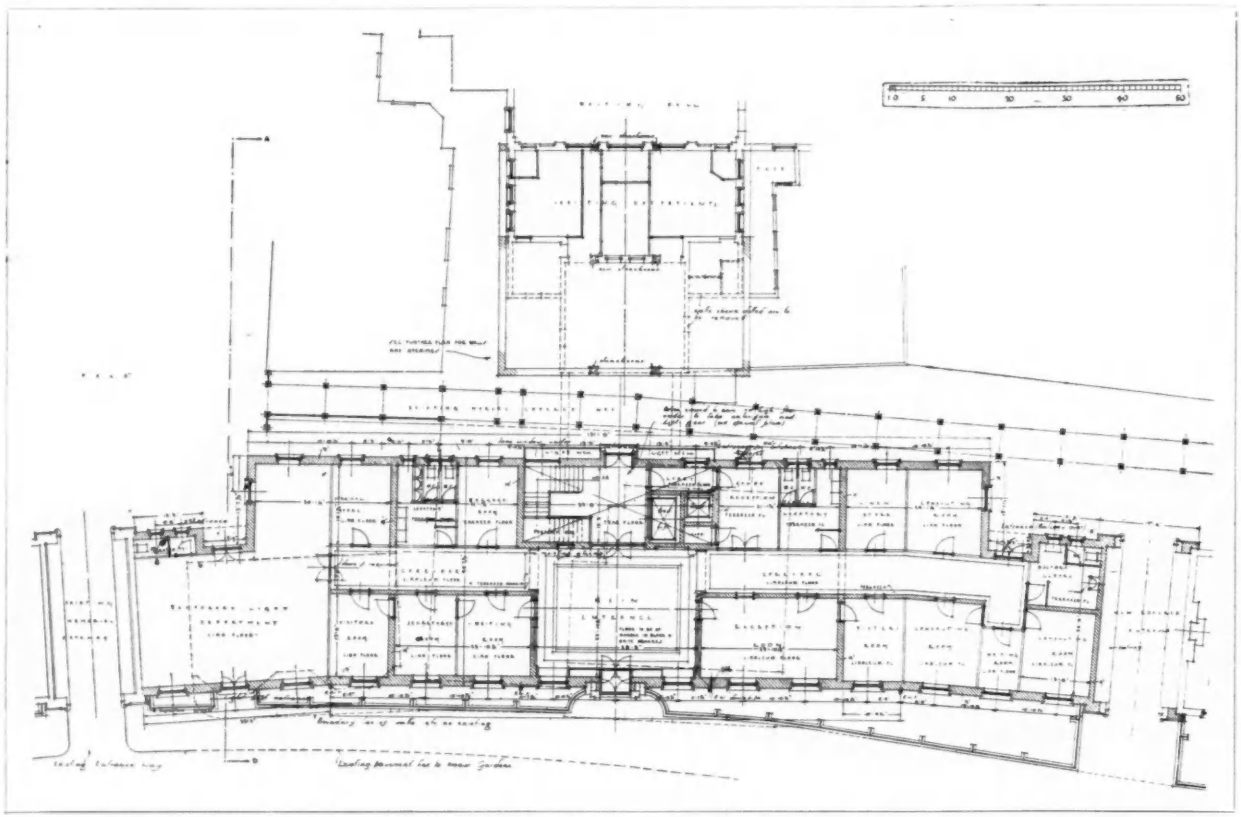
ADAMS, HOLDEN & PEARSON

telephone, and hot-water radiators supplemented by electric fires. The sisters' room is placed centrally opposite the staircase, and each patient is in communication by a system of illuminated call signals; the corridors are covered with rubber for the sake of quiet.

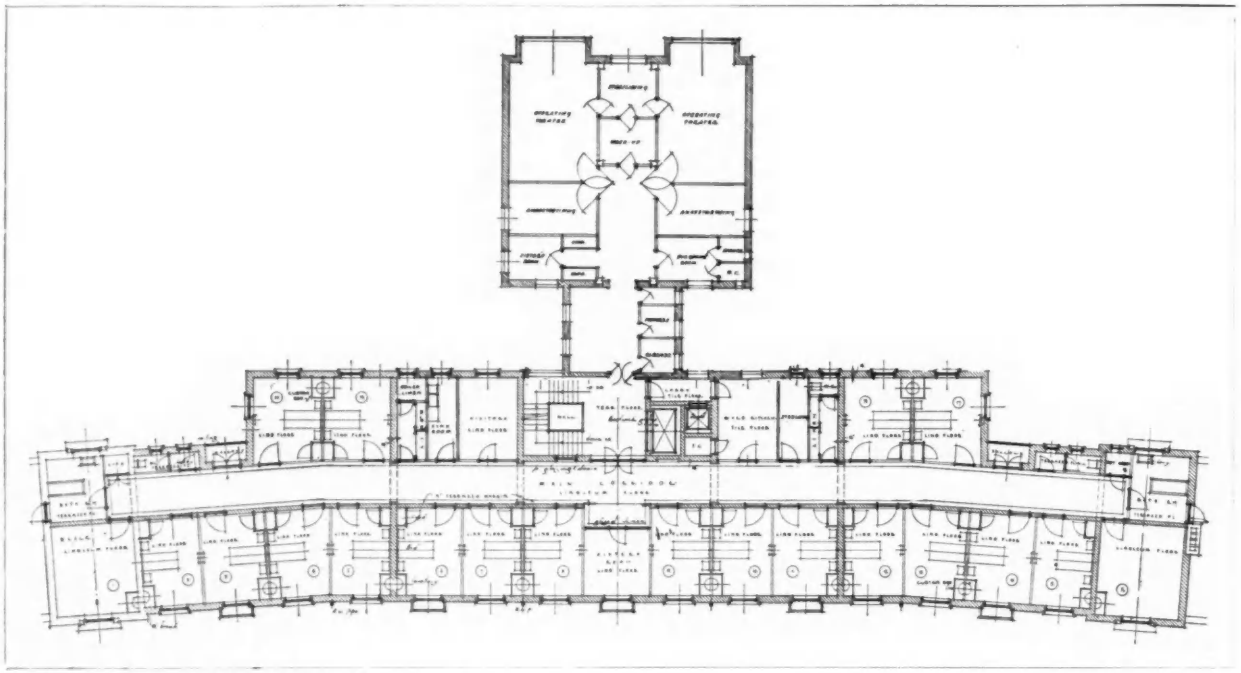
The windows are large double-hung sashes, and the Hospital Committee laid special stress on the necessity for reducing the number of window panes. The architects, therefore, provided as many large panes as was compatible with the elevation, and all corners have been rounded.

During the progress of the building, it was decided, in the interests of height and light, to reverse the positions of the kitchen and operating suites. The kitchen, therefore, was placed on the first floor, the food being conveyed by special trolley lift direct to the patient,

The sun room : exterior. This view shows not only the special windows to trap the sunlight, but the roof garden outside, from which fine views are obtained.

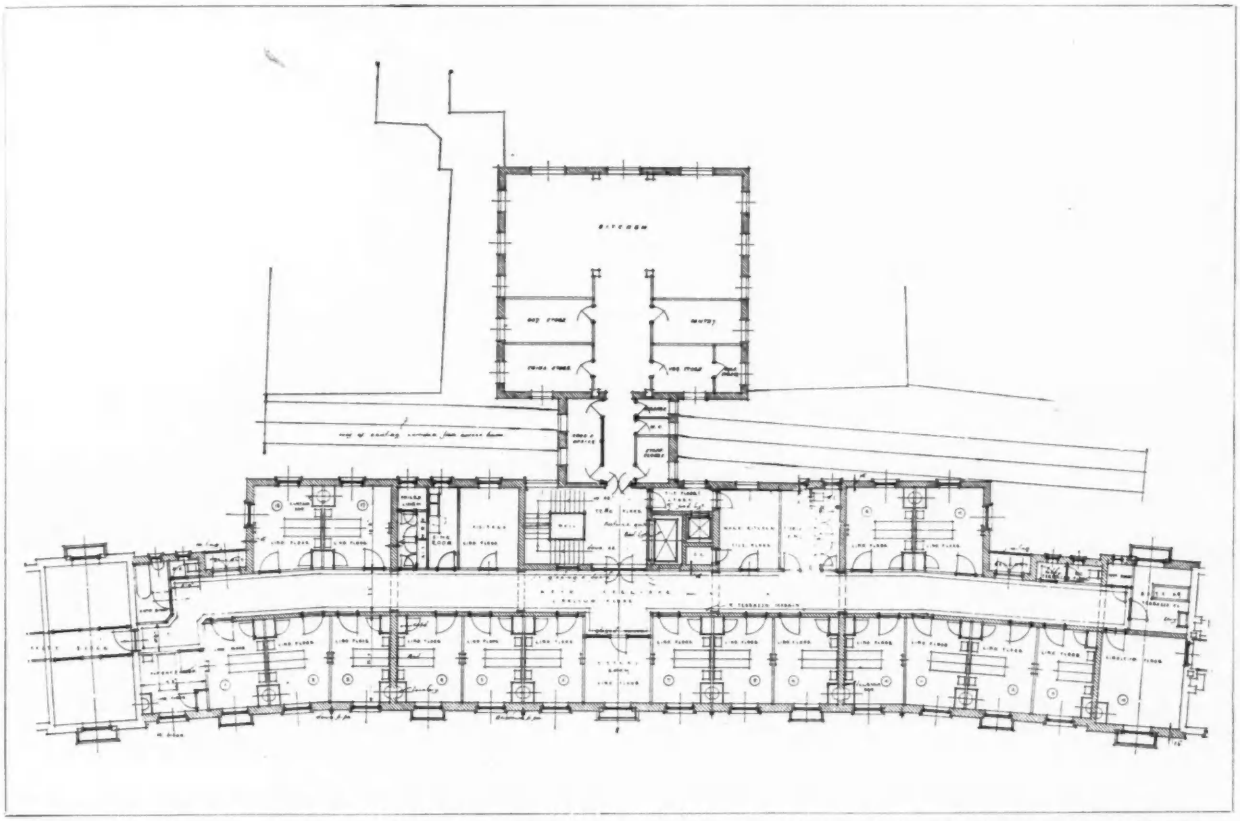


Ground-floor plan. On the left of the entrance hall are the secretarial offices, on the right the reception and consulting rooms.

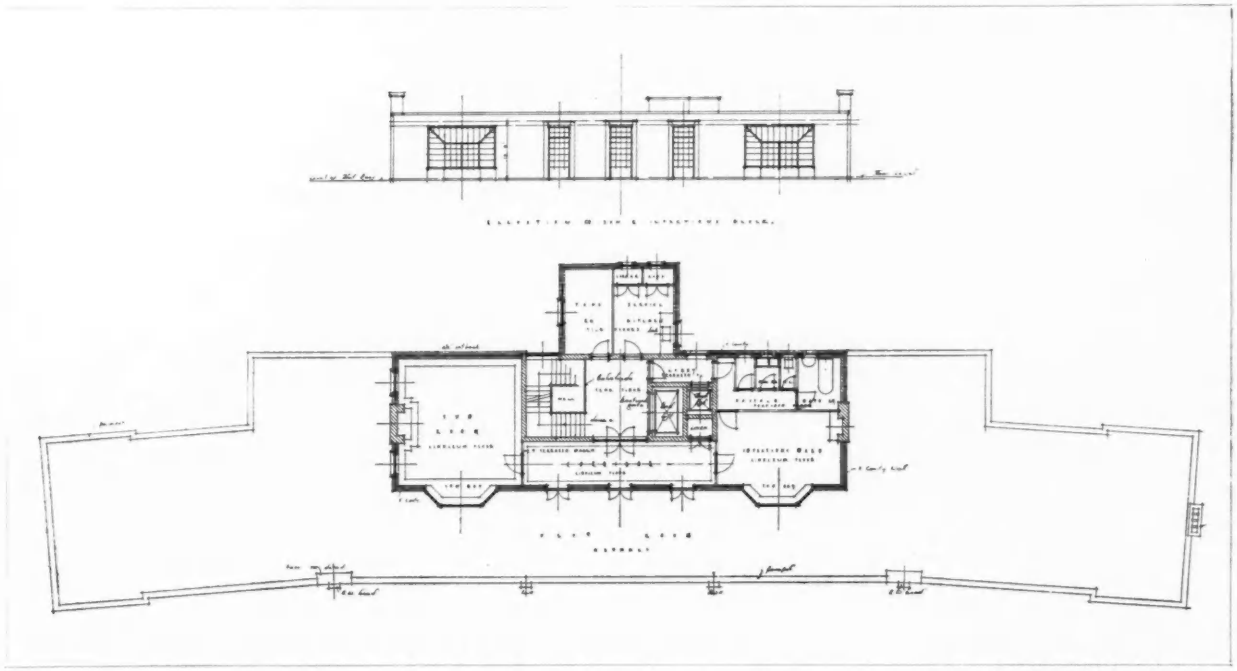


St. David's Wing, Royal Northern Hospital, N.]

Second-floor plan. On each floor, in addition to ward rooms, is a visitors' room for the use of patients' friends.

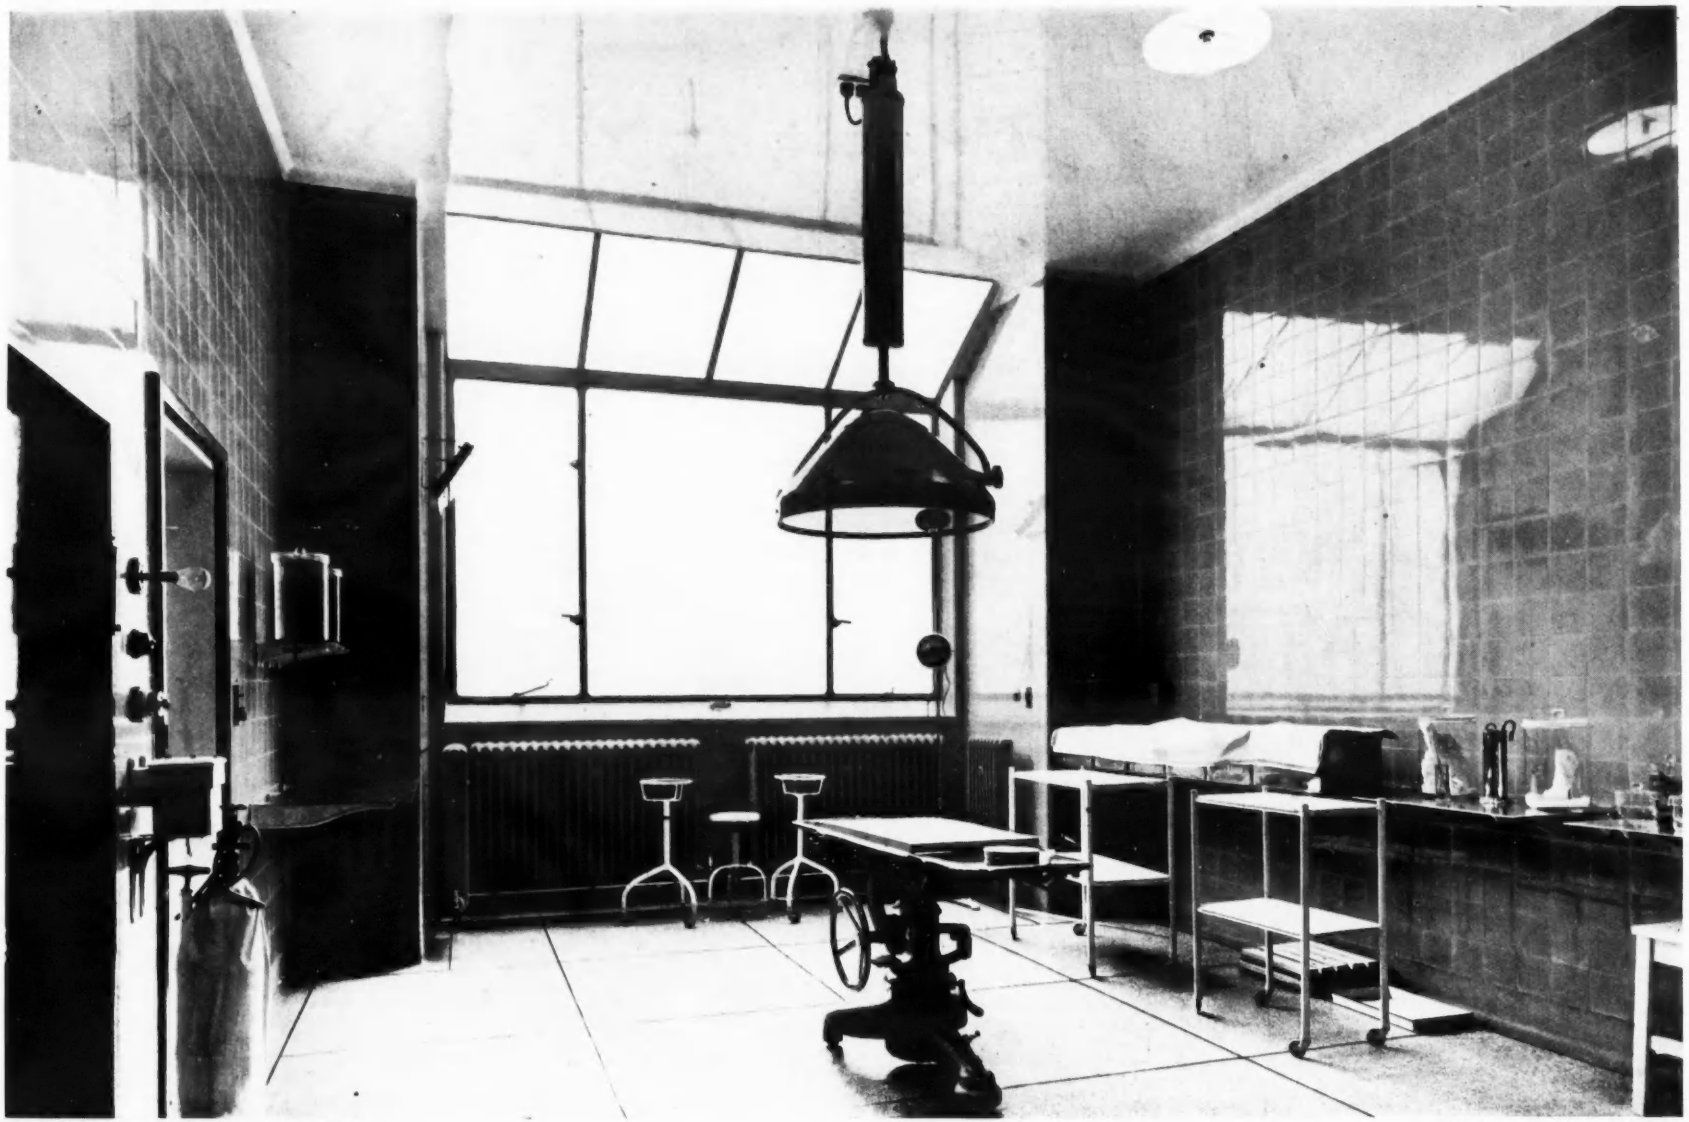


First-floor plan. There are sterilizers and bathrooms and twenty rooms for private patients on each of the first, second and third floors.



[*By Adams, Holden and Pearson.*

Fourth-floor plan. Here are the sunroom, roof garden and a section for the isolation of patients suffering from septic conditions.



St. David's Wing, Royal Northern Hospital, N.] [*By Adams, Holden and Pearson.*

One of the two operating theatres. The walls are faced with grey-green tiles, and the floors are of light-green terrazzo, divided into squares by expansion strips. The suite consists of twin theatres and anæsthetizing rooms, served by centrally-placed sterilizing and wash-up rooms. It was designed in close collaboration between the architects and the surgical staff.

without, as is usual, being distributed from the ward kitchens.

The operating suite is self-contained and worthy of special note. The walls are faced with grey-green tiles, specially chosen for their soothing colour. A noticeable feature is the reduction of doors to the minimum, it being possible, by an ingenious arrangement, to transfer patients from the anæsthetizing room to the theatre by reversing the single doors leading to these rooms so that they project into the lobby, closing it at 90° and allowing sufficient room for the trolley to pass screened from view. The windows are formed as projecting bays to afford top lighting, and Zeiss lamps are used for the artificial illumination.

The third floor, which is planned similarly to the first and second floors, is used temporarily as nurses' bedrooms, but the immediate success of the new wing makes it likely that it will be used for patients in the near future.

The top floor contains the sun room and two isolation rooms. The former, with its cheerful fire and projecting glass bays, is a notable feature.

Each of the patients' rooms is fitted with lavatory basins, with hot and cold water; a telephone connected with the exchange; wireless; and signalling lamps to secure the attendance of nurses at any time.

St. David's Wing, Royal Northern Hospital, N.] [*By Adams, Holden and Pearson.*

In the kitchen the walls are tiled to their full height, and the ceiling is covered with opal glass. The latest apparatus is installed for cooking and for the rapid service of hot food to each room. The catering is under the supervision of a qualified dietician.

THE BOLSHEVIKS AS BUILDERS

BY CLOUGH WILLIAMS-ELLIS

I WENT to Russia in self-defence—I was tired of being told what I strongly suspected were lies, both by the press and by people generally without being able to retort with complete certainty "You d——d liar!"

Now that I have been there I have the daily satisfaction of—shall we say—tentatively suggesting that certain current English views are tinged with error.

I do not mean the grosser errors about chained slave gangs, boiled babies, nationalized women and such like, but less picturesque inventions, such as the legends that "You can only see what they choose to show you." "The Five-Year Plan is all a façade and the most colossal failure anyway." "Labour is forced, and the people miserable and underfed."

Just because I have been so rash as actually to go and see things for myself, I am told all this more than ever by those who haven't—just to correct my unnatural, unaccountable and unpatriotic enthusiasms.

That I should return fatter and jollier than I went out, and dare to say that I found myself infinitely stimulated by the most marvellous summer holiday ever, amongst the friendliest people, was, it seems in the worst possible taste.

As to things being specially window-dressed for my or anybody else's benefit, or being shepherded round, everyone was so infernally busy getting on with the job, that the great difficulty everywhere was getting hold of adequate guides and interpreters.

For the most part one snooped around on one's own, and in that fashion I saw just precisely what I had determined I would see—going here, there and everywhere—by air, rail and steamer. And what did I see? Well, the far-sighted, co-ordinated town and country planning of a whole Continent. The raising of great new industrial cities on what two years ago was barren steppe, new satellite towns by the score, the old towns being re-planned and re-conditioned—vast new works and housing schemes, great office blocks and public buildings, schools, hospitals, crèches, clubs, theatres, cinemas, clinics, Soviet halls, stadia, co-operatives, factory kitchens, etc.

The scale of the things is just staggering—fabulous.

And how are they doing it all? Not too well, though the marvel is not that it is done badly, but that it is done at all.

Short of just every single thing needed for building, desperately short of skill, and even of the roughest man (or woman) power, none the less, they are achieving prodigies under conditions that we should certainly call impossible.

In short, they are doing, against appalling odds, what we have never attempted.

In a decade or less, they will have done for all Russia much what we did in the peak century of our industrial revolution—but with most of our mistakes left out.

They think that what we built has become our prison, and may well become our tomb, whereas they are building a new Jerusalem—a heaven upon earth—in place of that more speculative hereafter that has now been abolished by decree.

There are too few everybodies in Russia—far too few architects, who, good or bad, are all grossly overworked.

Hence the rather orphaned look of many of their buildings—they seldom have time to visit them during construction, and never after they are finished.

There is, indeed, no such thing as "finish" in our sense.

You never quite know whether a building is being "built" or "repaired." Very often it's both.

Their joinery is a scream—partly the architects' fault for not designing more realistically for green timber and rough-and-ready labour. They do not sufficiently allow for the "war-time" conditions on the site and in the shops—the poorest materials, the labour diluted with boys and girls straight off the land.

For five months the weather is what we should call utterly impossible for any building work—terrific frosts—Arctic winds—snow, and then in spring and autumn torrential rains—the whole roadless country a quagmire.

And yet they are doing it—and yet they are showing the rest of the world how.

All the new building is in the Modernist vein, some good, some indifferent, a great deal rather dull, but (and what a relief to an Englishman!) *nothing anywhere that is vulgar.*

Everywhere one perceives a ghostly German Svengali behind the Russian architectural Trilby.

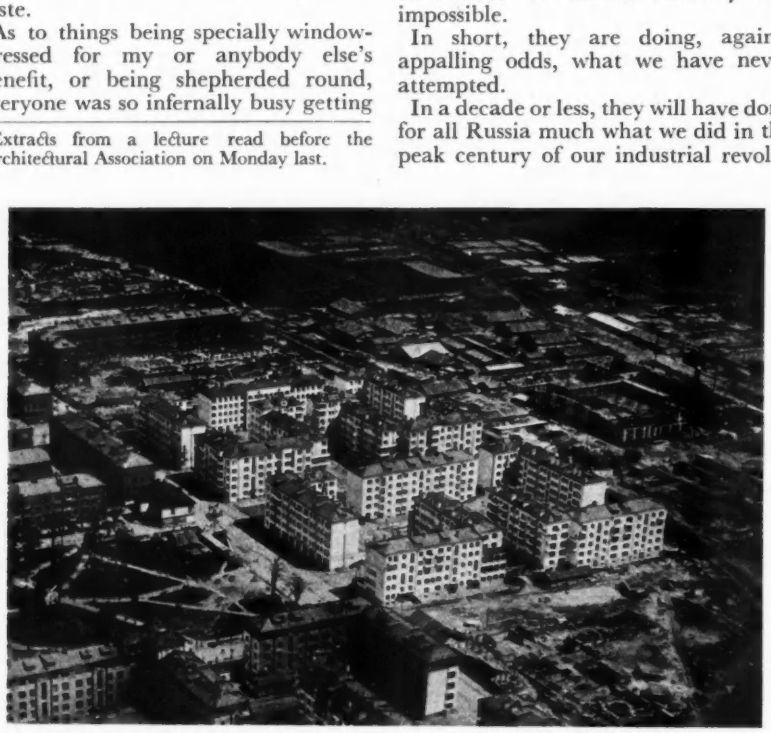
They have swallowed, but not quite digested, the Functionalist technique, and a good deal of their stuff *won't function.*

They have learnt all the fashionable tricks—thinking that they have cast away all sentiment and tradition, they are really falling into a neo-romanticism—mechanistic.

Really, the greatest achievement of, and advertisement for, Communism and the Five-Year Plan is that it has managed to make the Russian himself function.

Inefficient, unpunctual, lazy, untidy, procrastinating, and altogether exasperating as a business proposition individually, as a team, under National guidance working to a set plan, he looks like beating the world.

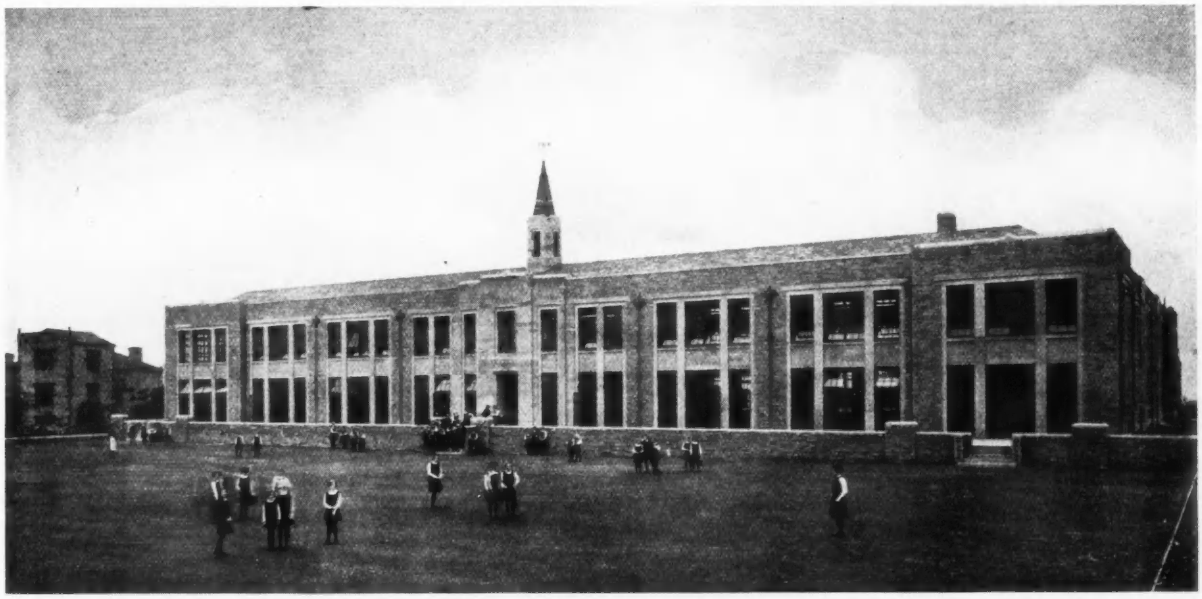
Extracts from a lecture read before the Architectural Association on Monday last.



A section of one of the new housing estates, Moscow, undertaken as part of the Five-Year Plan, referred to by Mr. Clough Williams-Ellis on this page.

BOLLING HIGH SCHOOL FOR GIRLS, BRADFORD

DESIGNED BY W. WILLIAMSON (*City Architect*)



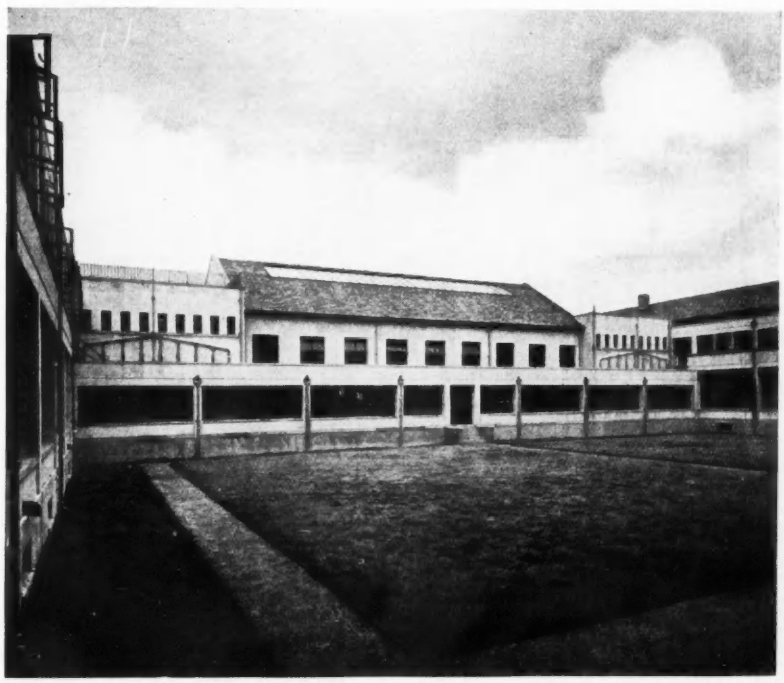
A general view of the main front, showing part of the old Bolling Hall, which adjoins the site, on the left. The walls are of local bricks, with snecked wallstones, varied in colour, and with boasted stone dressings. The roof is covered with thick rustic-red and green Old Delabole slates, laid to graduated courses. Wood casements are fitted.

THE completion of the Bolling High School for Girls, Flockton Road, Bradford, on a site adjoining the historic Bolling Hall, has met a long-felt need for secondary school accommodation in the southern area of the City.

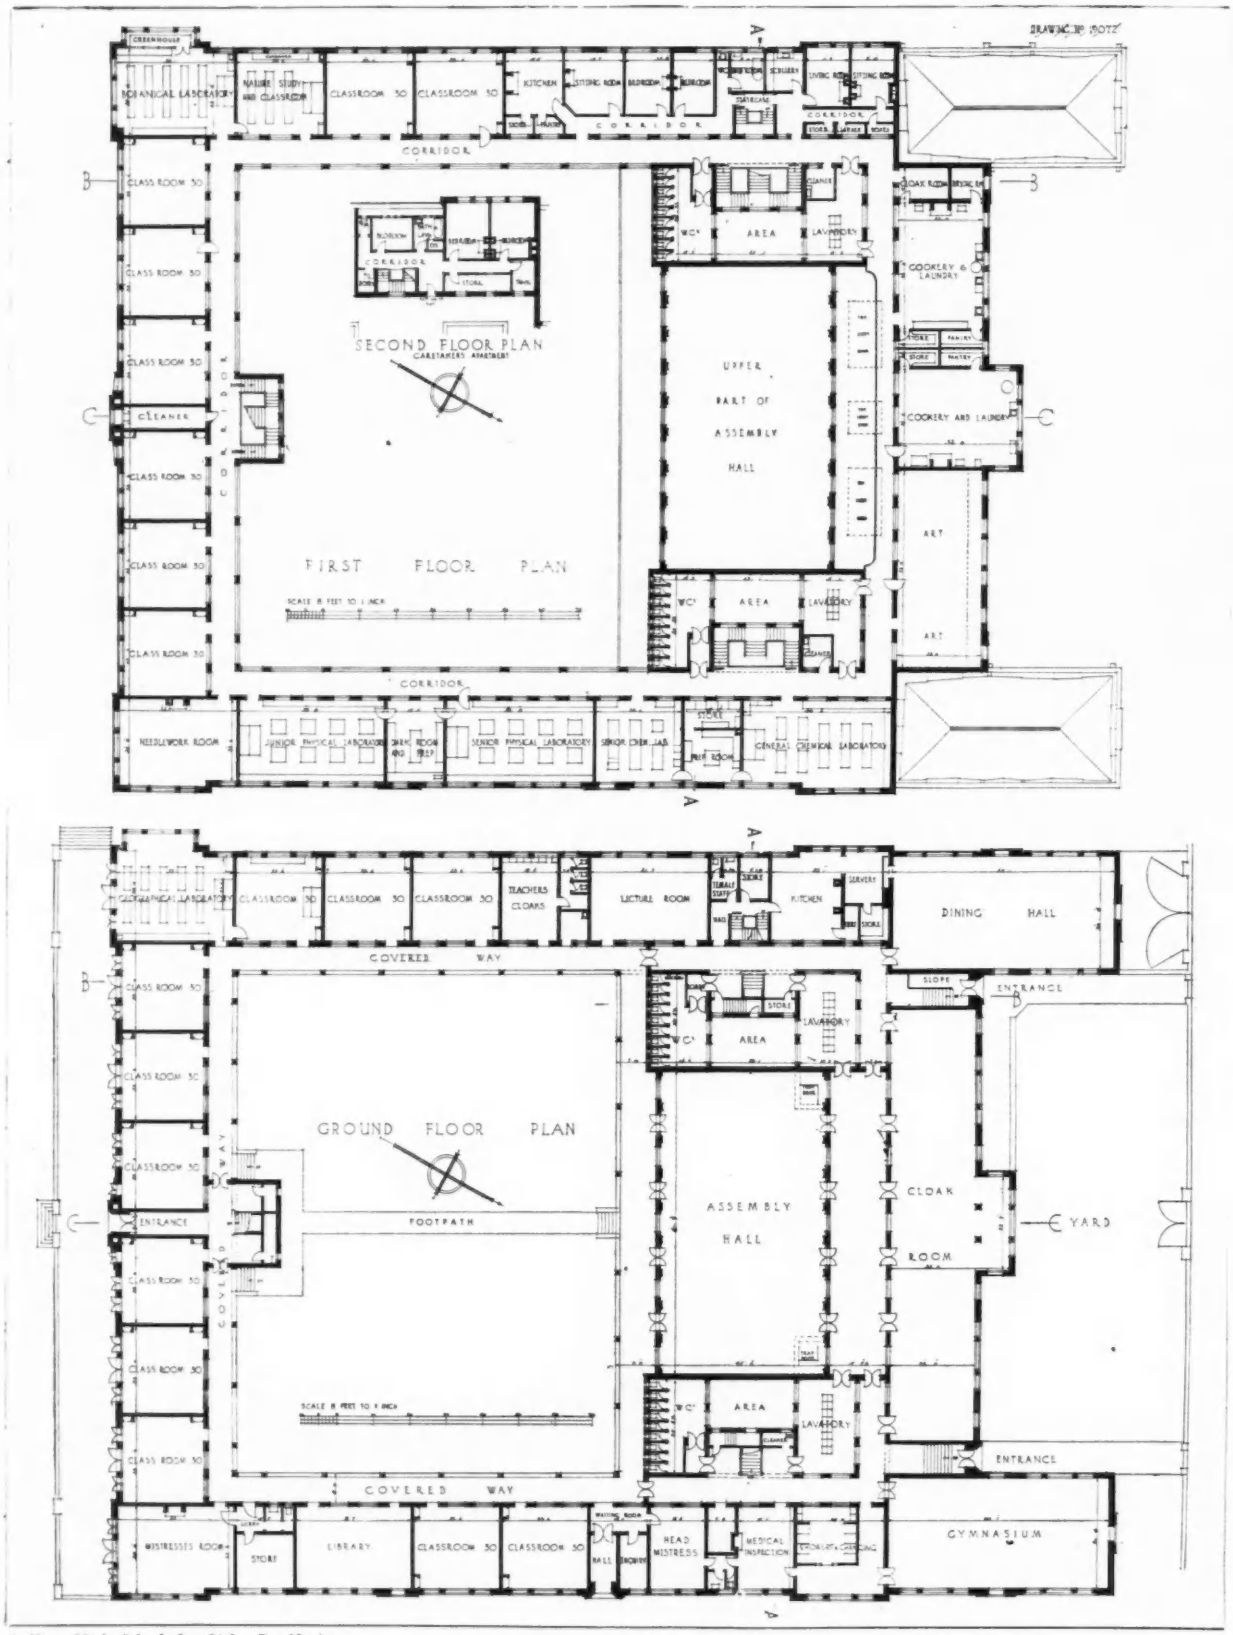
The school has been planned in the form of a square, the classrooms being grouped in two stories round three sides of a quadrangle, with an assembly hall, providing seating accommodation for 600 persons on the fourth (north) side. The planning of the hall has been given special attention by the architect, both as regards its general proportions and treatment. It is situated in close proximity to the scholars' entrances from the north side and the cloakrooms; and is also conveniently placed in relation to the entrances from Flockton Road, the head mistress's room and inquiry office.

In addition to the classrooms, the accommodation includes junior and senior laboratories for physics and chemistry, with the necessary stores and preparation rooms; a botany laboratory with a junior "Nature Study" room adjoining a specially fitted room for geography; and a balcony for meteorological observations; a library with provision for private study; a lecture room suitable for lantern lectures or music practice; a large art room with north light; an art crafts room in which the girls will be taught the modern light home-crafts; a domestic science section with provision for the teaching of cookery and laundry; a housewifery flat with two bedrooms, dining-room, and kitchen complete; and at the sunniest corner on the first floor, a room for needlework; and a gymnasium, with dressing-rooms and shower baths attached. In addition, there is a large school dining-room with separate kitchen and servery.

Adjoining the buildings on the south are hard tennis courts, with a terrace on the school side, and, farther away, pitches for hockey, net-ball, and other games.

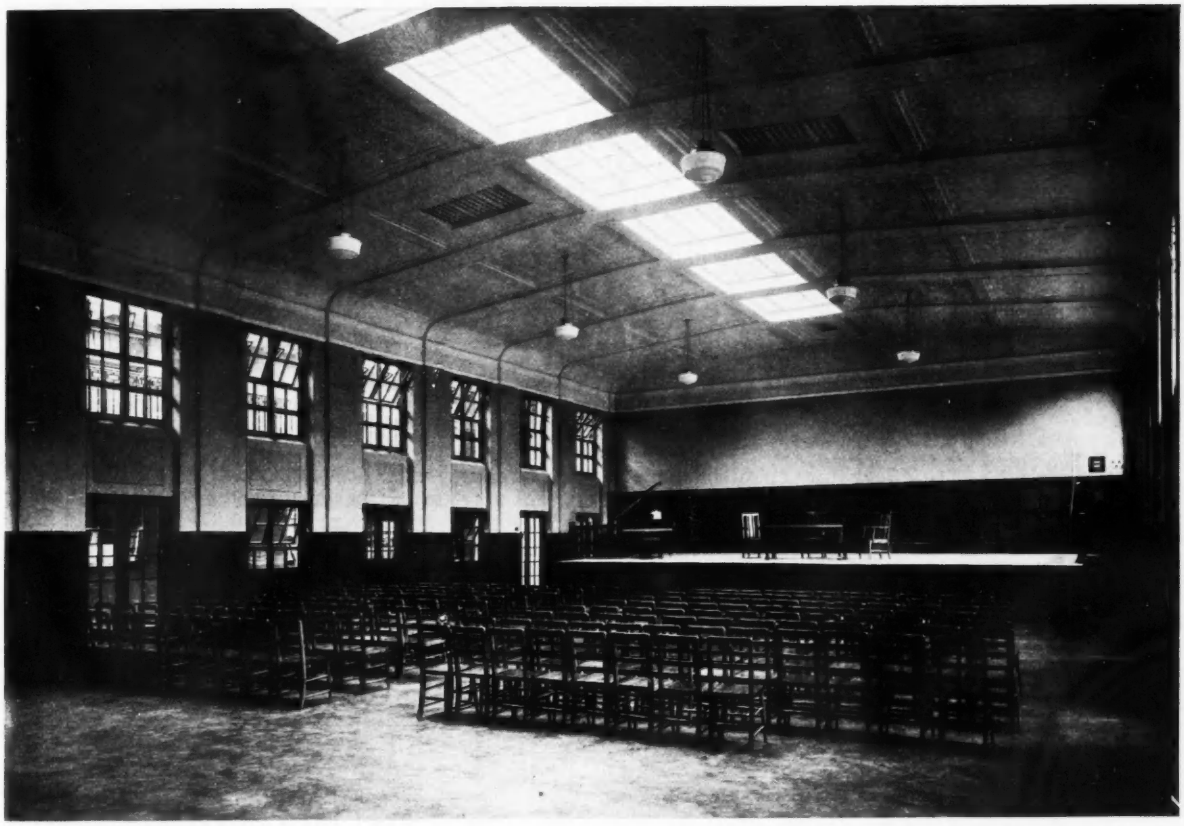


Looking across the inner quadrangle towards the entrance to the assembly hall. The walls have been faced in white cement, a wood float being used to finish the surface.

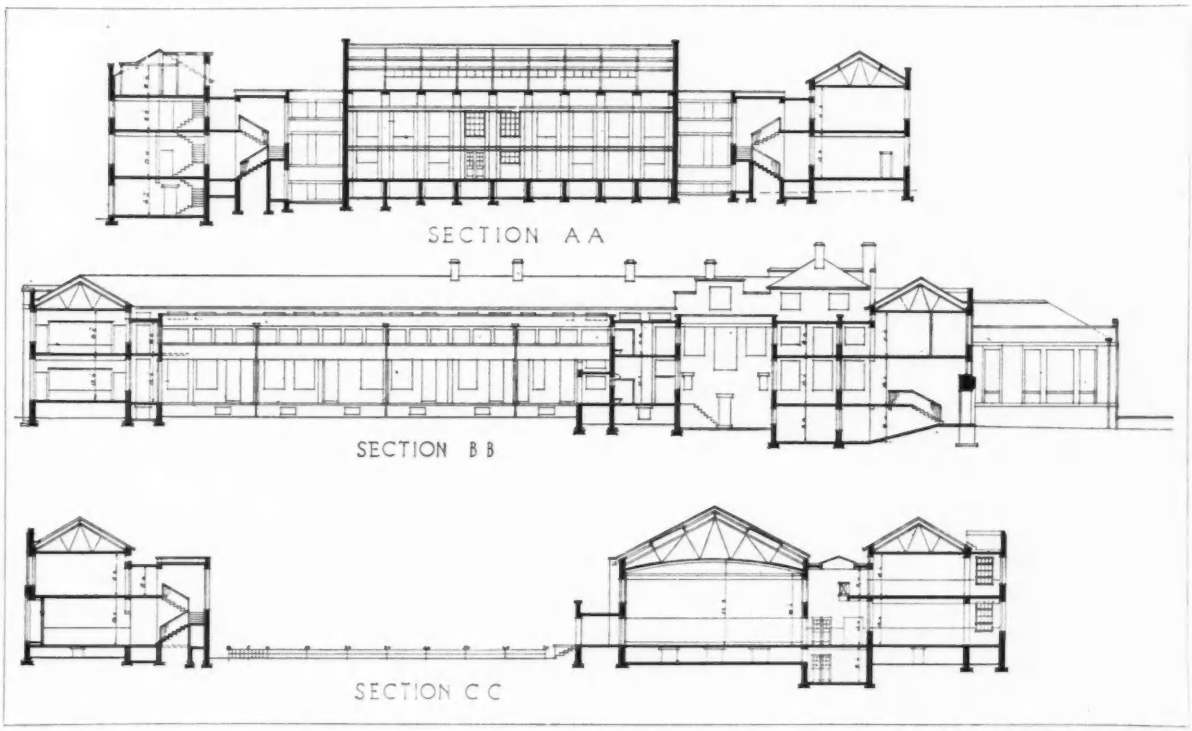


Bolling High School for Girls, Bradford.]

Ground, first and second floor (devoted to the caretaker's apartment) plans. The classrooms are grouped in two stories round three sides of the inner quadrangle, on the fourth side of which is the assembly hall. A footpath connects it to the main entrance.



The assembly hall, which runs through two stories, provides seating accommodation for 600 persons. The walls are panelled in oak, and plastered above; and the floor is laid with oak wood-blocks. The ceiling is slightly curved and has been formed into a series of panels, with a central ceiling light. The stage is a permanent fixture.



[*By W. Williamson (City Architect).*

The architect's cross sections A–A, B–B and C–C, which should be studied in conjunction with the plans reproduced on the facing page. Wallboard panels have been introduced into the ceiling and frieze of the assembly hall for acoustical purposes.

PLACES FOR RECREATION

BY J. MURRAY EASTON

MR. J. MURRAY EASTON, F.R.I.B.A., in delivering the fourth of a series of public lectures, organized by the Architectural Association, at 36 Bedford Square, W.C.1, on Saturday last, said recreation was the indispensable complement to industrialism, and to provide adequate facilities for recreation was one of the most urgent social problems of today.

Evils of Mass Production

Mass production, while it held out for us hopes of an era of plenty and of leisure, threatened also boredom and discontent. We could very easily have an inferiority complex in face of machines, for it was not difficult to feel that there was almost nothing a machine could not do better. Hence it was of prime importance for everyone to have the chance of some activity in which the doing of things counted for more than what was done.

Only a few years ago we in this country had an unshakable belief that we were the only nation that really played games and took enough exercise. Now we all knew that our best players in nearly every game had been beaten by those of other countries, but he doubted whether most people realized the extraordinary advance that had been made on the Continent—in Germany particularly—in providing widespread facilities for public recreation. This country had a very big start, and in many ways it still led. No city in the world, he supposed, had quite the extent and variety of open spaces in and around London, but in the industrial areas of the Midlands and the North things were very different. But it was above all in the convenience, order and seemliness of its playgrounds that Germany could teach us a lesson, and so, without any intention of decrying our own achievements, he was going to deal largely with what had been done of recent years on the Continent.

J. Murray Easton, F.R.I.B.A., author of the paper reported on this page.

The Stadions of Germany

Every German city that he had visited had prepared a plan of development that included the provision of open spaces, play centres, baths, etc., for children and adults. Ground was earmarked for the purpose and, if not available at the moment, was acquired when the opportunity occurred. The culmination of those centres was the stadion, which consisted of a group of stadia, a ground for the various sports, and generally included an open-air swimming pool, tennis courts and a restaurant. Those grounds were used for the more important matches and athletic events, and they provided a certain amount of accommodation for spectators, but not generally of the same extent as were English football grounds. At Frankfurt, which possessed one of the most magnificent stadions in the country, there was no space for spectators around the swimming pool. All the extensive space round it was reserved for the users, who had ample room to play and obtain the benefit of the sun or light baths.

It might be thought that such places were not really the concern of architects. A field was the principal ingredient of them all, from the simplest to the most elaborate. Even then the architect, as town planner was concerned from the first. That it should be in the right place, be part of a considered scheme, that it should be so fenced, planted, equipped with partitions for spectator accommodation as to be an asset to the neighbourhood, not an eyesore—these were things that architects did concern themselves with.

In conclusion, he said, we wanted in this country to have more and better conceived schemes for places of public recreation, and the very highest skill was not too good to apply to this object.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Bill for Prevention of Dumping

GENERAL satisfaction is felt among the supporters of the Government at the passage of the Abnormal Importations Customs Duties Bill, which, it is hoped, will prevent much of the dumping which has been going on during the past few weeks.

The measure provides that "if the Board of Trade are satisfied that articles of any class or description comprised in Class III of the Import and Export list issued under the authority of the Treasury and the Commissioners of Customs and Excise for the year 1931 are being imported into the United Kingdom in abnormal quantities," it shall be lawful for the Board, with the concurrence of the Treasury, by Order to impose duties on these articles up to a limit of 100 per cent. of their value. The measure is to last for six months, and Empire goods are to come in free of duty.

The articles specified in Part III, "wholly or partly manufactured," are as follows :

Coke and manufactured fuel; pottery, glass, abrasives, etc.; iron and steel and manufactures thereof; non-ferrous metals and manufactures thereof; cutlery, hardware, implements and instruments; electrical goods and apparatus; machinery; manufactures of wood and timber; cotton yarns and manufactures; woollen and worsted yarns and manufactures; silk and silk manufactures; manufactures of other textile materials; apparel; chemicals, dyes, drugs and colours; oils, fats and resins, manufactured; leather and manufactures thereof; paper and cardboard; vehicles (including locomotives, ships and aircraft); rubber manufactures; miscellaneous articles, wholly or mainly manufactured.

The value of Class III imports during the past three years has been as follows :

	1929.	1930.	1931.
	£	£	£
October	30,173,095	27,715,299	27,248,715
Ten mos.	278,442,312	262,101,321	215,099,350

Special figures compiled by the Board of Trade show that in the ten days following the period included in the returns for October of this year the value of the imports under Class III was £14,158,373.

Debates on Dumping

In the debates which have taken place on the subject, Sir Henry Page Croft stated that in the first eight months of 1924 we imported 4,000,000 bricks. In the first eight months of 1931 we imported 137,000,000 bricks. That was an increase of 3,300 per cent., a very serious matter for the workers of this country. We were quite competent to produce bricks ourselves.

Mr. Runciman, the President of the Board of Trade, said that the measure was an emergency one, designed to prevent forestalling while the Government were framing a larger scheme.

ARCHITECTURE AND DECORATION

BY HOWARD ROBERTSON

THE great styles of architecture were all modern in their day, all significant. Social changes helped transitions; but the greatest changes of form coincided with the most far-reaching developments in structure: Greek, Roman, Byzantine, Gothic, all marked by their own phase of structure. And then came the grand summary of the Renaissance, employing all phases, followed by a reversing of the wheel of development through a period of revivals, until we returned to pseudo-Greek.

A New Period in the Making

Today, another period is in the making. History will find the label. The phase of structure is still developing: starting with cast iron, and working through steel and concrete, we are not sure whither. The all-metal building is on the horizon. One is being built in Chicago, with walls, floors, partitions all of metal, lined with insulation. One of our structural problems has been the large dead weight of walling, still in brick and stone, carried by the steel of big buildings. The tallest building in the world, the Empire State Building, has to carry 14 tons of dead weight for each one of its 25,000 inhabitants. The average weight of a square foot of wall on a skyscraper is 150 lb. to the square foot. The walls of the new metal building will only weigh 121 lb. to the square foot, and there will be a great saving of space as well.

Treatment of City Roof-tops

One of the problems which we have not yet had to face is the treatment of our city roof-tops. In New York, with towering buildings and innumerable "set-backs," the view over the roof is important; and in Radio City, containing the largest office building in the world—a scheme sponsored by John D. Rockefeller—the roofs are being laid out in gardens, with planting, trees and even a 90-ft. waterfall.

One of our peculiarly English problems in big cities, like London and Manchester, is the present change of scale. Our civic scale, relative to the Continent, has been habitually small. We have developed a charming domestic and street architecture of small scale, and today our national style is a really pleasant free version of a friendly Georgian. But it is a style with limitations. We twist and turn between Georgian and Italian Renaissance, or Neo-Classic, in the effort to find a solution to the design of big commercial buildings. And we cannot do so, because solution does not lie that way. For big modern commercial work we must seek new formulæ and build up a fresh tradition, like the fine old traditions, based on requirements and structure. The start is made, but progress is hesitating.

Buildings and Advertising Value

People say today that most big modern buildings present a fresh and difficult problem, because they have to serve not only as shelter, but as advertisement. But in all periods buildings have served, in their way, as advertisements. Was not the Parthenon the sign of a cult, the Colosseum an advertisement for the popularity of emperors, Chartres Cathedral a striking symbol of religion? And today we have buildings as symbols for trade, advertisements for commerce, transport, amusement. Our task is to advertise in comely fashion, and in this the client must be willing to co-operate.

Comparison with Other Countries

Compared with countries like Germany, Holland, France, England suffers from lack of co-ordinated architectural ideals. For the last hundred years or more it has been a case of each man for himself; individuality, and too often individuality untrained and amateurishly unfit to express itself in building. Witness the architecture of nine-tenths of our streets. The great boon of the recent floodlighting of our big cities was the emphasis on our best buildings, and the blotting out of all the rest. Darkness hid for a moment our architectural sins, and gave glimpses of ideal cities.

Expression of Building Requirements

Until there are in England greater mass movements towards an agreed goal, with a greater agreement as to what is fundamentally important in the expressing of building requirements in terms of form and detail, we will fail in dignified street architecture. We are groping now; whereas the process of research into fundamentals of design and of constructive experiment has been going on for years past in many Continental countries.

In domestic architecture and decoration change is on the horizon. The expression of form, and decorative treatment, may modify itself slowly as ideas alter in respect of the utilization of the space within the house, and the service expected from such elements as windows, doors, fireplaces, etc. The day may come—it is already announced in German experiments—when interiors will be divided less into regular rectangular compartments of rooms, and will consist more of large spaces broken up by walls treated as screens, with curtains instead of doors, except to private apartments and kitchens.

Popularity of Glass

One large area will be so planned as to provide living space and nooks for dining, reading, and so on. And bedrooms, fitted like those of a yacht, will be sacrificed in size to the benefit of the living-room. Bigger areas of glass will probably become and remain more popular. But, to ensure privacy, placing and outlook of windows will be more closely studied, and plans will probably be of the type which can most easily be covered with flat roofs.

The house on stilts, with only the garage and store rooms on the ground floor, has also great possibilities. In town, as in the country, the high level of the living floor opens up splendid possibilities for terraces and loggias secluded and yet commanding in their views.

Furnishing and Decoration

The problem of furnishing and decoration is slow to be solved. Our furniture, even if modern in shape, is not truly modern in its planning and design for use. Desks, sideboards, dressing tables, cupboards have internally the same old defects. They are built, but not planned. Few makers have thought to design for the cramped spaces of today. And few decorators have realized how to create in form, colour, and reflections, the illusion of amplitudes.

Howard Robertson, F.R.I.B.A., author of the paper summarized on this page.

Summary of a lecture on "Problems of Architecture and Decoration," given by the author at a meeting of the West Yorkshire Society of Architects on Thursday last.

COMPETITION FOR TUBERCULOSIS HOSPITAL, SULLY, NEAR CARDIFF

Winning Design : By William A. Pite, Son and Fairweather

Elevation facing the sea. A footpath runs along this side of the site. It was stipulated that the buildings should be placed at a sufficient distance from this path to ensure privacy, and that no part of the buildings should be within 200 ft. of it.

AS announced in last week's issue, Messrs. C. E. Elcock, F.R.I.B.A., and T. Alwyn Lloyd, F.R.I.B.A., the assessors of the competition for the tuberculosis hospital, Hayes Farm, Sully, Cardiff, for the King Edward VII. Welsh National Memorial Association, made their adjudication as follows :

First premium (£400), William A. Pite, Son and Fairweather, FF.R.I.B.A.

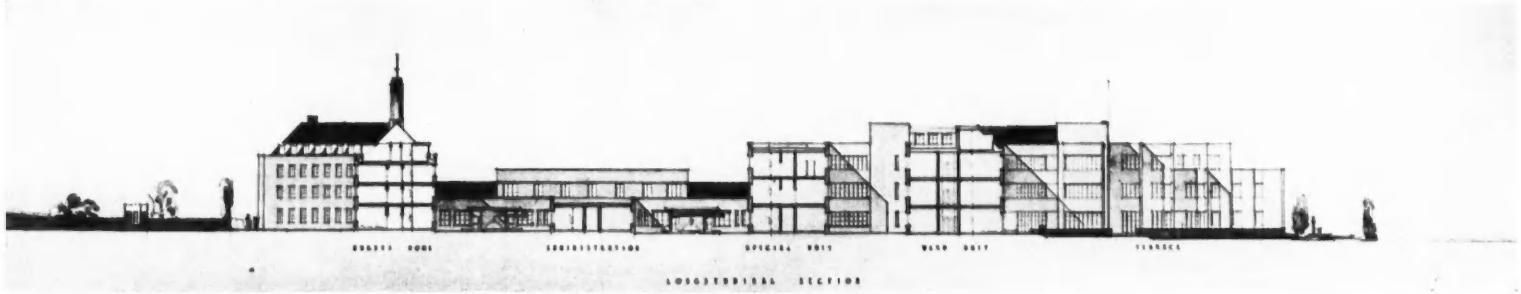
Second premium (£300), Lanchester and Lodge, FF.R.I.B.A., in association with Ernest E. Davies, A.R.I.B.A.

Third premium (£175), Stanley Hall and Easton and Robertson, FF.R.I.B.A.

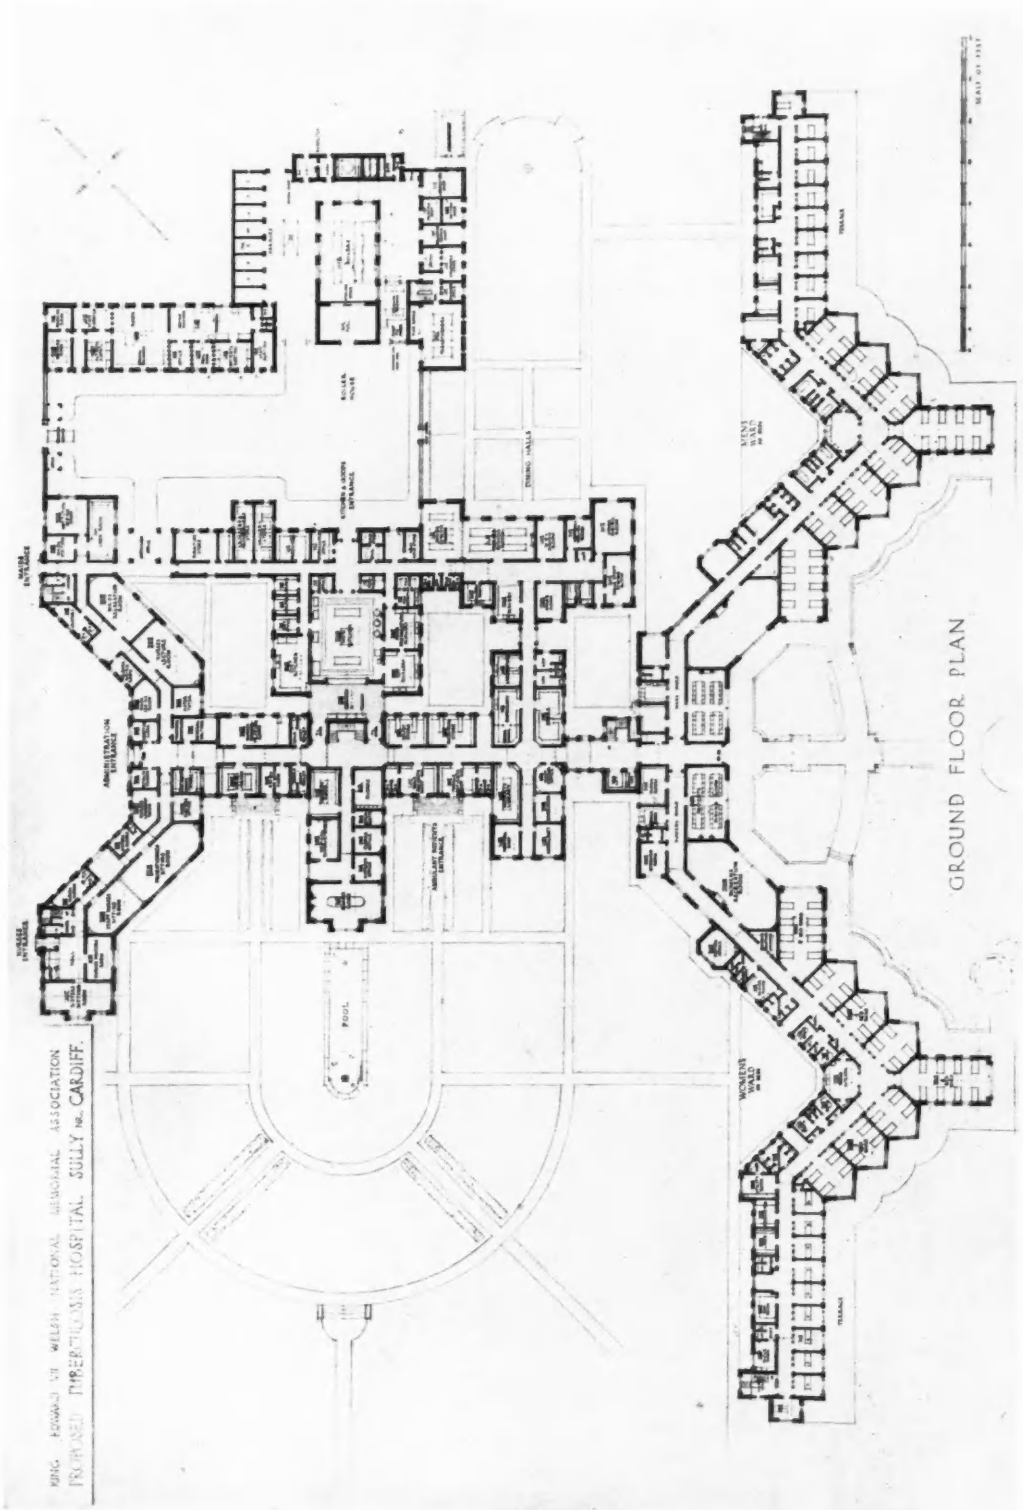
Fourth premium (£100), Todd and Thompson, A.R.I.B.A.

It is stated in the conditions of the competition that the Association intended to erect on a site of approximately 22½ acres, facing the Bristol Channel and flanked by existing belts of trees on the north and west, a hospital for the treatment of patients suffering from pulmonary tuberculosis. The hospital was to accommodate 250 patients, with provision for an additional fifty if the need arose. It was stipulated that the main approach should be from Hayes Road to the north of the site (see block plan), the approach avenue being laid in from the road more or less parallel with the north-west estate boundary. It was further emphasized that the outlook over the sea required consideration, so as to avoid glare from sea-shine and sun-shine. The buildings erected were to be arranged and constructed so as to offer protection for patients with rigid chests and heart and kidney complaints, so that the varying meteorological conditions might not be unduly felt by them.

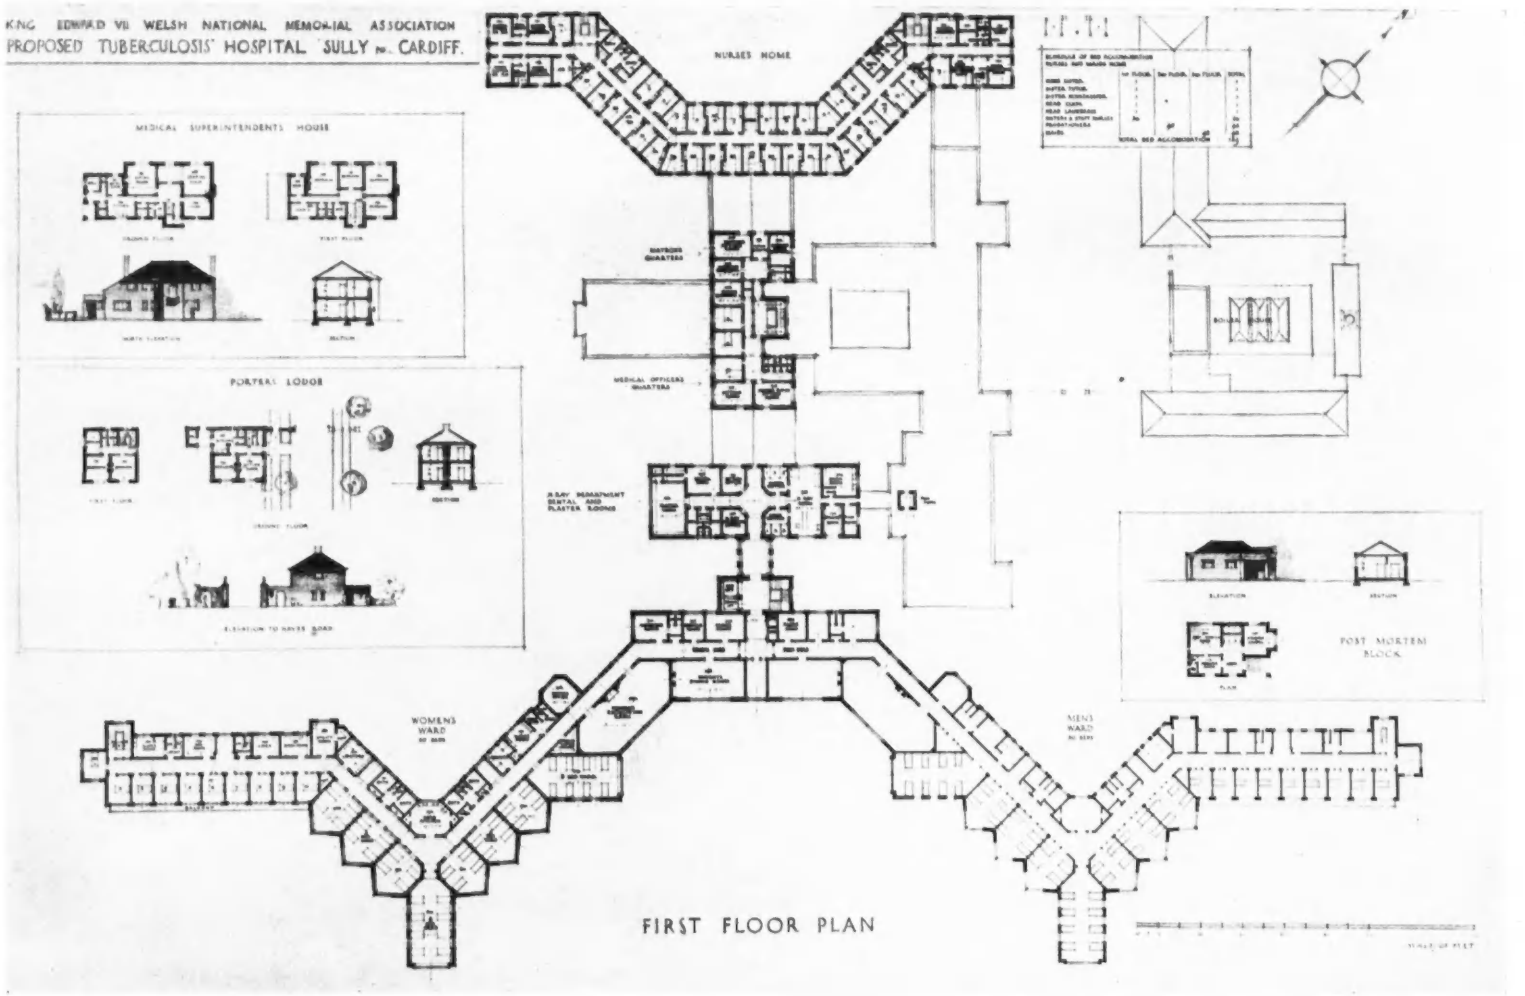
The assessors, in their report, state that forty-six sets of drawings were submitted by forty-five competitors, one set being evidently an alternative design. The estimated cost of the schemes submitted varied considerably, from £122,462 to £229,014.



Longitudinal section. Reading from left to right, are the nurses' home, administration block, and special and ward units. An entrance for ambulant patients has been provided in the centre of the administration block. The approximate cost of the scheme is £156,969, which, if the proposed extensions are executed, will total £165,188.

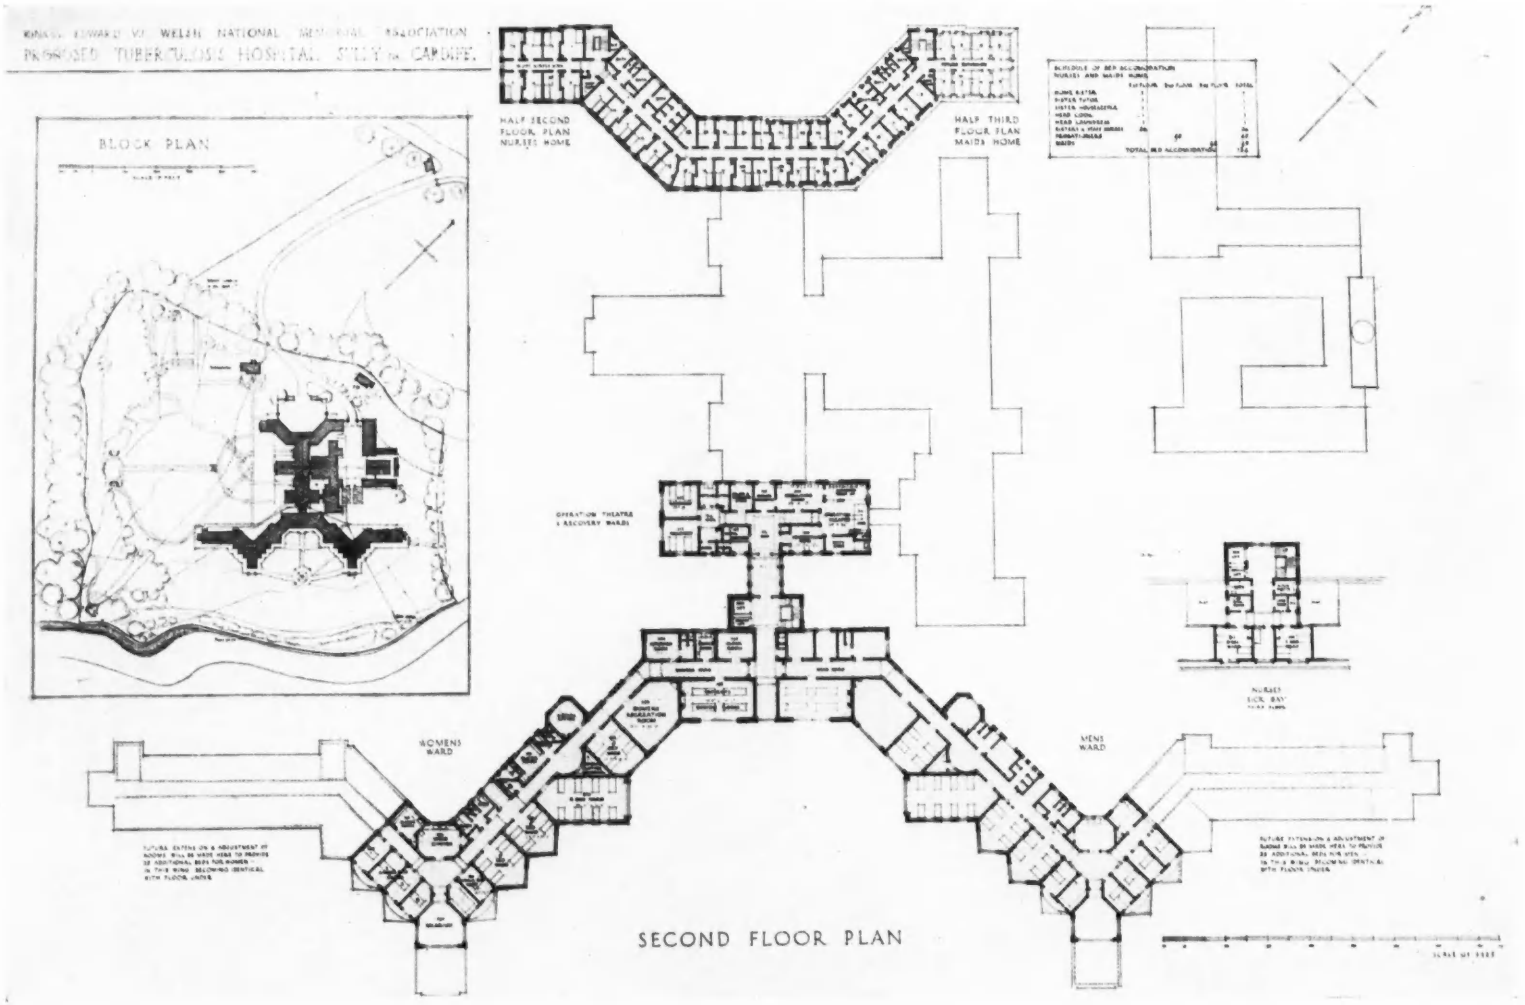


Ground-floor plan. There is a central corridor providing access to practically the whole of the accommodation on this floor. At the south-easterly end of the corridor are the entrances to the women's and men's wards. Both provide accommodation for twenty beds. The men's and women's ward units include recreation rooms, dining-rooms, offices, cloakrooms, etc., and there is a terrace running round them on the south-eastern side.



The architects' drawings of the first-floor plan; with plans, elevations and sections of the medical superintendent's house, porter's lodge and post-mortem block. The nurses' and maids' home provides total ac mmodation for 134 beds. The women's and men's wards also provide accommodation on this floor for fifty beds each. The medical superintendent's house is placed at the north-west corner of the site and contains living-room, dining-room, kitchen, study, etc., with, on the first floor, four bedrooms, two maids' bedrooms, bathroom and other necessary accommodation. The porter's lodge, containing living-room, parlour, kitchen, three bed rooms, etc., is situated at the entrance from Hayes Road.

TUBERCULOSIS HOSPITAL, SULLY, NEAR CARDIFF



Winning Design.] [*By William A. Pite, Son and Fairweather.*

Block and second-floor plans. It will be seen that the architects have provided for future extensions for the women's and men's blocks, each to accommodate twenty-five additional beds, eventually becoming identical in plan with the floor below. Competitors were asked to note particularly that "the building is not a *sanatorium* in the sense that this word is popularly understood. A cheerless and comfortless arrangement for tuberculosis wards is not desired, and stress is laid on hygiene combined with comfort. 'Pure air' treatment for patients is in this case a better designation than 'open-air' treatment."

LETTERS FROM READERS

"Bernard Whistlow, F.R.I.B.A."

SIR,—Now that "Bernard Whistlow, F.R.I.B.A.," has reached a sad but inevitable end, and Mr Towndrow has written his sad, inevitable letter, I would like to offer my doubtful solution :

I appreciated Bernard as an honest, sober and hard-working business man, and felt that he had made a success of his life—that is, he got what he was working for.

Mr. Creswell, however, must pardon my slowness if I had failed to grasp the fact that Bernard Whistlow was an architect—I realized that his business was connected with building, but thought that Mr. Creswell was depicting the perfect commercial traveller.

I should like to employ him.

HAROLD GREENWOOD

"Bernard, the Socially Sodden"

SIR,—When, some months ago, a correspondent to your columns referred to Whistlow as "Karshish's hero," my feathers all stood on end; but when Mr. Frederick Towndrow tells you he finds Whistlow to be a poor sad lot, a palpitating, curmudgeonly, tuft-hunting worm and socially sodden, they do not. Mr. Towndrow is, of course, merely measuring himself against Whistlow; for Whistlow remains the Whistlow we all know, and Mr. Towndrow is only telling us how he reacts to Whistlow, and in thus revealing his inability to assess values in life, Mr. Towndrow gives the clue to his fantastic assessments—as they seem to me—of architectural values.

Tchekov, in a letter to a friend who had charged him with being too strictly objective in his plays and stories, says, in defending his position, that the author who reveals his own prejudices by indicating his views of his characters and their actions, offends the reader as though he should display to him his naked foot. That illustration rams home an elementary principle of artistry in fiction-writing; and though I do, on my conscience, write with a deep sense of responsibility lest I should seem to recommend what I abhor or slight what I esteem, Bernard Whistlow's autobiography is an exact picture of life as I have experienced it within myself, and a true, if not entirely a literal one, in its episodes, and is coloured by no subjective purpose. I have been careful to avoid satire—great as the temptation to me always is—because my purpose is sincere, and facetiousness would impugn sincerity; but it is, by a curious paradox, those very precautions I have taken to remove any implications of satire that have, apparently, suggested a satirical motive to Mr. Towndrow. If I had allowed Whistlow to make his confessions, unaware that his actions invited adverse criticism, or even unconscious of his motives, satirical colour would have been latent in the narrative, but the challenge Mr. Towndrow makes would not, in that case, have been invited.

Whistlow, however, in the light of greater experience, writes of his past in full consciousness of the meanness of his aspirations and the falsity of the manœuvres by which he sought to accomplish them. This is greatly to Whistlow's credit, as it is to Mr. Towndrow's credit that he so detests Whistlow's social and professional climbings. It is also to be noticed that when Whistlow does particular violence to our self-respect, the pungent voice of Garston—who, I need hardly say, is the man for my money and the "hero" if the story holds one—re-establishes it.

Mr. Towndrow has the happiness to be young; but his position on the foothills of life disallows him that wide view which is the possession of those who have travelled farther and reached the vantage-point of higher ground. I think, however, that if he applies himself to a study of his own conscience—like the philosophers who of old sought the apocalypse of nature in their own bodies—and uses his observation in the light of the knowledge so acquired, he will cease to think Whistlow—who, in his simplicity, accepts the conditions of life in which he finds himself—is the abnormal person he now supposes, or that, as an architect, he is moved by different springs than those common to men in other professions and callings.

Does Mr. Towndrow suppose that people give dances and dinner- and house-parties to gratify a desire to entertain and give pleasure to their friends ? Is it the necessitous who are sent presents of game and offered shooting and salmon-fishing; or is it those who have well-stocked larders and fishings and shoots of their own ? Does he suppose that private social functions are other than evidences of keen, and even bitter, competition; or ever consider what the prizes in that competition are ? Has he ever tried to imagine what the mind—and soul—of "a famous hostess" is like, and what her idea of happiness is ? Why, I ask him, must a doctor have a showy car as formerly he aspired to a well-set-up carriage and pair; and why does the generality of all conditions of men strain their resources to maintain showy establishments ? What is the meaning of *parvenu*, and what methods does he employ, and to what ends and for what motives ? What is the general application of the maxim "Nothing succeeds like success," and why is it that those uttered by Whistlow's wife are not merely true but even trite ?

I ask him these questions, but I hope to goodness he will not answer them in print.

Poor Whistlow, in his single-minded, naked conflict with life, in which he has no guidance but his own experiences, is merely responding to vital instincts that are common to all men; but, unlike many men, he is no hypocrite, for he regards his machinations as a "game," and never disguises from himself, as the majority of Garston's tom-cats do, the meanness and falsity of them; and he also fully realizes the improbability of reconciling himself to such a way of life, and acknowledges this last of many errors with bitterness. "It pays an architect to have his front teeth knocked out," he comments. It seems to me that Whistlow's scorn is even greater than Mr. Towndrow's; and, Tchekov notwithstanding, is there any doubt of *my* views in the matter ?

H. B. CRESWELL

P.S.—Mr. Harold Greenwood's letter, which I have seen since writing the above, tells us how Whistlow strikes a boy who has just left school. I do not disparage that statement—I wish it were mine; but I think it possible that our difference of view may arise from the circumstance of my speaking after a considerable experience of professional life, and Mr. Greenwood before he has had any at all. He will not mind my chaffing him, for it was he who started the game. I hope he will hold to his beliefs and not, like Whistlow, be led unconsciously into drifting with the stream and live to regret lost ideals—or, worse, live never to regret their loss, from the early-formed habit that avoids recognizing motives which are irreconcilable with ideals. The commercial traveller is innocent of any such hypocrisy : he at least is an honest fighter, out simply to do the other fellow in the eye by fair means or foul, or be similarly done in the eye himself. If Mr. Greenwood, in fifty or sixty years' time, turns up his letter and is led to the reflection that the practice of architecture has, for him, been a dirtier game than the bagman's, he cannot lay the blame upon me nor upon Whistlow. He has been fairly warned, and at a peculiarly impressionable time of life.

H. B. C.

THE SPECIFICATION WRITER

Economical Hospital Construction

BY SIR G. T. BEATSON

IN Germany, prior to the war, preference was being given to the central-corridor plan with its one-story bungalow in the erection of large hospitals. For instance, in the case of the Rudolf Virchow Krankenhaus for 1,000 beds, which was completed in 1914, the hospital was laid out with a number of single-story pavilions, which could be immediately duplicated should occasion arise, and that without any increase in the administrative buildings or in the general services, such as water supply, heating and electricity. In Germany it was felt that this plan was conducive to rapid building, quick extension, and, above all, economy.

Cambridge Hospital

When the Great War broke out, and Cambridge decided to erect a large general hospital, it selected the central corridor and bungalow type of building. In the spring of 1915 the Scottish Committee of the Red Cross Society realized the possibility that a prolonged war might have to be faced, and resolved to erect a large general hospital that would take its place in the first line of military hospitals in the organization laid down by the War Office. It was necessary that such a hospital should be built quickly and economically, and that it should be capable of expansion in case of need. A small committee was sent to Cambridge to inspect the war hospital there, and the result of this visit was that they recommended the adoption of the central corridor plan, with the single-story wards leading off each side of the corridor, but with the introduction of some small changes to meet our different climatic conditions.

Bellahouston Hospital, Glasgow

Through the kindness of the Glasgow Corporation a site for the hospital was furnished at Bellahouston Park, and, after some preliminary levelling had taken place, the construction of the hospital was put in hand. At this time building materials were scarce, and, an alternative method of construction having to be chosen, the selection fell upon asbestos sheeting. By using this and by adopting the bungalow plan with its single stories, thus doing away with lifts and stairs, the cost of erection and of future upkeep was lessened. Rapid building was also facilitated, and the hospital structure was practically completed in three months.

The Hospital's Equipment

Provision was made in the hospital for the reception of patients, operating theatres, curative baths, capacious rooms for radiant heat, electricity, and massage—the last with physical apparatus. Around the hospital were arranged, separately, a pathological department, a block with isolation wards, blocks for doctors' quarters, nurses' quarters, administration, and other blocks, as for the kitchen, orderlies' quarters, recreation room, etc. Later on a building for orthopædic curative workshops was put up.

The hospital began with beds for 500 patients, and the ease with which it could be extended was illustrated by the fact that, subsequently, that accommodation was increased to 1,200 beds by adding seven additional blocks, and this without the work of the hospital being interfered with. So expeditiously were the building and equipment carried out that in October, 1915, the hospital was ready for patients, and was then formally opened.

Central-Corridor Plan

Reference to the adjoining plan will show the position of the central corridor running north and south, with one-story bungalow wards opening off it on each side, there being sufficient space between the wards to allow of the beds being wheeled out into it, so as to let the patients have the benefit of the open air and sunshine. Each ward held fifty beds, and was complete in itself, having six small rooms at the end nearest the corridor—one for the sister-in-charge, two for special cases, one for clerical work, one as a linen-room, and one as a ward kitchen with a larder opening off it. At the other end of the ward each block had its own sanitary arrangements, which were completely shut off from the ward by a short passage with cross ventilation.

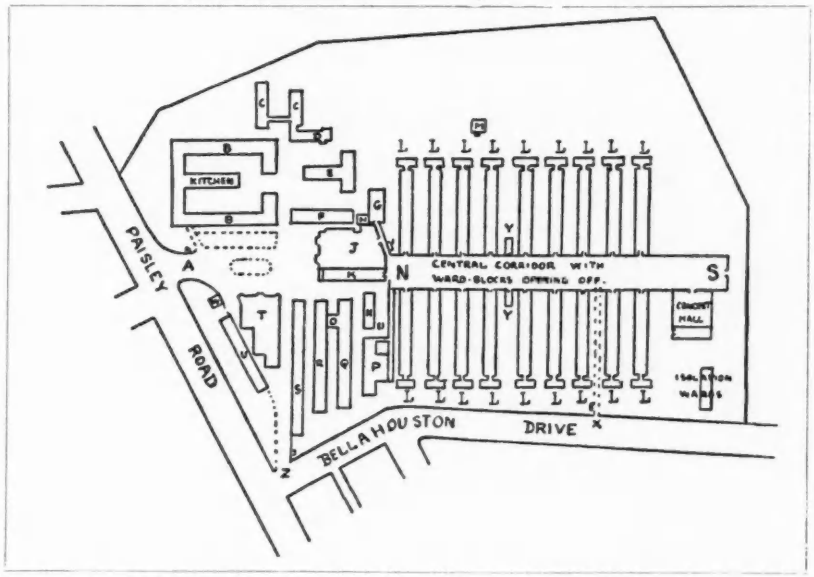
It will also be quite apparent from the plan that the central corridor lends itself readily to expansion of the hospital by extending it southwards, and so allowing the addition of extra wards. Further, the central corridor gives two entrances to the hospital—one at the northern end for members of the staff and the admission of patients, and another at the southern end for the friends of patients. An exit was provided at the southern end for access to the grounds of the hospital, and, subsequently, there was also built off the corridor a large concert hall for entertainments.

An Educative Factor

The Glasgow Herald of January 7, in its editorial diary, intimated that Bellahouston Hospital had been evacuated, and attention was drawn to, and emphasis laid on, the fact that it had served notably its day and generation. The hope was also expressed that, though it would soon pass into oblivion, its story should be preserved in some form or other. This outline of the hospital to some extent should do this. Besides the great service that Bellahouston rendered to 15,000 sick and wounded in the Great War, it supplied valuable lessons in hospital construction, in hospital co-operation with county auxiliary hospitals, and in finance.

As one of our leading medical journals said, these lessons would amply repay further study, as they should now be of great service to our voluntary hospitals at a time like this, when their position in all the above three matters is far from satisfactory and is seriously compromising the suitability of that voluntary principle which it is so desirable should be retained.

Bellahouston Hospital has, undoubtedly, been an educative factor on the points mentioned above, but



Layout plan of Bellahouston Hospital, Glasgow, now evacuated, a typical central corridor, one-story bungalow design, the economies of which, in construction and upkeep, are emphasized in the accompanying article.

markedly so in introducing into Scotland the central corridor and bungalow type of building, and in having given it a thorough trial from which it has emerged most successfully.

It is well to draw attention to this modern type of construction, and it is not unreasonable to hope that the twentieth-century hospital should adopt it, recognizing that it is rapid in construction, easy of expansion, not costly in upkeep, gives a good return in accommodation for the money spent, and, above all, is economical. With its 1,200 beds Bellahouston Hospital cost £100,000. While it does not claim originality for the central corridor and bungalow system, but only for its introduction into Scotland and for demonstrating its value and usefulness, the memory of the hospital might very properly be perpetuated by calling this mode of construction " the Bellahouston central corridor system."

In a recent notice, *The Lancet* spoke of Bellahouston Hospital as " the Great War hospital." It was so in two senses —the Great War called it into existence, but it was great also in the work it did and in the valuable hospital lessons it supplied, and that entitled it to well-deserved recognition.

[The foregoing article is reprinted from *The Glasgow Herald*.—ED. A.J.]

COLOUR IN INTERIOR DECORATION

THE point of view of Mr. Holmes's book,[1] which has been admirably printed and bound by The Architectural Press, is well expressed by the quotation which he prints on his title-page :

" If knowledge alone be insufficient to form a good colourist, it must at least prove useful in explaining the causes of failures and in suggesting the conditions of success."—(A. H. Church, 1901.)

With so modest an outlook Mr. Holmes prefaces a book which is devoted to the very lucid exposition of a simple theory of colour, developed out of his knowledge of the practical problems of decoration, and applied to a series of examples which are good proof of the value of his theory.

Although it is quite clear that some of the best colourists are not acquainted with any colour theories and produce schemes instinctively, it is none the less invaluable for them to be able to analyse the means by which their ends are achieved, and it is still more valuable for the great mass of designers, who work haphazardly and experimentally, to be able to direct their labours in accordance with a theory such as that put forward by the author of this book.

Concerning himself with the pigments, which are the decorator's medium, Mr. Holmes has produced a colour disc with a circumference of twelve " primary " colours, the centre of the disc being neutral grey. An infinite number of these discs can be produced according as the general tone of all the colours varies. This primary circle is the basis of Mr. Holmes's discussions of contrast, harmony, monochrome, neutralization and discord, which colour relationships are each examined by reference to appropriate plates.

It is not my intention to give a *résumé* of the subject-matter of the book, which can only conveniently be studied with the colour drawings at hand.

Apart from the principal theory propounded, Mr. Holmes's general remarks on interior decoration are to the point :

" As interior decoration in colour and the painting of pictures have unfortunately become separate activities, the decorator is much more closely concerned with relationship of colours than the painter of easel pictures or the individual designer. His problem is to unite colour to architectural form, and his freedom to break up large areas with patterns is necessarily limited."—(Page 58.)

Particularly valuable, however, is the chapter devoted to " The Carrying out of Colour Schemes." I would strongly recommend The Architectural Press, in the interests of architects generally, to reprint this chapter, and circulate it amongst paint manufacturers in this country. On the subject of sample books of colour, Mr. Holmes remarks : " It is a strange fact that the ordinary sample book of ready-mixed paints of various kinds does not usually contain a comprehensive set of primary colours, but consists of a haphazard selection of various tones of the purer colours and a large number of unassorted and unrelated greys . . . Under similar conditions in the pianoforte industry, and assuming that no player were able to " mix " his own notes, each manufacturer would attempt to furnish on the keyboard an unlimited number of notes without any preconceived relationship. There would be an attempt to provide not only a key for every single variation in the scale, but also a key for every combination of notes, or chord, possible. The notes would be " ready mixed," but they would not be grouped in octaves of ready-mixed notes, or taken from any one musical composition. Imagine now the player who does not know much about music, but " knows what he likes " performing on this instrument. That is what is taking place with regard to colour in many otherwise happy homes. Greys, like chords, are mixtures which give a simultaneous impression, though the analogy must not be pressed much further."

In many colour books it is impossible, as he says, to find more than two or three colours which are well related, and he gives concise instructions as to how the manufacturer could produce a useful and well-organized sample book. The need is an urgent one. I could, but I refrain from doing so, give a fairly long list of manufacturers who supply me with almost useless colour books. The method of arriving at the particular tints is incomprehensible to me.

The whole question of standardized colours deserves serious attention. One of the most valuable contributions to this subject is Joseph Lovibond's book on *Light and Colour Theories*, which I do not see mentioned in Mr. Holmes's bibliography.

The purpose of Lovibond's book is to demonstrate that colour is a determinable property of matter, and he establishes a unit for measuring the intensity of both light and colour. He is concerned with the necessity for a system of nomenclature and reliable standards of reference. The importance of this to manufacturers is obvious.

Mr. Holmes chooses seven somewhat arbitrary primaries. There are other seven colour theories, but there is no common agreement as to what the primary colours are. To establish a unit of measurement it was necessary to establish a standard white light. Having done this, Lovibond produced an apparatus with a six-windowed frame with sliding shutters and a tray of eighteen standardized glasses, a mechanical scale which is now employed in a great number of laboratories.

Any colour can in this way be matched by standard glasses and described qualitatively and quantitatively. Colours are denoted by such symbols as R.3.0 or R.3.0—N.T.1.0. Such a system generally adopted would standardize the colour of paints or materials produced by any number of manufacturers, and instead of William the Conqueror's Red or Narcissus Yellow, some exact and standard nomenclature could prevail.

Each architect or decorator would then possess a more or less complete range of marked colour cards, by means of which an order could be placed, without fear of confusion, with any manufacturer. There are difficulties of permanence of pigments, etc., but the general principle is sound.

I would commend Mr. Holmes's book to all who are interested in the subject of interior colour decoration. I recommend Mr. Lovibond's book as a suggestive appendix.

IN THAT CONTINGENCY

The following abstracts of inquiries represent a number of those recently submitted to the Building Research Station. The information given in the replies quoted is based on available knowledge. It has to be borne in mind that further scientific investigations may, in the course of time, indicate directions in which the replies might be supplemented or modified. Moreover, the replies relate to the specific subject of each inquiry, and are not necessarily suitable for application to all similar problems. Crown Copyright Reserved.

Lightweight Concretes

AN engineering consultant inquired regarding the types of aggregates most suitable for a lightweight, mass concrete capable of carrying a load of 3½ tons per sq. ft. The concrete was required for filling in bad ground, and it was desirable to keep the weight as low as possible. It was also stated that the work would be below ground water level.

The following materials suggest themselves for this purpose: (i) Furnace clinkers and coke breeze; (ii) pumice; (iii) blastfurnace slags; (iv) burnt clay. In addition, there are also, of course, lightweight concretes of special composition.

Of these aggregates, the clinkers and breezes are probably by far the cheapest. With furnace clinkers there is a danger of obtaining unsound material, and the consequences of this with concrete under water would be likely to be serious. By careful sampling and testing, however, it should be possible to guard against unsound material, although, no doubt, this would add appreciably to the expense. With a true coke breeze, as distinguished from the various types of coal residue to which the term is often applied, there should be no serious danger of unsoundness due to the presence of unburnt coal, but danger may be expected in the event of the presence of an excessive amount of sulphur as sulphide. Concretes made of these aggregates, even if sound, are liable to a high moisture movement, and, if exposed to conditions where alternations of humidity are likely to occur, there is a danger of cracking due to volume changes. It also appears that exposure of clinker or breeze concrete to wet conditions is likely to lead to failure in an aggravated form, in the event of unsound aggregates being present.

The dangers inherent in the use of clinker and breeze aggregates can be much reduced by the elimination of all fine material. By using only those fractions of the material retained on a ⅜ in. or ½ in. sieve, much of the risk of failure is removed. It is quite possible that a concrete, without fine aggregate, would have sufficient strength for the purpose.

Pumice aggregates are believed to be considerably more expensive than breeze or clinker aggregates. So far as is known, however, they are not likely to be unsound, and should not be liable to failures of the type associated with unsound breezes and clinkers. The moisture movement of such pumice concretes as have been examined at this Station is approximately double that of normal ballast concrete and comparable with that of a sound clinker concrete. Blastfurnace slags, as normally produced, are usually considered to give a lighter concrete than gravels. Figures from American sources indicate weights of about 130–140 lb. per cu. ft. for well-compacted slag concretes as against 150 lb. for comparable gravel concretes. Weights of representative, coarse, slag aggregates are about 70 lb. per cu. ft. against 90 lb. per cu. ft. for stone and gravel aggregates. The elimination of the finer grades would result in a considerable reduction in weight of the concrete. Granulated slags are sometimes produced by running the molten slag from the furnace into contact with water or steam. Such examples of this material as have been seen at this Station tend to be rather on the fine side, but it may be possible to obtain coarser grades.

Certain types of burnt ballast and broken brick aggregates will be found to be considerably lighter than gravel aggregates, although probably not comparable with clinker or pumice. There is also to be considered the possibility of burning ballast on the site.

So far as strengths of the lighter materials are concerned, the following table summarizes the information available in the records of this Station:

Concrete.	Crushing Strength. lb. per sq. in. Dry.	Crushing Strength. lb. per sq. in. Wet.	Weight of Concrete. lb. per cu. ft.
Pumice .. Graded ⅜ in. down. Mix not stated	490	434 (At about 1 month.)	54
Pumice .. Pumice 9. Cement 1.	432	271 (At about 1 month.)	56
Typical Clinker Concretes .. (Partition slab)	150–500	110–450	Varies from 60–80
Burnt Clay .. 1 : 6 by weight	—	2,360	approx. 110

With lightweight concretes, normally of rather a porous structure, it is likely that any deleterious substances present in soil waters will have a more aggressive effect on the cement than would occur with a densely compacted concrete.

Cavity Wall Construction

The architect for a syndicate engaged in the erection of small house property required the views of the Station on a method of wall construction in which external walls are built up of two 4½ in. leaves of brickwork, with 1 in. space between filled with cement mortar. The wall was to be built without through bond headers.

The correspondent stated that he did not care for the normal cavity form of construction in the form of two 4½ in. walls, separated by an air cavity, 2 ins. to 3 ins. wide, and bonded by metal or other ties, although he was of the opinion that an ordinary 9 in. solid brick wall does not offer really satisfactory resistance to the penetration of moisture, and that roughcast has its limitations.

No case of the penetration of moisture through a properly designed and constructed cavity wall has ever been brought to the notice of this Station, and it is considered that, with the materials at present available, the cavity wall is by far the most satisfactory form of construction for domestic buildings. The weaknesses of the cavity wall lie in the fact that careful attention must be given to details at openings: these details must be interpreted in an intelligent manner by the operative, and supervision is necessary to ensure that the cavities are kept clean. There can, however, be no doubt that the cavity form of construction has become normal practice, and the better class of builders are sufficiently familiar with it to be able to guarantee satisfactory work.

We have not made any experiments with a wall of the type suggested, but consider that in some respects it is open to objection. An interesting experiment on a practical scale was carried out by a local authority at our suggestion. Three houses were erected on a housing estate of identical bricks and mortar, the walls being built as follows:

(1) Red facing bricks backed with clinker bricks in solid 9-in. work, built with greystone lime and sand, 3½ to 1, pointed with Portland cement and washed sand. All cross joints put right through and lateral joints between stretchers thoroughly well flushed up. Plastered internally. (2) As above, but no flushing up of internal joints. (3) As above, but built as two separate 4½-in. walls, no flushing up, bonded with metal reinforcement every six courses.

On completion of the houses, a hose was attached to a ½-in. bibcock, full on and direct from the main, and was directed on the brickwork at 3-in. distance. The following observations were made: (*a*) Dampness appeared

on the inside after 3½ hours' continuous flow. (*b*) No dampness appeared after 5½ hours' continuous flow. (*c*) No dampness appeared after 9 hours' continuous flow.

The essential reason for the penetration of walls by moisture is that ordinary walling materials have a porous structure and water is transferred to the inner face of the wall by capillary forces. In the cement mortar core capillary forces will still be exerted, although with a very dense mortar the amount of water actually transmitted may be small. It would be a matter of some difficulty to ensure that a thin core of mortar is thoroughly compacted, especially since the water content of the mortar will be much affected by the absorption of the bricks. The likelihood of efflorescence will be much increased: it is generally recognized that much of the efflorescence observed on new brickwork is due to soluble salts derived from Portland-cement mortar joints. The amount of salts available will be appreciably increased by the 1-in. core.

An important factor also is the tendency for cement mortars to crack, and any defects of this kind will be liable to result in damp areas at the inner face of the wall. There would be an additional difficulty in ensuring that the mortar core is quite watertight round any ties which are used to form a bond between the two half-brick walls.

SOCIETIES AND INSTITUTIONS

SPOLIATION OF THE COUNTRYSIDE

MR. ERNEST H. BUCKINGHAM, F.R.I.B.A., President of the Norfolk and Norwich Association of Architects, presided at a joint meeting of architects and builders, held at Norwich on November 13.

Mr. Edwin Gunn, lecturing on "Architecture and the Crafts," said that he had never addressed a joint meeting of architects and builders before, so they would forgive him if he took advantage of the occasion. He was afraid the sermon would be popular with neither. His text was standardization as a palliative for the dismal stupidities and lapses of taste which afflicted the bulk of cheap building carried out without architectural aid since the rise of industrialism. Previous to the decay of individual craftsmanship such building existed but was invariably inoffensive and sometimes quietly beautiful.

He would be either a bold or a blind man who would claim that it was so now. The day of the small self-supporting community was ended by ready means of transport. Of the old independent craftsmen the thatcher was the sole survivor. In these circumstances they must seek fresh lines if, as he believed, the present conditions were a needless muddle and an imperfect utilization of man's best powers. The function of an architect was to design and of a builder to construct. What he objected to about many architects was that they seemed to have no clear aim in design, and about many builders that they seemed to lack constructive sense.

Speaking of the characteristics which made most recent cheap housing estates so fidgety and mean in appearance, Mr. Gunn said that with all its dullness he preferred the Victorian terrace to the modern building estate, on which every land-purchaser followed his bent as to size, height, forward or backward position and angle-inch frontage, not to mention material and colour. There were State-aided housing schemes in which, from a mistaken effort to achieve liveliness, blocks of houses were disposed alternately backward and forward, and the materials varied from brick to roughcast and from slate to tiles on no discoverable plan. And how did the thousand and one varieties of each common detail, windows, doors, etc., benefit anyone or contribute to the visual pleasure? He would like to see applied to the housing of the multitudes the same principle as the Swedes applied to industry. Let them get their standard plans refined and improved, striving by experience to make every essential as perfect as could be. They need not fear long lines or unbroken series, but they must be specially careful at all road junctions or angles, where a little thought and skill on modified types could make or mar a scheme. Let them use standard patterns for all repetitive details, but let the patterns be as good as they could be made.

Mr. Edwin Gunn, A.R.I.B.A., whose lecture on "Architecture and the Crafts" is reported on this page.

ARCHITECTURE IN IRELAND

Judged by contemporary standards, the Irish architects could claim that at least they were as good as their public deserved, said Mr. Manning Robertson, F.R.I.B.A., at a meeting of the Architectural Association of Ireland, held on November 10.

In Ireland, he continued, they had as a body concerned themselves actively with the training and education of architects. They aimed at a good standard, and were entitled to say to the public: Give your architects a chance; they know their jobs. In Ireland during the Victorian period, when building was largely the output of amateurs, they had less building, and now less consequence to lament, but the habit of disregarding the qualified architect, especially in house work today, was identical. It was up to each individual to see that his work was up to the standard, since the dissatisfied client was more likely to build for himself in future than employ another architect.

Dealing with architecture generally, he said that civilization must include art, not as an agreeable by-product or relaxation, but as an essential for everyday expression and wellbeing. Commerce was discovering that art paid.

He warned architects to be on guard against frightening the public by excesses in modernism that might be legitimate, but not always tasteful. Many of the Continental examples of stark realism were unlikely to stand the test of time, and, robbed of their newness, they would be seen to lack the enduring virtues of good proportion and architectural composition.

PLACES OF ENTERTAINMENT

Mr. W. Milburn, B.SC., F.R.I.B.A., lecturing on "Places of Public Entertainment," at a meeting of the Sheffield, South Yorkshire and District Society of Architects and Surveyors, held at Sheffield, said, in spite of all the thought and care which was devoted to render places of public entertainment safe for the public, there still remained the human element to control, and the risk of panic. The audience should have confidence in the building, and know that everything possible had been done for their safety, and that in any circumstances there was no need to take panic or alarm. It was desirable to familiarize them with all exits, so that they had knowledge of egress, other than by the way they entered.

The system in some American cities of numbering the exits and printing on the programmes plans of the floors and tiers, showing the exits, was a step in this direction, for if only a few members of the audience studied the plans, they would, if an emergency arose, be able

to guide sections of the audience away from the building. Plans of the building placed in the foyers, or other public places, showing the exits and surrounding streets, might also be of advantage.

BEAUTY IN BRIDGES

"Beauty in Bridges" was the subject of an address by Mr. G. H. Jack, F.R.I.B.A., at a meeting of the Liverpool Architectural Society on November 11.

The disappearance of old bridges in industrial areas was inevitable, said Mr. Jack, but in rural districts where the traffic was not so intense we might hope to preserve the good work of our forefathers for a long time to come, though we must avoid an obsession for preserving the merely old. There was more bad work than good in every period, and much of the beauty we admired was due largely to the limitations of the mediæval builders, who could not deal with long spans.

But wherever the clever architect of the Middle Ages had a good chance he made the most of it, and to this day we had not been able to surpass in grace the best work of the fourteenth century. Our productions seemed to lack spirit. We had standardized our methods, and consequently our modern road bridges looked very similar.

He would like to see every bridge of character scheduled, not with the idea of preventing demolition, but in order to give time for the careful consideration of whether it would not be advantageous to recondition and preserve.

Professor Abercrombie, who presided, announced that the H. W. Williams £50 award for a design in concrete had been won by Mr. Glynn Roberts.

MODERN SCULPTURE

Under the auspices of the South Wales Institute of Architects (Central Branch) and the Institute of Builders (South Wales Branch), a lecture on "Modern Sculpture" was given by Mr. W. Aumonier, at the Engineers' Institute, Cardiff, on Thursday, November 12.

The lecturer dealt with modern sculpture, not only in America and Great Britain, but also in Norway, Denmark, Sweden, Holland, Germany, Austria, France, Czechoslovakia and Yugoslavia, and made particularly interesting references to a number of the more extreme examples which have been so much discussed in recent times, including Epstein's "Genesis."

He suggested that the public should not condemn experiment in sculpture without careful thought, and explained that while modernist examples naturally varied in type and quality, many of them were undoubtedly the result of a genuine effort on the part of able sculptors to express themselves more fully than they found possible on traditional lines. He drew attention, however, to the great importance of a full and scholarly training on traditional lines as a necessary preliminary to later efforts in whatever direction these might develop.

SWEDISH ARCHITECTURE

Mr. F. R. Yerbury, HON. A.R.I.B.A., lecturing on "Modern Swedish Building," at the Royal Institution on November 14, pointed out that it was during the last two or three years that some of the Swedish architects had flirted with the idea of an international architecture and had produced a style, such as at the Stockholm Exhibition, 1930, popularly known as "Funkis," which was heartily approved of by some and equally heartily disliked by others.

But whatever line of adventure the Swedish architect followed, he never seemed to lapse into bad taste or show any trace of vulgarity in his work, with the result that the Swedes were uniquely fortunate in having no really bad new buildings.

COMPETITIONS OPEN

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius of Liverpool Town Hall. Assessor: A. H. Moberly, F.R.I.B.A. Premiums: £200, £100, and £50. Conditions were obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

December 31.—Sending-in day. Latest date for conditions: September 31. Proposed New Town Hall and Municipal Building, for the Walthamstow Corporation. Assessor: H. Austen Hall, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Conditions, etc., obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

January 1, 1932.—Sending-in day. Proposed Church at Low Shiregreen, Sheffield, in connection with the Bishop of Sheffield's 100,000 guineas appeal (limited to architects with an office in the Sheffield Diocese). Assessor: C. C. Thompson, F.R.I.B.A. Full particulars obtainable from the Hon. Secretary, Sheffield, South Yorkshire and District Society of Architects and Surveyors, 15 St. James' Row, Sheffield.

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors: Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium: £500; also a further amount of £750 will be awarded to other designs according to merit.

September 31, 1932.—Sending-in day. All-British House (cost to be less than £1,000) for the Incorporated Association of Architects and Surveyors. Premiums: 50 guineas, 20 guineas and 10 guineas. Conditions, etc., from the Secretary, I.A.A.S., 1 Wilbraham Place, S.W.1.

The last day for submission of designs in the Southampton Grammar School Competition has been extended to December 8.

LAW REPORT

CONSTRUCTION OF A ROAD-MAKING CONTRACT

Marsden Urban District Council v. *Sharp and another. Before Lords Justices Scrutton, Greer and Slesser*

THIS was an appeal by the plaintiffs, the Marsden Urban District Council, from a decision of Mr. Justice Rowlatt, sitting in the King's Bench Division, in a special case stated under section 7 of the Arbitration Act, 1889.

It raised a question of the construction of a road-making contract and the amount of damages payable thereunder.

Mr. Rayner Goddard, K.C., for the appellants, stated that the contractors had been engaged by the Council in making a road over Standedge Moor, and the Council alleged that the work had been badly done and that they were entitled to damages.

The contract under which the work was executed contained an arbitration clause, and also a clause, No. 35, which was here material. It stated :

> Should it at any time subsequent to the termination of the period of maintenance up to but not exceeding a period of five years from the date of the completion of the works be discovered that the terms of this specification have been violated by the execution of bad, insufficient or inaccurate work the council shall be at liberty to make good such work and to recover the cost thereof from the contractor . . .

The Council alleged that before the period of five years had expired they discovered that the concrete used by the contractors was defective, and that the road was beginning to fall into bad repair. They found that further damage occurred after the expiration of the period. They claimed a sum from the contractors by way of damages. The matter was referred to arbitration, and the arbitrator stated this case for the opinion of the Court.

It was at first contended that in any event the Council could not make any claim against the contractors unless they had themselves first done the work of making defects good, but that point was abandoned. The only point now to be decided by the Court was whether the Council could recover for work which was not discovered to be defective until after the five years had passed.

The question which arose was which of the two alternative sums named by the arbitrator as damages the Council were entitled to recover.

Counsel argued that before the five years had passed the Council discovered that defective concrete had been used, and that was a violation of the specification and gave a right to all the damages naturally resulting.

Mr. Justice Rowlatt held that the Council could only recover for the defects discovered within the five years to the natural extent of that discovery, and that such discovery did not entitle the Council to recover for defects discovered thereafter.

The Court, without calling upon Mr. Macaskie, K.C., for the contractors, dismissed the appeal.

Lord Justice Scrutton, in the course of his judgment, said in his view both the arbitrator and the judge in the Court below had arrived at a right conclusion. Mr. Justice Rowlatt had held that clause 35 was limited to actual discovery within five years, and not to a subsequent discovery. His lordship could only say that he should have taken the same view himself. It followed that the appeal failed and must be dismissed.

Lords Justices Greer and Slesser concurred.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

St. David's Wing for Private Patients, Royal Northern Hospital, Manor Gardens, Holloway Road, N. (pages 698–703). General contractors, Dove Bros., Ltd., who were also responsible for the demolition, excavation, fireproof doors and plumbing. Sub-contractors : Trussed Concrete Steel Co., Ltd., Reinforced Concrete Engineers, foundations and reinforced concrete; Ragusa Asphalte Paving Co., Ltd., damp-courses and asphalt ; Geo. M. Callender & Co., Ltd., " Ledkore " dampcourses; S. and E. Collier, Ltd., and T. B. Lawrence and Sons, bricks; Bath and Portland Stone Firms, Ltd., stone; Patent Victoria Stone Co., Ltd., artificial stone; North British Rubber Co., rubber flooring; James Slater & Co. (Engineers), Ltd., central heating; Bratt, Colbran & Co., Ltd., grates and mantels; Girdlestone & Co., electric wiring; Doulton & Co., Ltd., sanitary fittings; A. E. Davis, door furniture; Crittall Manufacturing Co., Ltd., casements; F. Jukes, folding gates and metalwork; Haywards, Ltd., iron staircases; R.N.H. Works Dept., flush hospital door; Art Pavements and Decorations, Ltd., marble; W. B. Simpson and Sons, Ltd., tiling; Waygood-Otis, Ltd., lifts; Mumford, Bailey and Preston, kitchen equipment ; Fosalsil partition blocks were used.

Bolling High School for Girls, Flockton Road, Bradford (pages 705–707). J. Moulson and Son, Ltd., mason and joiner; T. Feather, plasterer and concretor; Atkinson and Smith, Ltd., plumber and glazier; J. Smithies and Sons, slater; A. Dibb, painter; J. Carter, electric lighting; S. Butler & Co., Ltd., steelwork; G. N. Haden and Sons, Ltd., heating; D. A. Holdsworth and Son, Hirst and Smith, Dunhill Bros., and Midland Educational Co., Ltd., furnishing contractors.

TRADE NOTES

Messrs. G. A. Harvey & Co. (London), Ltd., are showing an extensive range of perforated metals at the Engineering Exhibition, now being held at Cardiff. This firm specializes in both perforated metal and woven wire, suitable for screening, grinding, separating and filtering such widely different commodities as coal, coke, gravel, ore, sugar, food products and fine chemicals. A selected range of ornamental patterns for radiator covers, pipe guards, grilles and ventilating panels, are also on view. The use of English steel furniture, both in offices and works, has considerably increased during the last few years, and Messrs. Harvey & Co. have accordingly considerably extended their steel furniture department.

Many kinds of industrial plant are manufactured at the firm's works, and equipment of the latest type is installed, and they claim to have one of the most up-to-date departments in the United Kingdom for the economical production of industrial plant in copper, aluminium, nickel and stainless steel, up to 1½ ins. in thickness and in the largest sizes.

Facilities are available to produce hydraulic presswork on the spot, and presses able to produce dished and flanged ends up to 10 ft. 6 ins. diameter by 1½ ins. thickness have been installed, amongst others. Apart from the heavy plate work associated with the chemical and allied trades, the firm claim to have a unique experience in all kinds of sheet-metal work, wire work, tank making, and galvanizing.

*

An exhibition of modern decorative treatments by the use of white and coloured cements was opened at Portland House, Tothill Street, London, S.W.1, on October 16. The exhibition consists of over seventy panels showing different types of finishes obtained mainly by the use of " Snowcrete," British white Portland cement and the new " Tintocrete " patent cement-spraying process. The exhibition will remain open until November 28, between the hours of 10 a.m. to 4.30 p.m.

*

On Tuesday morning, October 20, a " rush " order was received by the United Strip and Bar Mills of the United Steel Companies, Ltd., Sheffield, for 375 tons of steel bar. The mill commenced work on this order at 11.20 a.m. that morning. At 11.10 p.m. the same day, the rolling was completed. At 1.40 a.m. on the following day, the whole of the material had been inspected, tested and loaded, and it was delivered to a destination 76 miles distant by 5.40 a.m.—eighteen hours from the commencement of work. The magnitude of the task will be understood when it is realized that this tonnage of steel represents 74 miles of bar, or nearly 400,000 ft. of steel, all rolled and delivered in much less than twenty-four hours.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The St. Pancras House Improvement Society, Ltd., is to re-develop part of the Drummond Crescent Area, CAMDEN TOWN.

The Essex Education Committee is to acquire sites on the Rylands estate, DAGENHAM, for the erection of two elementary schools.

Messrs. Richard Costain and Sons, Ltd., are to develop the Rylands estate, DAGENHAM. The layout scheme provides for the erection of 1,900 houses.

The FINSBURY Borough Council is to erect eleven flats in Margaret Street, at a cost of £6,950.

The Essex Education Committee has approved plans for the erection of new premises for the ILFORD county high school for boys, at a cost of £52,648.

The Ecclesiastical Commissioners are to erect 188 flats in Wilcox Street, LAMBETH.

The Surrey Education Committee has acquired a site in Middleton Road, MORDEN, for the erection of a school clinic.

SOUTHERN COUNTIES

Mr. G. T. Richards is in negotiation with the BOURNEMOUTH Corporation regarding a scheme for the erection of a residential hotel, adjoining the Overcliff Drive, Southbourne.

Messrs. Seal and Hardy have prepared a scheme for the development of Pine Grange estate, Bath Road, BOURNEMOUTH.

Plans have been prepared by Mr. S. Jackson for the development of the St. Peter's Vicarage site, BOURNEMOUTH.

Plans passed by the BOURNEMOUTH Corporation: Three houses, Cardigan Road, for Mr. A. E. Adams; block of shops and flats, Exeter Road, for Mr. F. F. Tarrant; two houses, Pauncefote Road, for Messrs. A. J. Abbott and Son; additions, 10 Christchurch Road, for Bournemouth Motor Stations, Ltd.; alterations, 2-3 The Square, for Messrs. Gordons, Ltd.; shop and house, and eight bungalows, Kinson Road, for Mr. A. W. Saunders; twenty-six bungalows, St. Mary's Road, Ensbury, for Mr. F. J. Marks; two shops, Pokesdown Hill, for Mr. S. Kermode; five houses, Petit Road, for Mr. J. Kay; shop and house, Lystra Road, for Messrs. Newton and Fry; two houses, Belle Vue Road, for Mr. C. B. Phillpott; eight houses, Cranleigh Road, for Messrs. H. B. and E. Mudge; two houses, Noel Road, for Mr. C. Hawkins; extensions, Corpus Christi Church, Christchurch Road, Boscombe, for Rev. R. Baines.

Plans passed by the BRIGHTON Corporation: Alterations, 181-5 Western Road, for Messrs. F. W. Woolworth & Co., Ltd.; two houses, Winfield Avenue, Patchdean, for Mr. P. Wilson; two houses, Warren Road, for Mr. W. H. Clark; twelve houses, Bevendean Crescent, for Messrs. Braybons, Ltd.; alterations and additions, 20-3 Middle Street and 66-8 West Street, for Mr. B. D. Pinfold; alterations and additions, 159-160 Lewes Road, for Mr. A. S. Tilley; alterations and additions, Continental Hotel, High Street, Rottingdean, for Mrs. M. Wilshire.

The Kent C.C. is to remodel the COXHEATH institution, near Maidstone, at a cost of £25,000.

The LITTLEHAMPTON U.D.C. is to erect forty houses on the Thorncrost estate.

The MAIDSTONE Corporation is to erect eighty houses on the Western Road estate.

Mr. J. Clements is to erect fourteen houses in Detling Road, NORTHFLEET.

SOUTH-WESTERN COUNTIES

The BARNSTAPLE Corporation has obtained sanction to borrow £7,350 for various improvement schemes at the baths and parks.

The DORCHESTER Corporation has obtained sanction to purchase seven acres of land for the extension of the Victoria housing estate. Twenty houses are to be erected.

Plans passed by the DORCHESTER Corporation: House, Monmouth Road, for Mr. S. C. Budd; grand stand, football ground, for Dorchester Football Club; sanitary accommodation, cemetery, Weymouth Avenue, for Burial Committee; alterations, High Street East, for Messrs. G. Wright and Son.

The PAIGNTON U.D.C. is acquiring a site at Goodrington, for the erection of a pumping station.

Plans passed by the PAIGNTON U.D.C.: Four houses, Colin Road, for Messrs. Jones Bros.; additions, 24 Garfield Road, for Messrs. Dellers' Supply Stores, Ltd.; layout of ninety-six building sites, Blatchcombe Road, for Mr. A. Chippindale; house, Three Beaches estate, for The Coasts Estate, Ltd.; twelve houses, Clifton Road, for Messrs. Knapman Bros.; estate development, Colley End Road, for Messrs. Eastley & Co.; five houses, Headland Park Road, for Mr. H. Proctor; house, Shorton Lane, for Mr. K. Shears; house, Dartmouth Road, for Mr. A. Linford.

EASTERN COUNTIES

The Essex C.C. proposes to erect an admission hospital at the BRENTWOOD mental hospital, at a cost of £50,000; and enlarge the nurses' home, at a cost of £11,500.

The HITCHIN U.D.C. is to erect 166 houses and flats on the Walsworth estate.

The Essex Education Committee has passed plans for extensions at High Road School, LAINDON, at an estimated cost of £8,000.

Plans passed by the LOWESTOFT Corporation: Four houses, Kingston estate, Yarmouth Road, and houses, Normaston Drive, for Mr. S. C. King; two houses, Kirkley Run, for Mr. H. Mitchell; house and shop, Kirkley Run, for Mr. M. R. Graham; house, Chestnut Avenue, for Mr. S. F. Godbold; bungalow, Victoria Road, for Mr. Wm. Browne.

The Essex C.C. has prepared plans for the provision of additional accommodation at the SEVERELLS mental institution, at an estimated cost of £52,600.

The Essex C.C. has arranged with the L.N.E.R. for the reconstruction of Nags Head Lane bridge, near SHENFIELD, at a cost of £18,000.

The Essex Education Committee has purchased a site at WEST THURROCK, for the erection of a senior school.

MIDLAND COUNTIES

The ALCESTER R.D.C. is to build forty houses for agricultural workers.

Plans passed at BURSLEM: Four houses, off Milton Road, for Mr. B. S. Phillips; bungalow, off High Lane, for Mr. J. Birch; alterations, Longport Mills, for Messrs. H. and R. Johnson, Ltd.; additions, Chapel Lane, for Messrs. F. Copestick & Co.; six houses, Sneyd Street, for Mr. J. Jackson.

The COVENTRY Corporation is to erect 100 houses on the Stoke Aldermoor estate.

Plans passed at HANLEY: Alterations, Imperial Picture Palace, Glass Street, for Imperial Picture Palace; alterations, shop premises, Lamb Street, for Messrs. McIlroys; alterations, old fish market, Lamb Street, for Messrs. Hontbach & Co.; memorial hall, Queen's Road, for Mrs. Montford; reconstruction of premises, Grosvenor Street, for Messrs. R. H. Bell, Ltd.; two houses, Longton Road, for Mr. J. James.

The SHIPSTON-ON-STOUR R.D.C. has prepared a scheme for the provision of 118 houses for agricultural workers.

Plans passed by the STOKE-ON-TRENT Corporation: Five houses, Bedford Street, Basford, for Mr. G. A. Johnson; shop, Trent Vale, for Swettenhams Co-operative Institutions; six houses, Elliott Street, Penkhull, for Mr. A. Millward; alterations, Market Street, Fenton, for Plaza Cinema Co.; shop and house, Sandon Road, Meir, for Mr. H. Hammond; two houses, Gladstone Street, for Mr. J. Addison; alterations, old Crown Inn, Commerce Street, Longton, for Mr. Walklate; two houses, Branch Lane, Hanford, for Mr. F. Gibson; eighteen houses, Leek Road, for Messrs. Holloway & Co.; two houses, Quarry Avenue, Hartshill, for Mr. E. Harris; extensions, Vivian Road, for Burslem and District Co-operative Society, Ltd.; four houses, Brocksford Street, Fenton, for Mr. H. R. Hughes; two houses, Weston Road, Meir, for Mr. H. Godwin.

The STRATFORD-ON-AVON R.D.C. is to erect 115 houses for agricultural workers.

Plans passed at TUNSTALL: Shop and two bungalows, High Street, for Messrs. Maddock and Sherratt; two bungalows, Packmoor Road, for Mr. C. Sutton; two houses, Chell Green Avenue, for Messrs. Ray and Sons; additions, Royal Albert Pottery, for Messrs. A. Meakin, Ltd.

The Warwickshire Education Committee is to obtain a site at WILNCOTE, for the erection of an infants' school.

NORTHERN COUNTIES

The Durham County Education Committee has approved revised plans for the erection of a school clinic and welfare centre at BLAYDON.

The BLYTH Corporation is in negotiation for land at Bebside, for the erection of fifty houses.

The DURHAM County Education Committee is to provide portable school buildings at Billingham, at a cost of £6,000; at Horden, at a cost of £3,000; and at Monkton, at a cost of £2,000.

The ESTON U.D.C. has arranged for the further development of the Grangetown estate, by the erection of two-bedroomed houses.

The PENRITH U.D.C. has obtained sanction to borrow £37,000 for the erection of 120 houses on the Tyne Close estate.

Plans passed by the SEDGLEY U.D.C.: Rebuilding Alexandra Hall, Redhall Lane, for Mr. A. R. G. Jones; two bungalows, Moden Hill, for Mr. G. Sheldon; four houses, Ward Road, for Mr. E. Minty; house, Robert Street, for Mr. A. Collins.

The SOUTH SHIELDS Corporation is seeking a site at Ceadon Park for the erection of houses for aged persons.

The SOUTH SHIELDS Corporation is to proceed with the Mitre Street clearance scheme, which will include the erection of about 300 new houses on various sites.

Plans passed by the SOUTH SHIELDS Corporation: Ten bungalows, Summerhill Road, for Mr. J. H. Woolgar; alterations, premises in Winchester Street, for Messrs. T. A. Page and Son; additions, Empire Palace, Ltd., Mill Street, for Messrs. W. and T. R. Milburn; extensions, business premises, 34–8 Hill Street, for Mr. P. Johnson.

The WAKEFIELD Corporation is seeking sanction for permission to erect 100 houses, by direct labour, on the Eastmoor estate, at a cost of £39,000.

The WAKEFIELD Corporation is to proceed with the scheme for the erection of public baths in Almshouse Lane, at a cost of £24,970, providing a grant is obtainable.

Plans passed by YORK Corporation: Fourteen houses, and two shops, Hull Road, for Mr. H. Williamson; three houses, Greencliffe Drive, for Messrs. R. J. Pulleyn and Sons; two houses, Bermby Avenue, for Messrs. J. Allison and Son; layout of Hull Road estate, for Messrs. Abbott and Son; additions, 26 Goodmangate, for Messrs. A. E. Steigmann & Co.; additions, Market Tavern, Coppergate, for Tadcaster Tower Brewery Co., Ltd.

SCOTLAND

The GLASGOW Corporation is to erect twenty-four houses at Altyre Street, Tollcross.

The GLASGOW Education Committee is to erect an elementary school in Elmvale Street, Springburn.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

*In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

LUXURY SHOP WINDOW

HERPICH'S BERLIN FUR STORE: BY ERICH MENDELSOHN

THE CONTINUOUS GROUND FLOOR WINDOW

THIS fur business originated in three dwelling-houses, combined and extended. The building of which a photograph is given above, with the relative detail drawings overleaf, was erected in three sections, and completed in 1924.

The constructional members lie back from the façade, so that, on the ground floor, the show windows present an unbroken expanse of glass. Here, too, for the first time the display lighting has been expressly included in the architectural form: the sills of the windows encase directional lights arranged in troughs. The source of the lighting is thus invisible from the street outside and does not dazzle the spectator.

The façade is clothed with slabs of black limestone. The show windows, other windows and lighting troughs are of bronze, burnished for the ground floor, and toned brown for the upper stories.

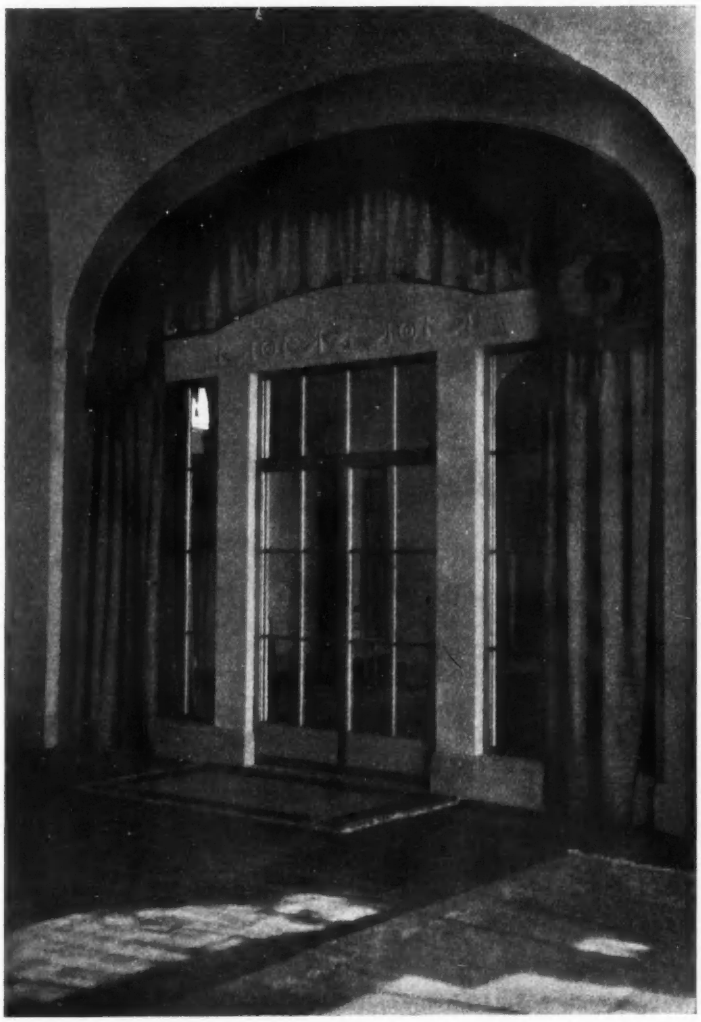
THE HERPICH FUR STORE BERLIN

ERIC MENDELSOHN ARCHITECT

WINTER GARDEN at the GRESHAM HOTEL, DUBLIN

RECONSTRUCTED FROM DESIGNS BY ROBERT ATKINSON



METAL DOORS LEADING FROM WINTER GARDEN TO BALLROOM

THE photograph reproduced above shows one end of the Winter Garden. Originally, a marble-cased fountain was incorporated in the design of this wall, but at a later date a ballroom was added to the amenities of the hotel and the fountain gave place to a pair of metal doors, shown in detail in one of the drawings overleaf, glazed with mirror glass, fixed with hardwood beads. The plaster enrichment over the doors was designed by the architect.

The shape of the ceiling of the Winter Garden should be noticed. This is vaulted on arches which employ no less than five centres—that for the main arc being struck from a point about 12 ins. below the floor. This and the other four points, from which arcs are described to complete the building-up of this very subtle curve, are indicated.

In the midst of this ceiling is a fibrous plaster ventilating grille, which is the subject of the other plate. It is also illustrated in the photograph on the last page, which shows the cast and cut glass electric-light fitting suspended from four points of the grille.

The design is based entirely on a pattern of interlacing and overlapping circles, set out on 6-in. centres from both axes of the grille. The amount of void thus left is considerable, especially as the actual "bars" which form the pattern are only 1 in. wide and $\frac{3}{4}$ in. thick. The grille is painted a pale ivory cream, in keeping with the ceiling.

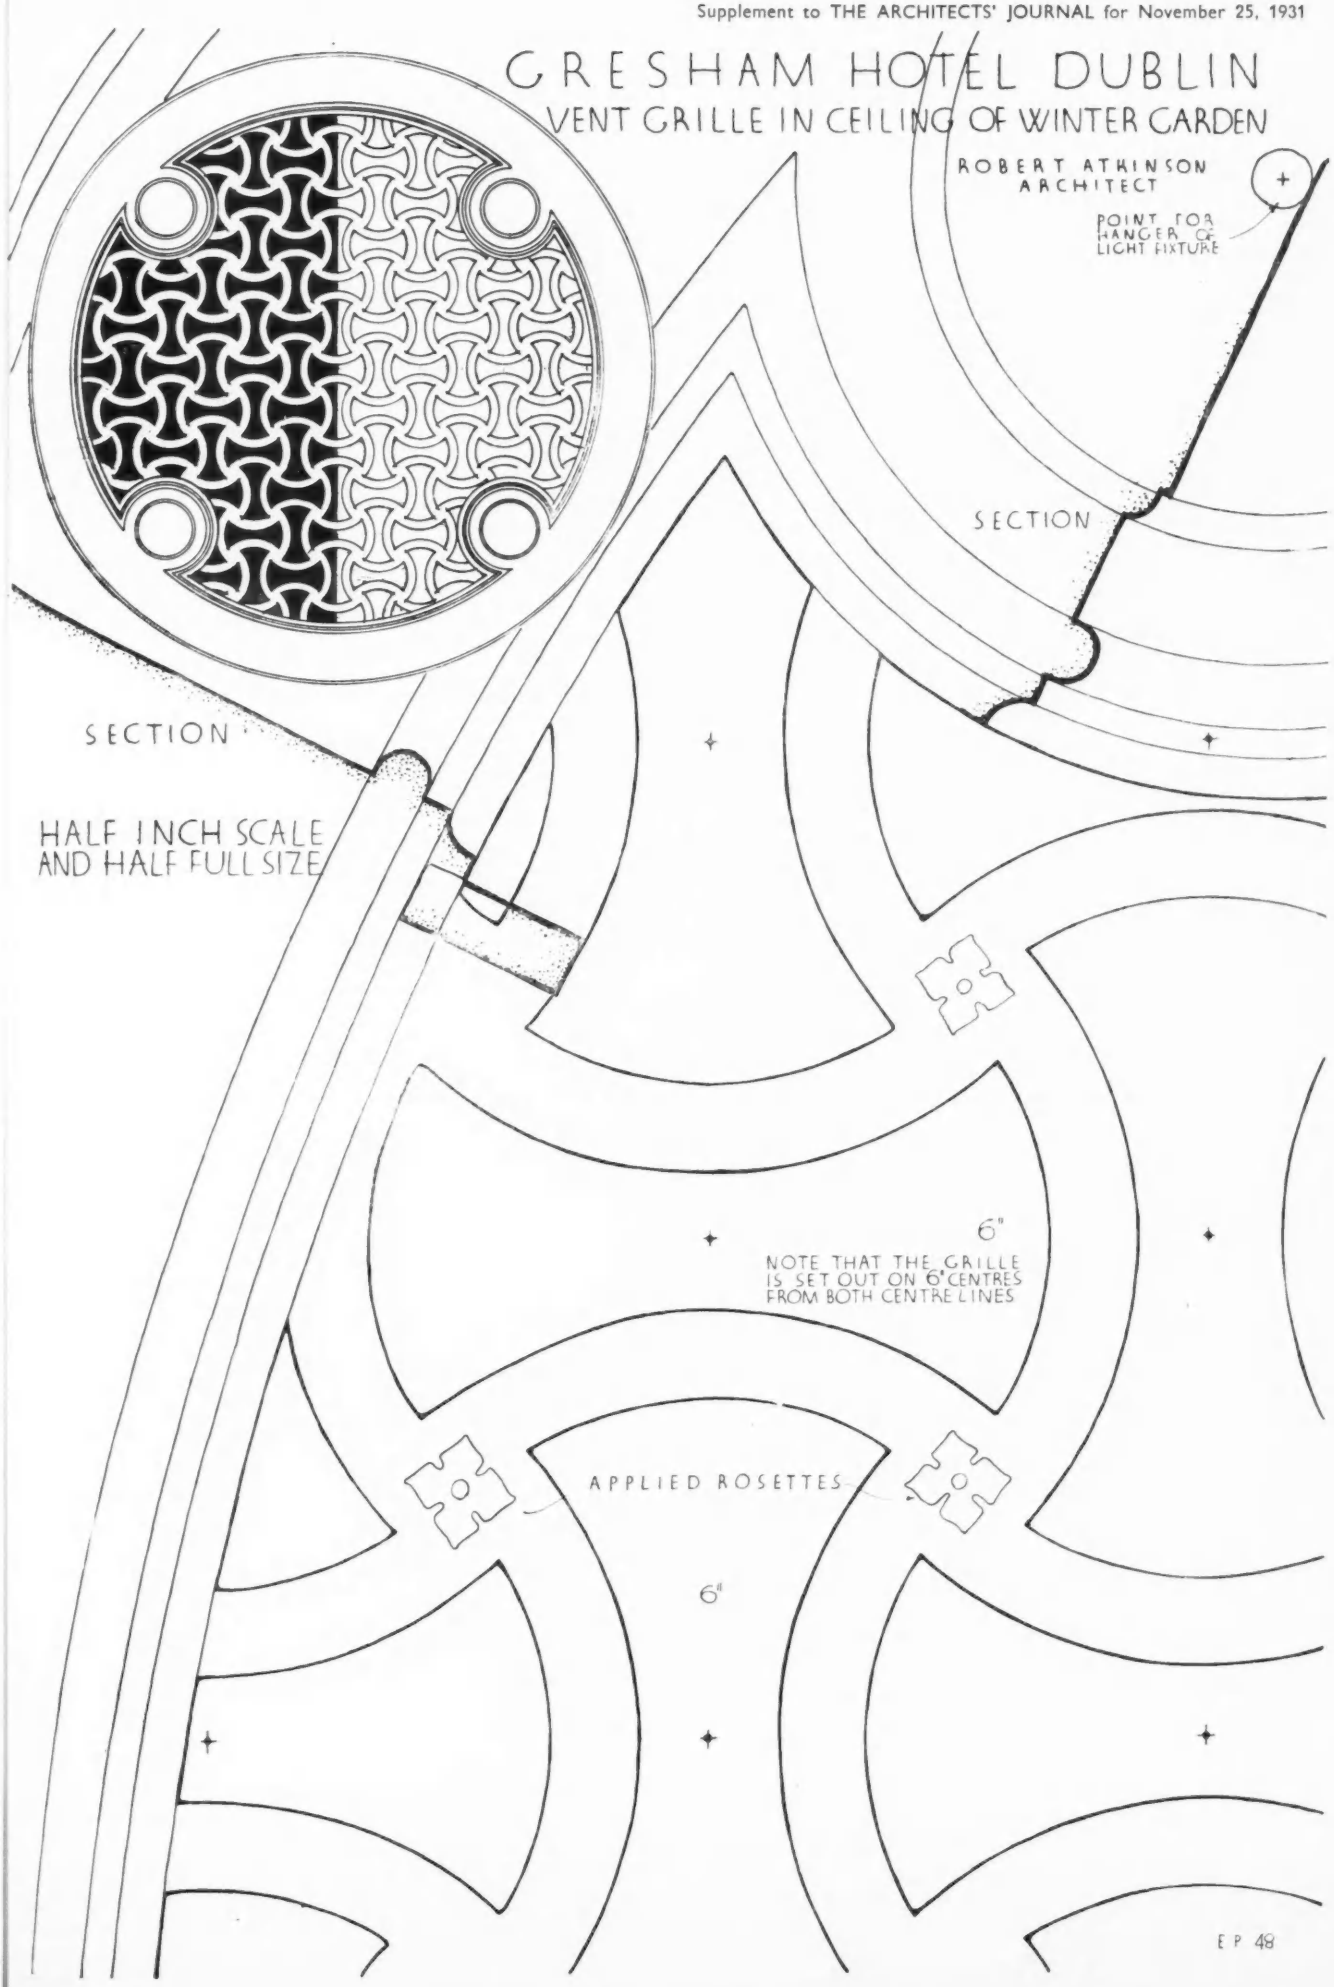
VENT GRILLE IN CEILING OF WINTER GARDEN



E P 48

VENTILATING GRILLE AND LIGHT FITTING

SELECTED PRECEDENTS:

EXITS AND ENTRANCES

THE degree of formal emphasis evinced by a main entrance is the acid test of what may be called architectural tact. In our theatres, cinemas, and big stores this feature is only too often characterized by the most blatant vulgarity: a vulgarity that does not even possess the saving merit of being English. French influence has been almost uniformly disastrous, and never more so than when it reaches us via the United States. On the other hand, the front doors of modern English houses are nearly always either faithful replicas or composite rearrangements of eighteenth-century exemplars, which, though unequalled for well-bred reticence and quiet dignity, have no relation to the present age.

Figures **1** *and* **2** *are good, because entirely sensible, examples of German functionalism, in which purely structural details are worked into decorative patterns. Guard-rails play a prominent part in both. The curious-looking object over the lintel of the door in the latter is a vertical tubular light that acts as a directional arrow to the street number below it.*

Figure **3**, *a modernist study in plain surfaces, shows that our bank directors are well aware that the stereotyped reproductions of Renaissance façades they still consider good enough for this country are no longer good enough for others. The succession of receding planes in this simple design is every bit as effective as the usual paraphernalia of carved mouldings copied from the classical crib-books, and costs far less money.*

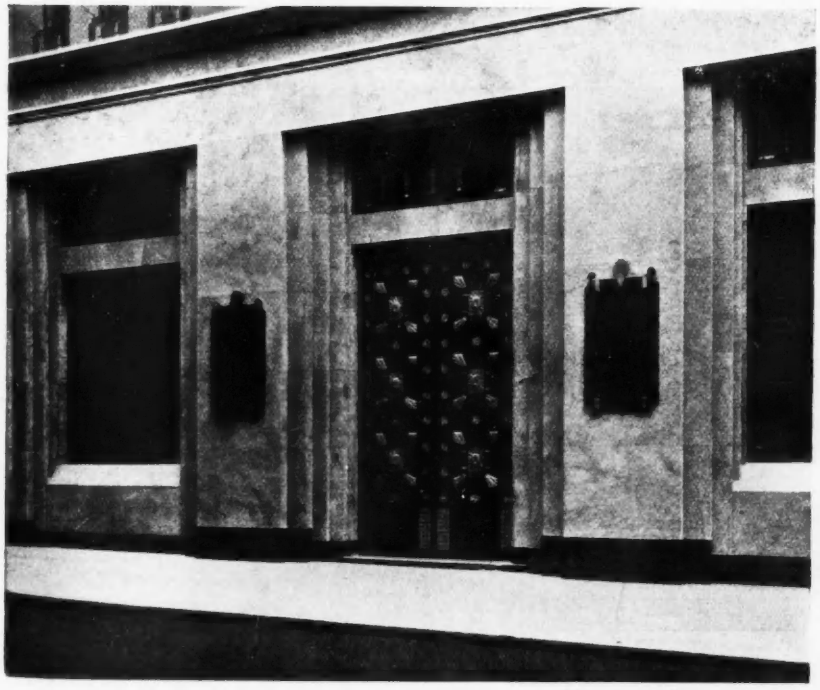
[*Leo Nachtlicht, Architect.*

2. *THE STREET DOOR OF A VILLA, GRUNEWALD, BERLIN*



[*Prentice and Flodever, Architects.*

3. *THE MAIN ENTRANCE OF THE BANK OF SOUTH AMERICA, SÃO PAULO, BRAZIL*

Figure **4**, *however, an exquisite little Regency lodge which ought to be scheduled as a national monument, is so superlatively lovely that criticism can only gasp in admiration before it. Never have plain iron railings and plain wall surfaces been more perfectly or logically combined. Here we discover, with a further gasp, that the real English tradition and real modernism can assume identical forms. With such a magnificent example as this under our very nose, it is doubly humiliating to confess that we have not yet succeeded in evolving a national modern style of our own.*

Figure **5** *is an attempt—interesting if not altogether successful—to use sculpture that is realistic to the point of caricature as plastic relief for an otherwise severely inornate entrance. The groups of figures, representing typical scenes of hotel life, are of dull-glazed, stone-coloured ceramic.*

WASTE IN ARCHITECTURE

FROM time to time attempts are made to discover some kind of absolute standard of good architecture, as by considering, for example, the relation of construction to ornament and of form to material. It will soon be discovered that good architecture is informed by some ineffable quality that eludes such formulæ. Nevertheless, it is instructive to observe how the decadence of the main European styles of architecture is characterized by abuses of these relationships. Thus, the decay under the Roman Empire was an abuse of construction in relation to ornament; the latter being used with a profusion which disregarded fitness. The decay of Gothic was an abuse of form in relation to material, stone being used almost with the technique of wood or metal. The decay of the Renaissance was an abuse of form in relation to structure; the classic elements being deprived of their real use and significance and being robbed of their virility by the assignment of tasks unbecoming to their original purpose.

All these blemishes actually spell waste—of ornament, of material, of form. Of these, at the present time, the most prevalent is an unconsidered use of material. With the elimination of distance, due to swifter transport methods, materials are ceasing to have any local significance. Stone, brick or flint districts are becoming archæological terms. Moreover, special materials, such as fine-grained marble or delicately-figured timber, are to be obtained from any part of the world with comparatively little difficulty. Such a state of affairs not only encourages prodigality but tends to break down traditional methods of handling material. And these traditional methods that have been slowly and laboriously evolved are, for the most part, the antithesis of waste, for they exploit the material to the best purpose.

Bad design almost invariably necessitates waste of material in some way. If the properties of a material are not understood, a two-fold waste may arise—structural and decorative. For example, lack of precise knowledge as to the tensional or compressional strength of a certain timber might lead to the use of unnecessarily large scantlings; or, again, lack of precise knowledge of the purpose for which a particular timber is adapted might lead to its use in unsuitable positions.

As for decorative waste, this, too, arises where the qualities are not understood. Different stones, for example, are best worked with certain tools and in certain ways, and to each, therefore, there is an appropriate form of ornament. The same applies to timbers: a beautifully figured wood is best displayed in large surfaces, whereas another may be more suitable for carving. To ignore these considerations is to waste the material.

Wastage also occurs where a building is designed with so little foresight that it soon ceases to meet the developed needs for which it was erected; and to a still greater extent through haphazard and uncontrolled development leading to demolition long before the normal life of the building expires.

The more complex conditions become, so do the opportunities for waste of material increase. But the very term waste has no absolute significance. To us, the old builders, with their thick walls and heavy scantlings, may appear wasteful, yet, if the supply of material exceeded the demand, there was neither need nor incentive to economize. Prodigality of material is a characteristic of Nature which mankind has now learnt to cease from following. It cannot be gainsaid that the buildings which we most admire are those in which this quality is obviously absent, whether from plan or elevation.

Yet, when this has been admitted, it remains true that an assessment of waste cannot be entirely based on reason or logic. It is only when the sense of waste obtrudes itself that we may count upon it that design is at fault. We are driven back upon the reflection that good architecture depends on something elusive which evades the confines of logic, and which seems to originate from that part of ourselves from which emanate our absolute standards of goodness and beauty.

Of a truth, it is impossible to study current architecture without being conscious of a sense of waste. We see it in our suburbs in the ugly, feeble and restless ornamentation of the houses; we see it in our cities, in the inappropriate use of materials, in the degradation of architectural idiom, in the disregard of the relations of buildings to each other, so that they are not seen to the best advantage; we see it in the design of our streets, where architectural efforts are wasted through lack of co-ordination.

In a time of economy, let us learn what economy means.

THE KEEP, CASTLE HEDINGHAM, ESSEX

"It was not," says Mr. Edward Sackville West, in his review (see pages 735-8) of Mr. Nathaniel Lloyd's book, *A History of the English House* (The Architectural Press, price £3 3s. net) "until the passing of the need of defence relieved the great from the necessity of living in fortresses, the architecture of which was entirely dictated by . . . comparative impregnability, that people were able to turn their attention to comfort and æsthetic considerations."

One of the earliest of these Norman strongholds was Castle Hedingham, built c. 1130, some forty-three years after the Tower of London. Contemporary with Rochester Castle, its keep is better preserved, though the embattled parapet and two of the four turrets have been destroyed.

Mr. Sackville West makes the very interesting observation, in summing up present tendencies in domestic architecture in America and on the Continent, that the larger modern buildings "exhibit, in their huge, grim bareness, a return to the twelfth-century castle, minus the fortifications—and the execrable taste, at any rate in England—of their exterior decoration."

NEWS & TOPICS

A VITAL QUESTION FOR ARCHITECTS

SPEAKING to the Institute of Structural Engineers, Mr. W. T. Creswell enlarged upon the position of the structural engineer in relation to building contracts, and suggested that he should be employed directly and separately by the employer, taking full responsibility for the stability of the framework, and leaving the clothing of it to the architect. This is a vital matter to architects, to whom responsibility is as the breath of their existence, and the means and power by which they exercise a *controlling* influence over the whole of a work, in all its parts. In practice, the structural engineer, be he private practitioner or member of a commercial organization, takes the responsibility for his work under the architect, though in the last resort the architect must take the blame for the consequences of failure, and it is doubtful, I think, whether the division of responsibility will react to the welfare of architecture if it leaves the architect a mere ornamenter and internal organizer.

*

If, indeed, steelwork or reinforced concrete has become half the matter of building, then the architect must and will become master or controller of these, or cease to be an architect, a constructor. The one thing you cannot do is to say this man will be responsible for the construction, and this man looks after æsthetics and what not. Such practice would represent a misconception of the elemental laws governing the design and execution of structures. Nevertheless, the problem exists to be solved, and seems to call for a rather prompt answer from architects.

PROFESSIONAL STATUS IN THE IRISH FREE STATE

Architects in the Irish Free State are taking steps towards registration. A Bill is being prepared and will be taken to Parliament. I hope, very sincerely, that they will get a really thorough measure upon their Statute book—one that preserves for themselves the right to the only one word that properly describes an architect to those who require him—namely, "architect." If they are very lucky, they may make it impossible for any plan to go before any local official without the signature of a qualified architect, as happens, I was told recently, in parts of Canada. Whatever they do, it must, I feel, be a thorough measure of protection if it is to be of real use to either the public or to the architectural profession.

STREET ARCHITECTURE

Mr. Howard Robertson, in his paper on "Street Architecture," read at Monday's meeting of the R.I.B.A., made some interesting remarks about the floodlighting of buildings in London during the International Illumination Congress. He thought that the floodlighting served to stress their virtues and to show that architecture, strong and bold, is a necessity in certain key positions of the city plan. But he asked his audience to suppose that instead of upon St. Paul's, the Tower, Big Ben, Thames House, etc., the engineers had turned their batteries upon the architecture of the Strand, Victoria Street, Shaftesbury Avenue and Tottenham Court Road. What then? A few people might have come to scoff, and fewer and fewer still would have remained to pray—for the lights to be switched off!

The odd thing is, as he said, that in the daytime, we accept without dismay the architecture of these and other streets like them, architecture nearly always dreary and often ugly, coarse, mean-spirited, pretentious, or vulgar. It was in the streets of the last seventy years that the chief offenders were to be found; they reminded us, in our lucid moments, of the degradation to which architecture had been subjected. And by their multitude, their air of settled familiarity, they induced the coma and lethargy from which neither public nor architects seemed able to rouse us. The greater the need then for such discriminating measures as the award of the medal for street architecture, year by year, presented on this same occasion to Mr. Arthur Davis, for the Westminster Bank, Threadneedle Street.

MR. GLEAVE HONOURED

The brilliant achievement of Mr. J. L. Gleave, the winner of the Columbus Memorial Competition, was celebrated by the Manchester University School of Architecture, of which he is a past student, by a dinner given in his honour, on November 28. Professor Dickie, in proposing his health, said six months before the closing date of the competition, Gleave left school, and started on his design. He finished it: and then, ten days before the last day for submission of designs, he had a sudden inspiration. With amazing courage, he scrapped all his drawings. The design submitted was the product of those last ten days. It was good enough to place Gleave in the last ten out of the 456 competitors—many of them famous architects—from all over the world. Gleave had been ably assisted in his scheme by Eric Kennington, who had designed a series of sculptures illustrative of the life of Columbus. Finally, Professor Dickie read an extract from a letter written to Gleave by the technical adviser on the competition: "You won hands down. Your design was in a class by itself." Dr. Raymond Unwin, P.R.I.B.A., who was also present, announced that Mr. Gleave had been elected an associate member of the Institute, holding that no examination it could set him could equal the task he had overcome. What better tributes could a competition winner expect?

TOMBSTONE DUMPING

As a counterblast to the leading article of last week, let me make mention of tombstones, imported tombstones of marble and choice granite. They enter this country in alarming quantities, and it is perfectly safe to say that 99·99 per cent. are of a hideousness which we could only properly assess were our senses not dulled by years of contact with the accursed things.

*

For the sake of our good name, I could never hope that we should learn to make as bad tombstones ourselves in order to keep money in the country, but we might—or the granite and stone quarriers might—organize an educational campaign for better-designed English tombstones, and employ architects to produce some designs for them. Propaganda directed to the specialized quarters where tombstone choosing is effected could alter the complexion of the matter in a very few years. As it is, we deserve to have the beastly things dumped on us. We have no taste in tombstones.

CREEPERS FOR DECENCY

A little argument for and against creepers on houses is wending its way through the columns of *The Times*. It is quite a pleasant debate, in no way bitter, as in days past the same subject has been provocative of bitterness. Indeed, both parties seem agreed that English domestic architecture, generally considered, is in need of a covering of creeper. In fact, that it doesn't half need covering. And when I come to think of several square miles in Wembley and Harrow that I know of, and several olde English Tudor residences in Surrey, and many and many other causes for distress, I ask myself, not why not cover these decently with creepers, but why has there not been founded a strong society for the suburb-wide distribution of hardy, unkillable, galloping creeper. This is a work to be done.

MORE SITES FOR STATUES

The alarming multiplication of those Tom-Tiddlers' grounds known as traffic circuses, of which Cambridge Circus is the latest, must be making sculptors whet their chisels in anticipation of a big boom in orders. In Berlin they are solemnly turfed and planted with dwarf shrubs; but one cannot somehow imagine our civic authorities encouraging experiments in landscape gardening inside their magic circles. So I am afraid that the demand for "sculptural embellishment" will have things all its own way. The logical accompaniment of gyroscopic traffic is clearly the gyroscopic statue, revolving in tempo with the whirling wheels, and halting statuesquely when the red lights flash to indicate that it is comparatively safe for pedestrians to cross.

*

In point of fact, revolving statues of this type might advantageously replace both traffic police and traffic signals. They could bear those alternating lights in gesticulating hands, or as garlands upon their brows. And at night they could be flood-lit in "Go," "Caution" and "Stop" colours. Frankly, this coming glut of sites for better and brighter statues fills me with considerable apprehension. Nor do I see why these glorified street refuges should become the monopoly of carvers of stone and moulders of bronze. The architects ought to be given an equal chance. There is at least one type of small building for which these halcyon isles in the troubled seas of London's traffic are peculiarly well adapted : the mortuary chapel.

MOTORING IN FOG

Most architects are motorists, and will be interested to learn that, at the recent International Illumination Congress, held at Cambridge, the fallacy of using a yellow light to improve penetration during fog was raised by the Automobile Association's representative, and unanimously supported. Fog contains minute droplets of water which act as lenses; consequently the more powerful the illumination, the greater the reflection. Coloured rays merely reduce the intensity of the light, and are useless as an aid to visibility. The A.A. advocates a fog lamp on the near-side dumb-iron, or a spot light attached to the nearside pillar of the windscreen; thus the driver is able to look either over or under the beam. If caught in fog without such a lamp, it is recommended to extinguish the offside headlamp and direct the other headlamp beam on the near side of the road : this method necessitates driving close to the near-side kerb. Tissue paper attached to the outside of the headlamp glasses, or whitening mixed with water, will be found helpful. Either of the foregoing is easily removed. By the way, all motorists are now required to sign their driving licences; using an unsigned licence may involve a fine up to £5. ASTRAGAL

Competition Result

Miss Helga Richards, of 3 Southfield Avenue, Street Lane, Leeds, has been awarded the premium of ten guineas in the competition for a pictorial map of the area of the West Yorkshire Society of Architects.

The safety curtain at the Cambridge Theatre, Seven Dials (Wimperis, Simpson and Guthrie, architects), designed by G. W. Leech, illustrates the traffic centre from which the district takes its name. Astragal, taking his text from Cambridge Circus, near by, has a whimsical suggestion to make for gyratory statues at London's traffic circuses.

NORTH END HOUSE, W.

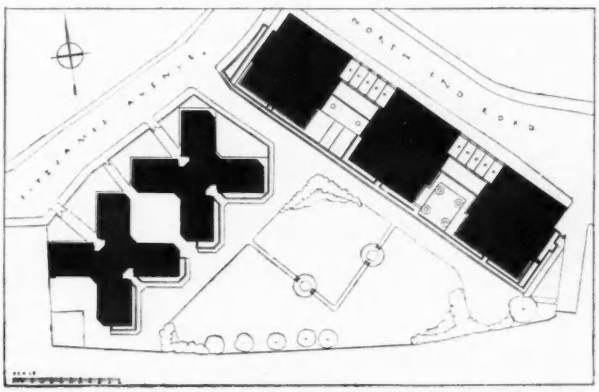
DESIGNED BY MESSRS. JOSEPH

Looking from the staircase hall, illustrated on page 733, towards the entrance vestibule in one of the north-east blocks. The flats are entered from the garden.

SITUATED as these blocks of flats are, amid the crowd, the buzz and the murmurings of a densely populated district of London, within a stone's-throw of Olympia, there is a charm in the quiet of the inner garden, a cessation, a coolness from business, an indolescence almost cloistral, which is delightful. Even the sight of the trees, fortunately preserved by the architects, readily brings to mind the wise words of Jane Austen " to sit in the shade on a fine day and look upon verdure is the most perfect form of refreshment."

But this is not all. The scheme is undoubtedly one of the most successful attempts yet made to provide small flats with all the amenities and conveniences of modern luxury flats at moderate rents. The accommodation and the labour-saving appliances make a formidable list.

In even the smallest flat are a hall, coat cupboard, living-room, with fireplace and flue for coal fire, dining recess, wine cupboard, a tiled bathroom (with lavatory basin, heated towel rail and w.c.), linen cupboard, tiled kitchen with cupboard and enclosed dresser and sink, two reception rooms and w.c. There are from two to four bedrooms, one being installed with a lavatory basin. Central heating is available in the hall and living-room, electric heating points are provided in the hall, living-room, dining recess, reception and bedrooms, and gas is laid on in the living-room and kitchen. A frigidaire point is also supplied to the kitchen from a central source.



Block plan. The site is a few minutes' walk from West Kensington, Baron's Court, Olympia, and Addison Road stations.

Then, as in the modern luxury flats, special attention has been given to the design of the entrance halls, landings and staircases. Electric passenger lifts are installed, and separate staircases and lifts are provided for the servants and tradesmen.

A view of two of the north-east blocks, taken from one of the south-west blocks. The garden, planned by the architects, has several fine trees and covers a considerable area of the site. The scheme forms one of the most successful attempts yet made to provide small flats with all the amenities and conveniences of modern luxury flats at moderate rents.

Bramshill, Eversley, Hampshire, from the south-west. Like most Elizabethan and Jacobean houses, Bramshill has an imposing entrance, the design of which is more than usually original in its conception.

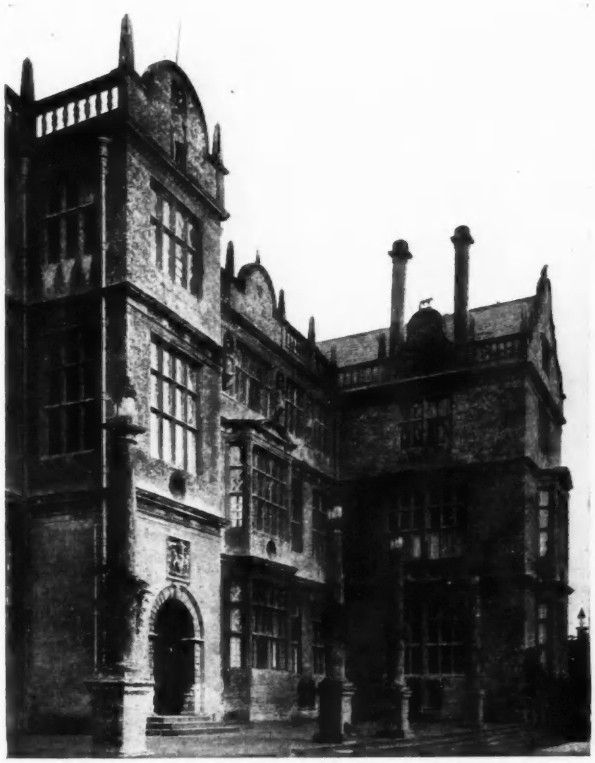
A HISTORY OF THE ENGLISH HOUSE

Reviewed by *E. Sackville West.*

BY NATHANIEL LLOYD, O.B.E.

THIS is an important as well as a beautiful book; for there have been few, if any, works of this kind, dedicating as it does equal importance to the development of domestic comfort and amenity in the English house and to that of the purely architectural side. A more fascinating subject it would be hard to find; and the fact that it is also highly complex does not detract from the fascination.

Mr. Lloyd begins at the beginning, and shows that the great hall, which underwent various transmogrifications up till the eighteenth century, was from Saxon times the basic fact round which all large houses were built. The Roman type of house was clearly unsuitable to the English climate, and disappeared with its inventors, leaving the Saxons to introduce a style of which no example remains, though some of their churches, which show a clumsy effort to imitate timber-work in stone, may give some idea of what they were like. Contemporary drawings, however, show a curious resemblance to the typical Provençal house, with its violently ridged tiles. For some time, also, hut-like houses continued to be built in Ireland and the west of Scotland; Mr. Lloyd's plates show them to be comic in effect, like stone haystacks.



[*Queen :* Elizabeth. *c. 1580–1600.*]

Montacute House, Somerset. Detail of south front and terrace.

With the advent of the fortified manor-house, under Henry II, we see the beginnings of the type which was to develop, through the mediæval castle, into the elaborate dwellings — often more like a close village than a single house—of the sixteenth and early seventeenth centuries. During the Middle Ages no distinction is observable in architectural style between church and domestic architecture (a phenomenon reintroduced by the Gothic Revival); it was not until the passing of the need of defence relieved the great from the necessity of living in fortresses, the architecture of which was entirely dictated by ease of defence and comparative impregnability, that people were able to turn

their attention to (1) comfort, and (2) æsthetic considerations.

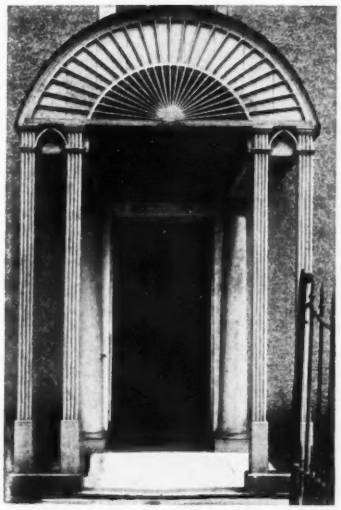
The actual designers of these castles remain for the most part obscure, the reason probably being that there were always several engaged on each castle: first, a master-mason and carpenter, afterwards a host of master-craftsmen in their own particular spheres. That many of these castles were in their way superb, an example such as Castle Hedingham (a fine photograph of which figures in this book) suffices to show; and many of the adulterine castles built under King Stephen were equally fine.

With the opening of the thirteenth century we see the first glimmerings of comfort and amenity being introduced into the castle; from then until the final flowering of the eighteenth-century small house, the history of domestic architecture is in no small degree the history of the development of privacy and comfort. Not until the rise of the decorative style in the fourteenth century and its emergence into the Perpendicular, did the idea of a house as an æsthetic whole dawn in the minds of English architects; and even then the owner was apt to wreck the design by the haphazard addition of rooms, passages, etc., which by no means hung together with the original whole.

It was now, too, that the desire for privacy began to appear with the general improvement of manners, and the toning down of a life which must, on the whole, have had an odiously barbaric atmosphere about it. In early days the castles were not, in a proper sense, private; the enormous number of dependants ate with the lord and—quite often—sat with him. The building of rooms for the private use of the lord and his family increased gradually from the fourteenth to the sixteenth centuries, when it reached its fullest development. Various attempts, Mr. Lloyd points out, were made to check this tendency (notably by Henry VIII), but they were fortunately vain. Thus, gradually, the central hall, hitherto the most important room in the house, and stretching from the ground floor to the roof, sank in importance, and often ended, as at Knole, by being ceiled, to make space for more rooms above it.

There can be no doubt, I suppose, that the astonishing flowering of English architecture (begun under the auspices of Henry VIII) in the sixteenth and seventeenth centuries, was the most important in every way that England has yet known. Beside the glories of such houses as Haddon and Montacute and (much later) of Queen's House, Greenwich, the grandiosities of the Vanbrugh style seem vulgar and unsuitable. To an epoch which produced such buildings as those (profusely illustrated in Mr. Lloyd's beautiful plates) it is possible to forgive the fussiness of detail—introduced by an army of Italian workmen as well as by architects like Sir Henry Wotton, whom the Renaissance had attracted to Italian travel—which spoilt so many of them, inside and out. England had to wait for the genius of Inigo Jones to sweep away the masses of bastard decoration, which damaged the appearance of such houses as Bramshill (in many ways still so lovely) and Wollaton Hall and Hatfield and Burghley.

Thereafter, Italy possessed the imaginations of English architects, until the Gothic Revival came temporarily to oust it. The result was, on the one hand, vast palaces of the type of Blenheim and Castle Howard; on the other, that perfect ideal of English



Late 18th and 19th Centuries.] *King :* George III.

comfort and discreet beauty, the late-seventeenth- and early-eighteenth-century house. For the latter conforms more exactly to what may be called the *idea* of a dwelling than anything that preceded it in England. One of the reasons for this was the doing away of the passage-room, and its replacement by the passage, as a mere means of communication between separate rooms, all of which thereby gained in privacy. In the houses of the immediately foregoing age the rooms tended to run straight into one another, in a disagreeably public manner.

The other side of the picture is less reasonable; for it is difficult to regard the immense piles which the late seventeenth and early eighteenth centuries erected, under the inspiration of Italian palaces and of Versailles, as, *qua* houses, anything but a colossal mistake. Looking at them, one expects to learn that they are Government buildings, museums, or even very grand railway stations. And the chief trouble is that the interiors confirm one's impression. That Elizabethan and Jacobean houses were frequently enormous is not an answer to this criticism, for the simple reason that they contain an infinite number of relatively small, liveable-sized rooms, in which it is possible to carry on a private existence.

Vanbrugh's vast palaces are magnificent enough, regarded abstractly as architecture; but regarded as dwellings, even when the ceremonious life of the aristocracy of the epoch is taken into consideration, they are not much more suitable—from the English point of view—than Louis XIV's stately but otiose residence. The whole point of English houses, from the fifteenth century onwards, has been the improvement

c. 1605.] [*King :* James I.

The solar (now called the ballroom) at Knole, Sevenoaks, Kent, one of the few remaining early-seventeenth-century rooms, which, notwithstanding its later furniture, presents some resemblance to its original appearance.

of homeliness, easiness and an atmosphere of domestic amenity, combined with, but never sacrificed to, a fine decorative display. But the first Duke of Marlborough, imbued with the usual megalomania of the parvenu, thought otherwise; and the result was as portentous as anything he could have imagined. For the wish for such houses can only be ascribed to a desire for display run mad. No doubt we should be grateful to the fulfilments of this desire in the magnificence of the *coups d'œil* they produce; our contention is simply that they are no more *houses* than they are *English*, falling as they do right outside the saner traditions of English grandeur as suited to English people and the landscape of the English countryside.

It is pleasant to notice that Mr. Lloyd does full justice to the many charms produced by the Gothic Revival; but we think it a pity that he stopped there and did not continue his history and his plates down to the present day. The result would not have been very pleasing—though the rather grim, box-like stucco houses erected in the 1830's are frequently charming as well as comfortable.

c. 1790.]

A house and shop at Witham, Essex.

Even if he had wished to omit twentieth-century Queen Anne some critical commentary on the latest developments, such as we are now undergoing from the *avant-garde* architects of France, Germany and Holland, accompanied by a few plates, would have been very welcome. He might have pointed out the disparity between the various excellences of the larger of these modern buildings, which in their American and Continental prototypes exhibit, in their huge, grim bareness, a return to the twelfth-century castle minus the fortifications—and the execrable taste, at any rate in England—of their exterior decoration.

But these criticisms are unimportant when compared with the manifold excellence of the book as a whole, which must make it a delight alike to specialists and to amateurs of the subject.

THE MOUNT SCHOOL, YORK

Centenary Hall

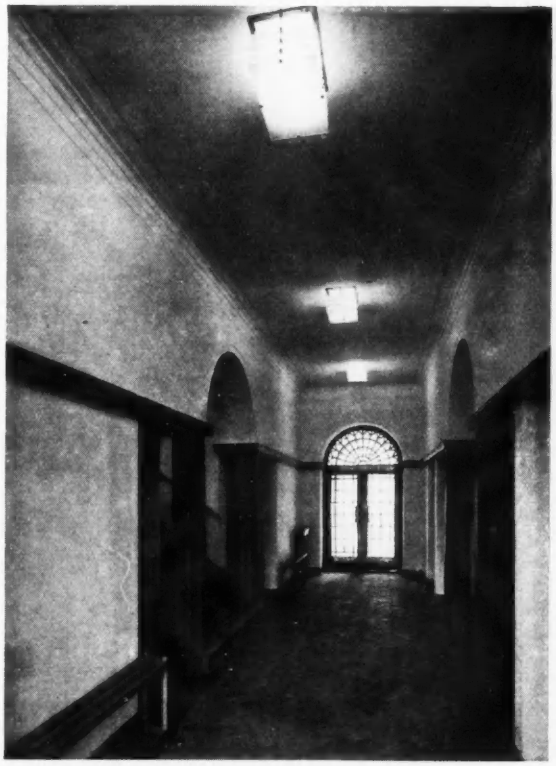
DESIGNED BY HUBERT LIDBETTER

THIS building was the result of a competition for a hall to celebrate the centenary of the Mount School, which was founded by the Society of Friends in York in 1831.

The hall had to be added to the end of the present long range of buildings, and is approached by a central corridor at two levels. The main floor is above the ground, and the connecting corridor between the hall and the school descends to the foyer and ascends to the gallery. This gave ample supervision and easy access from both levels, as will be seen from the plan on page 740.

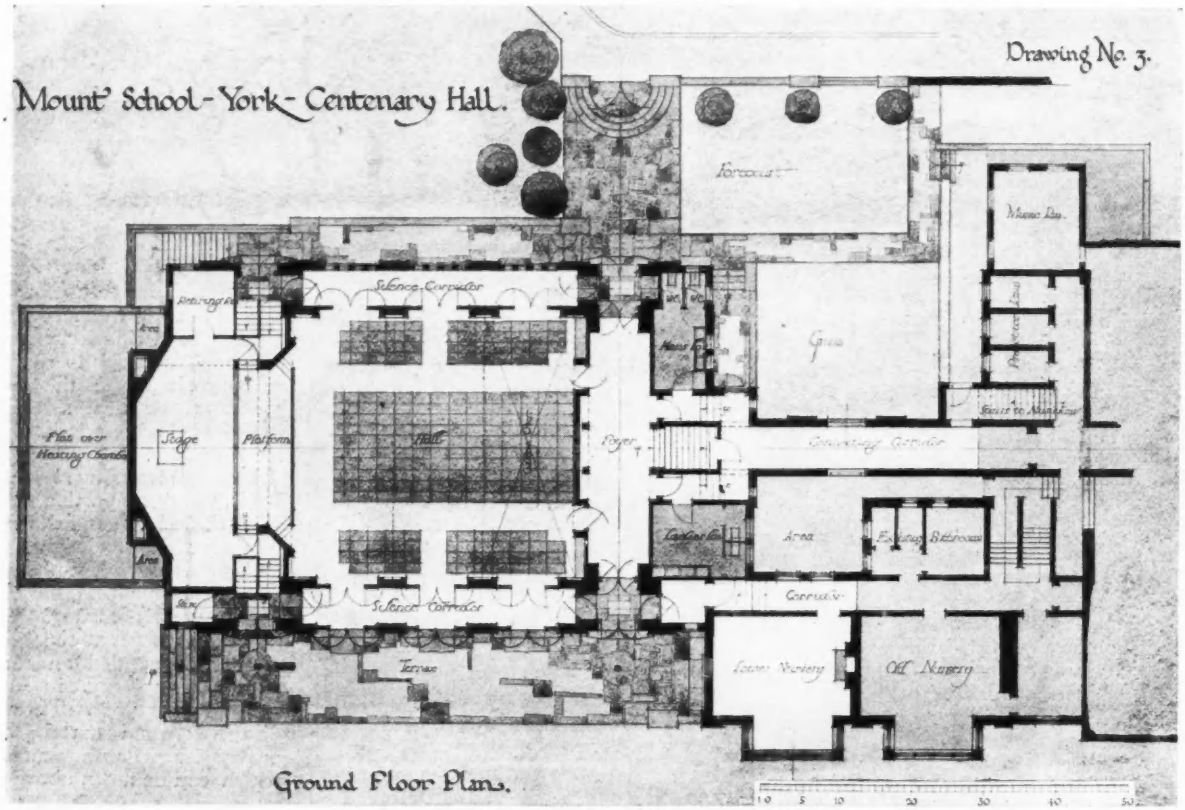
The stage was placed at the opposite end of the hall from the school, with the retiring rooms under. Access to the stage and retiring rooms is by means of corridors on each side of the hall. The corridor on the garden side would also serve as access to a swimming bath, which it is proposed eventually to build around the heating chamber behind the stage. The corridor on the road side serves as a "silence" corridor to exclude undue noise from the main road, and on this side also there are double windows on the clerestory.

The stage is arranged in two levels, the front portion being at platform level, and the back portion at full stage height, with an extension over the platform for the larger performances. The stage is arranged for curtains of grey material; these can be dismantled and ordinary scenery put in their place, as required. There is also a cinema curtain and provision for a fireproof curtain, which can be flown above the stage.



The foyer, looking towards the doorway to the terrace. The staircase is on the left, and faces the entrance to the hall.

The main entrance front, as seen from the road. The walls are of local York 2-in. bricks, with brown York stone dressings. The windows on the right, of the steel casement type, light the "silence" corridor adjoining the hall.



Ground-floor plan. The floors are oak, the woodwork throughout being of American whitewood, except the external joinery, which is in mahogany, stained to match the whitewood. It is proposed eventually to erect a swimming bath around the heating chamber.

Looking from the stage towards the gallery. Seating has been provided for 250 persons on the ground floor and a further 100 persons in the gallery. Ventilation is by means of induced tempered air, with natural outlets in the clerestory windows and vents in the ceiling.

Mount School, York.]

A general view of garden front, showing terrace, which is of grey York paving, and, on the right, the nursery buildings. The whole of the doors on this façade give direct access to one of the two "silence" corridors. Extensions were also made to the nursery block.

The stage is arranged in two levels: the front portion being at platform level; and the back portion at full stage height, with an extension over the platform for larger performances. The curtains can be dismantled. Acoustical panelling has been used for the ceiling.

By Hubert Lidbetter.

LETTERS FROM READERS

"Dreadfully Disappointed"

SIR,—I have read a good deal of what Mr. Creswell has written during the past few years. That reading has forced me to the conclusion that Mr. Creswell is a dreadfully disappointed man, and that he wants to assure us all that when we are as old as he is we shall all be dreadfully disappointed too.

But until we reach that age—which I gather to be one of almost perfect wisdom—we shall not be in a position to give Mr. Creswell the lie direct. In the meantime, I am hoping that things won't be as bad as Mr. Creswell says they will. I have met a number of men who must be as old as Mr. Creswell, or possibly older, who are not dreadfully disappointed men, and so I have some reason for still hoping that Mr. Creswell isn't quite right after all—but perhaps their sense of values is not quite the same as Mr. Creswell's.

In any case, it's dreadfully sad to see Mr. Creswell so dreadfully disappointed.

JAMES BURFORD

Bernard Whistlow, F.R.I.B.A.

SIR,—I thank Mr. Creswell for taking me so seriously, and I gladly adopt the "boy-straight-from-school" status that he has given me. I thank him for pointing out how my youth prevents me from having his experience.

I am sorry that my well-meant remarks about commercial travellers should have touched him in such a tender spot that he counters them by pointing to this youthfulness of mine, which must have been so obvious in my letter.

My intention was to help Mr. Towndrow to appreciate Bernard as I do, and I am very happy indeed to have unwittingly drawn Mr. Creswell's fire in the shape of his charmingly serious letter, which I am sure will have a great effect on all the other boys at my peculiarly impressionable time of life.

HAROLD GREENWOOD

The Seven Sisters Ramp

SIR,—It relieved my spleen to read Astragal's recent note on "The Seven Sisters Ramp," of which I have been one of the hapless victims.

The procedure was much as he describes. I had no idea that I was committing a technical offence by leaving my car out of other people's way, off the road, as I had been accustomed to do in years gone by. I received no warning of any kind whatever before that local policeman of his popped out from behind the gorse bushes, note-book in hand and pencil ready licked. I suggested that even the dog has been held to be entitled to his first bite. But he insisted on transacting business, copying from my licence with more zeal and labour than accuracy. Thereafter he was pleased to unbend a bit and volunteered the almost incredible information that the trap was actually set in operation at the direct suggestion of the National Trust.

In due course I received a summons, with my name incorrectly spelt; but that did not prevent the local bench from imposing a fine—a proceeding the legality of which I doubt. But of course to fight would have cost time and money; and I took the line of least resistance, smarting under a double injustice.

"DY 2257"

Another Confidence Trickster

SIR,—Astragal's note in the JOURNAL for November 18, on "A Confidence Trickster" constrains me to describe a variation of the trick which was played on me a few weeks ago here in Edinburgh.

A well-dressed man, about forty-five years of age, rushed into my private room one day and seized me by the hand, claiming acquaintance with me.

I had no recollection of ever seeing the man before, and told him so.

He stated that he had been for many years with a well-known firm of engineers, with whom I had formerly done business.

He was now dealing in motor accessories and would be glad to do business with me.

After a long chat about the old firm he rose to go and suddenly found that he had left his purse at his hotel. Could I lend him 2s., which he would return without fail next morning at 10 a.m. before he left town?

Needless to say he has not yet returned with my 2s. Of course he may have been killed in a motor accident.

Such a trick might be played with great success for a time if architects are not warned of it.

WILLIAM DAVIDSON

Arthur J. Davis, F.R.I.B.A., of Mewès and Davis, who was presented with the 1931 London Street Architecture Medal, for his Westminster Bank, Threadneedle Street, E.C., at the R.I.B.A. on Monday last.

Plaster for Concrete Ceiling

SIR,—During the past few years there has been a considerable increase in the number of new materials which have been placed upon the market. Architects have ventured from old habits and have favoured the use of some of these materials as an advance on methods of construction, and to conform with the modern architectural style in design.

There is certainly a hesitancy in some instances to depart from old methods, which is justifiable.

Since the introduction of reinforced concrete floors, plastered ceilings have been carried out either by two- or three-coat work.

After the removal of the shuttering, it has been necessary to hack cement concrete while in a green state, in order to provide a key. The liquid, falling to the bottom of the thickness of concrete, forms a fairly smooth surface, traversed by the lines of boards composing the centering.

Hacking has proved none too reliable, unless strict supervision is attendant upon the work. Many failures are undoubtedly due to the lack of a key for the floating coat. Left too long after the striking of the shuttering, the labour in hacking cement concrete becomes too much of an exertion to the workmen, and too great an expense to the builders, so that at times, except for a number of incisions in the concrete, the key is inadequate.

I have observed new materials advertised, fairly widely used, taking the form of painting a liquid on the shuttering which retards the setting of the concrete immediately against the boarding. Brushed over, the aggregate is exposed sufficiently to form a very good key for the plaster.

I have seen this liquid used and in work under my supervision. I have also used it and had the ceilings plastered with two-coat work—i.e. floated and set.

The point, however, which has struck me is: why use two coats of plaster?

Given a really excellent key, what is there against reducing the weight and expense of two-coat plasterwork to these ceilings, and substituting one coat of lime putty, gauged with cement?

F.R.I.B.A.

The PRINCESS Cinema, Kirkdale, LIVERPOOL

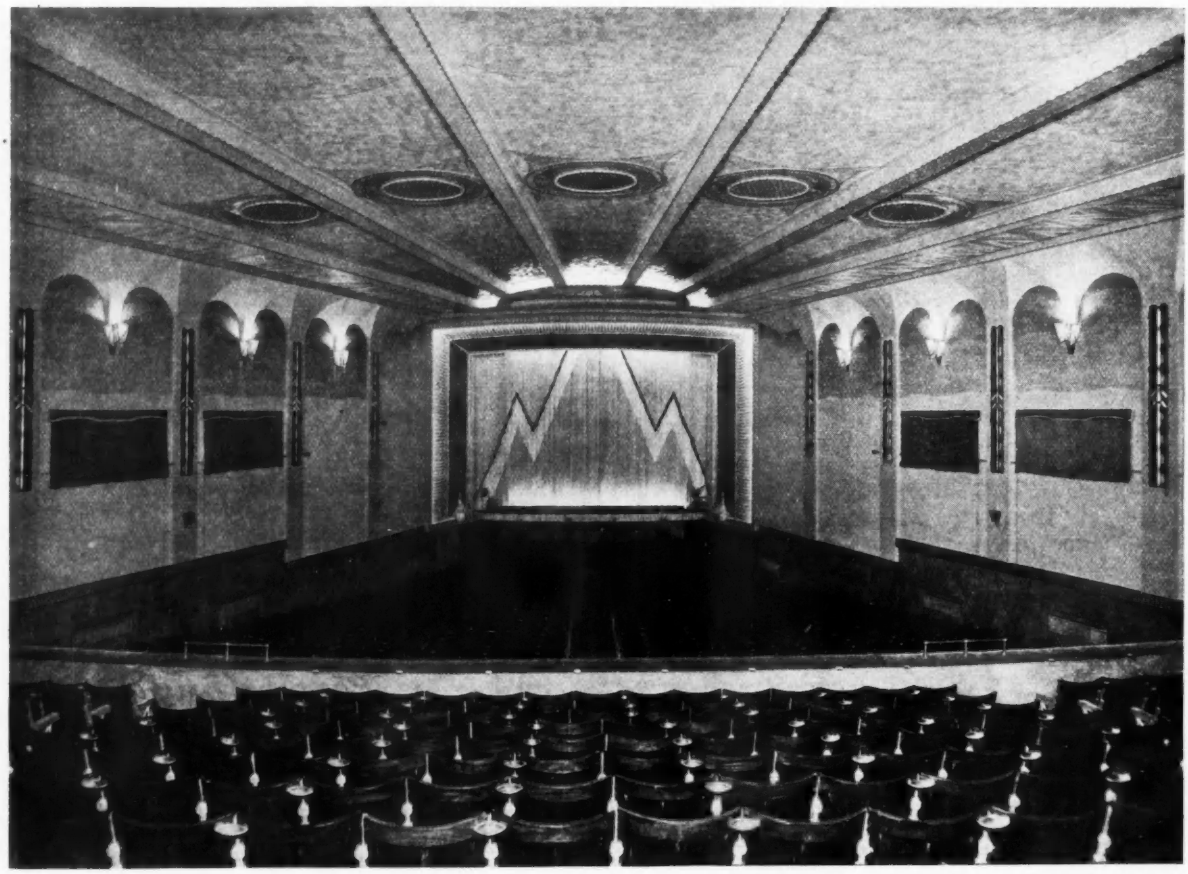
DESIGNED BY G. STANLEY LEWIS

The main entrance, here shown, is at the apex of the roughly triangular site. Rustic bricks and artificial stone are the materials employed. Very ample space has been allocated to poster displays. The house seats 1,500 persons.

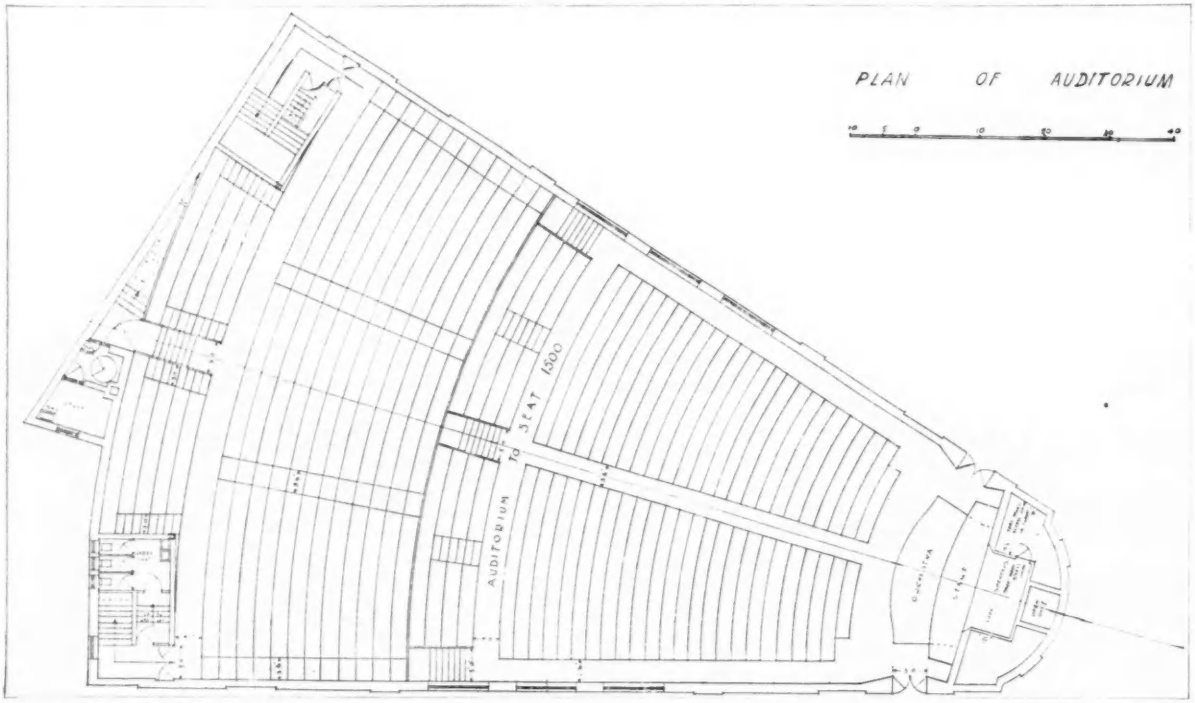
THE Princess Cinema, Kirkdale, is Liverpool's latest theatre, and accommodates 1,500 persons. Situated at the junction of two streets, the building has three main frontages, each of which has been treated architecturally in definite relation to the others. The materials used in the exterior elevations are rustic brick and artificial stone, both turned to decorative account. Large opening windows have been incorporated in the design, and an abundance of sunlight and air will be admitted every morning direct into the theatre. A comprehensive system of mechanical ventilation has also been installed.

The decoration of the auditorium is quite modern, though not of Continental severity. Original lighting effects have been used, with an abundance of colour. The decorations and lighting effects, together with the interior finishing, including the curtains, lighting fittings, waiting halls and floors, have all been carried out to the designs of the architect.

This exterior view is of the side elevation running off to the left from that shown at the head of this page. Entrances with marquises, the line of the cornice, and the central panel, with its large windows capable of admitting light and air direct to the auditorium in the interests of ventilation and sterilisation by natural means, serve as punctuation marks.



The stage and screen, viewed from the balcony. The whole of the decoration, lighting effects—in which a lavish use is made of colour-fitments—curtains and floor coverings, have been carried out to the architect's design.



Princess Cinema, Kirkdale, Liverpool.] [*By G. Stanley Lewis.*

As will be seen from this ground plan, the building has taken the only axis approaching a symmetrical solution of the problem presented by the site. Three frontages result, the most important being that utilized for poster display purposes.

THE NEW R.I.B.A. FORM OF CONTRACT

BY MICHAEL HOARE, B.A., BARRISTER-AT-LAW

The standard form of contract, published by the R.I.B.A. in 1909 and in general use from that date until now, has been withdrawn from circulation, and in its place a new form has been issued. This, though containing some similar or identical provisions, introduces innovations, found desirable by experience, in principle and in expression. The object of this and succeeding articles is to indicate the nature of the more important changes.

IT was pointed out by Mr. Justice Channell as long ago as the year 1901 that building contracts, as a rule, contain provisions whereby a particular person—the surveyor, the architect or the engineer, or whatever (he may be called—is given a double position.

> So far as regards all the direction of the work (he said), and saying what is or what is not to be done and so on, he is the servant and agent of one of the parties; but it has become the practice to make the person who is the servant and agent of one of the parties also perform a totally different duty : he is often authorized to act between the parties as an arbitrator or judge to settle matters between the parties. He has to act in a totally different way according as he is acting in one of those capacities or in the other.
>
> But the position is obviously one which is difficult. Even if the gentleman were a skilled lawyer . . . he would have a difficulty in separating his two duties, and a gentleman who possibly is extremely skilled in his profession is very likely . . . to confuse the two portions of his duties; and, having to obey and follow the direction of one of the two parties in reference to the great proportion of what he has to do throughout the business, he falls into the way of taking a certain amount of instruction from them with reference to either part of his duties.

This passage occurred in the course of the judgment in a case in which the contract provided that the decision of the surveyor with respect to the value of the works executed should be final and without appeal, and the contractor was seeking to recover an amount in excess of the value certified by the surveyor, on the ground that, as the employer, though without any dishonest intention, had interfered with the surveyor in the exercise of his functions as quasi-arbitrator between the parties and influenced him in arriving at his decision as to the value of the work, the final certificate of value in which the surveyor's decision was expressed was not conclusive and binding upon the contractor. It was decided that the contractor was not in the circumstances bound by the certificate, and was entitled to recover the larger amount; for the function of the surveyor as final arbiter upon the question of value was one which he was bound to exercise in a judicial manner, with complete impartiality and uninfluenced by either contracting party; and any failure so to exercise it disqualified him from holding his position as final arbiter and rendered his certificate ineffective.

This practice of investing the expert in charge of the works with a dual capacity has been found in many cases to be very inconvenient, not only from the point of view of the expert himself (who in building contracts strictly so-called is generally the architect), but also from the point of view of the employer and the contractor. The employer loses the assistance of his professional adviser at times when he most needs to be advised as to the extent of his obligations to the contractor, and as to the best method of presenting his side of the case before an arbitrator, while the contractor, who desires to remain on good terms with the architect, so as to obtain approval of his work and materials and payments regularly on account during the course of the whole work of construction, is often obliged as a matter of policy to acquiesce in decisions given by the architect in the exercise of his judicial functions, even though he considers those decisions inequitable.

The 1909 form to some extent mitigated these evils by including an arbitration clause of which the terms of submission were extremely wide, though limited by several important exceptions. The clause provided that the arbitrator should have power to open up, review and revise any certificate, opinion, decision, requisition or notice, save in regard to the matters expressly excepted, . . . and to determine all matters in dispute which should be submitted to him . . . in the same manner as if no certificate, opinion, requisition or notice had been given, and as a result, although it was still the duty of the architect to express opinions and to issue certificates of value, the question whether in arriving at his decisions he had brought his mind to bear upon the subject judicially as an impartial arbiter was (save with regard to the excepted matters) purely of academic interest; for if either party was dissatisfied with the architect's decision, he could appeal to the arbitrator. But the excepted matters (those upon which the architect's decision was to be final) were such that contractors on occasion thought it better not to insist upon what they conceived to be their strict rights with regard to some things in order to avoid disputes with the architect, who in regard to the excepted matters might still give decisions adverse to but binding upon the contractor : of those excepted matters, perhaps the most important were those whereby the architect had power to order, during the progress of the works, the removal of any materials which in his opinion were not in accordance with the specification or his instructions and the substitution of proper materials, or to order the contractor to dismiss from the works any person employed thereon who might, in the opinion of the architect, be incompetent or misconduct himself. The arbitrator had no jurisdiction to hear any dispute as to whether the opinion of the architect upon these matters was justified.

The new form of contract contains alternative arbitration clauses, the second of which is a reproduction of the arbitration clause of the 1909 form. Of this, suffice it to say that the wording of the earlier clauses of the form is so changed that it is doubtful whether the matters, which appear at first sight to be excepted matters, are, upon a true interpretation of the contract, excepted at all. However this may be, the first of the alternative arbitration clauses is quite new in form, and empowers the contractor without exception to submit to arbitration all decisions of the architect as to which he is dissatisfied. Moreover, the position of the architect as the professional expert, engaged by the employer and acting as the employer's agent, is still further emphasized by a provision whereby disputes or differences are, in the first instance, to be submitted to the architect, whose decision is to be regarded as that of the employer and binding upon him, leaving to the contractor alone the right to appeal to the arbitrator.

From the foregoing, it is clear that, under the provisions of the new form, the architect will be free to devote himself to the service of the employer as his agent and adviser far more effectively than was possible so long as he had judicial functions to perform as an impartial arbiter between the parties.

In addition to this, however, provision has been made in the new form for the more expeditious execution of variations and extra work than was possible under the 1909 form. Although by that form the architect could order on behalf of the employer any changes which his principal required or he himself thought desirable, there was apt to be delay in the execution of his orders, if, contrary

to the architect's expectation, the contractor gave notice that he considered that the work necessary to comply with his orders would be extra to that comprised in the contract.

Clause 1 of the new form avoids this difficulty by postponing, until after the work has been done, the consideration of the question whether compliance with the architect's orders will involve an extra. It provides in effect—much as before—that the contractor shall carry out and complete the works in accordance with the directions and to the reasonable satisfaction of the architect, who may issue written drawings, details or instructions in regard to a number of matters, including variations, the removal of materials from the site and the re-execution of work already executed. But the contractor is no longer required to give notice before proceeding with the work when he is of opinion that the work necessary to comply with the architect's instructions is extra to that comprised in the contract. By the terms of the new clause the contractor is to comply with the architect's instructions forthwith and without question. If such compliance involves a variation, the contractor's remuneration will be adjusted accordingly. Any dispute as to whether such compliance has involved a variation will, of course, be determined by arbitration.

In consequence of these changes and of others which we shall have occasion to notice in a subsequent article, the employer will enjoy the benefit of the expeditious and efficient execution of the job exactly in accordance with his requirements, even though he changes these a hundred times during the course of the work of construction, while the contractor, though called upon to comply with even the most extravagant orders of the architect, will have the assurance that he will be entitled to demand adequate remuneration for his services.

[*To be continued*]

STREET ARCHITECTURE

MR. HOWARD ROBERTSON, F.R.I.B.A., in his paper on "Street Architecture," read at a meeting of the R.I.B.A. on Monday last, when Mr. Arthur J. Davis, F.R.I.B.A., was presented with the London Street Architecture Medal for 1931, said we had built up in England architectural traditions as fine as any in domestic and ecclesiastical work, and by no means negligible in civic buildings, but in certain fields we had failed to realize that tradition was formed as the result of successful experiment.

Narrowness of outlook and lack of imagination at the time of the Revival killed the Gothic, at the time when its constructive principles might have become a source of inspiration for design appropriate to modern frame construction; and, for one cause and another, we found ourselves today with a style which, for the sake of simplicity we would call Georgian, as our generally accepted national expression.

Sir Edwin Lutyens' Skill

But the Georgian style was never developed on the basis of the structure or the requirements encountered today in modern commercial buildings, and the best efforts to adapt it served only to illustrate its limitations. Sir Edwin Lutyens, for instance, was a master in handling it; he had never designed a single building which was uninteresting. But his skill was the most satisfying in those buildings to which his characteristic type of expression, a free Georgian, was best suited. Even the finest architects who were accustomed to clothe their structures in a certain style of dress, were sooner or later faced with the question of whether the time had not come to change their tailor. And, more especially in commercial buildings, all architects needed to forget their favourite themes and to examine their problems in a fresh and fundamental way.

Structural emancipation from limitations permitted today wide licence. Immense spans, vast areas of glass might be demanded, and called for expression. Requirements tended to become more and more specialized, and it was doubtful whether there was a great future for the uniform screen type of façade treatment which marked certain phases of traditional street architecture.

The Expression of the Individual Purpose

The uniform architecture of certain sections of Bath or the rue de Rivoli and the Place Vendôme in Paris, with its inevitable restrictions on the use of the building behind the architectural screen, was an example of a form rarely feasible today. In building the Place Vendôme anew, it would really be more in accord with modern requirements to provide merely floors and stanchions, settle the roof lines, and leave the façades to be filled in from top to bottom within those guiding lines in much the same way as a ground showroom was left to be subdivided and faced according to the tenant's requirements. At the moment only the ground and mezzanine floors of new buildings were thus left to be completed. The future might, perhaps, witness the subsequent erection of the total façade screen to suit the expression of the individual purpose.

The abandonment of the uniform street treatment of the type exemplified in sections of Regent Street resulted in the loss of certain elements of cohesion and grandeur. Each building in a street tended to become, as was already the general rule, a separate unit. But if there could be control of main lines, an insistence on the importance of a proper junction with contiguous façades, and, above all, a greater community of outlook between architects, the chances of failure would be greatly lessened.

Harmonious Street Architecture

Many Parisian streets composed of individual façades had an ensemble of unity, due to a tradition in the observance of certain principles and to the habitual use of stone as a material for facing. The Parisian façade took cognizance of the support of its neighbour; the centres of buildings were not unduly stressed—thus avoiding a repetition of detached points of emphasis—and a certain community of feeling between the designers of different ages and schools was still evident even in these days of rapid changes.

It would be to the benefit of London street architecture were it possible for the buildings in selected streets to be allocated to architects of similar tendencies. It would be fairly easy to name a dozen architects of the "modern" persuasion who would put together, in a row, a dozen or more individual frontages, each to their own clients' requirements, yet forming a harmonious ensemble; and the same would be true of designs of members selected from the "traditional" group.

Elements of Discord

Trouble arose when the functional modernist worked alongside the man who detested that type of work, and meant to say so with all the emphasis of columns and pediments. Team work was essential to the success of street architecture, and it was because so much new building in Amsterdam, Berlin, and even New York, had been handled by architects with a certain similarity of ideals and training—in most cases with modern tendencies—that the street architecture of those cities had outstripped our own in unity of conception as well as in vitality and interest.

Behind diversity of form and treatment peered the possibility of discord or harmony in the essential approach to design, and the result was either war or peace. Façades vertical, façades horizontal, façades patterned, might all join together in street harmony if their design was imbued with the same spirit. Form was an important factor, but more so still were the foundations of character.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

The Housing Policy : A Statement

AN important statement on housing policy was made by Sir E. Hilton Young, the Minister of Health, in reply to an amendment moved by Mr. Maxton, to exclude from the Expiring Laws Bill that section of the Rent Restrictions Act of 1920 which permitted an increase of 40 per cent. in rents stabilized under the Act of 1915.

Sir E. Hilton Young said that there was information now available to show that our housing policy had failed to provide an adequate supply of the lower class of houses to let for the wage-earners. Owing to current financial conditions, if never before, it was now absolutely imperative that we should get full value, from the point of view of social development, for every penny of public money that we spent on houses, and that reconsideration would be necessary for the whole problem in order to secure the absolute extortion, as it were, of full value for our public expenditure under changed conditions. The Government would consider the problem in the single light of the interest of the whole community, in one of the greatest of all interests, an adequate housing supply, and, as a first aim to secure the housing accommodation that the nation needed and as an incidental to that end, a fair deal to the landlord and a fair deal to the tenant.

As to rent restriction, the Government could not deal with the present system by an abrupt and arbitrary interference of the sort proposed in the amendment. He would, however, give the undertaking that the whole matter would receive the prompt consideration of the Government in view of the changed conditions of the time. He asked the House not to throw the whole of the administration into confusion by the acceptance of the amendment.

The amendment was rejected by 311 votes to 40.

Housing Schemes Suspended

At question time Major Milner asked the Minister of Health if he would state the number of housing schemes which had been suspended or retarded, following the suggestions to local authorities that all expenditure should be reduced to a minimum; and if he could state the number of persons who would have been employed had the various housing schemes been continued.

Sir E. Hilton Young said he had only been informed of nine cases, covering quite a small number of houses, in which any definite action had been taken by the local authority to curtail or suspend their housing programme. The hon. member was under a misapprehension in stating that it had been suggested to local authorities that all expenditure should be reduced to a minimum, irrespective of its character or purpose.

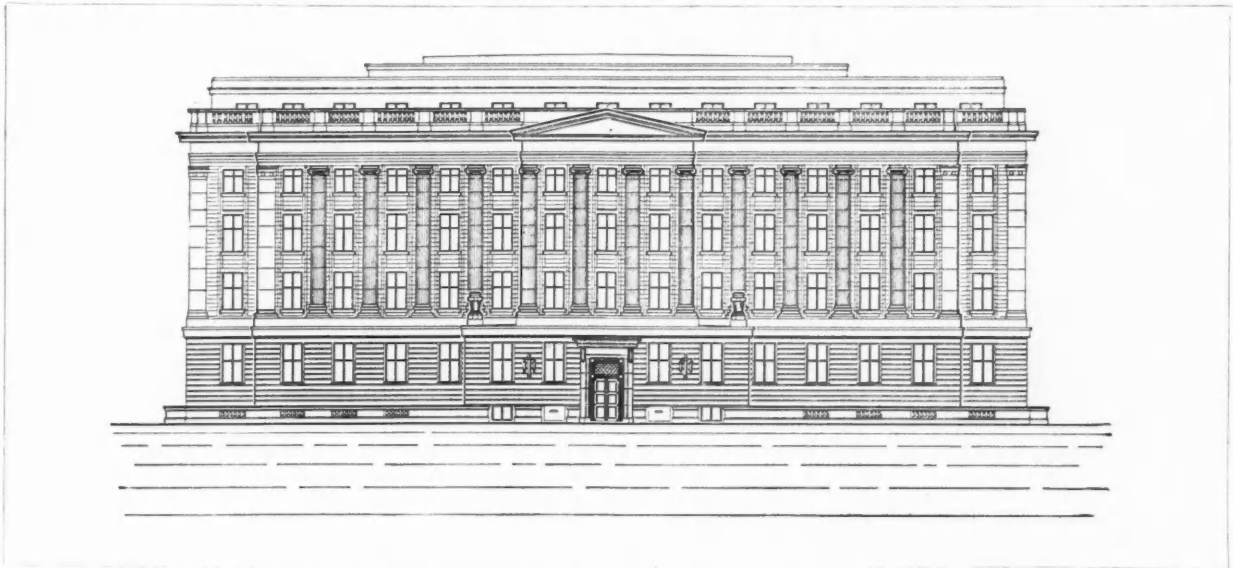
Manchester and the Housing Problem

Sir J. Nall asked what was the present position regarding the housing schemes of the Corporation of Manchester; and whether his department would continue to require the city council to build only the types of houses for which the greatest demand existed.

Sir E. Hilton Young said that the Corporation of Manchester had recently submitted proposals for the building of over 2,000 houses, many of which were of a larger size than he thought was required. The Corporation had been asked to revise their proposals so that the bulk of the houses to be provided could be let at a lower rent than had been usual in the City for Corporation houses, and he was in communication with them on the subject.

Sir J. Nall then asked the Minister whether he was aware of the proposals of the Corporation of Manchester to demolish a large area of property in the district of Hulme without any provision for alternative accommodation in the immediate vicinity; that previous schemes had resulted in only 25 per cent. of the dispossessed population moving to new housing estates, whilst 75 per cent. had remained in overcrowded conditions in the vicinity of the demolition area; and would he review existing legislation on this matter at an early date.

Sir E. Hilton Young said he understood that the question of rehousing accommodation to be provided by the Corporation of Manchester in connection with the proposed clearance referred to was still under consideration by the Corporation. As regarded the only other area which had been cleared by the Corporation since the war, his information was that 75 per cent. of the persons displaced were in fact rehoused by the Corporation. He did not think that any amendment of existing legislation on this matter was required.



The elevation to Euston Road of the Wellcome Research Institution, now in course of erection from the designs of Septimus Warwick. British Empire materials, with the slight exception of some Italian marble, are to be employed throughout the building, the external facing of which will be of Portland stone. The corner stone was laid by the Rt. Hon. Lord Moynihan, K.C.M.G., on November 25.

IN THAT CONTINGENCY

The following abstracts of inquiries represent a number of those recently submitted to the Building Research Station. The information given in the replies quoted is based on available knowledge. It has to be borne in mind that further scientific investigations may, in the course of time, indicate directions in which the replies might be supplemented or modified. Moreover, the replies relate to the specific subject of each inquiry, and are not necessarily suitable for application to all similar problems. Crown Copyright Reserved.

Cement-Lime Mortars

AN architect commented on the poor working qualities or "harshness" of 1 : 6 cement mortars, and asked whether a mortar composed of a mixture of 1 : 5 cement mortar and 1 : 3 lime mortar would give better workability, that is, would be more "buttery."

On account of the harsh working properties of very lean mixes, cement mortars extended with lime are in common use in the United States of America and on the Continent. The value of the lime addition, however, depends largely on the degree of workability of the lime used. In the United States of America extremely plastic "finishing" hydrates are, apparently, available commercially, and even a small addition of such limes improves the lean cement mixes quite appreciably. When, as is often the case in Great Britain, a dry hydrated lime is employed for the sake of convenience and simplicity in gauging and mixing, the additional plasticity obtained may be illusory, on account of the relatively low workabilities of some of the dry hydrated limes available at the moment. The use of a plastic "run" putty, well aged, should afford a comparable improvement, in spite of the greater difficulty of obtaining a uniform mix. There is, however, a tendency for operatives to look upon such gauged mortars as ordinary lime mortar or coarse stuff, to be left about indefinitely and knocked up for use again at convenience, regardless of the normal setting time of the Portland cement present, and this must be guarded against.

It is suggested that one part of Portland cement by volume be added to three parts of hydrate or run putty of ordinary stiff consistence, with as much sand as the mixture will carry for the particular job in hand : i.e. a 1 : 3 : 8 or 1 : 3 : 12 mix by volume.

Higher proportions of Portland cement may predispose a rendering to crazing and cracking when in large panels, and in a mason's mortar result in a degree of hardness and impermeability which is often undesirable.

Crazing of Plaster Applied over Heating Panels

A contractor had experienced trouble with ceiling plaster applied over heating panels on the underside of a concrete floor, and requested the opinion of the Station on the possible cause of the occurrence. After one year the surface of the plaster was badly crazed, and it was found that a canvas scrim, embedded in the plaster, had deteriorated. A sample of the plaster was submitted.

On analysis, the plaster undercoat was found to be richer than is usually specified for work over heating panels; it was, however, heavily gauged with plaster of Paris, and this heavy gauging was probably sufficient to prevent excessive shrinkage. The finishing coat was found to be very rich, but was only moderately gauged with plaster.

The scrim was well embedded in the sample, and it appeared that a skimming coat of plaster about $\frac{1}{8}$ in. thick had been applied over it.

Experiments carried out at the Building Research Station have shown that the severe conditions of exposure over heating panels are very liable to cause cracking in ordinary plaster finishes. The function of the scrim, which is normally specified, is presumed to be that of bridging over any cracks which are formed. It is essential, however, that the scrim should act as a surface reinforcement, and all specifications normally adopted for plastering over heating panels lay particular stress on the point that the scrim must be worked into the surface, but under no circumstances should a skimming coat be applied over it. In this case there is little doubt that the failure is due to the fact that a skimming coat of a very rich and lightly-gauged plaster has been applied over the scrim.

The sample of plaster submitted appeared to be very much thicker than is ordinarily recommended for work of this kind. The thickness was of the order of $1\frac{1}{2}$ ins. to $1\frac{3}{4}$ ins., whereas $\frac{3}{4}$ in. to $\frac{7}{8}$ in. thickness is usually specified.

No explanation can be given for the deterioration of the scrim, which appears to be a normal hessian fabric. Similar material which has been used in our experimental panels has not undergone serious deterioration. It can only be suggested that the deterioration is due to some previous treatment of the fabric, before incorporation in the plaster.

SOCIETIES AND INSTITUTIONS

TOWN PLANNING INSTITUTE

MR. R. C. MAXWELL, O.B.E., in his presidential address to the Town Planning Institute, said all bodies and persons interested in town and country planning, whether from the point of view of the preservation of the amenities of the countryside, or the orderly and economic development or re-development of urban areas, recognized that it was a matter of the first importance that the Town and Country Planning Bill should be placed on the Statute Book, and that, too, at an early date. Action by builders and land developers was in progress in all directions, and damage was being done which it would be impossible to repair or make good. At the same time it was fully recognized that much useful work could be done and was being done by many authorities under existing powers; and no expectation of increased powers should be allowed to stop the work now in hand, or damp the energy or enthusiasm of those who were now carrying on planning work.

There existed a somewhat prevalent impression in the public mind, and even in the minds of many local authorities who ought to know better, that a town planning scheme necessarily involved more or less heavy expenditure in connection with the works and improvements which the scheme was intended to direct and control. There could be no greater delusion, or one which was more likely at the present time to interfere with the passing of the Bill. Apart from the initial cost of the preparation of a scheme, no expenditure by the local authorities was necessarily or even ordinarily, involved in a town planning scheme. What a scheme did or should do was to direct and control the lines to be followed by development and building when and as it came along, so as to secure, in connection with such development and building, proper sanitary conditions, amenity and convenience, and to protect existing amenities, whether in urban or in rural areas.

It was fully recognized that the Government now in office had a national task of supreme and overriding importance to perform, and that nothing must be allowed to interfere with the performance of that task.

But probably much of the work involved would be carried on outside the immediate purview of the legislature. This being so, and having regard to the interesting aspect and composition of the Opposition benches in the House of Commons, a considerable amount of Parliamentary time should be available for other business. There seemed no reason, therefore, why the Town and Country Planning Bill should not be

reintroduced at an early date. It behoved them, therefore, as an Institute, and the other organizations interested in town planning, to use all and every means at their command to secure that the Bill should again come before Parliament, and that this time the measure should be passed through all its stages, in both Houses, to a triumphant issue.

LIVERPOOL ARCHITECTURAL SOCIETY

Mr. Leonard Barnish, F.R.I.B.A., opening a discussion on "Functionalism means the overthrow of Tradition," at a meeting of the Liverpool Architectural Society, held on November 18, said: Nothing would ever overthrow tradition. Function had always been the main element in architecture. To talk of functionalism as a new architecture was going too far. It would help, but it was not a cure-all. Functionalism was a stunt of the architectural schools, and the man who imagined he could design without other aid was most strangely conceited.

Mr. H. Hinchcliffe Davies stressed the difference between live and dead tradition. The eighteenth-century architects of Georgian houses were designers in the tradition of their day, the live tradition. The modern designers of half-timber buildings were mere copiers of a dead tradition. Tradition was not static; it moved, and much modern work which many considered untraditional was really in the living tradition.

Professor Lionel Budden, F.R.I.B.A., said modern architecture was in an experimental stage, though it would eventually establish its own convention. The danger was that people would become dogmatic, and praise or blame a building at sight, according to its use or non-use of the orders.

Mr. T. Taliesin Rees, F.R.I.B.A., stated that there was no such thing as modernism in architecture. Tradition persisted as a spiritual thing. The mischief was that very often we copied the bad instead of the good.

Professor Patrick Abercrombie, F.R.I.B.A., saw it as a sign of weakness that the modernist method had already established a very strong tradition—that was, had got into a cliché.

PALLADIO AND INIGO JONES

Sir Banister Fletcher, PP.R.I.B.A., lecturing on the later art of the Italian Renaissance at the Central School of Arts and Crafts, on Wednesday, Nov. 18, dealt with the work of such outstanding architects as Sanmichele, Vignola, and Palladio.

Palladio, he said, too often restricted to the use of mean materials, erected many beautiful buildings in his native city of Vicenza; notably the celebrated Basilica, built around a mediæval structure. It was of special interest to us that Palladio's work was closely studied by our own Inigo Jones on his visits to Italy, and thus Palladio became associated with English Renaissance; for Inigo Jones, inspired by much of the great Italian master's work, introduced his regularized type of design into this country, as seen in the Banqueting House, Whitehall.

A copy of THE ARCHITECTS' JOURNAL for November 4 (the New Materials Number) has been returned to the publisher by the Post Office, on the grounds that the address given is insufficient. The copy was addressed to C. H. Scott, Esq., Messrs. James Hirst & Co., Ltd., Manchester. The sender of this copy is asked to communicate with The Publisher, The Architectural Press, 9 Queen Anne's Gate, S.W.1, in order that it may be returned to him.

COMPETITIONS OPEN

December 8.—Sending-in day. New Orphanage to be erected in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage. Limited to architects who are resident or whose principal offices are within a ten-mile radius of Liverpool Town Hall. Assessor: A. H. Moberly, F.R.I.B.A. Premiums: £200, £100, and £50. Conditions were obtainable from the Secretary, the Liverpool Orphanage, Myrtle Street, Liverpool. (Deposit £1 1s.)

December 31.—Sending-in day. Latest date for conditions: September 31. Proposed New Town Hall and Municipal Buildings, for the Walthamstow Corporation. Assessor: H. Austen Hall, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Conditions, etc., obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

January 1, 1932.—Sending-in day. Proposed Church at Low Shiregreen, Sheffield, in connection with the Bishop of Sheffield's 100,000 guineas appeal (limited to architects with an office in the Sheffield Diocese). Assessor: C. C. Thompson, F.R.I.B.A. Full particulars obtainable from the Hon. Secretary, Sheffield, South Yorkshire and District Society of Architects and Surveyors, 15 St. James' Row, Sheffield.

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors: Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium: £500; also a further amount of £750 will be awarded to other designs according to merit.

September 31, 1932.—Sending-in day. All-British House (cost to be less than £1,000) for the Incorporated Association of Architects and Surveyors. Premiums: 50 guineas, 20 guineas and 10 guineas. Conditions, etc., from the Secretary, I.A.A.S., 1 Wilbraham Place, S.W.1.

The last day for submission of designs in the Southampton Grammar School Competition has been extended to December 8.

THE ARCHITECTS' DIARY

WEDNESDAY, DECEMBER 2

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Exhibition of photographs and drawings of Russia's new buildings. Until December 18.

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "The Development of Lighthouses." By D. Alan Stevenson, M.INST.C.E. **8 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "The Chateaux on the Loire." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

APPLIED ARTS AND HANDICRAFTS EXHIBITION. At the Royal Horticultural Hall, Westminster, S.W. Until December 4.

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. At Swedenborg Hall, 20 Hart Street, Bloomsbury, W.C.1. "The Principles of Calculation of Low Temperature Radiant Heating." By A. H. Barker, B.A. **7 p.m.**

INSTITUTION OF CIVIL ENGINEERS, Great George Street, S.W.1. Students' Meeting. "Ventilation, with special reference to Heat Removal on the Tube Railways." By E. A. Turner. **6.30 p.m.**

THURSDAY, DECEMBER 3

GEFFRYE MUSEUM, Kingsland Road, Shoreditch, E.2. "Collecting Cottage Furniture." By Fred Skull. **7.30 p.m.**

THANET SCHOOL OF ART LECTURES ON ARCHITECTURE. At Chatham House School, Ramsgate. "Later Gothic Buildings." By R. Goulburn Lovell, A.R.I.B.A. **7.45 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "Submersible Bridges." By R. P. Mears, M.INST.C.E. 6.30 p.m. Yorkshire Branch. At the Hotel Metropole, Leeds. "The Influence of Structural Steelwork on Building Construction. By J. Kershaw. 7 p.m. **6.30 p.m.**

CHARTERED SURVEYORS INSTITUTION. Annual dinner of the quantity surveyor members, to be held at the Hotel Victoria, Northumberland Avenue, W.C.2. **7.30 p.m.**

TRADE NOTES

Messrs. Haywards, Ltd., of Union Street, Borough, S.E.1, have just issued a new catalogue describing their Reform lanterns and skylights, etc., accompanied by numerous diagrammatical drawings and illustrations showing some of the various types of buildings in which Reform roofing has been incorporated. Reform glazing, it is stated, as used in the construction of lanterns, skylights, roofs, shelters, verandas, etc., has specially treated glazing bars. The glass sheets are supported on asbestos wicks, and securely but freely fastened to the glazing bars by means of delta springs and stop clips. Whilst each piece of glass is held with the utmost security, it remains free to expand and contract. It should be noted that ample channels are provided at each side of the bar for carrying away condensation water from the underside of the glass, when this forms owing to the excessive moisture in the atmosphere.

Among the many buildings for which Haywards' roofing has been specified, are the following: Forum Theatre, South Kensington (J. Stanley Beard and Clare, F. & A.R.I.B.A.); Council Offices, Chingford, Essex (Frank Nash, F.R.I.B.A.); Royal Automobile Club, Pall Mall, S.W. (Mewès and Davis, FF.R.I.B.A.); Handsworth Library, Birmingham (H. H. Humphreys); Electric Sub-Station, Newington Green (E. C. P. Monson, F.R.I.B.A.); Dulwich Baths, Goose Green, S.E. (William Bell); Public Library, Edmonton (E. J. Willis); Limehouse Public Library, Norway Place, E.14 (Bernard J. Belcher, F.R.I.B.A.); Filling Station, Fulham, S.W. (Hockley and Chamberlain), and the Kodak Building, Wealdstone, Middlesex.

*

In the full-page advertisement of Messrs. Homan and Rodgers, on page xlvii of the JOURNAL for November 18, there occurred a misprint by which this well-known firm of specialists in self-centering fire-proof floors were made to appear as makers of self-centering doors. They naturally do not wish the regrettable mischance to lead any of their old friends to the conclusion that they have deserted fire-proof floors. They are, and have been for over sixty years, laying various types of fire-proof floors, and it was their system of flat ceilings which became the forerunner of every type of suspended floors now in wide use.

*

A brochure has recently been issued by Messrs. Holophane, Ltd., comprising illustrations of some of the principal buildings, both in London and the provinces, floodlighted by them on the occasion of the International Illumination Congress, held in September last. Copies of the brochure are obtainable, free of charge, on application to Messrs. Holophane, Ltd., at Elverton Street, Westminster, S.W.1.

*

Messrs. W. T. Henley's Telegraph Works Co., Ltd., have opened new branch stores at Nottingham and Burnley. The Burnley store was opened on November 2, at Victoria Mill, Trafalgar Street, under the management of Mr. R. H. West; telephone number: Burnley 3682. The Nottingham store was opened on November 9, at Park House, Friar Lane, under the management of Mr. J. W. Bayliss; telephone number: Nottingham 4470.

*

In the New Materials issue of THE ARCHITECTS' JOURNAL (November 4 last), Mr. Raymond McGrath, in his article, "Modern Synthetic Facing Materials," referred to cellulose wall sheets used at the Paris Exposition de la Société des Artistes Décorateurs in 1930. It is interesting to note that Mouldings Development, Ltd., of 34 Victoria Street, S.W.1, are the representatives in this country for the supply of Trollit cellulose wall sheets.

*

Messrs. Fredk. Braby & Co., Ltd., recently secured the sole rights of a new invention in metal-covered plywood, which they have marketed under the trade name of Eclipse. The firm have just equipped a special factory with the necessary machinery at their Eclipse Steel Works, Glasgow, for the manufacture of this product. This new material consists of thin sheets of plywood, to which galvanized sheet steel or other sheet metal is cemented by hydraulic pressure on one or both sides. The cementing composition is of such a nature that, it is claimed, neither moisture, heat, water nor force can separate the metal from the plywood, and results in the finished panel being dead flat and smooth. On account of its great strength, rigidity, light weight and freedom from warping, it is also claimed to be specially suitable for the body work and dash boards of motor vans, coaches and cars; ships' cabins, doors and refrigerator holds; partitions, doors, fancy panelling, steel furniture equipment, and shopfronts. It will also be available for roofing purposes, either flat or corrugated. In addition to galvanized steel sheet covering, the plywood can also be supplied covered with stainless steel, bronze, copper, zinc or aluminium.

OBITUARY

G. S. PACKER: 1857–1931

We regret to record the death, at the age of seventy-four, of Mr. Goodwin Simpson Packer, F.R.I.B.A., of Southport. He was articled to Messrs. Garside and Johnson, architects, and afterwards with Messrs. Maxwell and Tuke, and also had several years' experience in the Borough Engineer's Office at Bury. Something like forty years ago he commenced to practise on his own account as architect in Southport, and during his long career has designed many buildings both in and out of Southport. He secured first place among thirty competitors for a church and vicarage at Barnsley, and also submitted a design for the Liverpool Cathedral.

In 1919 he was joined in partnership by Mr. Alfred Crampton.

He was elected to the Fellowship of the R.I.B.A. in 1928.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

North End House, North End Road, Kensington, W. (pages 731–734). General contractors, Higgs and Hill, Ltd. Sub-contractors: Ragusa Asphalte Paving Co., Ltd., asphalt; Geo. Tucker, bricks; Shaws Glazed Brick Co., Ltd., faience work to shopfronts; Kleine Co., Ltd., floors and roofs; Carter & Co. (London), Ltd., tiles; Rheocrete Pumice Stone Slab Co., Ltd., partitions; Richard Crittall & Co., Ltd., central heating; Bratt Colbran & Co., grates; Gas Light and Coke Co., Ltd., gasfitting; F. H. Wheeler, electric wiring; J. Bolding and Sons, Ltd., sanitary fittings; W. N. Froy and Sons, Ltd., sanitary fittings; Frigidaire, Ltd., refrigerators; Crittall Manufacturing Co., Ltd., casements; Blunt and Wray, metal entrance doors; F. A. Norris & Co., Ltd., iron staircases; Morris-Singer & Co., canopies to front entrance; Plastering, Ltd., plaster and decorative plaster; Rippers, Ltd., joinery; W. H. Gaze and Sons, Ltd., shrubs and trees; Express Lift Co., Ltd., lifts.

Mount School, York (pages 739–741). General contractors, W. Birch and Sons, Ltd. Sub-contractors: Shouksmiths and Sons, Ltd., heating equipment; Ames and Finnis, Ltd., roof tiling; George Wragge, Ltd., steel casements; Girdlestone & Co., lighting and stage lighting and fittings; May Acoustics Co., Ltd., acoustic ceiling panels in Cabot's Quilt; Albert J. Shingleton, stage fittings and scenery.

Princess Cinema, Kirkdale, Liverpool (pages 743–744.) General contractor, Walter Spencer. Sub-contractors: Penmaenmawr and Trinidad Lake Asphalte Co., Ltd., asphalt; Trussed Concrete Steel Co., Ltd., Reinforced Concrete Engineers, reinforced concrete fabric; McIntyre and Sons, Ltd., structural steel; L. Keizer & Co., Ltd., glass; Frank White, Ltd., canopies; A. and O. Stefanutti & Co., Ltd., terrazzo flooring; Young, Austen and Young, ventilation and central heating; McGoff and Vickers, electric wiring; Harcourts, Ltd., electric light fixtures; Holophane, Ltd., electric head and foot lights; Rowe Bros. & Co., Ltd., sanitary fittings; Quiggin Bros., Ltd., door furniture and metalwork; Crittall Manufacturing Co., Ltd., casement work; J. and J. Hall, fireproof doors and iron staircases; J. Alberti, Ltd., decorative plaster; John Stubbs and Sons, marble; Harold D. Godden, curtains; Walturdaw Cinema Supply Co., Ltd., projector machines; Arthur Roberts, window gearing; C. R. Harrisson and Sons, seating and carpets; Western Electric, Ltd., sound equipment.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Mr. H. S. Davis is to enlarge the White Line Laundry, BLACKHEATH HILL.

Plans passed by the COULSDON U.D.C.: Two houses, Bradmore Way, for Mr. H. C. Doddrell: house, Coulsdon Road, for Messrs. R. D. Taylor, Ltd.: alterations and additions, Swiss tea rooms, Brighton Road, for Mr. A. S. Filce: school, Chipstead Valley Road, for Messrs. Jarvis and Richards; four houses, Vincent Road for Mr. W. C. E. Ingram: house, Windermere Road, for Mr. G. Jensen: two bungalows, Waddington Avenue, for Mr. T. C. Sales: ten houses, Woodlands Grove, for Mr. P. Richardson: five bungalows, Keston Avenue, for Mr. H. S. King: estate development, Chaldon Way, for Mr. C. H. Cearn: nineteen garages, Woodman Road, for Messrs. Bayley Bros.

The following figures show the progress that has been made in State-aided housing schemes in Scotland to October 31, 1931: 1919 Act, 25,129: 1919 Act (by public utility societies), 421: private subsidy schemes (1919 Additional Powers Act), 2,324: slum clearance schemes, 14,001: under construction, 1,442: 1923 Act, by local authorities, 4,033: 1923 Act, by private enterprise, 20,454: under construction, 2,260: 1923 Act, by public utility societies, 80: 1924 Act, by local authorities, 53,104: under construction, 6,412: 1924 Act, by private enterprise, 3,135: under construction, 573: 1924 Act, by public utility societies, 127: under construction, 16: 1930 Act, by local authorities, 126: under construction, 3,180: unallocated houses (under construction), 70: demonstration houses, 17: steel houses erected on behalf of Government by Scottish National Housing Co., 2,552. Total completed, 125,503. Total under construction, 13,953. Total, 139,456.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

Stripping off old paper	Piece 2 0
Hanging ordinary paper	from 2 9

CLOCK TOWER: HAMPSTEAD INSTITUTE

DESIGNED BY CHARLES HANSCOMB, IN ASSOCIATION WITH SIR EDWIN LUTYENS

CREWE HALL, FROM THE GARDEN, SHOWING THE CLOCK TOWER

WITHIN are reproduced the architects' drawings of the clock tower which, as shown in the above illustration, surmounts the Hampstead Garden Suburb Institute, known as Crewe Hall, after Lord Crewe, first president of the governing council. Both the design and the method of construction are clearly indicated in the series of sections illustrated.

The Institute buildings are carried out mainly in brick, stone and tiles, and their inception and erection in sections, the first of which was begun over twenty years ago, was described in an illustrated article in the issue for July 23, 1930.

MEASURED DRAWINGS OF AMERICAN COLONIAL DETAILS

DOORWAY IN BOSTON, MASS.

THE excellent design and proportion of this simple doorway in Chestnut Street, Boston, cannot fail to arrest attention, even at first glance. A closer study reveals its refinement of detail. An uncommon feature is the use of the double book-pilasters without capitals, and with but a slight projection to form a base. This treatment, by divorcing these inner pilasters entirely from the free-standing columns, affords a happy solution of the difficulty encountered when, as in this instance, the front order springs from a lower level.

The details were measured and drawn by R. Keith Harris.

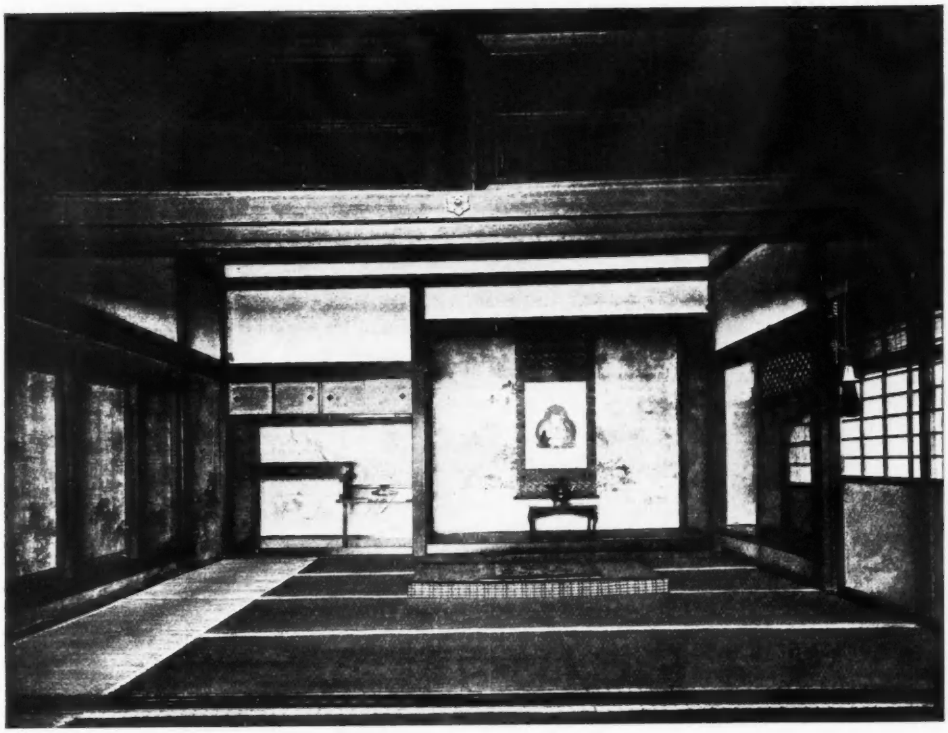
SELECTED PRECEDENTS:

DECORATIVE LESSONS FROM JAPAN



1. *TOKONOMA AND CHIGAI-DANA.*

AT more than one period in the history of European art, when creative energy has seemed to be almost extinct, it has received fresh inspiration from the inexhaustible East.

These three examples of old Japanese furnishings contain precedents of much modern interior decoration. "A quantity of ornament may materially injure but never can improve the effect of any composition," said Sir John Soane, and the moderns have, since the war, been hard at work "rationalizing" their decoration, relying for effect upon the sense of space and harmony of colour. Works by such artists as Mallet-Stevens, S. Chermayeff and Raymond McGrath seem to have transmuted the Eastern idiom for Western needs, and their art, far from being "jazz," is founded on true principles.

The scheme of figure **1** *includes posts and beams of richly coloured wood and tinted plaster walls. The frieze with the vertical channels and the glazing bars to the window on the right strike a modern note. In figure* **2** *the setting of the delicately-painted wall pictures in a scheme of gold and lacquer gives richness with austerity—the room of a patrician rather than a plutocrat. The parlour of figure* **3** *is remarkable for the fine lacquer frieze above the opening from which the rice-paper screen has been removed.*

By a strange irony, Japan, which has given to the West exquisite examples of interior decoration, is in exchange greedily absorbing the worst Brummagem products of Late Victorian taste.

LL. E. WILLIAMS

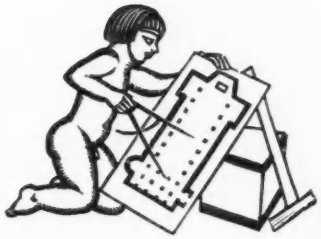
THE ARCHITECTS' JOURNAL



WEDNESDAY, DECEMBER 9, 1931

BRINGING STEEL UP TO DATE

IT is a remarkable fact that England, acknowledged by every other country to be the originator of modern building in steel, should still be debarred by old-fashioned legal enactments from making proper use of this valuable material. Improvements in the manufacture of steel and advances in structural technique have produced a cumulative result that makes Paxton's Crystal Palace seem even more remote than the old penny-farthing bicycle. No one expects the modern motorist to comply with regulations devised to protect the population of these islands from the ravages of primitive cyclism. But steel constructors, who have certainly gone forward no less far along the road of progress, remain hopelessly fettered by official safeguards long out of date.

There are signs today that this unhappy state of affairs will soon come to an end. The steel industry of Great Britain has entered upon a plan of research more ambitious than any similar effort undertaken by any other country. The first *Report* on this work was published the other day. A summary of its most important provisions will be found elsewhere in this issue. This Steel Structures Research Committee, as it is called, has, under the chairmanship of Sir Clement Hindley, reviewed the standards obtaining in Germany and the United States, and on the basis of this survey it has drafted a constructional code which should be of the greatest practical benefit to this country. Further, the committee is carrying on its investigations by experimenting with actual buildings on a scale never before attempted.

The results of another year's work are expected to carry the provisional code now issued into an improved form, giving a maximum of economies in large commercial and industrial buildings. The science of building as a whole, hampered by legal enactments, has retained too much that is merely traditional in its methods, and the national economy has not benefited by a rational exploitation of the most recent achievements in steel and steel construction and other materials. An entirely fresh light will be shed on building problems by the research now in progress.

It is not generally recognized what a large field for industrial activity is afforded by the building industry, and how severe a handicap a contraction of building operations must become to a vast number of manufacturing trades. In attempting to make a contribution to cheaper and more efficient steel-frame building, the committee is engaged in a work which will occupy the front rank in the reconstruction which must be undertaken throughout the country. And this is not all, for an interesting aspect of the committee's work is the close contacts established with the Dominions and the Colonies, and a process of rationalization throughout the Empire which will lead to a uniform Empire standard and lead to simpler and easier trading relations. Trade follows the technical standard as well as that other which is the flag, and the work of the steel industry in promoting the most scientific methods cannot fail to carry with it the greatest advantages to Empire trade.

Mr. Stanley Baldwin has blessed the report with a preface in which he draws attention to the great spirit of enterprise shown by the steelwork industry through the British Steelwork Association. " It reflects great credit," he says, " on the leaders of the structural steel industry that intense trade depression, which has affected their industry more seriously than many others, has not held them back from devoting money and energy towards studies of the fundamental principles of technique and practice. The British Steelwork Association, in seeking to foster development in this way, has taken a far-sighted view. In full sympathy with this view, the Committee of Council, on the advice of their Advisory Council, and after consulting the Institution of Civil Engineers, had no hesitation in agreeing that the Department of Scientific and Industrial Research should accept the responsibility for devising and aiding the scheme of co-operative investigations.

" It is an encouraging feature of modern civilization that, whenever the cause so requires, there are forthcoming men of the highest ability who are ready to give freely of their services, without thought of reward. The membership of the Steel Structures Research Committee and Panels, and the generous collaboration of all those who have been approached by the Committee for information and assistance, give further evidence, if it were needed, of this lofty spirit."

MODERN STEELWORK PRACTICE ON THE CONTINENT

The above illustration shows the steel framework of Erich Mendelsohn's new building in Berlin, which he has designed for the Bellevue-Immobilian A.G., Berlin.

Columbus Haus, as the building is called, is a notable contribution to modern commercial architecture. It stands at the corner of Bellevuestrasse and Potsdamer Platz, one of Berlin's busiest thoroughfares.

Mendelsohn's design embraces some most striking features in steel structural work, the whole front of the building being cantilevered out with a complete absence of columns, foreshadowing a particularly light and graceful exterior.

The whole question of structural steel practice in this country has been undergoing scrutiny by an expert research committee, whose first report is discussed in detail on pages 767-770 of this issue, in comparison with the existing London County Council Regulations.

NEWS & TOPICS

STEELWORK RESEARCH

THE report of the Steel Structures Research Committee is a very valuable document, about which I have no doubt there will be a deal of comment in the JOURNAL and elsewhere. Its major recommendation concerns the need for a scaling down of factors of safety, which so long as the scientific study of structural steelwork remained unco-ordinated were liable to be high, and in practice wasteful. Far higher standards are prescribed than are necessary, while progress in materials and methods of construction have made building regulations obsolete.

★

The Committee which has been scrutinizing the question in all its bearings is constituted, under the chairmanship of Sir Clement D. M. Hindley, K.C.I.E., as follows :

Commander W. R. Gilbert, R.N.; Messrs. J. H. Humphreys, M.I.STRUCT.E., J. E. James, C. J. Kavanagh, O.B.E., J. D. Stitt, D. Anderson, M.INST.C.E., R. Freeman, M.INST.C.E., B. L. Hurst, M.INST.C.E., E. S. Andrews, M.INST.C.E., O. Faber, O.B.E., G. Topham Forrest, F.R.I.B.A., and C. Gribble, M.INST.C.E.; Professors C. Batho, D.SC., M.INST.C.E., Sir H. C. Harold Carpenter, PH.D., C. E. Inglis, O.B.E., F.R.S., M.INST.C.E., M.I.MECH.E., M.I.STRUCT.E., A. J. S. Pippard, M.B.E., D.SC., M.INST.C.E., M.I.MECH.E., and A. Robertson, D.SC., M.INST.C.E., M.I.MECH.E. The Secretary is Mr. A. Zaiman; the Executive Officer, Dr. R. E. Stradling, M.C.; and the Technical Officer, Mr. C. H. Lobban, D.SC., M.INST.C.E.

★

The code of practice recommended in the report will reduce the tonnage of steelwork in building, but it may, if architects are quick to realize what changes in design are implied by the more scientific use of steel, increase the amount of structural steelwork carried out. It is, of course, useless to talk of saving steelwork so long as architects go on putting up Unilever Houses and Midland Banks and other great masses of stonework, beneath which the steelwork is hidden : economy is not to be mentioned in the same breath.

DECENTRALIZATION OF ARCHITECTURAL EDUCATION

Sir Edwin Lutyens is a firm believer in decentralizing architectural education. Speaking at the sixth annual dinner of the I.A.A.S., of which he is President, Sir Edwin wished that students might start in the country and be in no hurry to reach the city. The city student, he thought, had too easy access to the solutions of problems, and learned them before he could absorb the problems themselves. It was hard for both old and young to fight on the side of beauty against mercenary battalions in their imposing uniforms of efficiency and economy. Beauty demanded from all and every one of them a measure of sacrifice, if they were to save the countryside. It was the country that taught us the observance of good manners, consideration of environment and of neighbours, be they of stone or flesh—qualities that Sir Edwin feared were lost in our cities by owners who, for their own insistent private needs, were impelled to sacrifice those of the public.

★

In Dean Inge, who also spoke, the country has, it seems, a modern Guy Fawkes. He advocated the abolition of the House of Commons, because, " as long as one class has power to impose burdens without limit on another class, which is practically disfranchised, we are not likely to get justice or economy " ! But the " gloomy " atmosphere was, to some extent, dispelled when the Rt. Hon. P. J. Pybus, Minister of Transport, optimistically assured us that, as a result of the co-operation between architects, surveyors and engineers, our present-day railway and electric-power stations proved that a structure might be efficient and at the same time beautiful.

DESIGN—OR DECLINE !

The annual dinner of the Design and Industries Association last Friday concluded Mr. Clough Williams-Ellis's long and very valuable term as president, a term remarkable for the ferocious activity of its attack upon the spoliation of the national landscape. With Mr. Frank Pick as the new president, the Association is to embark upon a programme that will tackle very thoroughly the job for which the D.I.A. was founded—namely, the encouragement of design in industry; and I believe we shall see during the next few years an enlargement of its influence within and outside the bounds of industrial production, for as the Prince of Wales remarked in his most stirring message to the Association, the attacking point of competition has largely moved from the centre of quality to that of design, and the building up of a school of designers and design-minded business men is now to become a task of tremendous importance. It is, veritably, design—or decline.

INDUSTRIES AT CAMBRIDGE

Professor Abercrombie has written a letter to *The Times*, pointing out the danger of any attempt on the part of the Corporation of Cambridge to attract industries to the town by definitely laying down considerable industrial zones on the outskirts. It may sound at first as if industrial development would bring material gain, but, as Professor Abercrombie indicates, there is more loss to be suffered from industrial housing than can be offset by gains from factories. Add to this the many new problems of traffic congestion, involving central reorganization and reconstruction, and it may easily happen that the rise will be more noticed in the rates than in anything else. National planning policy, one would say, would look upon Cambridge, and even at this late date, Oxford, as sufficiently useful in their particular ways to be scheduled as not to be touched by industry.

SMOKE AND INCOME TAX

The annual report of the Smoke Abatement Society shows that, like many another similar body, it has had to contend with the general movement of retrenchment. The national saving through the absolute consumption of smoke would take off a third from the income tax, and I wish I knew clearly what difficulties in the way of complicated mechanism and capital expenditure prevent manufacturers from pocketing such a substantial sum of money. Difficulties there appear to be in plenty, great enough, it seems, to invalidate the Smoke Abatement Act of 1926, which the Institute of Civil Engineers have washed their hands of, and which local authorities find trouble in administering.

GARDEN MODELS

Undoubtedly the model is the most satisfactory way of showing a garden to a client, and the idea behind Mr. Kenneth Brook's recent exhibition at Harrods is interesting. You can buy your model material in parts—the clipped hedges and peacocks, pergolas, pools, pavements—and arrange them how you please. It is not, however, an idea that will appeal to the designer, for whom Mr. G. A. Jellicoe is now catering in the JOURNAL, since he is forced to a standardization of detail, and the ultimate garden is not

his own. The detail is sound, but commonplace. For children they are admirable, and would provide scope for the imagination. As table centres they could not compare with the Spanish tiled garden models exhibited in London a few years ago; the bizarre detail of these raised them from naturalistic representations to works of art, related to the spoons and forks and other furnishings of the dinner-table.

A PRACTICAL ARTIST

The exhibition held at Messrs. Batsford's Galleries, 15 North Audley Street, W.1, of a section of the work of Mr. Paul Nash shows yet another side of this versatile artist—his designs and decorations for books. Paul Nash, unlike so many other modern painters, does not confine himself to landscapes, but, as this exhibition shows, has designed stage settings which are easy to understand, and abstract designs which, in a series called "Urn Burial," are satisfying and alive. It is encouraging to see an artist who is willing to draw not only framed pictures to hang on walls, but also designs for fabrics and binding papers, and the furniture and colour schemes of rooms. If other artists as good as he would follow this example, there would be more enlightenment in modern design.

*

The accompanying illustration is from the series of stage designs made for "King Lear," published in *The Player's Shakespeare* (Benn, 1927). The drawings were made from models constructed by the designer. In this storm scene the effect of the rain is got by taut strings clamped to the stage and set above, like rigging on a ship. Across this dense rigging light is constantly swept—up and down and across—so that the "rain" is kept in motion. Flashes of brighter light break at intervals, while light is used in yet another way to affect the whole structure of the scene so that it appears to sway fantastically, like the mind of Lear himself.

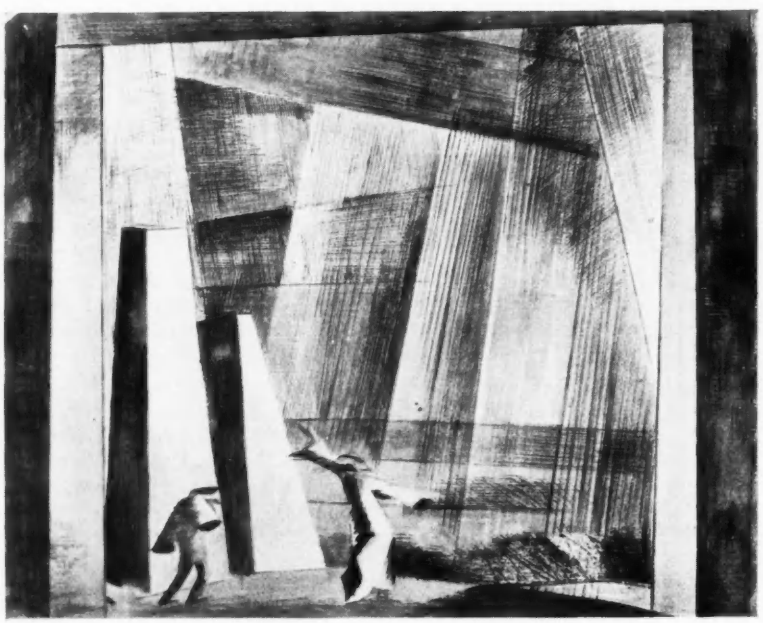
ASTRAGAL

Planning the Town

DR. RAYMOND UNWIN, P.R.I.B.A., in delivering the last of the Architectural Association's series of public lectures at 34 Bedford Square, W.C., on Saturday last, after expressing the hope that the Town and Country Planning Bill would be passed during the next session of Parliament, said the method of town growth on which town and regional planners were agreed called for the control of the continuous haphazard accretions round the fringe of the built-up areas of towns, a form of growth which produced increasing constriction, deprived the central functions and areas of any opportunity for natural expansion, and pushed the open land, to which the inhabitants needed access for health and recreation, farther and farther away as building round the fringe extended.

In place of this continuous haphazard spreading outward there should be a grouping of new development into compact units, as self-contained and self-sufficing as possible, to each of which there should be reserved its adequate quota of open land for games, recreation, etc. Planning would then begin by distributing the units of new urban or suburban development as a well-designed pattern of building units, carefully distributed on a green background of open land. Having secured those main dispositions of building development units and open space, and solved the problem of separating the through traffic routes from the service roads, the planner, whether in the centre, the outskirts or in the country, could approach the detail planning of the areas allocated on lines appropriate according to whether they were intended for industrial, commercial, residential, recreational or cultural use.

Until there were available rational plans based on the requirements of present-day life and modern traffic facilities, we should go on increasing the confusion and the difficulty, and making costly blunders through dealing with problems in isolation. With such plans the detail designing of each area could be undertaken to adapt it to its particular purpose, to reduce useless traffic by placing the parts in suitable relations to one another, and to develop the amenities which the sites might afford. Upon such a plan there might arise buildings suitably assorted and beautifully grouped and designed, so that something of the dignity and charm of our old towns might be recovered.



The Storm scene from "King Lear" (Act III, scene 2), designed by Paul Nash from a model made by himself. This design, which is described above, is one of the set prepared for *The Player's Shakespeare* (Ernest Benn, Ltd., 1927), and shown at the recent exhibition of the artist's work.

MATERNITY HOME AT OXFORD

DESIGNED BY STANLEY HAMP (COLLCUTT AND HAMP)

THE new maternity home at the Radcliffe Infirmary, Oxford, forms the first part to be completed of the ambitious extensions of the hospital for which appeals for funds have been made during the past three years. It is the gift of the President of the Infirmary, Sir William Morris, BART., D.C.L., and was officially opened a few weeks ago by the Duchess of York. Sir William Morris has not only given the home, but has also presented to the Infirmary and to the University Medical School jointly the adjoining site occupied by the Radcliffe Observatory.

The maternity home is built of multi-coloured bricks, the elevations being partly rendered in white cement, and the roof is covered with red tiles. Metal casement windows are fitted.

The building is four stories high, except the two main wards. These comprise two stories only, the roofs being used for large open-air sun flats having access for beds.

The ground floor contains the pre-natal clinic, with emergency labour ward, sisters' quarters, nurses' lecture-room, sitting and dining rooms, and kitchen, and maids' dining room. Waiting-room accommodation for visitors is also provided.

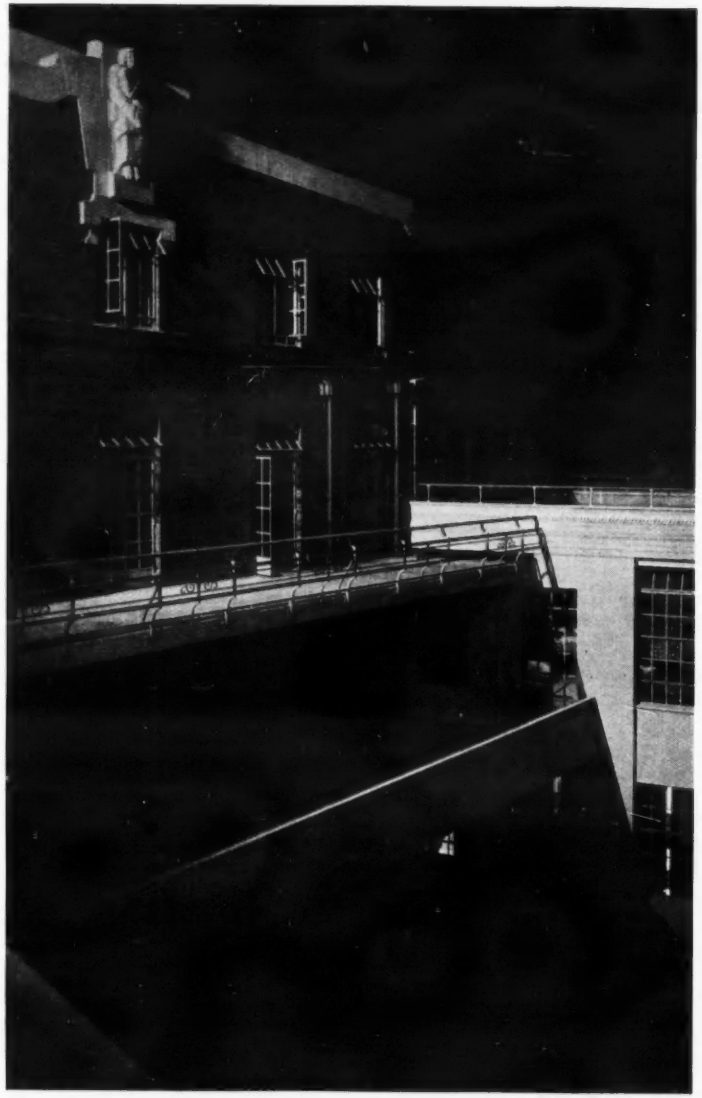
On the first floor are the two main wards, each with provision for twelve beds. Other single and two-bed wards occupy the remainder of the floor, together with the large night nursery, babies' bathroom, room for sick babies, and the necessary service rooms, bath-rooms, and storerooms.

The second floor contains the rooms for paying patients, isolation rooms, and a suite of labour wards with all necessary service rooms.

The third floor is devoted to staff rooms, consisting of bedrooms for mid-wives, nurses and maids.

The architect was Mr. Stanley Hamp, F.R.I.B.A., of Collcutt and Hamp, the consulting engineer, Mr. John F. Farquharson, M.I.C.E., and the quantity surveyors were Mr. R. E. Bennison and Messrs. Fleetwood Buss and Anns.

A glimpse from the roadway of the new maternity home at the Radcliffe Infirmary, the gift of Sir William R. Morris, BART., D.C.L. The gates and railings are of wrought iron. The vases were carved by P. G. Bentham.



Maternity Home, Oxford.]

Looking, after dark, from the sun balcony across the entrance front and showing the figure of "Maternity," carved by Laurence Bradshaw.

[*By Stanley Hamp (Collcutt and Hamp).*

The main entrance doorway and lobby by night. The surround is of artificial stone, and the doors and linings are oak, with fanlight in wrought iron. Note the harmony of treatment in the soffit of balcony.

One of the two general wards on the first floor. The walls of all the wards are coloured pale primrose yellow, and the floors are in blue and white rubber. The margins on which the beds stand are in blue and white Terrazzo.

Maternity Home, Oxford.]

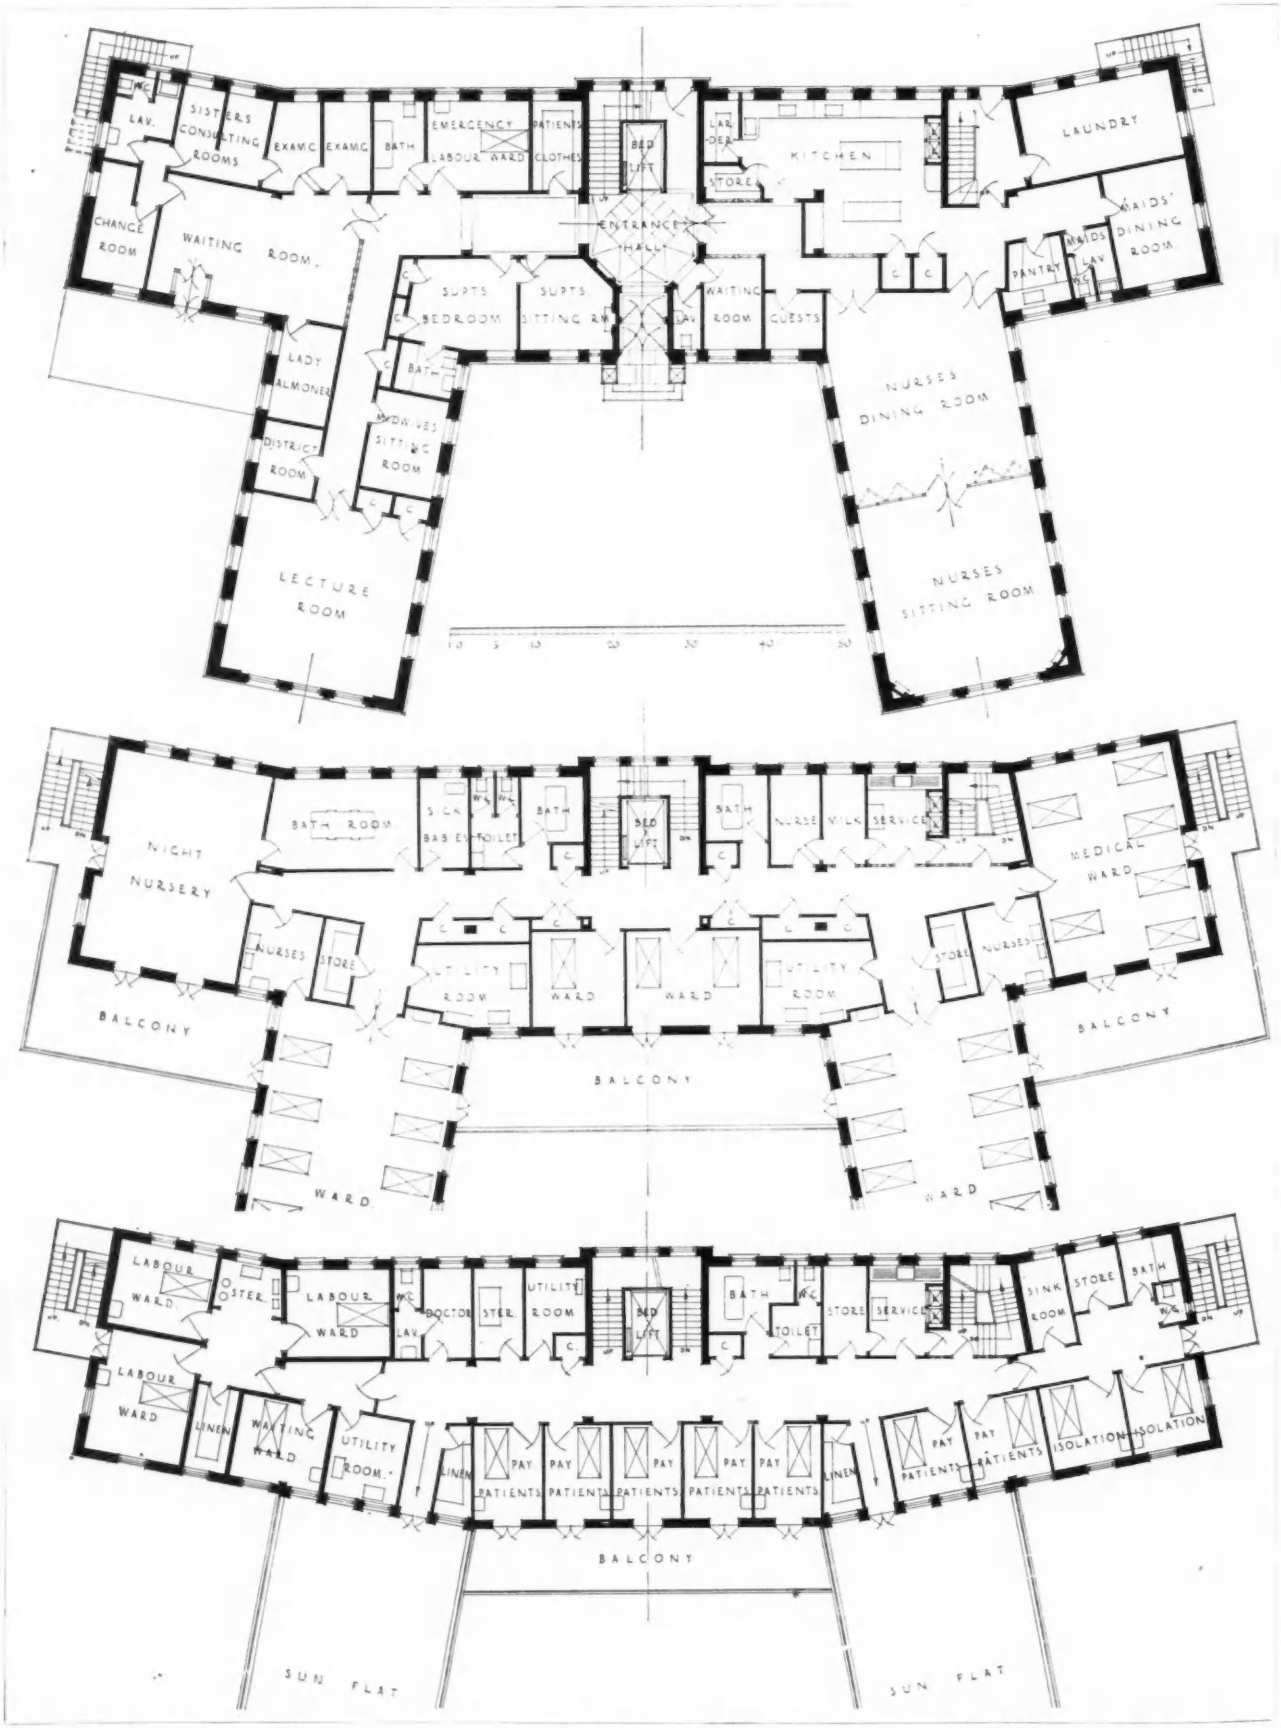
[*By Stanley Hamp (Collcutt and Hamp).*

Looking from the sterilizing room on the second floor into one of the labour wards. Behind the camera are two more labour wards, completing the unit.



Maternity Home, Oxford.] [*By Stanley Hamp (Collcutt and Hamp).*

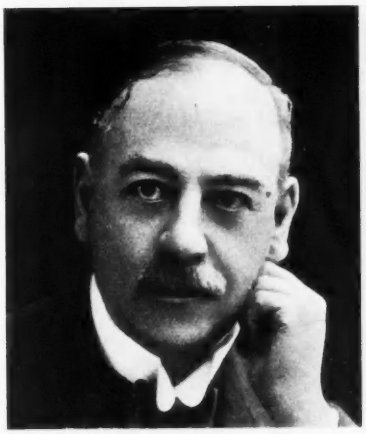
Plan of the ground floor and part plans of first and second floors. Each of the general wards on the first floor accommodates twelve beds. On the third floor are bedrooms for seventeen nurses and four maids.

STRUCTURAL STEEL IN BUILDING PRACTICE

The Research Committee's Recommendations Reviewed

BY ALEXANDER H. HAYES

Sir Clement D. M. Hindley, K.C.I.E., M.INST.C.E., chairman of the Steel Structures Research Committee.



G. Topham Forrest, F.R.I.B.A., superintending architect of the L.C.C., the only architect member.

COMPLAINTS that restrictive regulations prevent the full application of modern technical developments are by no means uncommon. What is uncommon is any well-considered proposal for adjustment which takes properly into account the object of the regulations and also is supported by sound evidence.

In the First Report of the Steel Structures Research Committee, Department of Scientific and Industrial Research, for the period ended March 31, 1931, which has just been published,[1] we find a welcome exception. The report represents the first eight months of the Committee's work of (*a*) reviewing the present methods and regulations for the design of steel structures, including bridges, and (*b*) investigating the application of modern theory to structures, and making recommendations for the translation to practice of such results as would appear to lead to more efficient and economical design.

It has long been felt in the steel industry that full advantage is not being taken of the excellent qualities which steel possesses as a material for building construction. Building codes and authorized practice, which ignore recent advances in technique, and the use of stress calculations not sufficiently refined, are held to be partly responsible. Hence the work of the Committee, with the object of extending the efficient uses of steel.

SCOPE OF THE RESEARCH

Needless to say, a cursory investigation and hasty recommendations would be valueless. The scope of the work will be appreciated when it is stated that no fewer than seven panels have been formed to deal with the various sections. These are considering respectively the following subjects :—

I : The external loads on buildings, floor loads, wind pressure and wall construction, with a view to reducing dead loads.

II : Estimation of the stresses set up in existing buildings and measurement of actual movement and strains.

III : Stress analysis and the effect of eccentric loading.

IV : Materials; the determination of yield point in steel, safe stresses and methods of test.

V : Struts, reviewing practice and formulæ.

VI : Welding.

VII : Vibrations in structures.

The practical work of research is being conducted under the general direction of Dr. R. E. Stradling, the Director of the Building Research Station at Garston, near Watford. Part of the work is being done at the Station, part in the National Physical Laboratory, and some at the Universities of Birmingham and Bristol.

It may be mentioned that the Committee is not concerned with administrative action for translating the results to practice. The means already exist for dovetailing into existing procedure for the statutory control of buildings the suggested rules and recommendations which will be formulated.

C. J. Kavanagh, O.B.E., Secretary of the British Steelwork Association, and a member of the Steel Structures Research Committee.

The recommendations put forward in the First Report relate only to the work of Panel I. Before discussing these, however, it will be interesting to glance at the work of the other panels.

SOME IMPORTANT PROBLEMS

The statement of the problem before Panel II points out that all practical calculations and designs of structures are, and must be, based on assumptions which are only approximations to the truth. Stanchion ends are assumed to be so accurately machined and erected that an upper length bears uniformly on a lower length. In practice this is but partially realized. Beam reactions are frequently taken as giving direct bearing on the midpoint of stanchion brackets, and eccentric stresses in stanchions calculated accordingly. In practice, the top cleats of the joint introduce a partial fixity of end connection which operates to modify this eccentricity. Stiffness of the joints also influences the beam stresses; the effect of casing in concrete adds to stiffness; and the concentricity of the bearing on the base introduces other factors.

For these and other reasons the comparison of measured stresses with calculated ones is necessary as a check on methods of calculation. Some work has already been done by the Panel on the distribution of stresses in a simple plated steel stanchion, and further, a strain gauge designed for use in the tests.

Shear tests on steel **I** beams, conducted by Panel III, indicate that in plain beams the tendency, where restraints are not imposed, is for failure to occur in torsion, the top and bottom flanges rotating in a horizontal plane about a central vertical axis. It is important, therefore, that such forms of failure be

[1] H.M. Stationery Office. Price 5s.

prevented by proper top cleats connecting beams and stanchions. When torsion failure is prevented, and the points of support are at the ends of the beam, the failure appears to occur by vertical buckling of the web over the end supports.

In beams which were allowed to overhang the supports, the additional stiffness of the ends increased the failing load for both plain and compound girders. This increase in the tests was about 12 per cent. for plain beams and about 70 per cent. for the compound members.

From the work so far done on struts, no very definite conclusions can be drawn. While stress analysis shows that the vertical members in a steel building frame are subjected to such bending moments that they should be considered rather as beams than as struts, it is not yet possible to give a reliable estimate of the maximum moment likely to be experienced by any particular stanchion. Professor Andrew Robertson emphasizes the point that strut analysis is only of paramount importance when dealing with a member which has a relatively small eccentricity of loading, for unless the strut is a very slender one, the addition to the effective leverage of the end load due to the actual bending of the strut is small. With some types of attachment the bending moment transmitted to the struts may be so large that the strut action is almost negligible.

In the work of Panel VI, the co-operation of certain welding firms has been secured and enabled the investigators to embark on a comprehensive programme.

THE PROBLEM OF LOADS

Reverting now to the work of Panel I, it is pointed out that, although the "floor loads" insisted upon by various building regulations are known in many cases to be greatly in excess of the actual loads resting on the floors, their reduction to a figure approximating to the actual loads existing on floors is not yet justified. Although practical experience has proved that the methods of design are safe, yet, because these are not based upon a complete scientific analysis, any numerical factors, such as "floor loads" or "maximum allowable stresses," are nothing more than constants in a series of empirical formulæ, and it is impossible to consider changing them into actual loads on floors or higher allowable stresses until a thorough overhauling of the methods of design has been carried through.

The correct analysis of the stresses in a building framework rests upon the conception that the stress in no member of that framework is independent of the stress in others, while the extent of dependence is controlled by the degree of rigidity of the connections. The problem of struts scarcely exists when the structure is looked at from this point of view, for the bending introduced by the "unconscious eccentricity" of strut action is so small compared with the bending moments introduced into columns from beams that the strut, as such, can be neglected.

With this need for a revolution in the methods of stress analysis, the amount of revision that can be recommended at present in building codes is not very substantial in fundamental matters of design. It is, nevertheless, possible, in the light of technical experience, to remove many restrictions which have proved to be onerous, and this has been attempted in the recommendations for a code of practice set out at the end of this First Report.

THE PROPOSED CODE ANALYSED

In the following notes the principal recommendations are summarised and comparison made with the existing requirements under the London Building Act and associated Regulations. Actual quotations are in small type.

MATERIALS

Cement and Concrete.—The specifications for concrete are substantially the same, except that the Committee's code prohibits clinker, whereas the Regulations allow furnace clinker in plain concrete walls.

The factors of safety suggested for concrete are higher than the present L.C.C. Regulations, but are in complete agreement with those recently issued by the Ministry of Transport for bridge work.

Hollow Blocks for Walling.—Hollow blocks for non-bearing walls with an aggregate width of voids, measured horizontally at right angles to the face of the block as laid in the wall, of two-thirds the total thickness of the block, shall have a minimum crushing strength, in lbs. per square inch, calculated on the gross area, as follows:

Hollow concrete blocks	700
Hollow blocks of brick-earth or clay	450

In cases where the aggregate width of voids is less than two-thirds of the total thickness of the block, the minimum crushing strength shall be increased in the proportion of

$$3 \times \left\{ \frac{\text{thickness of block—width of voids}}{\text{thickness of block}} \right\}$$

The existing Regulations for the use of hollow blocks for external walls between reinforced concrete pillars and beams call for 8½ ins. aggregate thickness, a minimum of 2 ins. for the side and 1 in. for end partitions, the clear and unsupported span of any part to be not more than four times the thickness of that part.

Bricks.—The minimum crushing strength of bricks, in pounds per square inch, shall be:

Engineering bricks (*a*) ..	10,000
Engineering bricks (*b*) ..	5,000
Building bricks (*c*)	3,000
Building bricks (*d*)	1,500

Mortar for Brickwork.—The recommendations on this point would appear to be more stringent, calling for 3 : 1 of sand and cement, as against 4 : 1 now required, and 2 : 1 of lime and sand as against 3 : 1.

Cement mortar, "3 : 1," shall be mixed in the proportion of 3 cub. ft. of clean silicious sand and 90 lbs. of cement.

Lime mortar mixes for the jointing of panel walls shall be such as will set in forty-eight hours.

Lime mortar, "2 : 1," shall be mixed in the proportion by volume of two parts of clean aggregate to one part of lime putty of the usual consistence, or one part of dry hydrate, and shall be such that the set mortar is sound and of good strength.

DESIGN

Encasing of Steelwork.—The existing Regulations stipulate that all pillars and girders in external walls must be completely enclosed and protected from fire by brickwork or other incombustible material 4 ins. thick, properly tied and bonded or secured to the adjoining work, parts other than external walls similarly cased 2 ins. thick, and the upper surfaces of girders and joists 1 in. thick. The Committee's recommendations are more specific in demanding, for buildings of the highest grade of fire resistance, fire-resisting materials of similar thicknesses properly applied to all steelwork:

Of the above casings at least 2 ins. of thickness in immediate contact with pillars and beams where built into external and party walls and 1 in. in immediate contact with all other pillars and beams shall be of 1 : 2 : 4 cement concrete properly reinforced with steel wire lattice of not less than 2-in. mesh, or equivalent reinforcement. Where the casing is of 3 ins. of properly reinforced concrete it need not be in contact with the steel.

The above requirements do not apply to . . . . . industrial workshops, storage sheds and hangars, of one story height, or to other buildings of one story not exceeding 25 ft. in height; and as regards the topmost story of all buildings, they apply only to pillars and beams where built into external walls.

Panel Walls of One Thickness.—The present requirement is a minimum thickness of 8½ ins. for the top 20 ft., and 13 ins. below where 20 ft. is exceeded. The recommendations call for an increase on 8½ ins. where either the horizontal or vertical span between supports exceeds 13 ft.

Panel walls constructed entirely of one thickness of either solid brickwork or hollow blocks shall be of at least 8½ ins. overall thickness throughout, exclusive of rendering, plaster or other decorative finish. In cases where the clear span of such walls between steel supports (either horizontally or vertically, according to which is the lesser) exceeds 13 ft., the thickness thereof shall throughout be increased by at least 2 ins. for each 3 ft., or fraction thereof, of such excess span. Any such additional thickness shall not be provided by unduly increasing the width of the mortar joints.

Reinforced Concrete Panel Walls.—Here the recommendations are in line with the existing requirements.

Faced Panel Walls.—Panel walls constructed of bricks or hollow blocks with a facing of either brick or stone work, shall be at least 12 ins. overall thickness throughout, exclusive of rendering, plaster or other decorative finish. In cases where the clear span between steel supports (either horizontally or vertically, according to which is the lesser) of such walls exceeds 16 ft., the thickness thereof shall throughout be increased by at least 2 ins. for each 3 ft. or fraction thereof of such excess span.

Any such additional thickness shall not be provided by unduly increasing the width of the mortar joints. The brick or stone facing shall in all cases be either bonded or otherwise adequately secured to the backing.

Cavity Panel Walls.—At present hollow walls must have a wall on one side of the hollow space of the full thickness prescribed in the London Building Act for walls. The recommendations are more in keeping with the utility of this type of wall in stipulating two solid walls of 4¼ ins. minimum thickness, tied in accordance with spacing up to 9 ins. apart :

Panel walls of brickwork or stonework may be constructed as cavity walls formed of two solid walls or shells, each not less than 4¼ ins. thick, spaced not more than 3 ins. apart and tied together across the cavity at the rate of one tie to every square yard of cavity area, the vertical spacing of ties to be approximately one-half their horizontal spacing.

The two shells may, however, be spaced more than 3 ins. apart, but not more than 9 ins. apart, provided that the number of ties is increased in direct proportion to the cavity width. The clear span of single panel of cavity wall between steel supports (either horizontally or vertically, according to which is the lesser) shall not exceed 13 ft., nor shall its clear overall area exceed 200 sq. ft.; provided that this limit may be exceeded where one of the thicknesses of the solid work conforms to the requirements of panel walls of solid brickwork or hollow blocks.

Permissible Overhang.—In no case shall a panel wall or a shell of a cavity wall overhang the concrete casing of the supporting beams by more than one-third in all of the thickness of the wall or shell, and in every instance where the overhang beyond the top flange of the supporting beam exceeds one-third of the thickness, plus 2 ins., the concrete girder casing shall be reinforced in combination with an adjoining floor slab in such a way as to transfer the load axially to the beam.

A cavity wall, the base courses of which are built solid for the full width of the wall, may overhang to the same extent as a solid panel wall.

Party Walls.—These of solid brickwork may be 13½ ins. thick, provided that they are supported by beams at a distance apart vertically not exceeding sixteen times the thickness of the wall.

Steel Pillars.—Recommendations are made in regard to base plates for steel pillars, in keeping with the necessity for proper stress distribution if maximum permissible stresses are to be extended. These and the associated recommendations include the machining of pillar ends, the fabrication of all steelwork as far as possible in the works, the character of bolts and rivets and their spacing.

LOADS

A comparison of the suggested superimposed loads and those at present required to be allowed for in various types of buildings shows a radical reduction in every case. The present L.C.C. requirements have been added to the table showing the Committee's figures, for convenience of comparison. The suggested figure for domestic and similar floors is in line with the existing requirements in New York and Germany. A comparison of requirements in different countries shows a wide divergence, even after allowing for local conditions. The adoption of the suggested figures would have an important influence on the design of steel structures, as the load reductions suggested range from 8 to 50 per cent.

Roof loads, similarly, are reduced radically, from 56 lbs. to 30 lbs. for angles of less than 20 deg., and from 28 lbs. to 15 lbs. for greater angles.

Further, the reduction of superimposed loads, which the existing Regulations allow for stories below the top story, are considerably increased in the recommendations. At present, the top story and first below must be calculated at 100 per cent., with a reduction of 5 per cent. (maximum allowance 50 per cent.) for each succeeding lower story. The suggested allowance is 10 per cent. reduction for the first below the top and 10 per cent. for succeeding floors below, with a maximum of 50 per cent. The reductions, however, are not to be allowed on any floor scheduled for an applied loading of 100 lbs. or more per sq. ft.

Dead Load.—Where the positions of partitions are not definitely located in the design, a uniformly distributed load sufficient to allow for them is to be added to the dead floor load, the minimum total allowance for internal partitions in offices to be at the rate of 20 lbs. per sq. ft. of floor area.

Superimposed Load.—For the purpose of calculating the loads on foundations, pillars, brick or stone piers, walls and beams in buildings, the minimum superimposed load on each floor and on the roof shall be estimated as equivalent to the following dead loads :

	Lbs. per sq. ft. of floor area.	*L.C.C.*
Rooms used for domestic purposes, hotel bedrooms, hospital rooms and wards	40	(*70*)
Offices, floors above entrance floor	50	(*100*)
Offices, entrance floor and floors below entrance floor	80	(*100*)
Churches, schools, reading rooms, art galleries and similar uses	70	(*112*)
Retail shops and garages for cars of not more than two tons dead weight ..	80	(*112*)
Assembly halls, gymnasia, light workshops, public spaces in hotels and hospitals, staircases and landings, theatres, cinemas, restaurants and grandstands	100	(*150*)
Dance halls, drill halls ..	120	(*150*)
Warehouses, book stores, stationery stores and similar uses, together with garages for motor vehicles exceeding two tons dead weight : actual load to be calculated, but not less than	200	(*224*)
	Lbs. per sq. ft. of covered area.	
Flat roofs and roofs inclined at an angle with the horizontal of not more than 20°	30	(*56*)

On roofs inclined at an angle of more than 20°, a minimum superimposed load (deemed to include the wind load) of 15 lbs. per sq. ft. of surface shall be assumed acting normal to the surface, inwards on the windward side and outwards on the leeward side, this requirement to apply only in the design of the roof structure.

All floors, except those for 40 lbs. per sq. ft., shall be capable of carrying in any position on an otherwise unloaded floor an alternative concentrated load as follows : Entrance floors and floors below the entrance floor of office buildings, 2 tons; all other floors, 1 ton; for garages for motor vehicles exceeding two tons dead weight, 1·5 × maximum wheel load; in each case considered as equally distributed over 2 ft. 6 ins. square.

In the case of subsidiary floor beams entirely embedded in concrete, and spaced not wider than 3 ft. centre to centre, the concentrated load may be regarded as borne equally between two beams.

Wind.—All buildings, other than those indicated below, shall be so designed as to resist safely a wind pressure in any horizontal

direction of not less than 15 lbs. per sq. ft. of the upper two-thirds of the vertical projection of the surface of such buildings, with an additional pressure of 10 lbs. per sq. ft. upon all projections above the general roof level. On the sea coast, and in similarly very exposed situations, a further provision not exceeding 10 lbs. per sq. ft. shall be made.

If the height of a building is less than twice its average width, wind pressure in general may be neglected, provided that the building is adequately stiffened by floors and walls.

The suggested requirement of resistance to a wind pressure of 15 lbs. per sq. ft. and an additional 10 lbs. on projections above the roof level, compares with 30 lbs. at present demanded. The suggestion that wind pressure need not be provided for in the case of a building of less height than twice its average width is in keeping with a similar relaxation in the New York regulations.

It is pointed out by Dr. Stanton that wind velocities corresponding to a pressure of 30 lbs. have rarely been recorded in the most exposed station in this country, while in London the maximum velocity corresponds to a pressure of about 19 lbs. per sq. ft. The pressure on a building of rectangular form would be appreciably less than this. On the other hand, existing regulations ignore the possibility of damage to buildings by the lifting of the lee side of the roof.

WORKING STRESSES

Working Stresses in Steel.—Here again the recommendations are in favour of the structural steel engineer. At present the L.C.C. requirements set limits of 7·5 tons per sq. in. for tension and compression, 5·5 tons for shear and 11·0 tons for bearing, as against 8 tons, 5·6 tons and 12 tons per sq. in. recommended—figures approximately the same as required in New York.

The permissible deflection in beams is increased to $\frac{1}{325}$ part of the span, compared with $\frac{1}{400}$ part required by the present Act.

The suggested permissible working stresses on pillars and other compression members, however, are not increased consistently in comparison with the existing requirements. For the ratio 20 of effective pillar length to least radius of gyration, the suggested working stress in tons per sq. in. gross section is 7·2 (as against 6), but at the ratio of 100 it is 3·8 as against 4, lower than the existing figure then being suggested for ratios up to 180, at which both are 1·5. The L.C.C. figures reduce to zero at 210 ratio, but the Committee permits 0·9 at 240.

It is further recommended that the calculated working stresses in grillage beams entirely embedded and void filled in solid concrete foundations of proportions at least 1 : 6 may exceed those specified above by 50 per cent.

Pressures on Subsoil.—The permissible figures put forward are the same as now required by the L.C.C. :

	Permissible load on ground. Tons per sq. ft.
Alluvial soil, made ground, very wet sand	Up to ½
Soft clay, wet or loose sand	1
Ordinary fairly dry clay, fine sand or loam	2
Firm dry clay	3
Compact sand or gravel, London Blue or similar hard compact clay	4
Hard solid chalk	6
Shale and soft rock	Up to 10
Very hard rock	Up to 40

Pressures on Concrete Foundations.—While the present maximum stipulated is 12 tons per sq. ft., the Committee recommends figures ranging from 5 to 40 tons, according to the composition of the concrete—a much more rational suggestion :

The bearing pressure, in tons per square foot, on foundations formed of cement concrete shall not exceed the following values :

1 : 1 : 2 concrete	40
1 : 1½ : 3 concrete	35
1 : 2 : 4 concrete	30
1 : 6 mass concrete	20
1 : 8 mass concrete	15
1 : 10	10
1 : 12	5

Pressures on Brickwork.—Permissible loads here also are extended, ranging from 4 to 20 tons, according to the character of the brickwork. The existing restriction is 5 tons for ordinary brick in cement mortar, 8 tons for hard brick, and 12 tons for blue brick :

The pressure in tons per square foot upon properly bonded and solidly bedded brickwork shall not exceed the following :

On engineering bricks (*a*) set in 3 : 1 cement mortar	20
On engineering bricks (*b*) set in 3 : 1 cement mortar	15
On building bricks (*c*) set in 4 : 1 cement mortar	10
On building bricks (*d*) set in 4 : 1 cement mortar	8
On building bricks set in 2 : 1 lime mortar	4

The above pressures may be exceeded by an amount up to 20 per cent. in all cases where such increased pressure is only of a local nature, as at the girder bearings.

For isolated brick piers without proper lateral supports, the above stresses are for a slenderness ratio :

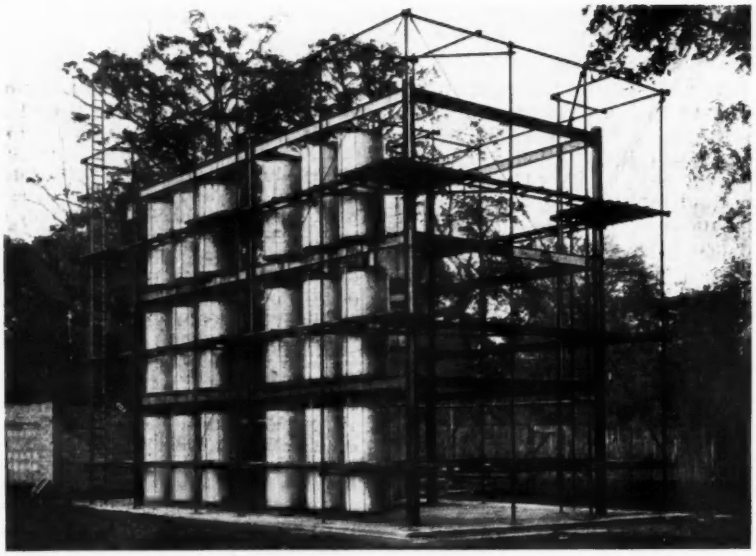
$$\frac{\text{height}}{\text{least dimension (D)}} \left(= \frac{L}{D}\right) \text{ not exceeding 6.}$$

The stresses are to be reduced as follows for high slenderness ratios :

Value of $\frac{L}{D}$	8	10	12
Stress reduced to : per cent. of above stresses.	80	60	40

The permissible pressures upon masonry may be classified as for brickwork, according to the crushing strength of the stone, provided that, for ashlar masonry constructed of large blocks of good quality dressed stone, the corresponding permissible pressures may be increased up to 50 per cent.

No isolated brick or masonry pier shall have a higher slenderness ratio than 12, or a width less than 13 ins.



The steel frame of a three-story building, equipped with water tanks for loading, erected at the Building Research Station, Garston, near Watford, in order to obtain data as to the degree of fixity existing in practical connections, and the distribution of stress obtained with considerable degrees of fixity.

NOS. 19—23 WELLS ST., W.

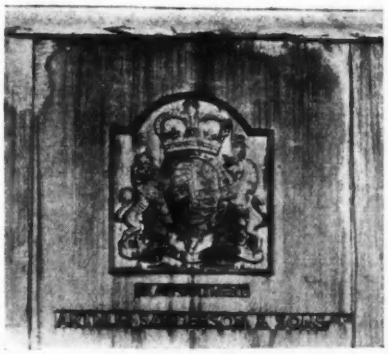
DESIGNED BY RICHARDSON AND GILL

THIS new building was originally designed for the use of Messrs. Arthur Sanderson and Sons, Ltd., the wallpaper and paint manufacturers of Berners Street, W., but the floors have now been sublet to various individual tenants.

The main façade has a frontage of about 105 ft. to Wells Street, a thoroughfare running from Oxford Street to Mortimer Street, and the rear elevation faces Wells Mews. This latter, a public right of way, is connected to Wells Street by a cartway, which had to be preserved in the rebuilding scheme.

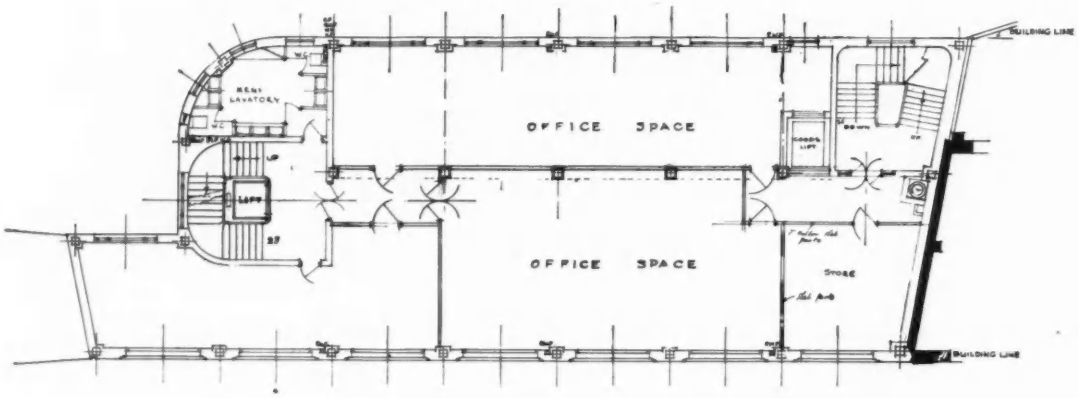
The building is of fireproof construction, and comprises basement and sub-basement, shops at ground level, with showrooms and offices over, and a large studio in the roof. The main entrance at the left of the principal façade leads through the vestibule to the staircase and lift which serve all floors. Marble plays a prominent part in the design of the vestibule and staircase. Special study has also been given to the finish of the lift, which is lined with leather and chromium-plated metal strips. There are also separate entrances to the shops on the main front, and to the building from Wells Mews at the rear, where also is the goods lift.

The treatment of the Wells Street front is simple, the materials being marble for the ground story and special 2-in. white bricks for the upper part. A feature of the design is the curved

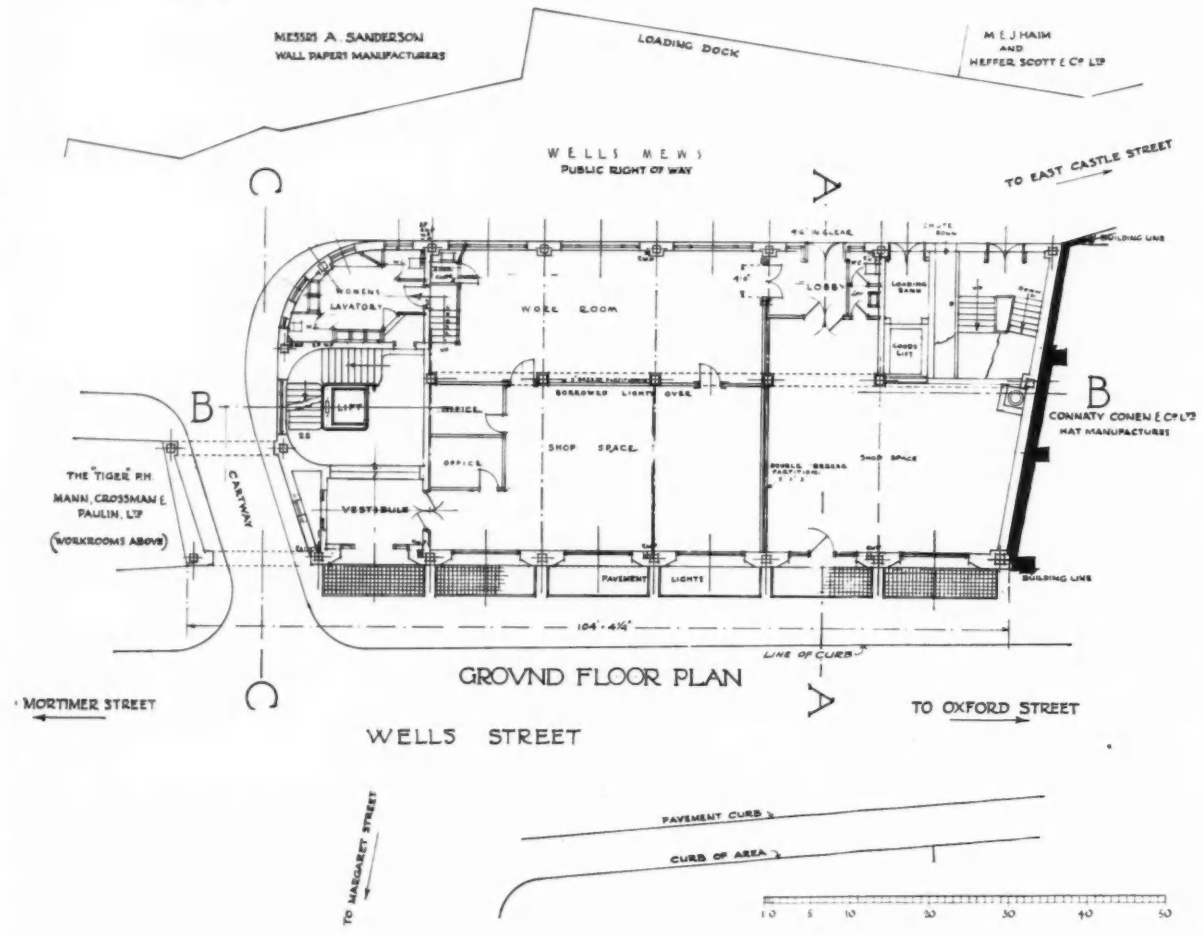


The coat of arms over the cartway entrance on the main façade. P. G. Bentham was the sculptor.

The main façade to Wells Street. The ground story is faced with marble, above which the elevation is of 2-in. white bricks. The roof is curved and covered with copper. The cartway on the left leads to Wells Mews, and had to be preserved.



FIRST FLOOR PLAN



Nos. 19–23 Wells Street, W.] [*By Richardson and Gill.*

Ground- and first-floor plans. There are a basement and sub-basement, shops at ground level, with showrooms and offices over, and a large studio in the roof. Light is obtained both from Wells Street and Wells Mews.

Nos. 19–23 Wells Street, W.] [*By Richardson and Gill.*

The lift and a staircase landing. The former is lined with leather and chromium-plated metal strips. Marble plays a prominent part in the design of the entrance vestibule and staircase.

roof, which is covered with copper. The back elevation is faced with glazed brickwork. The scheme involved the demolition of some Early Victorian buildings which stood on the site of the ancient wells in Wells Street.

LETTERS FROM READERS

Plaster for Concrete Ceiling

SIR,—I agree with the writer of the letter on the above subject in your last issue, that the use of a well-advertised liquid, as suggested by him, certainly makes hacking completely unnecessary, and there appears to me to be no reason why a single coat of plaster should not be sufficient for the purpose. I would go further than this, and would suggest that in many cases it would be merely necessary to brush on a thick slurry with a strong whitewash brush, and let that be the actual final finish. If a further coat was required completely to remove all further inequalities caused by the shuttering, a further painted coat of slurry could be put on, both these coats being cheaper than the ordinary plastering, and, as practice seems to make perfect, it might well be that an almost smooth surface could be obtained in this manner where it was essential.

As regards the whole matter of economical building, this will actually become essential in the near future, and I feel that architects should investigate every possible means of cheapening the cost of building construction whilst remembering that economy in capital outlay must always go hand in hand with economy in annual upkeep. It is quite true that an increase in capital expenditure may sometimes very considerably decrease annual upkeep: this should be carefully borne in mind, as the two must go together. The so-called "New Architecture," which has been appearing on the Continent, is not the outcome of æsthetic considerations but is purely the result of strict economy in capital and annual outlay. I was talking a short time ago to one of the leading Berlin architects on this matter, and he assured me that this was strictly correct, and that economy was at the root of the new designs which were appearing. They were endeavouring as far as possible to let voids and solids make the design rather than depend on the academic adornments which have made up so much of the so-called architecture of the pre-war period.

C. E. ELCOCK

Bernard Whistlow, F.R.I.B.A.

SIR,—Bernard Whistlow must not be entirely condemned, for although the practice of architecture is an art, and as such is totally different from a commercial undertaking, this is not appreciated by the "business man," who, without being offensive, places the architect in the same category of job-grabbers as his own commercial travellers.

This attitude is unfortunate, inasmuch as it makes normal practice impossible without constant diplomatic endeavour to attract new work. It has become a trite saying that, with the exception of the eminent few, it is infinitely harder to obtain new work than it is to execute it, and although one man may have spent his lifetime in the study of his profession, another, not so capable, but with the knack of ensuring a continuous flow of work to his office, is a success in the eyes of the world. This is exemplified in the number of offices where the architect is totally employed in angling for jobs, and his staff in carrying them out. This is not so bad as it sounds, however, as in some cases a principal may not be so capable as his chief assistant.

It would appear, therefore, that our admittedly competent Bernard is, after all, only earning an honest livelihood and keeping his charming wife and himself at a decent standard of living, and so, when we leave him, according to Mr. Creswell, at the summit of his career, looking back with repugnance on his former wiles, I wonder, would he choose rather to be poor? I think not. For, with all his faults, Whistlow is not a lunatic.

E. W. PALMER

The Bolsheviks as Builders

SIR,—Though Mr. Clough Williams-Ellis may disprove many of the current English views about Russia, he cannot deny that the Soviet is in debt. And no wonder! What country could embark on such a magnificent building programme without having to borrow money? Only when Russia is adequately industrialized and the best-equipped nation in the world (thanks to foreign loans) will the debt be paid.

England, cancelling or postponing its competitions and building schemes,

can only invent legends about a country whose enterprise she dare not rival. I would that England had a deficit due to the expense of development instead of one due to the number of unemployed. And, surely, the lull in development is one of the chief causes of unemployment.

SOLLY'S GEORGE

A Village Museum

SIR,—The gallant effort of Mr. Arthur Keen in forming a record of Oxted reminds me of the village museum started some years ago at Petersham. The collection of historic mementoes includes the only example known to me of a body-snatcher's basket, a beautiful thing of woven wickerwork, left behind by some surprised rascal in the churchyard. (The Westminster Theatre should have borrowed it for that fine play, "The Anatomist.")

There are also relics of Lord John Russell, who built the "British School" in which the museum is lodged. Drawings of old buildings in the parish, by local inhabitants, adorn the walls. Amongst the documents is an *Architectural Review*, containing photographs of many of the old mansions in the neighbourhood. The caretaker of the schools keeps the exhibits duly dusted, and relieves the visitor of a nominal fee.

P. M. STRATTON

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Housing Progress in England and Wales

IN reply to Mr. Thorne, Sir E. Hilton Young said that the following statement showed the number of houses completed in England and Wales each month from January to October, 1931, inclusive, under the Housing (Financial Provisions) Act, 1924, and the Housing Act, 1930.

Month.	Housing (Financial Provisions) Act, 1924.	Housing Act, 1930.	Total.
January ..	4,127	16	4,143
February ..	4,163	—	4,163
March ..	5,049	—	5,049
April ..	4,903	2	4,905
May ..	5,425	57	5,482
June ..	6,054	64	6,118
July	5,681	84	5,765
August ..	5,201	55	5,256
September ..	5,520	142	5,662
October ..	6,230	247	6,477

Houses Approved by Ministry of Health

Mr. David Davies asked the Minister of Health if he would state for each month of this year up to the latest available date the number of houses approved by the Ministry under the various Housing Acts.

Sir E. Hilton Young said that the following statement gave the desired particulars :

Month.	Number of State-assisted houses included in proposals approved for England and Wales during the month.
January, 1931	5,532
February ,, ...	4,240
March ,, ...	5,321
April ,, ...	10,273
May ,, ...	6,627
June ,, ...	8,543
July ,, ...	8,917
August ,, ...	7,816
September ,, ...	1,433
October ,, ...	3,797

Housing Proposals Deferred

Mr. G. Hall asked the Minister whether any local authorities had been asked by the Ministry of Health to defer housing proposals; and whether he proposed to take any action under the default powers conferred by the Housing Act, 1930, against the local authorities who were neglecting their responsibility to provide additional housing accommodation in their district.

Sir E. Hilton Young said that the reply to the first part of the question was in the negative. As regarded the second part, he was not at present aware of any instance in which he ought to consider default action.

Housing : Retrenchment by Local Authorities

Mr. Hicks asked the Minister of Health whether it was proposed to take any action against those local authorities which had decided to reduce the schemes for house-building below the number specified in their five-year programme.

Sir E. Hilton Young said he did not know of any case in which such interference with the discretion of a local authority was necessary.

Mr. Harris inquired of the Minister whether his department had held up any housing schemes submitted by local authorities since October 1 on the grounds of economy.

Sir E. Hilton Young said that there had been no instance of refusal to approve housing proposals on the ground of economy, but in present circumstances he had found it necessary to discuss with local authorities in certain cases some modification of their proposals with a view to securing the provision of a type of house which could be let at a lower rent than had been usual in the past. He had no information showing that local authorities had made any substantial curtailment of their programmes.

Slum Clearance

Mr. Salt asked the Minister if he could state the number of houses in England and Wales which were estimated to be dealt with under slum clearance schemes as part of the Housing Act, 1930, during the five-year period commencing January 1, 1931; and how many houses had been demolished under this scheme up to October 31 last or the latest available date.

Sir E. Hilton Young said that the estimate made by the larger urban authorities provided for the demolition of 57,000 such houses. The number actually demolished up to September 30 last was 201.

Houses by Instalments.

Mr. Palmer asked the Minister of Health whether, owing to the difficulty many purchasers of houses were faced with in having to meet their instalments, he would introduce legislation granting either a moratorium or a reduction of the amount of instalments to be paid, with necessary extension of periods of payment.

Sir E. Hilton Young said he had no reason to believe that the difficulty was at all widespread, and he was sure that such action as he suggested was neither necessary nor practicable.

Improvement and Reconstruction Schemes

Lieutenant-Colonel Fremantle asked the Minister of Health if he would state the number of houses demolished in connection with improvement and reconstruction schemes during the years ended September 30, 1930 and 1931, and the number of persons housed or re-housed under such schemes during those years.

Sir E. Hilton Young replied that during the years ended September 30, 1930, and September 30, 1931, respectively, the numbers of houses demolished under the Housing Act, 1930, and under improvement and reconstruction schemes confirmed under previous legislation were 1,930 and 2,290, but the number of persons actually rehoused during these years could not be stated.

Montagu House Site

Sir Vivian Henderson asked the First Commissioner of Works whether, in view of the need for economy, he proposed to proceed with the scheme to erect a large block of Government buildings on the Montagu House site and land adjoining it.

Mr. Ormsby-Gore said that though this scheme would eventually result in considerable economy in the annual cost of housing official staffs in the central London area, in view of the urgent necessity for restricting capital expenditure as far as possible, it was not proposed to proceed with the scheme at present.

PUBLIC HOUSE

At Southfields, S.W.

DESIGNED BY
FRANCIS J. HUMPHRY

"THE GARDENERS' ARMS," belonging to Messrs. Young & Co.'s Brewery, Ltd., is situated at the corner of Merton Road and Longfield Street, Southfields, S.W., and consisted originally of a pair of cottages which had been altered and adapted to the use of a beer house many years ago. Lately it was decided to pull down the old premises and erect a modern and up-to-date house on the site.

The reconstructed ground floor consists of public bar, saloon bar, dart room and lunch room, arranged round a central service bar, the main entrances to the bars being from Merton Road. The saloon bar is separated by a folding partition from the lunch room, so that they can be thrown into one if so desired, and a similar arrangement applies to the public bar and dart room. A service lift is arranged in the counter by the lunch room, and connects the service bar with the beer cellar in the basement, and the kitchen on the first floor. Lavatories are provided on the ground floor for men, and on the first floor for ladies, both easily accessible from any of the bars.

An entrance from Longfield Street gives access to the dart room and lunch room, and also to the staircase which leads to a large club room on the first floor, occupying the whole frontage to Merton Road. Behind the club room are arranged a private sitting-room, kitchen, larder, store, and ladies' lavatory. On the second floor are four bedrooms, &c.

The Merton Road front. Up to first floor level, the walls are finished in brown and green glazed tiles, above, in fine shingle rough cast, while the roof is of multicoloured, hand-made, sand-faced tiles. The name panels are glazed, and bear lettering in teak, gilt. The materials were selected to minimize the cost of upkeep and re-decoration. The floors are of special fireproof construction.

Plans of the ground, first and second floors. The planning of the building at road level is particularly interesting: around the central service bar are spaces normally divided up into lunch room and saloon bar on one side, and dart room and public bar on the other. But the partitions are folding, so that commodious floor-spaces are available for special occasions.

The elevations have been treated simply and symmetrically, and the tile and roughcast treatment was chosen in order to lessen the cost of external upkeep. Economy of labour has also been the governing factor in the internal finishings; wood-block floors in the public rooms, with non-slip tile surround to the counter, tiled floors and dadoes in the lavatories, bathroom, kitchen and larder, grained and varnished woodwork inside and out, and coved cornices to all rooms, all contribute to this end. Mr. Francis J. Humphry, F.R.I.B.A. (Young & Hall), was the architect.

THE THEORETICAL PLANNING OF GARDENS

BY
G. A.
JELLICOE

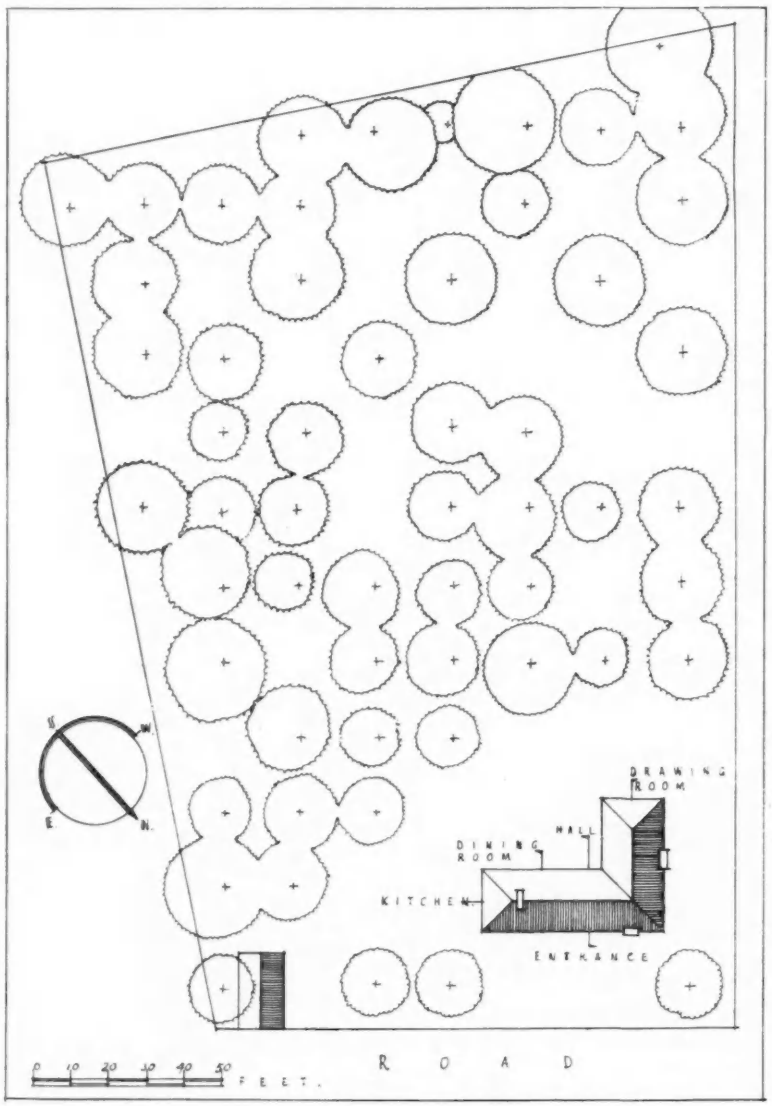
ii: The Orchard

WITHIN a few miles of London a number of orchards have in recent years been sold for building. Our client, who is a business woman, and the social editress of a London newspaper, has decided she must have a possibly small house where she can "get back to Nature." She is enchanted with a site among the apple-trees. Here is to be the realization of those dreams so brightly described in print. She builds a neat little house and garage, and calls for a cottage garden with some lovely flowers, a bower, paved paths, and a small secluded garden for the maid.

PSYCHOLOGICAL POINTERS

OUR client's car, her well-chosen furniture, the drink before dinner, the polished silver and glass, make us deduce certain things which are of the greatest importance in the initial stages of the plan. Our client is by nature a sophisticated woman of town associations, and though her wish to live in the country is a genuine and even a necessary one, she would soon tire of the whim of a cottage garden. She is not and never will be, like the countrywoman, the close associate of the old trees in their natural beauty.

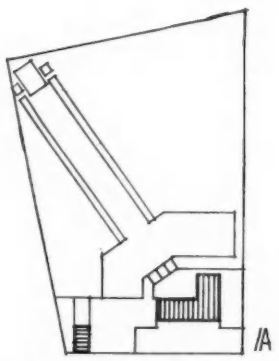
The problem, therefore, is to provide a garden in keeping with the house, to present the trees as a spectacle apart, and yet so to blend the two that the difference is not consciously apparent.



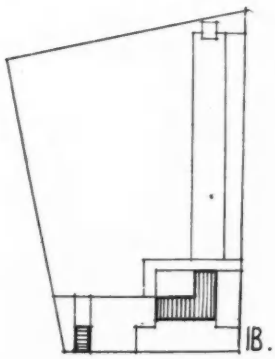
The material bestowed by Nature.

THE MAXIMUM VISTA; BUT—— !

The first block plan "A," which is so bad that we hesitate to show it, drives



a maximum vista through the orchard from the house. In this vista lies a garden, with lawns and formal planting and with, on either side, the orchard



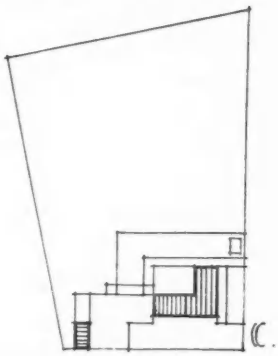
The attractive view is arranged to be seen at its best from the windows, but the plan can be discarded at once owing to its division of the orchard (which is the theme of the garden)

into two parts, and its essentially ugly relationship to the house and site.

STILL TOO PRETENTIOUS

This leads to block plan "B," which, on paper, is quite good. The garden builds round the site boundaries, which are themselves formal, and the orchard lies within. Clearly, however, it is still too pretentious.

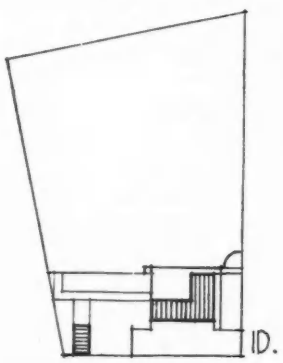
Block plan "C" has much more the required relationship between house,



garden and orchard. The part by the house is definitely a view garden; that is to say, it is a garden which is looking out in a certain direction for a certain reason. While, however, this plan is closely associated with the house, it is adrift from the site boundaries.

AN UNOBSTRUCTED VIEW

Block plan "D" gives an unobstructed view from the windows, isolates the herbaceous border, to be seen as a unit by itself, and places the summer-house where it will be easily accessible



from the house. To soften the too obvious abruptness between garden and orchard, a number of trees are left in the former, despite the detriment to flowers and hedges. From the orchard itself the house, the clipped hedge, and the garden should appear a single composition.

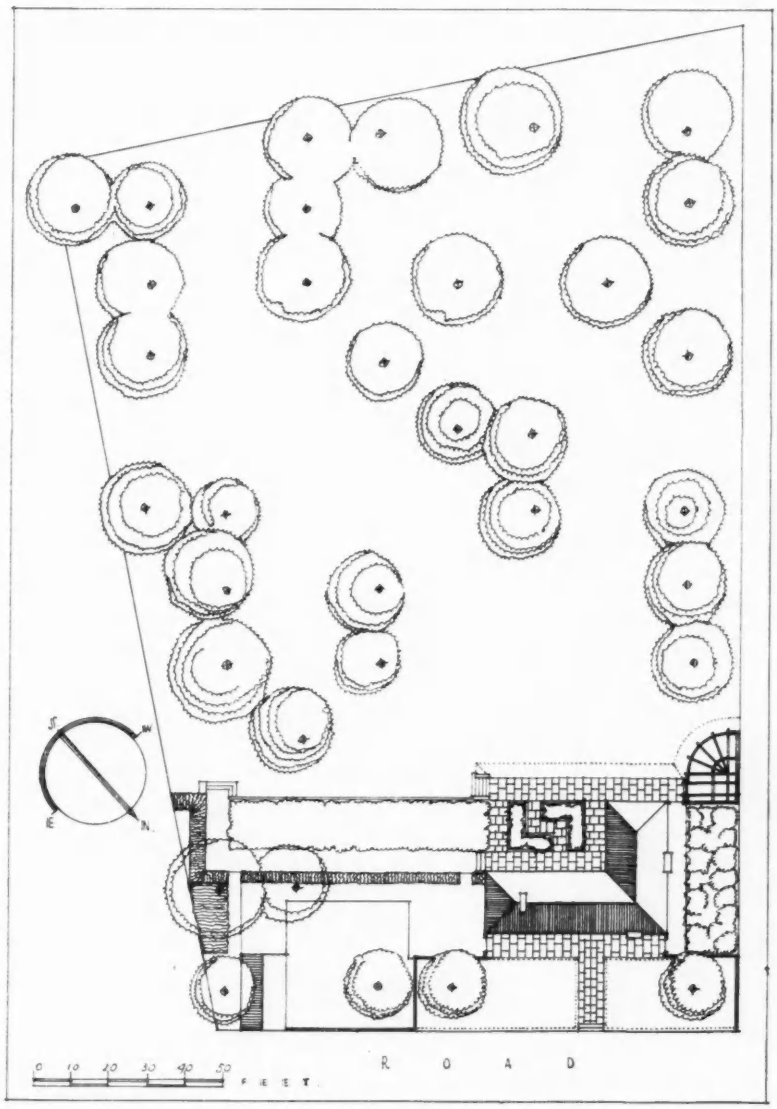
The essential difference lying between the character of the owner and that of the site has unwittingly stirred up some of the most vexed ideas in the history of garden design. The English school of landscape gardening that spread over Europe at the end of the eighteenth century, destroying or altering the old classic garden, was a just reaction against what had become a too rigid formula. Our orchard has been designed with the successes and failures of that movement in mind.

NATURE'S OWN CONVENTION

The poorer trees are cut out and the remainder left so grouped as to form a composed picture from the house. There are no summer houses nor gravel paths among the trees, for any association with conventional existence would destroy the illusion. There is no suggestion that this spectacle of Nature is realistic to the extent of seeing the trees growing in their natural setting, but, rather, that the character and shapes of Nature have set their own convention. Thus, the grass, which in its natural state under the trees would be extremely poor (if it existed at all), would be kept cultivated under a scythe, or (if upkeep would allow) considered as a lawn, properly rolled and mown.

FINAL RESULT: A COMPROMISE

The contrast between the two characters has been stressed for purposes of illustration. The result is a compromise, one that reflects the whole existence of the woman for whom it is designed. The struggle is that between the actor and the painter. The actor moves about his garden and is part of it; the whole logic of its terraces, paths and flowers is for his benefit. The painter arranges his material not as a fact to touch, but as a romance to be seen behind glass, like a picture.



The finished picture composed by art.

From The Orders of Architecture, *by Arthur Stratton, F.R.I.B.A.*]

LITERATURE

THE ORDERS OF ARCHITECTURE

PROBABLY no architectural subject has been made so frequently the theme for illustrated treatises as the Greek and Roman Orders.

Heavy tomes, embellished with copper-plate engravings setting forth the relation of their parts with varying degrees of unanimity and exactness, have been showered upon us for generations — even centuries. And small wonder: for these same orders were destined to become in due course the accepted models for the architectural systems of the whole of Europe and America.

It is because of our imposed familiarity with classic forms and ornament that none of us troubles to consider the incongruity of making our banks and our town halls exact counterparts, externally at all events, of the public buildings of the ancient Greeks and Romans.

Only the curious and the thoughtful reflect upon the dramatic fact that in turn every country in Europe abandoned its own national and indigenous style of architecture, and adopted in its stead the temple architecture of these pre-Christian civilizations.

Such sustained domination is without parallel in the history of architecture, and while we may speculate with regret upon the loss to art which the total extinction of so many national styles unquestionably brought about, we must pay full tribute to the extraordinary adaptability and stupendous vitality of the foreign systems of architectural composition that usurped them.

This mighty achievement has, in effect, produced a universal art which is practised today—with slight but characteristic modifications—by all the nations of Europe.

The foregoing observations have been prompted by the recent publication of *The Orders of Architecture* by Mr. Arthur Stratton. This is a most ambitious work and contains a great number of plates and text illustrations.

It is necessary, however, to say a few words upon what the reviewer regards as the scant justice which has been meted out to Mr. Trystan Edwards, who, although credited on the title-page with having merely contributed the introduction, is nevertheless virtually the author of the book, at any rate so far as the letterpress is concerned.

Now an introduction is invariably signed and usually precedes the author's text of the work itself, and one naturally expected to find Mr. Trystan Edwards's name at the end of such a preliminary statement. But the writer sought it in vain, as will others.

It was during the search that a small-type inset—gummed to the preface—was observed. This had the appearance of an "errata" slip, but was found to consist of a definition of the term "Introduction," as laid down by the publishers. Here it is admitted—in very obscure and reticent language—that Mr. Trystan Edwards is responsible for every one of the five chapters contained in the book. The unavoidable inference is that the attribution in question was an eleventh-hour addition to the work on the eve of its publication.

Inasmuch as a further scrutiny of this belated announcement reveals the fact that Mr. Stratton's contribution to the book comprises brief notes on the module, inter-columniation and other subsidiary matters, and the annotated lists of his own plates, one feels that Mr. Trystan Edwards should at the very least have been designated as joint author.

As regards the volume itself, Mr. Trystan Edwards's most scholarly disquisition upon various aspects of the Greek, Roman, and Italian Orders will be found of the highest value to all sincere students of architecture. In addition there are over eighty well-drawn plates, for the most part especially prepared for this work under Mr. Stratton's supervision, as well as a glossary and an index.

FREDERICK CHATTERTON

The Orders of Architecture. By Arthur Stratton. With an introduction by A. Trystan Edwards. London: B. T. Batsford, Ltd. Price 21s. net.

JAPANESE ARCHITECTURE

UNTIL Whistler demonstrated to Western eyes the beauty of Japanese prints, the pictorial arts of Japan had been strangely neglected. Even less was known of her architecture, Fergusson's *History of Indian and Eastern Architecture*, published in 1876, remaining the standard textbook up to nearly the end of the nineteenth century.

In 1898 Mr. Cram was invited to go to Japan to design a new Parliament House, and although the project never materialized, the charming perspective drawing in this book makes one regret the circumstances that caused the abandonment of the scheme. Most of these essays were published originally in 1905. Much has happened in the East since then, and if the revisions of the present edition had been more drastic, the book would have been of greater value, for a good history of Japanese architecture is badly needed. Unfortunately, a Ruskin-ridden outlook on modern artistic tendencies, coupled with a rhetorical style which leads the author to make such wild statements as "Sir Christopher Wren was an engineer of defective ability, with a flair for architecture of the theoretical sort," irritates rather than amuses, for Mr. Cram, when not straining after effect, can write very well indeed. At times the author contradicts himself. On page 94 he states that the beautiful Torii monuments were creations of Buddhism, but on page 111 he blames the Shinto priests for putting up a clumsy Torii at Horenji, which in Buddhist times had been without one. Again, one is left in doubt of his opinion on the Tokugawa temples, for in one place he calls them "trivialities," and in another "great architecture."

Except for such blemishes the chapters on the history of Japanese architecture give a clear historical account of the mingling streams of Korean and Chinese influences, which produced the most perfect style of timber architecture in the world.

The speed with which the Japanese assimilate new ideas was already characteristic in the seventh century. In 607 the Korean artists built the monastery of Horiuji, and in 680 the pagoda of Yakushiji marks the birth of a purely national style, free from the heavy severity of the Chinese prototype, and already full of the grace which was to characterize the art through the Fujiwara and Kamakura epochs, right up to the seventeenth century.

The disciples of Professor Strzygowski will challenge the author's assumption that the Japanese forms are classic, modified in their eastward passage from Athens through Persia and India. If one compares the crossed rafter ends of such a building as the Shinto temple on plate xvii with the gable ends of the Norwegian churches of Borgund and Gol, the theory of the author of *Orient oder Rom*, that there was a northern stream of communications, seems the more probable.

Mr. Cram believes that the best Japanese art is "unspotted by modernism," but some of the illustrations show strikingly modern forms. Many of the domestic interiors might be the work of some of our most advanced European modernists. These designs combine richness of gold and lacquer and precious woods with an austere refinement. The chapter on domestic interiors is, perhaps, the most valuable in the book, and illustrates the fact that once again the jaded West has turned for fresh inspiration to the ever-fecund East.

Impressions of Japanese Architecture and the Allied Arts. By Ralph Adams Cram. London: George G. Harrap & Co., Ltd. Price 12s. 6d. net.

THE SPECIFICATION WRITER

Cement Concrete Specifications

The following notes are condensed from the report prepared by the consultative board of the Manchester architects and builders on the specification of cement concrete. The full report[1] includes actual specifications suggested for use in bills of quantities.

THE use of concrete for building and constructional work is rapidly increasing, and owing to scientific research it is possible to specify concrete precisely and to replace some of the existing methods which are based on rule-of-thumb.

Concrete is used for two distinct and separate purposes, viz. :

1 : Mass concrete (with a safe compressive strength of 12–15 tons per sq. ft.) for large foundations, engine foundations, etc.

2 : Reinforced concrete (with a safe compressive strength of 35–50 tons per sq. ft.) for specially designed foundations, floors, monolithic frame construction, etc.

There are six principal factors in its production—cement, small aggregate, large aggregate, water, workmanship and curing. Owing to modern methods of manufacture, cement presents no difficulty, but the question of proper aggregates, correct proportions of water, workmanship and curing is of the utmost importance. The water: cement ratio, which is almost universally ignored in this country, can be controlled quite simply for practical purposes on the site by proper measurement of water and the use of the slump test.

CEMENT

There are three classes of cement : ordinary Portland, rapid - hardening Portland, and aluminous, the last of which is not dealt with here.

The characteristics of Portland and rapid-hardening Portland are similar, the chief difference being that rapid-hardening is made with such refinement in manufacture as to produce a much superior quality.

For the specification of cement, it is quite sufficient to stipulate that " cement must conform in every respect with the British Engineering Standard Association's Specification for the time being in force," stating whether normal Portland or rapid-hardening is required.

Cement Tests. The testing of cement is a matter for experts, but there is still room for some common-sense testing. A frequent difficulty is failure to harden in a reasonable time, and the responsibility for this can be determined by a few simple tests within the capabilities of any builder's foreman. To test the setting properties of the cement, about a pound should be mixed with just sufficient water to produce a stiff paste, and by means of a trowel moulded on a piece of iron, slate or glass into a cake or pat about 3 ins. square and 1 in. thick. This pat should be examined from time to time and its progress of setting observed. In eighteen or twenty-four hours the pat should have hardened sufficiently to resist any impression by a thumb-nail; in forty-eight hours it should not be easy to break the pat in the fingers. This rough-and-ready test will only be of value if the cement be mixed with the minimum proportion of water, and if the pat be preserved under cover in a moderately warm shed. If the temperature falls below 50 degs. F. the hardening will be retarded.

If it is proved in this way that the setting of the cement is satisfactory, the next step is to test the effect of the sand and other aggregate in the concrete. It is better to test each individual material separately. One pound of the cement should be mixed with about 2 lb. of the sand to be tested, and then water added to produce a stiff paste, which should be moulded into a cube-shaped block on a non-porous plate, and the sides smoothed with a trowel. This block should be kept under the conditions described for neat cement testing, and should harden at somewhat the same rate. A third test can be made with cement, sand and some of the coarse aggregate. When the cement, aggregate, and water have been proved satisfactory by tests and the concrete work in practice does not harden well, the conclusion must be drawn that the latter experience is the result of severe weather or defective mixing. The effect of the atmospheric conditions can be observed by making duplicate sets of pats and blocks, keeping one set under cover in a warm room and the other set in the open and subjected to the same conditions as the concrete in the work.

The neat cement pat can be used as a test for soundness or freedom from expansion by boiling in water for a few hours after it has hardened in the air. The boiled pat should not soften or crack. The " bottle test " and others similar are fallacious and out of date, as no regard is paid to varying rates of expansion for glass and cement. If tests are required a provisional sum should be included in the quantities to cover the cost.

AGGREGATES

Fine aggregate should consist of sand, stone screenings, or other inert materials with similar characteristics, or a combination thereof, passing a $\frac{3}{16}$-in. sieve, having clean, hard, strong, durable, uncoated grains, free from injurious amounts of dust, lumps, soft or flaky particles. A sharp sand is not necessary as it requires more water to give workability and may therefore produce a weaker concrete.

Coarse aggregate should consist of crushed stone, gravel, or other inert materials with similar characteristics or a combination thereof, having clean, hard, durable, strong, uncoated pieces free from injurious amounts of soft, friable, thin, elongated or laminated pieces, alkali, organic or other deleterious matter. Brick aggregate is suitable for use in mass concrete, etc., but not for reinforced concrete unless it is obtained from the brick kiln. To obtain first-class concrete, clean aggregates are essential; dirty aggregates are those containing loam, clay, old mortar and plaster, organic matter and refuse. If the aggregates are not clean, the cement adheres to the coating of lime or clay and prevents adhesion to the aggregate. A sharp aggregate needs more water to reach a given workability than a round one and may produce a weaker concrete.

Artificial aggregates, such as broken brick, clinker, etc., should be free from coal or partly-consumed coal and be chemically inert, otherwise there is a risk of the concrete expanding after it has set. Coke breeze is largely used as a concrete aggregate, with satisfactory results where no great strength is demanded, but here again it is essential that the breeze should contain no coal. Breeze or clinker should not under any circumstances be used in reinforced concrete work, chiefly because of the possibility of moisture percolating through and rusting the steel and also on account of deleterious chemical action.

WATER

Water must be free from earthy vegetable or organic matter, acids and alkaline substances in solution or suspension. Wherever possible, water should be obtained from towns' drinking supply to avoid risks of pollution. The water : cement ratio determines the ultimate strength of the concrete more than any other factor. There is a natural tendency to use a sloppy mixture because it is easier to mix and place in position, but it is established that after the essential condition of workability is secured, the concrete is weakened in proportion to the excess water added. It is possible to use too little water, which would produce porous concrete. In practice, however, there is little tendency in this direction. At present it appears that the most practicable method for arriving at a correct water measurement is by means of the " slump test."

[1] Obtainable from J. Denver, 2 Conyngham Rd., Victoria Pk., Manchester : 1s.

Slump Test.—This is effected by the use of a sheet-metal truncated cone-shaped mould, 12 ins. high, 8 ins. diameter at the base, 4 ins. diameter at the top, and a $\frac{5}{8}$-in. bullet-nosed metal rod 2 ft. long.

The usual method is as follows :

1 : Place metal mould on concrete or other smooth non-absorbent surface (mould to be held firmly down).

2 : Fill mould with concrete to a depth of 4 ins.

3 : Puddle the concrete with bullet-nosed rod. Exactly twenty-five strokes to be given.

4 : Fill mould another 4 ins. deep and puddle this 4 ins., as before (twenty-five strokes).

5 : Fill mould to top, strike off level, puddle top 4 ins., as before (twenty-five strokes).

6 : Hold mould in position for three minutes.

7 : Carefully remove mould *vertically* and place it on a clean surface as near concrete contents as possible.

8 : Measure difference in height between mould and concrete heap.

9 : This difference is the slump.

After the amount of slump has been fixed on the site for various portions of the work, the foreman should see that the amount of water is constant for each portion of the work.

A slump test should be taken wherever concreting is started for the day, and if the slump is not within the prescribed limits, more or less water must be used until the correct slump is obtained. The measurement of the water is easily arrived at with the use of modern concrete mixers.

The following slumps are recommended for different types of concrete :

Mass concrete	2–3 ins.
Reinforced concrete :	
Heavy sections	3–4 „
Thin vertical sections and columns	5–6 „
Thin confined horizontal sections	7–9 „

WORKMANSHIP

Except for small jobs, hand-mixing is not desirable. In general, the only satisfactory method is by means of a concrete-mixing machine, operated for a period sufficient to mix the concrete after placing all the materials and the water in the drum. For reinforced work, concrete requires to be well worked or rodded when deposited, to prevent air-pockets and cavities, and to ensure adhesion of the concrete to the reinforcement. Concrete should be in its final position before setting commences so as to prevent delay in the hardening and consequent injury. Concrete should not be mixed in larger quantities than can be used before setting takes place, especially in hot weather.

Construction Joints.—Trouble with concrete as regards permeability usually occurs at construction or day-to-day joints. In placing, segregation, forming stone pockets at the bottom of the layer, should not be permitted; any laitance rising to the top must be removed, and the surface cleaned and preferably grouted before proceeding with the next layer.

CURING

The best results are obtained when the concrete hardens in a warm damp atmosphere. At a temperature below 40° F. the rate of hardening is slow. If the concrete is exposed to a hot dry atmosphere when hardening, there is a danger of the water evaporating, thereby causing rapid contraction, and tending to produce contraction cracks. A wrong view is sometimes held that concrete hardens by drying out, whereas it actually improves if kept moist during the first two or three weeks. It is as important to protect concrete from heat and drying winds as it is to protect it from the action of frost, and this can only be done by constant wetting. This is of the utmost importance.

SOCIETIES AND INSTITUTIONS

R.I.B.A. COUNCIL MEETING

FOLLOWING are some notes from a recent meeting of the R.I.B.A. Council :

The Work of the Session : The memoranda prepared by the President on the future policy of the Institute and the work of the session were considered and discussed.

The Title of the Journal : On the recommendation of the Literature Standing Committee it was decided to discontinue the use of the obsolete title " The Architectural Journal " as the heading to the advertisement pages of the *R.I.B.A. Journal.*

The Fellowship : The Council, by a unanimous vote, elected the following architects to the Fellowship, under the powers defined in the Supplemental Charter of 1925 : Messrs. Eric Trewern (Queensland) and W. J. Walker Todd (Edinburgh).

Election of Students : The following Probationers were elected as Students of the R.I.B.A. :

Birmingham School of Architecture

Baker, H. G.	Dickinson, C. (Miss)
Grice, K. J.	Robson, W. C.
Hickton, E. H.	Rowledge, D. H.
Ledoyen, A.	Smeeton, R. H.
Redgrave, C. F.	While, G. H.

Liverpool Architectural Association

Abraham, J. G.	Holden, G. T.
Baxter, J. R.	Miles, E. G. R.
Brown, J. H.	

Leicester College of Arts and Crafts

Bent, E. L.	Prince, W. H.

Special Exemption

Cook, W. K.	Maung, M.
Gasson, A. S.	Taylor, A. R.

Also : Hansfor, E. E. [Miss] (*University of Manchester*) ; James, M. J. [Miss] (*Edinburgh College of Art*) ; Maunder, F. A. C. (*Armstrong College, Newcastle*) ; Saurin, C. P. (*University of London*) ; Taylor, A. R. (*R. W. A., Bristol*) ; Wadke, B. P. (*Bombay School of Architecture*).

Mr. Frank M. Elgood, C.B.E., F.R.I.B.A., who presided at the opening session of the National Housing and Town Planning Conference reported on this page.

NATIONAL HOUSING AND TOWN PLANNING CONFERENCE

A three days' conference of the National Housing and Town Planning Council was held at Blackpool, from November 27 to 30.

Mr. Frank M. Elgood, C.B.E., F.R.I.B.A., who presided at the opening session on November 27, devoted to the consideration of " Town and Country Planning Policy," said it was becoming increasingly recognized that town planning was a business proposition, and that it would pay to direct development on the right lines. It was also recognized that haphazard development involved waste, confusion, and delay, and ought no longer to be tolerated. Such ill-regulated and ill-considered use of land in towns led to residential buildings being placed on sites required in the near future for industries, and on the other hand to the indiscriminate placing of industrial buildings on other sites to the detriment of residential and social amenities, thus creating physical, moral, and financial ills for the whole community.

The rapidly increasing encouragement of all kinds of building in rural areas was a menace to a priceless possession of the nation, and to our country scenery, unequalled in its charm and beauty. Were we to go on disregarding

this spoliation or were we to try and arrest it? It could only be arrested by town planning, and an enormous responsibility rested, therefore, on our local authorities to exercise the powers they already possessed and to press for an extension of them. It was a delusion to think that town planning involved a vast expenditure. What should be borne in mind was what the ratepayers were going to lose in the absence of such schemes.

Dr. Raymond Unwin, P.R.I.B.A., said over 300,000 new workers had gone into London in five years, and between the 1921 and 1931 censuses over 1,000,000 new persons had had to be accommodated in the outer parts of London. Outside the L.C.C. area there had been no planning, no co-ordination for these persons, and authorities had been required to spend vast sums for drainage and water supply, and it would be just as sensible to have the shop doors opening on to the main line of a railway. He asked the conference to give the council their full support in pressing for the new Town and Country Planning Bill.

On Saturday, November 28, the housing situation in England and Wales was raised during the morning session in a memorandum by Mr. J. G. Martin, who said during the past year further progress had been made with working-class dwellings, and the grand total of houses of all classes completed between January 1, 1919, and September 30, 1931, exceeded 1,693,000. Notwithstanding this, it was indisputable that there was still a serious shortage of modern dwellings at rents within the means of the lower-paid wage-earners. Only the fringe of the slum problem had been touched.

Since the abolition of the subsidy under the 1923 Act the rate of building by unassisted private enterprise had considerably increased. The chief need was for the steady construction of houses of the three-bedroomed non-parlour type. Overcrowding was generally greater in the smaller than in the larger houses.

Mr. H. H. Humphries, in a paper dealing with housing standards and costs, said whatever method of re-housing was adopted in central areas it was evident that, if the replanning of such areas was to be undertaken on proper lines, it would be impossible to provide accommodation for anything like the number of people who might be dehoused. Some method of housing people other than in the central areas, or even placing them on suburban housing estates must be found. The only apparent alternative to the provision of either flats or suburban estates was by establishing complete suburban towns, such as were often described as "satellite towns."

LIVERPOOL UNIVERSITY

Mr. F. X. Velarde, A.R.I.B.A., speaking at the Liverpool University on "Present - Day Architecture," on November 25, said we seemed to have arrived at a period of architecture different æsthetically and constructionally from all other styles, though minor aspects remained traditional because their fitness had never been surpassed. The use of steel and reinforced concrete was a fundamental change in building construction: the use of brick and wood was not. Architecture had always relied upon a definite form of construction, æsthetically controlled. The more revolutionary the type of construction (as, for example, the Gothic) the greater the difference in external expression. It should follow that the new type of construction would produce a new architecture.

Roughly, modern architecture could be divided into two groups, functional and expressionistic. The functionalists declared that complete architectural beauty was achieved if the designer, having evolved a completely good plan, expressed this through the construction without æsthetic control. The expressionists declared that æsthetic control was essential. Practically all artist - architects favoured the expressionists' theory. History revealed that the number of creative architects was about 5 per cent. of the number engaged in architecture.

The greatest enemies to modern architecture were those untrained, uneducated designers who, realizing the advertisement quality of novelty or strangeness, sought to cull commercial success for themselves and their clients by giving their buildings a profusion of ill-fitting motives taken from every modern building the Continent of Europe had produced.

R.S.A. INDUSTRIAL DESIGNS COMPETITION

That improvement in design was absolutely necessary for the successful marketing of all our goods was stressed by Mr. P. H. Jowett, Principal of the L.C.C. School of Arts and Crafts, when he reviewed the designs submitted in the R.S.A. Competition of Industrial Designs, at the Royal Society of Arts on November 18.

It was regrettable, he said, that only by foreign competition had it been possible to convince many people of the necessity for fine design, which proved how completely we had lost sight of our early traditions. The late Sir Lawrence Weaver once said: "Design in manufacture is one of the things that concerns everybody, but very few realize that it concerns them." This, he thought, was very true, and our present problem was: How were we to make it the concern of all? We could, to some extent, stimulate interest by discussion and criticism, but a stupendous amount of hard work was necessary before we could hope for any definite results.

The schools must do their utmost towards the efficient training of designers, by co-operation with industry on as wide a basis as possible, and the manufacturers must be prepared to make full use of the material produced by that training. He was convinced that we had in this country as much ability, originality and invention in creative design amongst our students, as anywhere in the world, if only we could discover the means of using those qualities. It was pathetic to see the flood of foreign designs and articles, many of them very excellent, used in this country, when we could produce them ourselves if we had the will to do so.

This naturally introduced the question of what was usually called "Modern Art," an unfortunate term, but generally accepted as one that described the movement that had taken place since the beginning of the century. The great wave which had swept over Europe began with painting and architecture, and had influenced all forms of design for decorative and industrial art. The experiments in cubism made so many years ago were the forerunners of much that was designed today, especially in textiles and in interior decoration generally. This was perhaps more evident in France and Germany than it was with us, but most of our younger designers were very familiar with those forms and used them as their natural means of expression. Very often he found that students were told that their work was "too modern," or that "our public would not buy that kind of thing," and yet one knew that there was a definite demand for contemporary ideas in designs. He did not for a moment suggest that all those ideas were good, but he felt very strongly that if we were to make any great advance as an industrial nation we should have to be much more ready to accept, in fact to search for, new ideas in design, and to be prepared to lead and not to follow.

Following is the result of the awards in the architectural section:

Owen Jones bronze medal: George Robb (Manchester Municipal School of Art).

Prize offered by the R.S.A. under the Mulready Trust for a set of three drawings of architectural subjects in any town or district: A prize of £5 each to the following: George McKinlay, William D. Suddaby (Royal College of Art). A prize of £2 10s. each to the following: Harold F. Hoar (Bartlett School of Architecture), and John A. Pinckheard (Northern Polytechnic School of Architecture). Highly commended: George Robb (Manchester Municipal School of Art). Commended: Henry R. Lanchester (L.C.C. Central School of Arts and Crafts), Ernest J. Weir (Edinburgh College of Art).

Prize of £10 offered by the R.S.A. under the John Stock Trust for a design for a bronze wall tablet to

commemorate the loss of the Dirigible R.101 : George Robb (Manchester Municipal School of Art). Commended : Walter F. Martin.

Prizes or travelling scholarship offered by Messrs. Bagues, Ltd., for a design for a decorative ceiling light or laylight in wrought iron and glass for the roof of a palm court adjoining a fashionable restaurant : The judges were unable to recommend that the full amount of the prizes offered should be given, but the following awards were made : £10 to Frank W. McCall; £5 to Ronald F. Reekie (School of Architecture, Leeds College of Art).

Prizes offered by Messrs. Bratt, Colbran & Co. and the Heaped Fire Co., Ltd., for a design for a fireplace : The judges were unable to recommend that the full amount of the prizes offered should be given, but the following award was made : £2 10s. to Miss Elsie Rogers, A.R.I.B.A.

Prizes offered by the General Electric Co., Ltd., for designs of lighting fittings for a lounge in a private house : First prize (fifteen guineas), John A. C. Howard; second prize (ten guineas), Thomas J. Denny. Commended : Arthur Collett (Ryland Memorial School of Art).

Prize offered by Messrs. Hailwood and Ackroyd, Ltd., for a design for a ceiling electric light fitting suitable for a cinema entrance : Ten guineas to Miss Vera Moller.

Prizes offered by Messrs. H. H. Martyn & Co., Ltd., for designs for suite rooms on a large liner : Owing to the lack of suitable entries, the judges were unable to recommend that the full amount of the prizes offered should be given, but the following awards were made : £3 each to the following : Robert C. Davis (School of Architecture, Leeds College of Art), Miss Amy M. Hargroves, and Francis F. Johnson (School of Architecture, Leeds College of Art).

Prizes offered by the Morris-Singer Co. for designs for the entrance lobby to a bank : First prize (ten guineas), William A. Guttridge (School of Architecture, Leeds College of Art); second prize (five guineas), George Robb (Manchester Municipal School of Art). Commended : Frederick N. Cater (Westminster Technical Institute), and Gilbert J. Pratley (Northern Polytechnic).

UNIVERSITY OF LONDON

The awards for the Bossom and Bossom-Davis medals for the 1930–31 session of the University of London Architectural Atelier have been made as follows :

Bossom-Davis medal : Mr. D. A. Stewart (Design for a Fish Market). Highly commended : W. M. Goode-Smith (also for Fish Market).

Bossom medal : Mr. G. Q. Lay (Design for Flats). Highly commended : Mr. E. F. Starling (Design for Chapel).

THE ELORN-PLOUGASTEL BRIDGE

Mr. T. J. Gueritte, B.Sc., at a meeting held under the auspices of the Gloucester Engineering Society, at the Gloucester Technical College, demonstrated by still and moving pictures the methods and principles formulated and adopted for the construction of the largest ferro-concrete arched bridge in the world, at Elorn-Plougastel in Brittany. The arch has a clear span of 567 ft., and a rise of 115 ft., equal to 19 per cent. of span.

The theoretical law that proved elasticity and cohesion to be in direct proportion to the specific weights of common structural materials had oftentimes been overlooked in practice, but the appended table showed that the believed structural superiority of steel did not depend upon cohesion, but rather on its mode of deformation, which might be caused by reversible stresses setting up plastic changes, whereas other materials were too brittle in character to withstand reversible stresses.

Materials.	Young's Modulus.	Specific Weight.	Quotient.
Steel	28 to 30 × 10^6	7·8	3·4 × 10^6
Glass, and silicates ..	8·5 11·4 × 10^6	2·5 to 2·75	3·4 × 10^6
Cellulose, dry wood ..	1·3 1·7 × 10^6	0·3 to 0·5	3·4 × 10^6
Limestone, very compact ..	8·5 × 10^6	2·5	3·4 × 10^6

Taking full advantage of the above law, it was found, by introducing steel in concrete according to a definite plane and system, that the brittle constituents did not fail, and the elastic steel was also supported; the result being that stresses which would break down either material tested independently, were carried successfully. In addition, it was found that the steel was protected from its common form of failure through corrosion.

COMPETITIONS OPEN

December 31.—Sending-in day. Latest date for conditions : September 31. Proposed New Town Hall and Municipal Buildings, for the Walthamstow Corporation. Assessor : H. Austen Hall, F.R.I.B.A. Premiums : £500, £300, £200 and £100. Conditions, etc., obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

January 1, 1932.—Sending-in day. Proposed Church at Low Shiregreen, Sheffield, in connection with the Bishop of Sheffield's 100,000 guineas appeal (limited to architects with an office in the Sheffield Diocese). Assessor : C. C. Thompson, F.R.I.B.A. Full particulars obtainable from the Hon. Secretary, Sheffield, South Yorkshire and District Society of Architects and Surveyors, 15 St. James' Row, Sheffield.

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor : Robert Atkinson, F.R.I.B.A. Premiums : 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors : Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium : £500; also a further amount of £750 will be awarded to other designs according to merit.

September 31, 1932.—Sending-in day. All-British House (cost to be less than £1,000) for the Incorporated Association of Architects and Surveyors. Premiums : 50 guineas, 20 guineas and 10 guineas. Conditions, etc., from the Secretary, I.A.A.S., 1 Wilbraham Place, S.W.1.

Owing to the heavy pressure on our space, the "Questions that Arise" section has been held over from this issue.—ED., A.J.

THE ARCHITECTS' DIARY

WEDNESDAY, DECEMBER 9

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Exhibition of photographs and drawings of Russia's new buildings. Until December 18.

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "Roads and Road Transport." By Sir Henry Maybury, G.B.E. **8.30 p.m.**

LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. "Borromini." By Lord Gerald Wellesley, F.R.I.B.A. **6 p.m.**

MANCHESTER SOCIETY OF ARCHITECTS. "The Furnishing of Buildings." By Edward Maufe, F.R.I.B.A. **6.30 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C. "The Louvre and the Tuileries, Paris." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

BRITISH WOOD PRESERVING ASSOCIATION. At the Auctioneers' and Estate Agents' Institute, 29 Lincoln's Inn Fields, W.C.2. "Wood Structure." By Dr. I. Chalk. **6 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS. At Manchester. "Considerations on Foundation Problems associated with Pile Driving." By A. Hiley. **6.45 p.m.**

ARCHITECTURE CLUB. Dinner, to be held at the Savoy Hotel, W.C. **7.30 p.m.**

SOCIETY OF WOOD ENGRAVERS. At the Redfern Gallery, Arcade House, 27 Old Bond Street, W.1. Twelfth Annual Exhibition. Until January 2. 10 a.m. to 6 p.m. (Saturdays, 10 a.m. to 1 p.m.). **10 a.m.**

LONDON HOUSING SOCIETIES. At the Central Hall, Westminster, S.W.1. Housing Exhibition. Until December 10.

THURSDAY, DECEMBER 10

WEST YORKSHIRE SOCIETY OF ARCHITECTS. At the College of Art, Leeds. "Architectural Lighting." By R. Waldo Maitland, A.R.I.B.A. **7 p.m.**

THANET SCHOOL OF ART LECTURES ON ARCHITECTURE. At Chatham House School, Ramsgate. "National Characteristics." By R. Goulburn Lovell, A.R.I.B.A. **7.45 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Softwoods." By Alexander Howard. **7.30 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "Ulster Parliament Buildings, Stormont, Belfast." By W. J. Stewart, M.P. **6.30 p.m.**

BERKS, BUCKS AND OXON ARCHITECTURAL ASSOCIATION. At the Town Hall, Oxford. Exhibition of member's work in architecture. 2.30 p.m. Formal Opening by the Mayor of Oxford. 4.45 p.m. "Commercial Buildings and Advertisements." Speakers : Alderman W. Hyde, J.P., and Frank Gray. **2.30 p.m.**

FRIDAY, DECEMBER 11

TOWN PLANNING INSTITUTE. At Caxton Hall, Caxton Street, Westminster, S.W.1. "Some Economies and Advantages that have resulted from Town Planning." By F. Marsden, M.T.P.I. **6 p.m.**

HASTINGS MUNICIPAL SCHOOL OF ART LECTURES ON ARCHITECTURE. "National Characteristics." By R. Goulburn Lovell, A.R.I.B.A. **7.30 p.m.**

FACULTY OF ARCHITECTS AND SURVEYORS. Annual Dinner, to be held at the Hotel Metropole, Northumberland Avenue, W.C.2. 6.45 for 7.15 p.m. **7.15 p.m.**

BERKS, BUCKS AND OXON ARCHITECTURAL ASSOCIATION. At the Town Hall, Oxford. "Town and Country Planning." Speakers : Lord Phillimore, M.C., and A. Francis. **4.45 p.m.**

LONDON SOCIETY. Visit to King's College Hospital, Denmark Hill, S.E.5. **2.30 p.m.**

ILLUMINATING ENGINEERING SOCIETY. At the Royal Society of Arts, John Street, Adelphi, W.C.2. Presidential Address by Sir Francis Goodenough, C.B.E. **7 p.m.**

SATURDAY, DECEMBER 12

Sunrise, 7.57 a.m. Sunset, 3.50 p.m.

BERKS, BUCKS AND OXON ARCHITECTURAL ASSOCIATION. At the Town Hall, Oxford. "Houses and Housing." Speakers : C. S. Kimpton, A.R.I.B.A., and Mrs. Roberts. **4.45 p.m.**

LONDON SOCIETY. Visit to the Admiralty Building, Whitehall, S.W.1. **2.30 p.m.**

MONDAY, DECEMBER 14

R.I.B.A., 9 Conduit Street, W.1. "Stained Glass in relation to Architecture." By F. C. Eden, M.A., F.R.I.B.A. **8 p.m.**

TUESDAY, DECEMBER 15

UNIVERSITY OF LONDON EXTENSION LECTURES. At the Victoria and Albert Museum, South Kensington, S.W. Last of six lectures on "French Art." By Miss M. Chamot. **3 p.m.**

WEDNESDAY, DECEMBER 16

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "The Churches and Later Palaces of France." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

CHARTERED SURVEYORS INSTITUTION. Annual dinner of the quantity surveyor members, to be held at the Hotel Victoria, Northumberland Avenue, W.C.2. **7.30 p.m.**

FRIDAY, DECEMBER 18

LONDON SOCIETY. At the Royal Society of Arts, John Street, Adelphi, W.C.2. "The Portent of Concrete." By Sir E. Owen Williams, K.B.E. **5 p.m.**

LAW REPORT

FARMHOUSE DILAPIDATION DISPUTE

Bennett v. *Harrow. Official Referee's Court. High Court of Justice. Before Sir William Hansell, K.C.*

THIS was an action by Mr. Henry Edward Bennett, of Ditton Court, Aylesford, near Maidstone, against Mr. Thomas Harrow, of Addlestead Farm, East Peckham, Paddock Wood, claiming the sum of £334 as damages for breach of covenant to repair Ditton Court, which the defendant occupied until September, 1930.

The case for the plaintiff was that in 1926 he bought the estate from the defendant, but allowed him to remain in occupation of the house till July, 1930, on condition that he kept it in repair.

Defendant pleaded that the tenancy was wrongfully terminated in September, 1930, when the plaintiff ejected the defendant's workmen and prevented them from repairing the premises. While denying liability, defendant paid £60 into court as sufficient to cover the claim.

Mr. Van den Berg, K.C., and Mr. W. Boileau appeared for the plaintiff, and Mr. Lynton Thorpe represented the defendant.

Mr. Van den Berg stated that the plaintiff purchased the estate from the defendant in 1926, giving him £28,000. It comprised a residence, with a farmhouse and 344 acres of land. Plaintiff resold several lots, but retained the residence, which he allowed the defendant to occupy rent free, pending the finding of another tenant, on condition that he kept it in repair. Defendant gave up the keys, and since he got possession plaintiff had spent over £200 in putting the place in proper order, and had not finished yet. After the keys were given up, the defendant sent men to the house, but the plaintiff refused to allow them to be there. The real question in regard to the dilapidations was whether Ditton Court was a residence or a mere farmhouse, and whether anything turned on its being let on a quarterly tenancy.

The plaintiff gave evidence and said the residence was like a large villa, with eight bedrooms. Even when he ordered the defendant's workmen out of the house they burst in again and continued to work there. The structural state of the place when the defendant left was very bad, and water came through the roof in several places. The outbuildings were dilapidated and the gardens were not well kept. The defendant seemed to regard himself more as a caretaker than a tenant.

Mr. John H. Day, chartered surveyor, of Maidstone, gave evidence as to the work necessary to be done.

Defendant gave evidence. He said he did not give up the key when he left in July as he thought he might return and see that it was left in good condition. He had then received no notice to quit.

Mr. B. A. Champion, valuer and surveyor, of Dartford and Maidstone, estimated that the amount of work to be done, treating the place as a farmhouse, would cost only £47 18s. He had rarely seen a farmhouse in such good condition.

Mr. E. H. Lambert, surveyor and valuer, of Paddock Wood, gave similar evidence.

The Official Referee thought the plaintiff had claimed too much and that the defendant had paid into court too little. He awarded the plaintiff £173 10s., and gave judgment for the plaintiff for that amount, with costs.

THE BUILDINGS ILLUSTRATED

Following are the names of the specialists, general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Maternity Home, Radcliffe Infirmary, Oxford (pages 763–766). General contractors, Benfield and Laxley. Sub-contractors : Veronese Co., artificial stone gateway and dressings and Snowcrete rendering; Kingsmill Art Metal Co., wrought-iron gateway; Tilehurst Potteries (1922), Ltd., bricks and roofing tiles; Crittalls Manufacturing Co., Ltd., and William Pye, metal windows; Constone, Ltd., Terrazzo ; Waygood-Otis, Ltd., lifts ; Leeds Fireclay Co., Ltd., and Dent and Hellyer, Ltd., sanitary fittings; Falkirk Iron Co., heating and hot water; Ruberoid Co., Ltd., flat roof; James Slater & Co., Ltd., sterilizing and kitchen appliances; Lowe and Oliver, electrical work; Troughton and Young, Ltd., fanlight; Chas. Smith and Sons, door furniture; Adrian Stokes, Ltd., iron balustrading and staff staircase; Korkoid Co., rubber flooring; Goodwork, Ltd., cellulose painting in interior.

St. Margaret's House, 19–23 Wells Street, W.1 (pages 771–773). General contractors, Bovis, Ltd., who were also responsible for the foundations and joinery. Sub-contractors : Ragusa Asphalte Paving Co., Ltd., asphalt; W. L. Jackson & Co., bricks; Redpath, Brown & Co., Ltd., structural steel; Fredk. Braby & Co., Ltd., copper roofing; Goldstein & Co., glazing; Kleine Company, Ltd., fireproof floors; The Adamite Co., Ltd., "Colemanoid" waterproofing materials; William Edgar and Sons, heating and ventilating; W. J. Furse & Co. (London), Ltd., electric wiring; Matthew Hall & Co., Ltd., plumbing; Leeds Fireclay Co., Ltd., terra-cotta cornices and sanitary fittings; Carter & Co., Ltd., Terrazzo; Yannedis & Co., ironmongery; Charles Smith & Co., casements and window furniture; Potter Rax Gate Co., balustrade and lift enclosure; Mather and Platt, Ltd., sprinklers, rolling shutters and fireproof doors; Carron & Co., metalwork; Anselm Odling & Co., Ltd., marble; Rusts Vitreous Tile Co. and Leeds Fireclay Co., Ltd., tiling; Morris Singer Co., shop fittings; Waygood-Otis, Ltd., lifts; Haywards, Ltd., pavement lights.

"The Gardeners' Arms," 268 Merton Road, Southfields, S.W.18 (page 775). General contractors, A. Roberts & Co., Ltd., who were also responsible for the excavation, foundations and joinery. Quantity surveyor, H. H. Connybeare, F.F.A.S. Sub-contractors : The General Asphalte Co., Ltd., dampcourses and asphalt; Fawcett Construction Co., Ltd., structural steel and fireproof construction; Ames and Finnis, roofing tiles; Building and Insulating Material Co., Ltd., Bimol hollow partition blocks; J. Chater and Sons, Ltd., glass; Acme Flooring and Paving Co., Ltd., wood-block flooring; George Wright (London), Ltd., stoves, grates and mantels; W. and H. W. Gould, boilers; McKone and Haynes, electric wiring and bells; B. Finch & Co., Ltd., plumbing and sanitary fittings; Nettlefold and Sons, Ltd., door and window furniture; Telling, Ltd., plaster; Carter & Co. (London), Ltd., external and internal tiling; Gaskell and Chambers (London), Ltd., counter beer engines and pewtering and cabinet; Educational Supply Association, Ltd., folding partitions; Geo. Johnson, Ltd., lifts; Nash and Hull, Ltd., letters on fascia.

TRADE NOTES

At the annual general meeting of the British Steelwork Association, Mr. J. H. Humphryes (of Braithwaite & Co., Engineers, Ltd.), was elected President for the year 1931–32, and Mr. Ben Walmsley, C.B.E. (of Dorman, Long & Co., Ltd.), was elected vice-president.

*

Messrs. James Clark and Son, Ltd., of Scoresby Street, Blackfriars Road, S.E.1, have recently issued a booklet explaining the many purposes for which the firm's glass may be used, together with numerous illustrations of buildings in which it has been incorporated. It is interesting to note that the glass letters on the tower of the Oxo Warehouse, Bankside, were glazed by Messrs. Clark and Son, Ltd., and they were also responsible for the glazing work on Royal London House, claimed to be the loftiest commercial building in the City.

*

While preparing tropical gums, which are extensively used in varnish manufacture at the Stratford Works of Messrs. Jenson and Nicholson, Ltd., recently, a number of tropical insects of many colours, including large spiders and ants, were found embedded in the solidified gum. It is thought that the specimens were caught in the gum flow as it oozed from the trees, and were overwhelmed before they could escape.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Plans passed by the BRENTFORD AND CHISWICK U.D.C.: Alterations, White Building, Barley Mow Passage, for Alliance Assurance Co., Ltd.; two houses, Sutton Court Road, for Kinnaird Park Estate Co.; alterations, 140 High Street, for Mr. C. Barrett; alterations, 301 High Road, for Mr. W. Beven; factory, corner of Great West and Boston Roads, for Mr. F. E. Simpkins; two houses, Boston Gardens, for Mr. A. L. T. Taylor.

The CROYDON Corporation is seeking sanction for a loan of £20,000 for fire station extensions.

The Middlesex C.C. has prepared a modified scheme for extensions at Redhill Hospital, EDGWARE, at a cost of £50,000.

Plans passed by the FINCHLEY U.D.C.: Alterations and additions, Assembly Works, Woodside Lane, for Messrs. Fraser and Glass; house, Edge Hill Avenue, for Mr. P. Preston; house, Blandford Close, for Mr. H. Lawrence; house, Gurney Drive, for Mr. A. Reast; two flats, Seymour Road, for Messrs. G. Payne & Co.; refreshment and dressing rooms, Hampstead Garden Suburb, for Widdenham Athletic Club; additions to gymnasium, Convent, East End Road, for Mother Superior; tennis pavilion, Creighton Avenue, for Mr. E. N. Nansick; ten shops and two houses, Holders Hill Road, for Messrs. Baldwin & Co. (Finchley), Ltd.; two houses, Britannia Road, for Mr. W. S. Cook.

The HENDON R.D.C. is to erect twenty-six houses on the Glebe estate, Great Stanmore.

Mr. Cutler has commenced the development of a building estate near Cannon Lane, PINNER.

The POPLAR B.C. is to proceed with the erection of forty-eight flats, two cottages and twenty shops, on the East Ferry Road site, at an estimated cost of £36,700.

The POPLAR B.C. is to erect thirteen tenements at Millwall and nine tenements at Bow for rehousing tenants displaced by the Benworth Street clearance scheme.

The Middlesex Education Committee is to acquire a site in Mutton Lane, SOUTH MIMMS, for the erection of a secondary school.

The L.C.C. has arranged for the clearance of further property in the Prusom Street area of STEPNEY.

Messrs. Gillespie, Kidd and Coia are to erect premises for the Roman Catholic Archdiocese in Whitevale Street, GLASGOW.

The PAISLEY Corporation has prepared plans for the provision of an isolation hospital.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

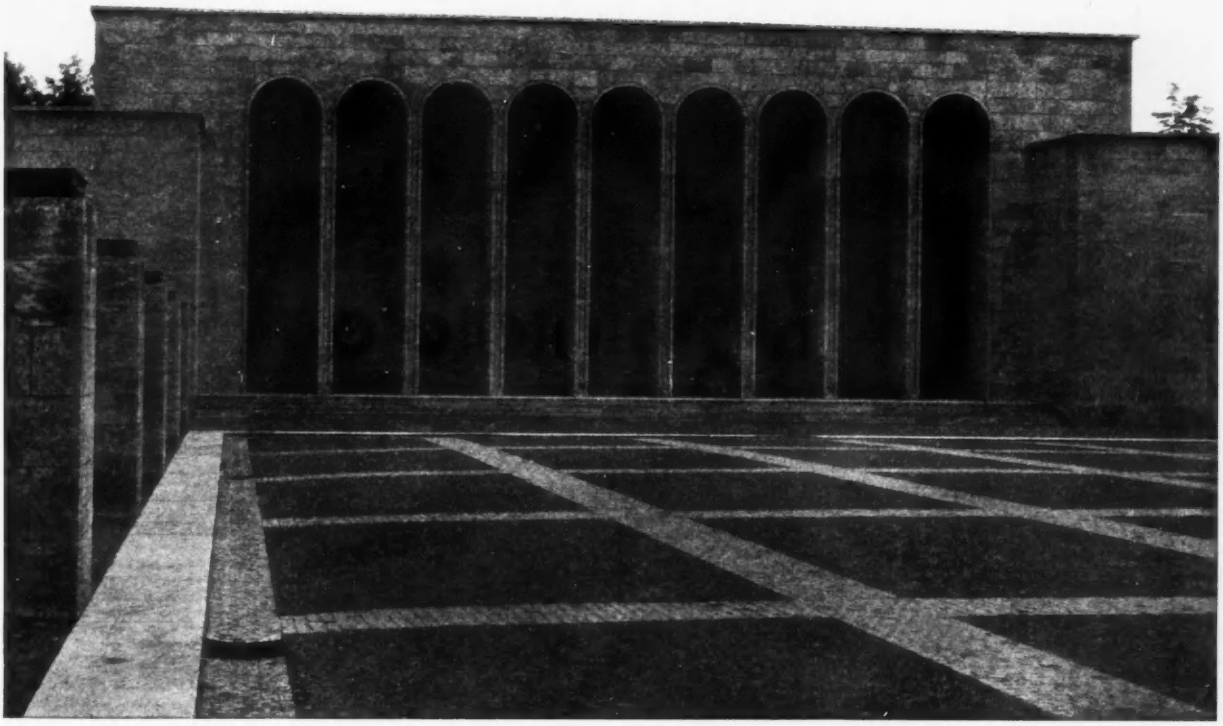
NUREMBERG WAR MEMORIAL

FRITZ MAYER : I. THE GENERAL DESIGN : ARCHITECT



THE HALL OF MEMORY FROM THE FORECOURT

THE most important of the newer German war memorials show a common tendency that essentially distinguishes them from older tradition. Memorials were formerly almost always sculptures. These new shrines of honour are no memorials in this older sense, but are places of remembrance. They are no longer sculpture, but architecture. A symbolical carving, it is true, marks the central point of the design, but it is now the constituent part of an indivisible larger conception. (For example, the symbolic cross in the Berlin memorial, or the inscriptions in that at Nuremberg —in other cases, sarcophagi or figures).

The basis of this new conception is many-sided. The most valid honour to the fallen is that they should be thought of and their memory kept green among the living. So the shrines of honour are so arranged that they form gathering places in a suitable atmosphere of solemnity. One is constrained to have them every day in mind, and to that end there are built either separate rooms (as in Berlin) or a quite independent place (as in Nuremberg and elsewhere). Lastly, this new conception, which gives these high aims not sculptural but essentially architectural expression, is evidence of the dominant position taken by architecture in modern art.

The Nuremberg memorial, of which a general view appears above, with drawings within, shows these aspirations particularly clearly. It is placed at the focal point of the long central axis of one of the public parks. The building itself stands in an outer court, flanked on either side by a row of pylons with censers. The boundary walls are divided by the hall of memory. On its inner wall are the inscriptions, with crosses and flags below them. To either side lie two smaller halls of remembrance. Within an iron case in a niche is kept a book of remembrance, with the names of the dead. There are graphic representations of war incidents on the walls by the Nuremberg artist, Jobst Kuch.

HALL CEILING AT CECIL SHARP HOUSE

ANOTHER DETAIL FROM THE ENGLISH FOLK DANCE SOCIETY'S HEADQUARTERS

[H. M. Fletcher and Godfrey Pinkerton, Architects.

THE CEILING OF THE MAIN HALL, SHOWING THE LANTERNS

THE ceiling of the main hall is illustrated in the photograph above, and in plan and section on the centre pages. Certain decorative features, such as rosettes, are shown to a larger scale on the back page of this supplement. The colouring is pale biscuit for the panels and white for the ribs, mouldings and enrichments.

The grilles of the three square central panels are for ventilation and acoustics. The whole of the work is in plaster except the long panels in the splays, which are of acoustic felt. Each of the square plaster panels between these has at its centre a square of flashed opal glass, behind which is a light. The hall is entirely lighted from these porthole lights and groups of lamps in the ceiling lanterns, and there are no pendants or wall-lights. By means of grouped switching there is a range of candle-power from darkness to great brilliancy, so that the lighting can be almost imperceptibly adjusted to the particular purpose for which it is required: lectures, concerts, massed folk-dances with hardly any audience, or displays of folk-dancing with full audience.

Cecil Sharp House was illustrated and described in the issue for June 4, 1930, and a detail of one of the external stairs was given in a supplement with the issue of August 19 last.

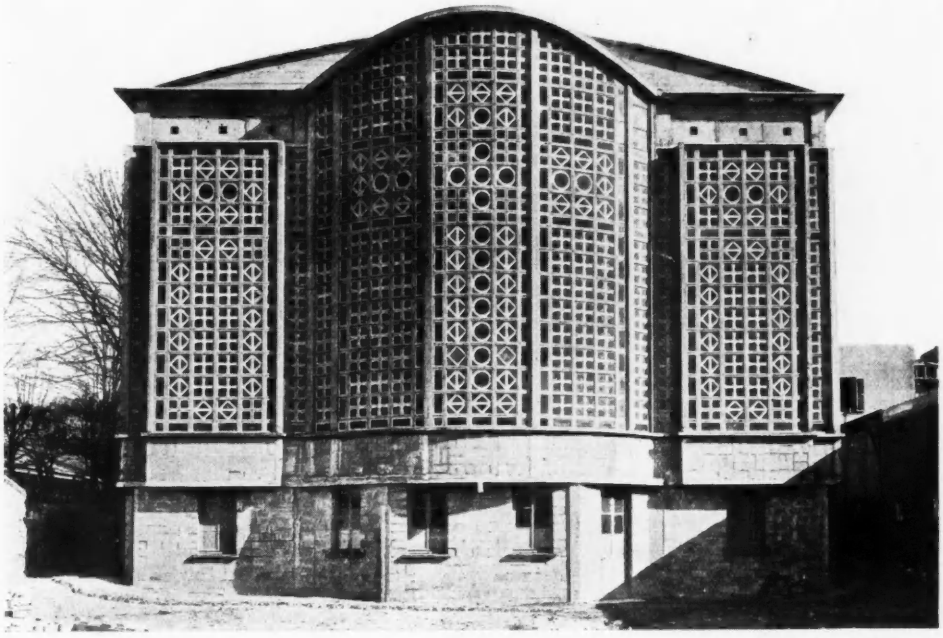
MODERN CHURCH AND CHAPEL EXTERIORS: II



[*A. and G. Perret, Architects.*

1. *APSE OF THE CHURCH OF OUR LADY, LE RAINCY, NEAR PARIS*

THE church would seem to be almost the last type of building which calls for the drastic revaluation of existing structural ends in the light of new structural means that we rather lamely call "Functional Modernism." People in all countries are accustomed to worship in churches built centuries ago. Here, then, is logical justification for buildings that try to soften the abrupt architectural transition between yesterday and today.

Figures 4 *and* 5 *are good, and typically English, examples of such architectural tact. Each, though modern in feeling, preserves a modicum of the familiar traditional detail. Neither attempts to break with the past. Both reassure the passer-by that they are the sort of churches in which there will be nothing to offend the susceptibilities of the aged. Yet, at the same time, both gently indicate that every generation must expect to find that "the old order changeth."*

[*Dr. Curt Steinberg, Architect.*

2. *THE LUTHERAN GEORGENKIRCHE, FRANKFURT-AN-ODER*

Figures 2 *and* 3 *are chosen from their German "opposite numbers." The first is Lutheran and brick; the second Catholic and concrete. Both have achieved a sane and dignified simplification of Renaissance and Gothic forms, respectively, without solecism or vulgarity. The effect of the vigorous upward thrust of the spire of the beautiful Frankfurt Church is, however, rather spoilt by the rustic porch at its base. The church at Rosenheim, a whitewashed concrete building, discards the pointed windows which Mr. Edward Maufe has been at some pains to retain at St. Saviour's, Acton.*

Figure 1 *illustrates the curiously fretted apse of the Brothers Perret's famous church at Le Raincy. Here again, though the construction adopted was daring enough to satisfy the most out-and-out Modernist, the form chosen remains purely traditional; and undoubtedly gains in consequence.*

THE CLASSIC ORDER ONCE MORE

SOME people are already prophesying that the next generation of designers will have nothing whatever to do with column and entablature, or at least the particular forms these features assumed in the styles affected by the ancient Greeks and Romans, and by the masters of the Renaissance.

This reaction against the Orders has hitherto made itself felt in the architectural schools and among a group of practitioners in this country who receive their inspiration from the Continental " modernists."

The profession as a whole has not yet yielded to the demands of these iconoclasts, and, indeed, the latter have been known to express a certain amount of chagrin at their failure to wrest the great professional prizes from " the old gang." Of course, there is the scandal of the City of London, where the bankers and other princes of finance obstinately cling to their columns as if these were emblems of respectability as sacred as their top-hats. But far worse is the state of affairs in the world of architectural competitions, where the effete classicists carry all before them with a wearisome monotony.

Let nobody contend that this success on their part is due to a superior skill in the art of planning. The obvious explanation is that " the old gang " are at their tricks again. The " bright young people " in our profession are convinced that there will be no " justice " for them until the present select list of competition assessors is replaced by another list more to their liking. Whether this replacement results from the natural death of the assessors in question, or from their supersession by some human agency, is a matter of indifference to our architectural innovators, provided that it be accomplished without undue delay.

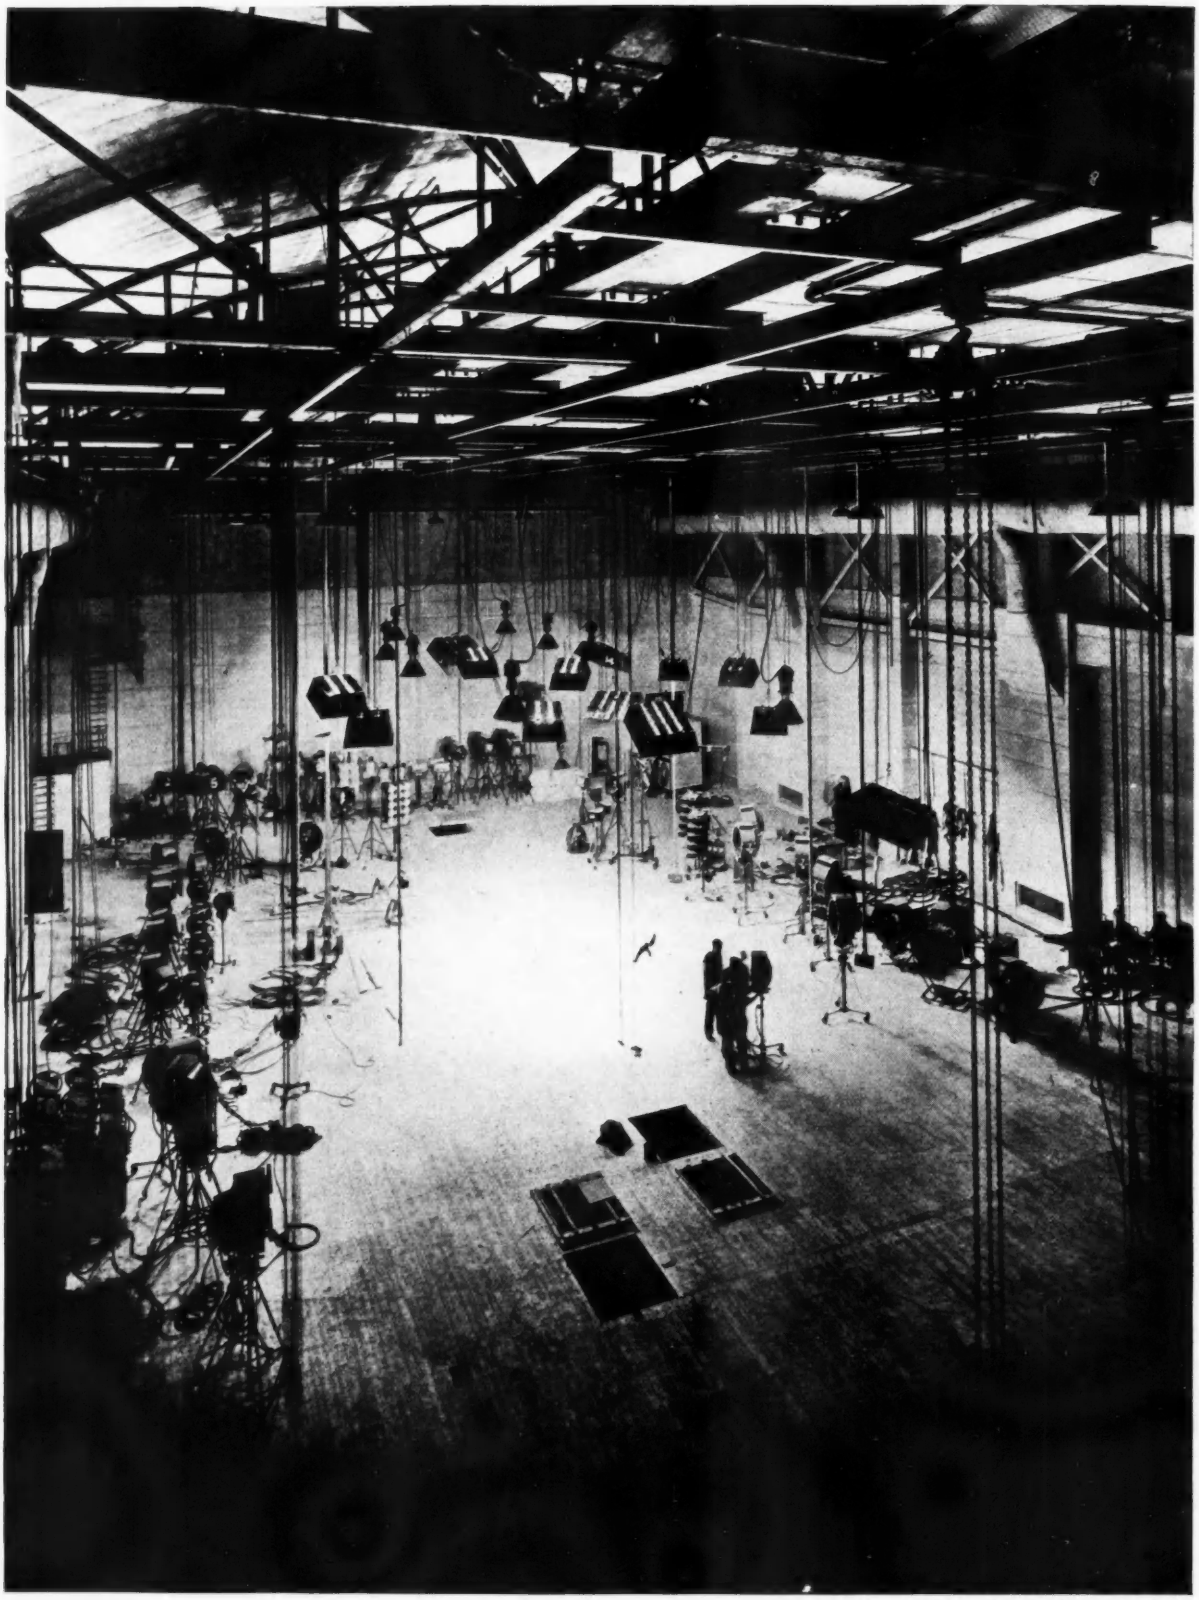
But why this animus ? It is all because " the old gang " have got a strange psychological complex which induces in them a predilection for the Classic Order. As a rule they are too astute to give reasons for this mental aberration; they allow it to be supposed that they go on designing columns because columns are part of the divine nature of things. All the books about the Classic Order were written long ago, and they consist principally of dryasdust statements giving the proportions of the various parts of the Orders in terms of vulgar fractions, and in any case the investigations are couched in such a form that they could be of interest only to archæologists.

It would surely be a bold man who in the twentieth century would write a book about the Classic Order, and a very bold publisher who would publish such a book. This is a case for strategy rather than a frontal attack.

Hence it is not surprising that the beautifully produced volume, entitled *The Orders of Architecture*, reviewed in our last issue, should be distinctly more subtle than its bare title suggests. In the first instance we note that on the jacket of the volume the name of the author is given as Mr. Arthur Stratton, whereas on turning the pages it is discovered that the villain of the piece is Mr. Trystan Edwards, who once more expounds the organic principles of Number, Punctuation and Inflection—all exemplified, according to his witness, in the old Classic Order. In fact, the Preface notwithstanding, the whole of the five chapters in critical commentary of the Classic Order appear to be his work.

Whether the architectural student is convinced by Mr. Edwards's thesis or rejects it, here at least is a book which for the first time seeks to give reasons why we should admire the Classic Order and regard it as a living instrument of design. Yet the choice does not necessarily lie between the total acceptance and the total rejection of the old Classic Orders.

Is it too much to hope that the present generation will evolve new Orders of their own, which will be satisfying to traditionalists and modernists alike ?



[*Messrs. Robert Atkinson, Architects.*

THE FIERCE-LIT CRADLE OF MAKE-BELIEVE

Two generating sets of no less than 600 h.p. each, are provided to supply the intense lighting required in this A.R.P. film studio at Ealing Green, W. There are many features unique as far as this country is concerned. Further illustrations appear on pages 795–8.

NEWS & TOPICS

ARCHITECTURE CLUB DINNER

THE Architecture Club dinner, held last Thursday at the Savoy Hotel, was remarkable for the nearly continuous flow of sense. The subject was air ports, and to show that the Club meant business, it had arranged with Mr. John Drower, the secretary of the R.I.B.A. Aerodromes Committee, to show some of the best examples of air-port architecture upon a screen. There followed a fairly complete exposition of the subject from speakers who approached it from different angles: Colonel F. C. Shelmardine, Director of Civil Aviation; Dr. Unwin; Nigel Norman, Director of Heston Air Park; Colonel the Master of Sempill, the distinguished airman; and G. L. Pepler. I did not like the way most of the laymen talked of architecture. "Architectural" and "practical" seemed to most of them to be totally different things. And they do mean different things to them. And what are architects going to do about it? And what is the Architecture Club for, anyway?

REGISTRATION ACT COMMITTEE

Under the Architects Registration Act, which takes effect with the New Year, the first sitting of the Committee appointed by the Home Secretary to decide upon the representation to be accorded on the Registration Council to the various architectural bodies was due to meet at the Home Office yesterday (Tuesday). The constitution of the Committee is as follows: Clifford A. Aish, Major G. B. J. Athoe, Major Harry Barnes, Harry William Crickmay, S. Phillips Dale, L. A. F. Ireland, W. G. Percy, A.Randall Wells, and F. R. Yerbury.

WESTMINSTER HOUSING EXHIBITION

At the Exhibition by the London Housing Societies at the Central Hall, Westminster, opened by H.R.H. the Duchess of York last week, I found a large assemblage of people showing the most lively interest in the urgent problem of the slums. The whole affair was admirably organized, and very great pains were taken to present the facts of housing, some doleful but others encouraging, in a striking manner. Great credit is due to Mrs. Darcy Braddell for the design and arrangement of the exhibit hall, and to Mrs. Maria Petrie, who painted most of the mural scenes depicting the expressive contrasts between good and bad housing conditions. It is a bright idea to employ the art of the poster in propaganda to abolish the evil of slums.

★

In addition to the attraction of the numerous photographs and models illustrating housing schemes, there were a number of cinema entertainments showing the Under-Forty Club housing film, and the Pioneer town-planning film, while a one-act housing play by Miss Creagh-Henry for the Church Army Housing, Limited, was performed by the Mystical Players. No less than twenty-five different housing societies were here represented, and one's only regret in connection with the exhibition was that it lasted for too short a time. It is, however, gratifying to learn that the "New Homes For Old" Housing Exhibition of the Under-Forty Club is now available for use on loan to any responsible body in provincial towns.

"BUY BRITISH TOMBSTONES"

I see no reason why Mr. Thomas's "Buy British" campaign should not be put to good uses when occasion arises, and if it can help to keep out the flood of beastly pasty-white marble tombstones that, as the Rector of Chislehurst has been saying in his church magazine, do not tone down to proper terms with their surroundings, then let the Church shout "Buy British" with the rest of them. But, as Dr. Hardman, the Rector, very properly points out, "the conversion of the stone-masons to this point of view is, perhaps, the first step; *for people are largely guided by their suggestions.*" The italics are mine. They mark a moral.

ANOTHER BALTIC ISLAND BRIDGE

The note on the bridge across the Little Belt (between the mainland of Jutland and the island of Fünen), which appeared on this page in October, has brought me particulars of another enterprise in the Baltic of a similar kind. A causeway, 2·5 kilometres long, is to be constructed across the Strelasund, the strait dividing the large German island of Rügen from the Prussian mainland. Hitherto 37–45 minutes have been lost on the direct railway route between Berlin and Stockholm via the Sassnitz–Trälleborg train-ferry (which conveys sleeping cars over more than sixty miles of open sea) owing to the existence of another, though much shorter, train ferry between Stralsund and Altefähr. This will be abolished when the new rail and road causeway over the Strelasund is finished in three-and-a-half years' time.

★

The present work is being financed by a 5 per cent. loan of 18,000,000 kronor (about £1,000,000) which the Swedish Government has made the German Reichsbahn in order to find work for Swedish quarrymen. The embankment, which will be 100 metres wide at its base, narrowing to 18 at the top, is to be built of stone ballast, faced with rubble. It will run straight from shore to shore athwart the intervening island of Dänholm. There will be two intermediate bridges, 125 and 500 metres long respectively, provided with opening spans to allow the passage of shipping.

★

In all other respects the Strelasund causeway will be modelled on that recently built between the mainland of Schleswig-Holstein and the North Sea island of Sylt by the German State Railways. It is interesting to recall that the prototype of both these causeways was one constructed a few years ago to connect the railways of the Malay Peninsula with the island on which Singapore is situated. Another has been suggested across the Kyle of Lochalsh to make the Isle of Skye accessible to motorists.

THE ARCHITECTURE OF THE "SHAPE"

One of the many intriguing mysteries of the kitchen is who introduced, and at what period, the castellated shapes of blancmange-moulds that have been familiar to so many generations of incurious cooks and curious children. Is their design contemporary with baronialized and machicolated railway tunnels? Or do they date back to some great eighteenth-century *chef* who aspired to do for "*glaces*" what Vauban had done for glacis? In any case, it seems high time that someone modernized the conventional forms of fortification in which the Architecture of Jelly has been too long condemned to find its loftiest expression. It is clearly an architect's job; and one in which, for once, he would be free to achieve pure form without bothering his head about structural considerations. A jelly is none the worse for being jerry-built.

ASTRAGAL

STAINED GLASS AND ARCHITECTURE

BY F. C. EDEN

I THINK it is sometimes forgotten that the prime function of a window is to admit light. Whatever may be suited to the tropics, where "the worst of your foe is the sun overhead," in this climate the cry must ever be "Light, more light!" So it was throughout the Middle Ages—those ages, not of sentiment, but of common sense. The solemn, gorgeous colouring of the thirteenth century gradually gave place to the delicate, silvery tints of the fifteenth, with its predominance of white glass, while at the same time the window openings grew larger and larger, till the wall became a mere pierced screen for the display of glass. Mason and glass-painter played into one another's hands, so that it might almost seem as if stained glass were the formative element in the evolution of Gothic architecture. Churches in this country need all the daylight possible. Nothing is so depressing as a town church the windows of which have been so obscured by semi-opaque glass that artificial light has to be used at all hours of the day.

It is a curious reflection that the culminating point of an art of which colour would seem to be the very *raison d'être* should be marked by this predominance, or rather triumph, of white. One reason, perhaps, for this gradual development from murk to the full light of day is that stained glass is peculiarly the art of the North, of sunless climes: an art, maybe, of compensation, to redress the balance, to cheat us into cheerfulness. As a French writer says: "If it be dull without, you may be sure of fair weather in church" (M. Proust).

However this may be, if you want to study glass, choose a dull day. Direct sunlight is a hindrance. With sun streaming through them, the windows facing south are too blinding to examine in comfort, while those on the north will receive the light from the wrong side and fade into lifelessness.

Lead Glazing

Lead glazing is not self-supporting. Apart from wind-pressure, a piece measuring a very few feet in area will sag and crack by its own weight. It therefore requires extraneous support. The wide lights of the thirteenth century were fortified by a regular armament of ironwork arranged in circles, lozenges and so forth, to define the shape of the medallions composing the design. With the introduction of stone mullions, whereby the width of the lights was reduced, say, from 6 ft. to 2 ft. or less, the patterned shapes of the earlier irons were simplified to a rectangular grid of standards and saddle-bars. It must not be supposed that these bars hamper the designer: they really prop the artist as much as they do the material, by compelling him to take the sections into which the surface is divided as units of his design, which is thereby forced on to a geometrical basis.

The "Thick" and "Thin" Schools

During the last thirty years or so, English glass painting has produced two new schools, diametrically opposed in methods and ideals. I do not want to describe them as modernist and traditional, because I dislike the terms, and I think they may be better defined by their works than by their aims, because the former can be seen and the latter only guessed at. I shall, therefore, call them the Thick and Thin schools. The one takes as its model English fifteenth-century glass, and aims at lightness of effect produced by abundant use of white glass combined with slight and delicate painting and a restricted palette. The other, the Thick school—if it may be said to have taken any traditional style as its point of departure, for it is really quite styleless—is to some extent based upon the mosaic method of the thirteenth century. It is characterized by colouring sometimes vivid to the verge of vulgarity, sometimes deep to the point of heaviness, a heaviness which is accentuated by the use of wide leads and coarse, if summary, painting: or, alternatively, the flesh only is painted, while the robes and ornament are an agglomeration of fragments, the only drawing being supplied by the shaping and leading of the pieces.

The Craft of the Glazier

It is obvious that the whole art is based on the craft of the glazier, and it is historically true that as the painter pushed his way more and more to the front the glazier was thrust more and more into the background, till the art sank to its lowest ebb in the west window of New College Chapel. Here the best that a great colourist like Sir Joshua Reynolds could do was to emit a sort of bituminous fog, while the leading which it was sought to avoid revenges itself by obtruding a rectangular grille across the murky and peeling pictures.

It is not surprising that such an example of the peril of shirking the limitation imposed by the leads should have driven some designers to the opposite extreme. Insistence on glazing for its own sake, and not merely as a technical necessity and wholesome restraint upon the painter's vagaries, is obvious in the work of the Thick school. Much of the leading, especially of skies and backgrounds, is in roughly parallel lines, the cames are unduly wide, and there is an effort to draw with the leads as far as possible, in addition to using them for their necessary function of connecting pieces of different colours. An unpleasant obtrusiveness is the result, together with that tinge of commonness which ever accompanies exaggeration and departure from the golden mean. It is hardly too much to say that some of the more anarchic developments of this modern school are as eye-splitting as anything that was done by the despised tradesmen of the nineteenth century.

The Thin school arose in reaction against the over-painting, excessive modelling and pictorial tendencies observable in some contemporary work, which it aimed at correcting by reversion to the fair colouring and delicate painting characteristic of the later mediæval work. Much of the glass it has produced, while noteworthy for careful design, always on an architectonic basis, has likewise suffered from exaggeration. Reaction against realistic modelling of form has resulted in the thinness and flatness of a transparency, with an appearance of timidity which the irreverent might call washiness.

Preference for the "Thin" School

For old churches I am inclined to prefer work of the Thin school. Its very lack of push and individualism, even its occasional vapidity, are less likely to disturb the serenity and repose that should characterize every church. What the Thick school gains in freshness and emphasis it is apt to lose in refinement. Its work is too personal ever to fade into the quiet atmosphere of an ancient building. With a reinforced concrete and thoroughly up-to-date church I feel it would be perfectly congruous.

The risks which the two schools have to guard against are insipidity in the one case, violence in the other. Who shall decide where the greater danger lies? The only advice I can give is the classic advice of common sense, *μηδὲν ἄγαν*, which may be translated, "never overdo it."

Extracts from a paper read by the author at the R.I.B.A. on Monday last.

THE A.R.P. FILM STUDIOS, EALING GREEN, W.

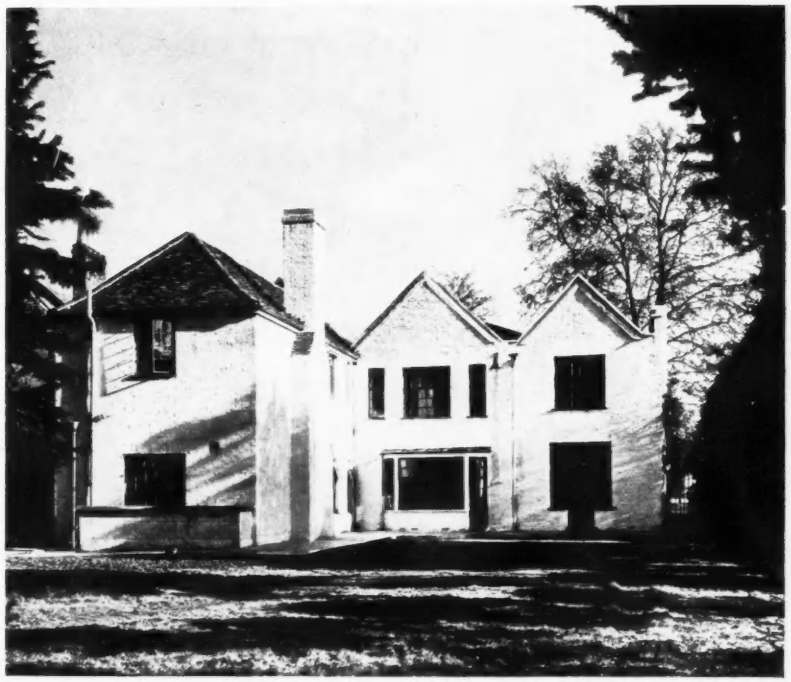
DESIGNED BY MESSRS. ROBERT ATKINSON

The administration block stands at the entrance to the property, some 80 ft. away in an easterly direction from the canteen shown on the layout plan reproduced on the following pages. It is connected by telephone to every part of the studio buildings.

THE question whether this country or America yields the finest films is always one of desperate speculation—and argument. Critical discernment offers no satisfactory solution for the patron, who, to enjoy the film, must assume not an examining but a believing frame of mind; to whom, as with poetry, "its imitations, like the realities from which they are taken, are subject, not for connoisseurship, but for tears and laughter, resentment and affection, and who are too much under the influence of the illusion to admire the genius which has produced it." In the moment in which the skill of the artist is perceived the spell of the art is broken.

Every mechanical and other means for obtaining and disguising this peculiar skill has been adopted in the new film studios of the Associated Radio Pictures at Ealing Green. In planning and design they are admirably suited to their purpose, and many unique features are incorporated in the construction and equipment. In fact, the studios are regarded as among if not the most modern in Europe.

In the studio, or stage, one of the most important problems confronting the architects was the exclusion of noise. There are two studios, or stages, the second of which is shortly to be erected. These are built as a steel-framed building, with solid brick walls, the dividing wall being carried on insulated foundations as a safeguard against



Another view of the administration block. The gardens to this building have been specially laid out to provide settings for possible use during the production of films.

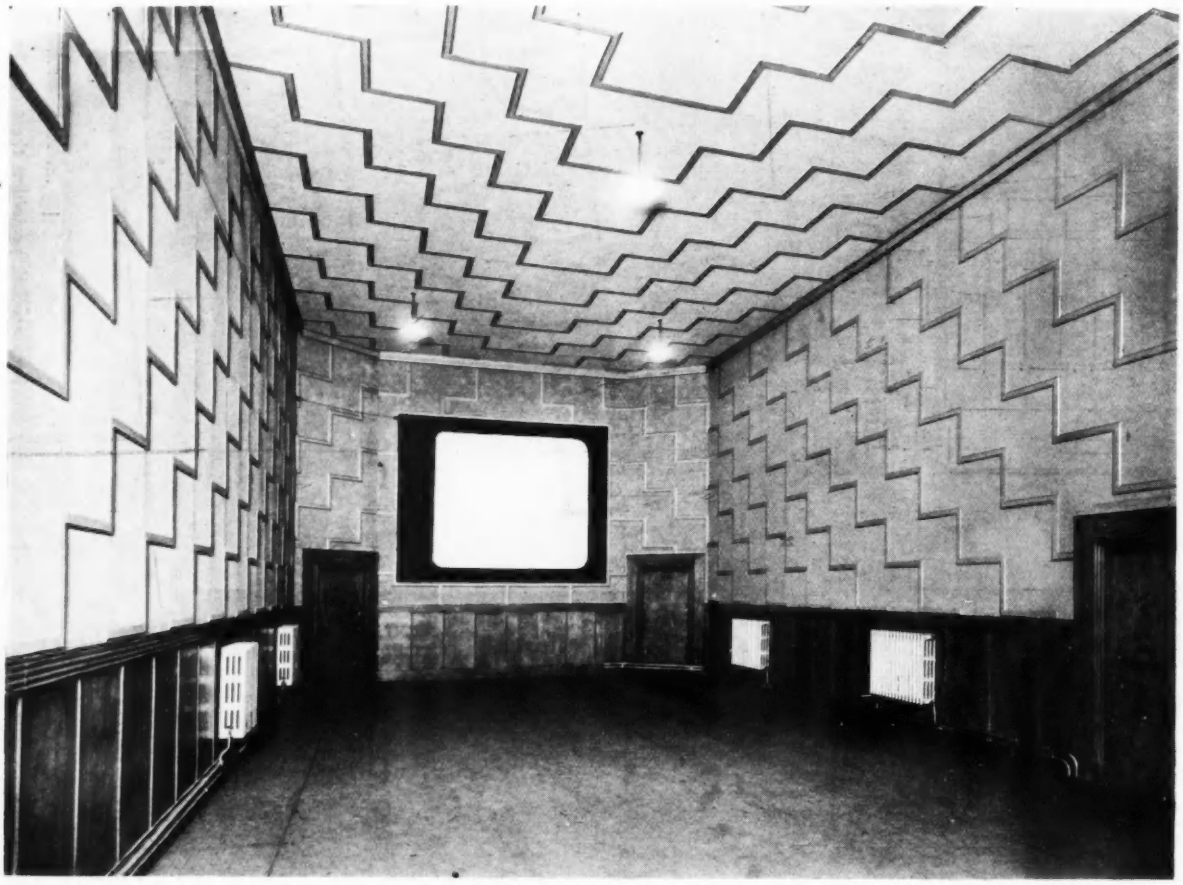
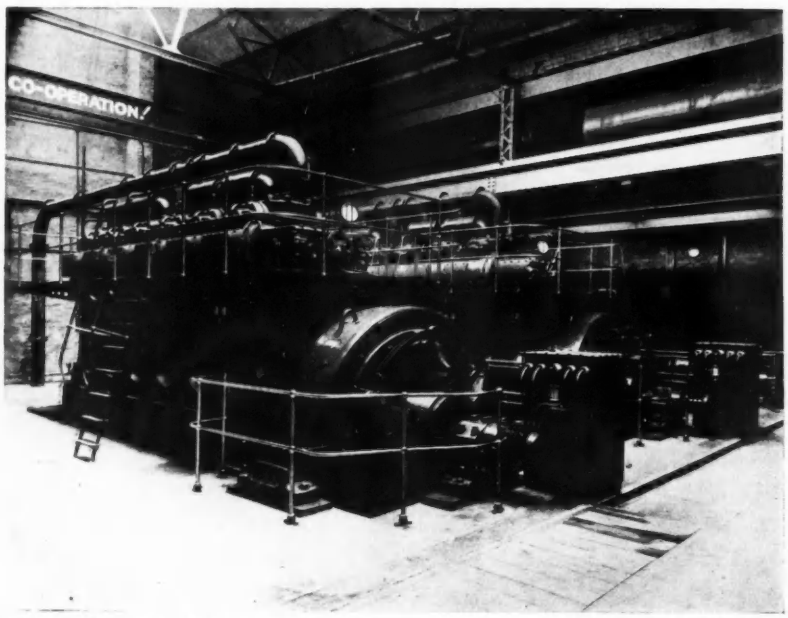
A. R. P. Studios, Ealing Green, W.] [*By Messrs. Robert Atkinson.*

A photograph of the exterior of the studio; and the layout plan of the site. An interior view of one of the stages appears as the frontispiece to this issue. The scheme includes two stages or studios, one of which only has been erected, projection theatre, rehearsal hall, dressing-rooms for "stars" and for the crowd, property department, and canteen.



The projection theatre is used for important pre-views, etc. At the back is the recording and effects room. A prism in the door enables the effects man to see the film from his room. The acoustic effects are similar to those of a large cinema.



A.R.P. Studios, Ealing Green, W.] [*By Messrs. Robert Atkinson.*

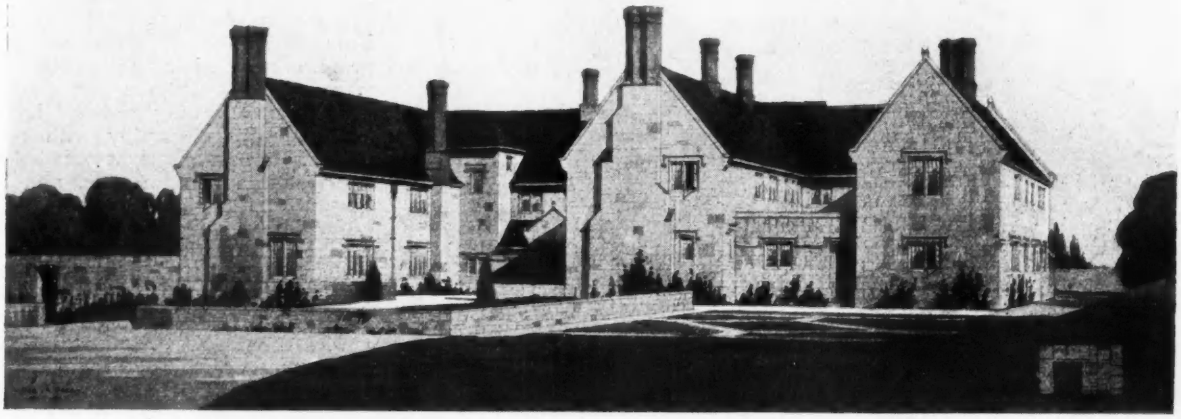
In the power house are two 600 b.h.p. six cylinder vertical cold starting oil engines direct coupled to d.c. generators and one 225 b.h.p. six cylinder vertical oil engine coupled to an a.c. generator. The two former sets are for studio lighting, the latter for generating power for the workshops and general service.

the transmission of noise and vibration between one stage and the other. On the inside of the walls are independent partitions of sound-proof materials, forming an internal shell right round the studio. A still further precaution against noise is provided by the two doors at the main entrance to the studio. Each door rises and falls in one piece. Specially designed mechanism ensures that each door, when in the closed position, is clamped tightly against the adjoining wall, and when falling, opens a flap in the floor below, which allows the door to fit tightly into a trench below floor level.

Among the other important factors to be considered was air-conditioning. The whole of the apparatus for this purpose, in so far as the studio is concerned, is operated from a remote control. Air is taken from outside and passed through an apparatus for warming before work commences in the winter time, and thence by specially constructed channels to the studio itself, where it is delivered in large volumes very slowly and absolutely silently. A means has also been devised whereby the input of cool fresh air can be enormously increased between periods of actual taking of pictures.

BERKS, BUCKS AND OXON ARCHITECTURAL EXHIBITION

REVIEWED BY A. TRYSTAN EDWARDS

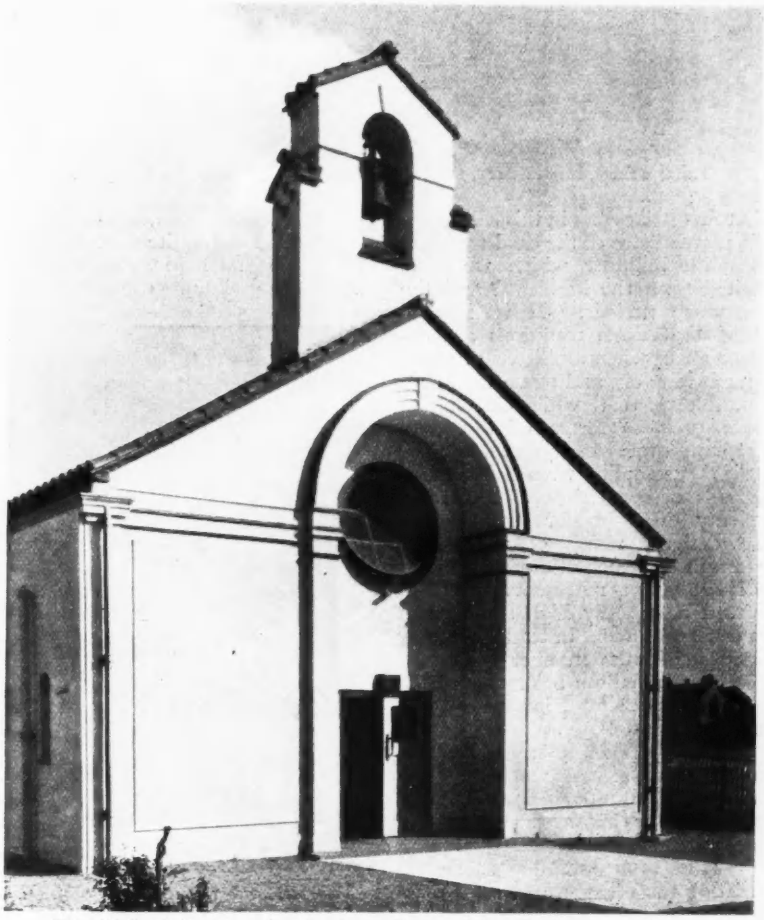


A perspective sketch of Chippenham Manor, near Oxford, reconstructed from designs by N. Fielding Dodd.

IT is five years since these three flourishing architectural societies combined to give an exhibition of their members' work, the last occasion being at Reading. The present exhibition, which was opened in the Oxford Town Hall on December 10, is a particularly good one, and not only serves to emphasize the activity and usefulness of such provincial societies, but comes at an especially opportune time when Oxford is the centre of a marked revival of interest in architecture.

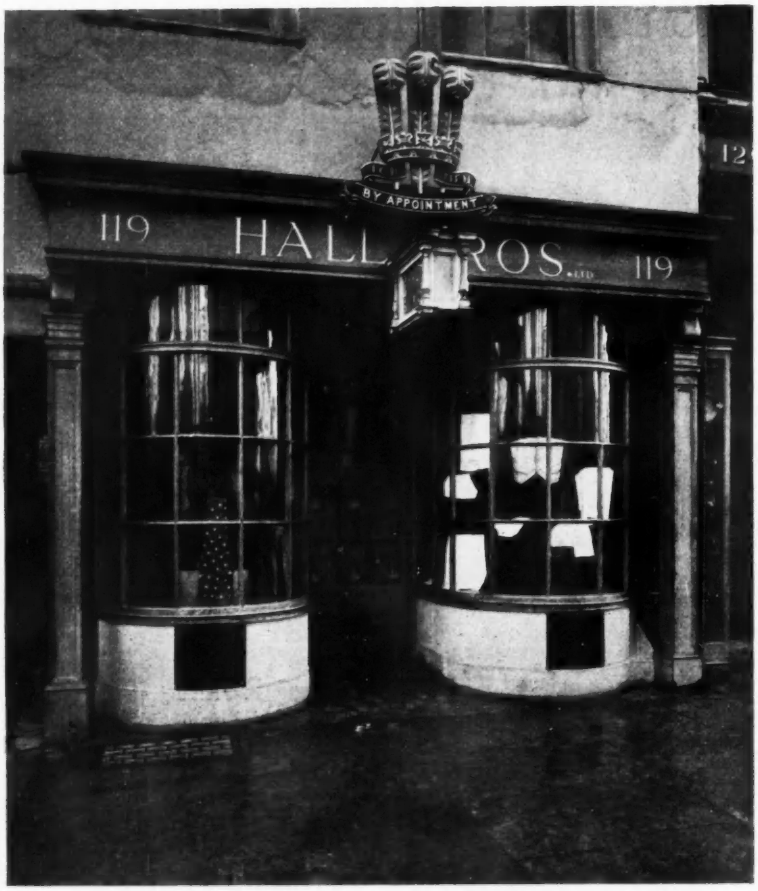
As Mr. Lawrence Dale said in his opening address, members of the architectural profession now have their actions criticized by the public, which expects of them a very high standard of accomplishment and service, and in an historic city such as Oxford the task of the modern architect is rendered doubly difficult by the necessity to harmonize new buildings with the old. Everybody has heard of the Oxford Preservation Society, which is doing its best to prevent the worst architectural atrocities now being committed in Oxford and its environs.

But the aims of the society may be advanced in two ways, first, by censuring the bad work and, secondly, by encouraging the good. This latter object is served by the present exhibition, which should prove to the residents of Oxford that architects in the three counties here represented deserve well of the public and should be encouraged to supervise a far greater proportion of the building work executed in this area than actually falls to their lot.



The Hall of St. Francis, Cowley. Designed by T. Lawrence Dale.

C



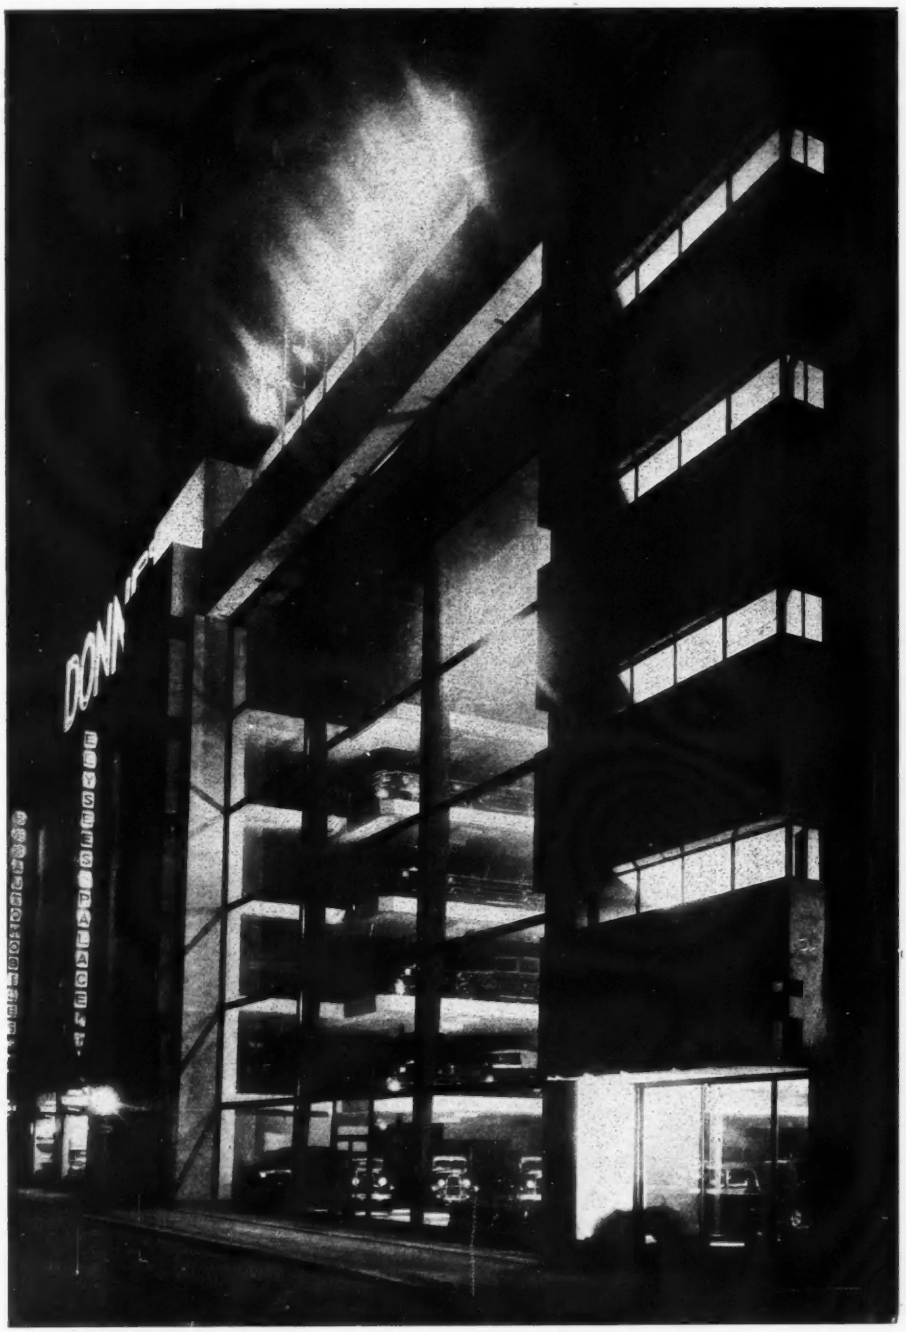
Tailor's shop, High Street, Oxford. Designed by Gilbert T. Gardner.

What first strikes one in this exhibition is the permanence of the dual tradition of English building which we have inherited from the Mediæval and the Renaissance periods. It is idle to pretend that these traditions are extinct or effete when architects of today are inclined again and again to exploit them, finding that, while cleaving to certain gracious forms of the past, they can quite easily make their buildings exemplify twentieth-century standards of convenience. Yet there is plenty of scope for invention in these designs, many of which are modern in the true sense of this word: that is to say, they represent an advance upon an admittedly high standard of past accomplishment instead of starting from zero, in the manner attempted by so many of those belonging to the school of architectural iconoclasts.

Chippinghurst Manor, designed by R. Fielding Dodd, is an admirable example of this sane traditionalism: it is scholarly without being pretentious. Moreover, it has an air of solid comfort. The new St. Peter's Hall, Oxford, shows the same architect's skill in recreating the collegiate style, while in his design for Winfield Orthopædic Hospital, Headington, illustrated by a charming model, quite another manner is displayed, for here we have a strictly utilitarian building conceived on a quite new type of plan. Lawrence Dale, who this year is the President of the Association, shows a number of interesting designs. His village housing scheme, at Wroxton, Oxfordshire, is a delightful group of country dwellings; while the little church here illustrated, the Hall of St. Francis at Cowley, has the qualities of the Regency style. Gilbert Gardner is well represented in this exhibition. Barclay's Bank, St. Aldate's, is a good example of modern Georgian, as is also the beautiful little shopfront, a photograph of which is reproduced on this page. Thomas Rayson has done a number of charming thatched houses which accord admirably with rural scenery, but on the right occasion he affects a more urban style, and the house at Ightham, although of small dimensions, has dignity and refinement. Other interesting exhibits include a design for Corpus Christi College barge by N. W. Harrison; decorations for the Regimental Chapel, Christ Church Cathedral, by H. S. Rogers; an attractively designed farmhouse by Reginald Rix; and several public-houses by H. J. Stribling, which show that this type of building, when treated skilfully, can be an architectural ornament to the countryside.

The arrangement of the exhibition was admirable, and it is noteworthy that the designs were arranged as far as possible in categories of subject, and there was an avoidance of that "jerkiness," the indiscriminate juxtaposition of contrasts in theme which is so distressing in the architectural room at the Royal Academy. In connection with this exhibition there was a conference, at which matters of architectural importance were discussed.

The garden front of "Lady Wood," Ightham, Kent. Designed by Thomas Rayson.



The exterior of the Garage Marbeuf by night. The window space is some 60 feet high and 70 feet wide, and is set back between massive stonework.

These showrooms, facing the rue Marbeuf, are new; behind is a slightly older building, garaging 500 cars, with double-ramp access from floor to floor.

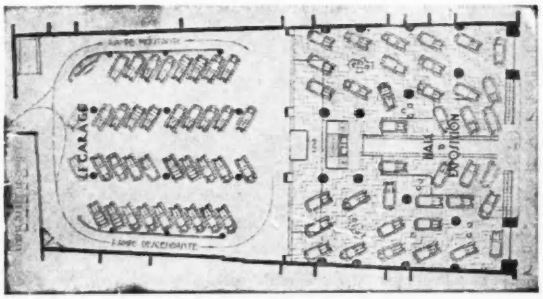
GARAGE MARBEUF MOTOR SHOWROOMS PARIS

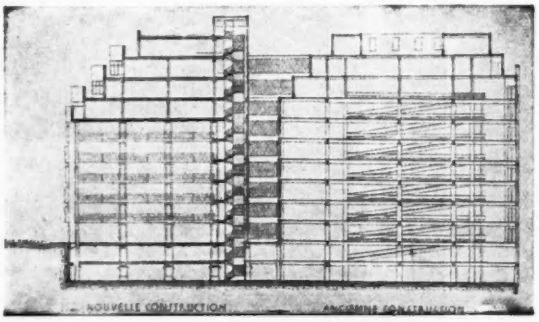
Laprade and Bazin *Architects*

DESCRIBED BY J. E. F. DE LUNE

THE erection of the gigantic Marbeuf car exhibition hall, off the Champs Elysées, marked the beginning of a new era in the architecture of commercial buildings in Paris. We owe it to the talent and the audacity of Messrs. Laprade and Bazin, well-known figures in the new generation of French architects. Covering a surface of over 3,800 sq. ft., it rises eight stories above the street level, in addition to affording two underground.

The street front is a marvel of boldness: between two powerful blocks of reinforced concrete, striped with oblong windows, spreads a huge glass front, 60 ft. high and 70 ft. wide, over which a wide lintel of concrete runs, upheld by two pillars of gracefully-curved steel, creating, by their slender elegance, an interesting contrast with the massive stonework. The uppermost floors are on a succession of cubic setbacks, and

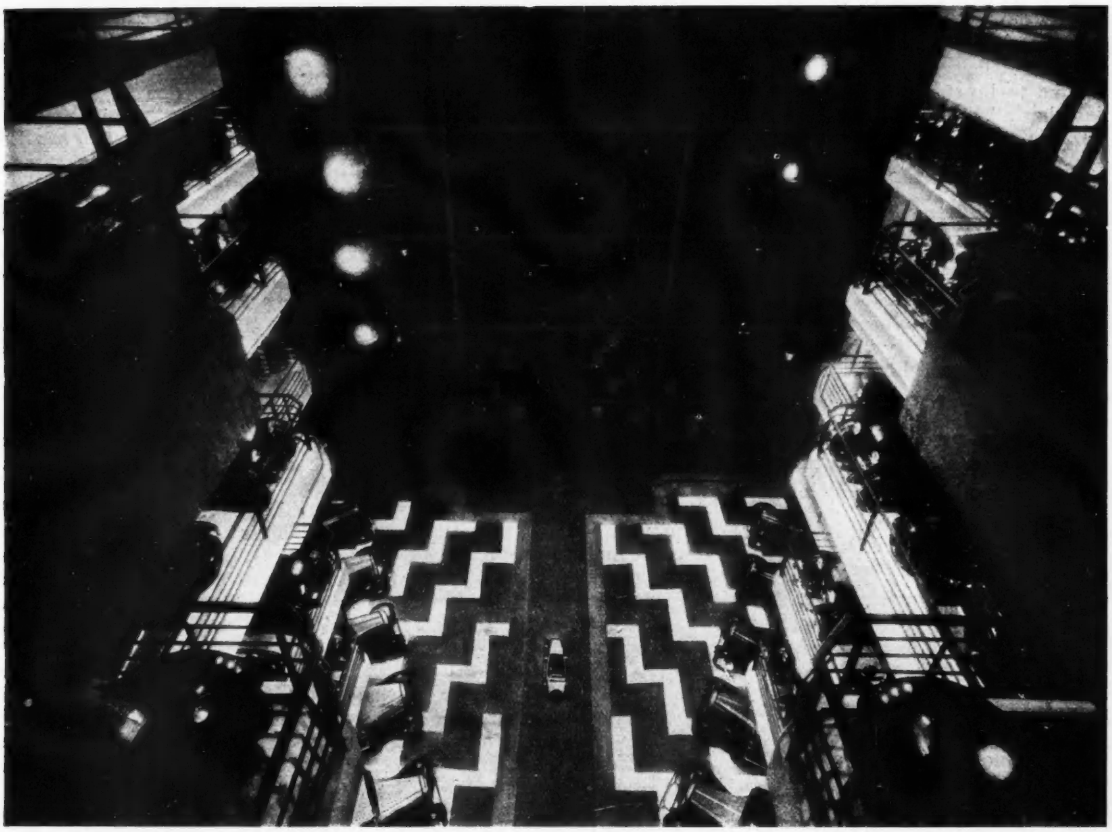




A perspective drawing of the exterior; ground floor plan; and section. In the plan the new building, facing the rue Marbeuf, is shown on the right; in the section, on the left. Both illustrate the operation of the double ramp system of communication for cars passing from floor to floor.

Garage Marbeuf, Paris.] [*By Laprade and Bazin.*

Looking upwards in the showrooms. In this unique design, the floors are arranged as balconies overlooking the ground floor, and the upper tiers are set back, thus adding to the effect of immensity produced on a spectator in the street, whence they are all visible.



Garage Marbeuf, Paris.] [*By Laprade and Bazin*

Looking downwards in the showrooms. The single car standing in the centre of the ground floor gives a graphic idea of the scale on which the building is conceived. Facing the camera is the enormous window to the street seen in the illustration reproduced on page 801.

on the top is a roof garden, well above the surrounding houses. The colour scheme of the whole stonework is in a deep yellow.

The interior contains five balconies, also in reinforced concrete, setting back at right angles and joining in the rear of the hall, where the staircase and the elevators make a centre axis.

A peculiarity of the construction is the massive pillars which uphold the galleries in the main hall. In the underground floors they are made of reinforced concrete, whereas above the street level they are of steel only. The reason of this new conception was the desire for rapidity of erection, which, in fact, was very great, the first two two floors and the basement being ready for use within two months.

Behind the car hall spreads a great garage built in 1926 and capable of parking over 500 cars. A novelty in it was the double ramp, one rising, the other descending, at each floor level.

We must be thankful to Messrs. Laprade and Bazin for having dared to make an actual realization of the principles of modern architecture—light, space and simplicity. Now that they have proved what can be done in this style on a large scale, no doubt their example will be followed and they will find many imitators—a sure sign of success.

LETTERS FROM READERS

Plaster for Concrete Ceilings

SIR,—The most satisfactory method of providing a good key for plaster on the soffit of concrete floors and ceilings is to fill in a layer about ¾ in. thick of concrete, mixed with fine aggregate and cement only, with no sand. The bulk concrete can then be filled in on top of this, and it will be found that when the centering is struck a very adequate key is left.

With regard to the mixture of the plaster to be applied to this surface, the best results are obtained with a gauged plaster consisting of a mixture of one part of lime putty to two parts of sand, with one of Portland cement added to four of this mixture.

There is a liquid on the market which can be painted on the shuttering and affords very good results, as it acts upon the cement and leaves a rough surface when the shuttering is removed.

Anyone requiring to go into the question of plastering thoroughly would be well advised to get into touch with the Building Research Station, near Watford, as they have devoted a lot of time to the subject, and from time to time published results of their researches. HERBERT BUCKLAND

The New Form of Contract

SIR,—It is pleasing to observe that a series of articles written by an expert, and dealing with the new Form of Contract, have commenced in the JOURNAL, for the first reading of a document of this kind is very difficult without an outline of the principal clauses from the legal mind.

Mr. Hoare has commenced by pointing out what he considers are certain benefits to the architect in the new form, and I trust that he will provide both myself, and others who are equally despondent, with reason for good cheer when he describes (and I hope he does) Clause ten, and that depressing finale to Clause one,

introducing "expense and loss," which reads in conjunction with Clause ten.

Describing matters in connection with the Arbitration Clause, which is in two sections (one to be struck out), "A," providing that all disputes are referred to arbitration, and "B," which is similar to the clause in the old form, and leaves certain matters to the sole discretion of the architect, Mr. Hoare has formed an opinion that these matters, left to the architect's discretion, may not, after all, be excepted from arbitration.

Would Mr. Hoare kindly inform us as to the wording in the early clauses of the contract which leads him to make this suggestion.

Possibly many architects will feel happier by being relieved from the position of *quasi-arbiter*, and will prefer to let section "A" in the clause stand; but section "B" would be useless if reliance cannot be placed upon it.

G. E. D.

The Seven Sisters Ramp

SIR,—I had always thought your Journal a strict guardian of all the amenities of the countryside. I was therefore surprised and shocked at Astragal's recent remarks, and the letter printed in last week's issue.

I am a motorist myself, and welcome the car as a helpmate in discovering the country's beauties. Nevertheless, I was overjoyed at the perfectly reasonable provision in the Traffic Act, allowing motorists to park within a few yards of a roadway but to go nowhere else. Must motorists disturb every haunt of peace and quiet because it is possible to get a car there? Not long ago I went down to the South Downs, leaving my car by a lane at the foot of the hills, and walking over to Chanctonbury. To my horror, when I got there I found cars roving over the beautiful turf, scoring it with wheel marks and utterly disturbing the peace and joy of the place. I have also found people running cars (with gramophones or wireless sets!) on to such places as the top of Holmbury Hill. Would Astragal condone such things?

I have been a walker for thirty years, and although I now frequently use a car to assist me in walks, I have found that the country cannot really be enjoyed except by walking, and cars should be kept within limits. And when will someone tackle the nuisance of these motor cycle trials ("trials," indeed, to the walker) that invade the tracks through our woodlands, and over all our hills and paths, making Sundays hideous? COUNTRY LOVER

QUESTIONS THAT ARISE

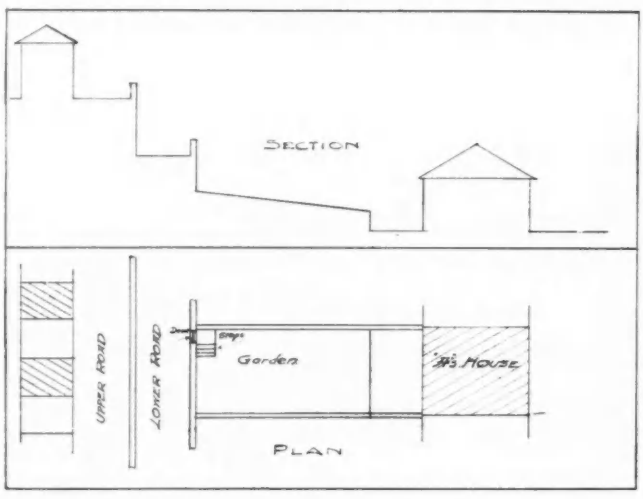
Ownership of Wall

J. T. B. writes: "*The accompanying sketch shows the situation of a wall between a road and private property. The wall collapsed into the garden about two years ago, and the urban district council, who maintain the road, called upon the owner of the property to rebuild the wall. The owner denied liability, and nothing further was done except that the council fenced off the breach and kept it lighted each night.*

"*About a year ago the council decided to rebuild the wall, and are now suing the owner for the cost of doing so. Is the owner liable* (a) *for the whole wall;* (b) *for that part of the wall above the road level;* or (c) *for that part of the wall below the road level?*

"*It is suggested by the council that this road is not an ordinary one, inasmuch as it leads across what was originally the property of an earl, who was the owner of the whole of the property. When the urban council came into being, the road was 'as an accommodation' taken over and maintained.* (*This is only, so far, a surmise.*) *In other words, the wall was built originally to divide two properties before the road came into being, and the road was afterwards constructed, as it so happened, against the wall. The council also contend that the wall is as necessary for the protection of the owner 'A''s property as it is for the road. There is a door through the wall providing a rear entrance to 'A''s garden, and steps lead down from the door into the garden. These steps also collapsed with the wall, and have been, of course, re-erected by the council.*

"*The council state that if the wall is the property of the council, 'A' has no right to build against it, or attach any fixtures to it, and that they should have permission to examine the wall on the inside to see that it is in order. They also state that a limit should be set to the depth to which 'A' may dig his garden. They point out that 'A' is, in fact, using the wall for hanging clothes lines* (*thus adding to the strain on the wall*), *and has undermined it by digging, and also that the steps and doorway indicate responsibility for the maintenance of the wall. The wall extends for about a quarter of a mile on either side, and runs along the rear of a great number of gardens. In places there is a sheer 'drop' of 40 ft. from road level to the garden, and at such a place the wall stands on a rock foundation, this rocky cliff extending almost up to road surface.*"



Plan and section showing the situation of the wall between a road and private property, referred to in the query on this page.

I am clearly of opinion that the council do not own the wall, and "A" is under no liability to maintain it in the absence of express agreement to the contrary. "A" has a liability to fence off his property so as to avoid permitting a danger to those on the highway. If he fails to do so, the highway authority can undertake the work and recover the cost thereof from "A."

Taking over a road by the highway authority is for the purpose of maintaining it, but the act of taking over does not divest the ownership in the soil under the road from whom it was vested immediately prior to the act of taking over (see *Harrison* v. *Duke of Rutland* [*1893*] *1 Q.B. 155*; *Hickman* v. *Maisey* [*1900*] *1 Q.B. 752*).

It will therefore follow that the wall did not pass to the council when the road was taken over, and that "A" can use it however he pleases.

In my view, the council was entitled to erect a proper fence only so far as it was necessary to prevent danger to those using the highway for a lawful purpose, but this may not extend to the cost of the re-erection of a brick wall.

It must be appreciated that the question does not contain a complete history of the property, and therefore I have dealt with the matter on general principles which may, or may not, have to be modified in the light of all the facts. E. F. I.

THE NEW R.I.B.A. FORM OF CONTRACT

BY MICHAEL HOARE, B.A.

Joint Author of The Standard Form of Building Contract

IN every form of building contract some provision has to be included whereby variations can be made in the design or method of execution of the building while the work is actually under construction, that is to say, after the contract price has been agreed; and both the 1909 form and the new form contain a clause providing that no variation shall vitiate the contract and that the architect shall have power to order extras for which the contractor is entitled to extra payment. Both forms also provide in effect that should an error in description or in quantity of the works appear in the bills of quantities, or should any item of work be omitted from them, the misdescription, error or omission is to be rectified and treated as an extra. So far as it goes, such a provision is satisfactory enough, but more than this is required. In what circumstances can there be said to be "an error in the bills of quantities" which is to be treated in this way? The contractor undertakes in normal cases to execute the contract works for a named sum, in accordance with the articles of agreement, which incorporate the conditions of contract, the plans, drawings, specifications and bills of quantities. In some cases, in order to achieve the result required by the plans, drawings and specifications, it becomes necessary to execute work or provide materials which are either not specifically or not sufficiently described in the bills of quantities, and not infrequently in the past the question whether the omission to mention or the insufficient description of such work in the bills amounts to "an error in the bills" has given rise to dispute.

For example, it may not appear from a reading of the bills of quantities what is the nature of the soil in which the necessary excavations have to be made, or whether the soil on the whole of the site is of the same nature. If, after the works have started, the contractor meets with some serious obstruction in the soil which increases the cost of excavation, the increase may be so serious that the contract price is, from the contractor's point of view, quite inadequate. Can the contractor in these circumstances claim to be entitled to extra payment?

Again, cases have arisen in which the cost to the contractor of carrying out the joinery and plastering work described in the bills has been far in excess of the amount contemplated by him when pricing the bills: the angles, curves and reveals, which appear upon the plans have not been enumerated or described in the bills, and the question has arisen whether there can in the circumstances be said to be an error in the bills. The difficulty confronting the contractor of contending successfully that there is an error, and that he is entitled to extra payment for work not specifically or sufficiently described in the bills, is increased when it is plain upon the face of the other contract documents, the drawings and the specification, that such works are contemplated. This difficulty was even more formidable when the contract in question was in the 1909 form, for that form contained the following condition:

> The contractor shall provide everything necessary for the proper execution of the works according to the true intent and meaning of the drawings and specification taken together, whether the same may or may not be particularly shown on the drawings or described in the specification provided that the same is reasonably to be inferred therefrom.

In fairness to contractors a very important change has been made by the 1931 form in the conditions of contract dealing with this matter. It will be remembered that in 1922 the Chartered Surveyors' Institution, with the approval of the building trade, issued a code prescribing a standard method of measurement of building works and laying down rules to be observed in the preparation of bills of quantities. These rules state what matters are specially to be brought to the notice of contractors, how measurements in particular cases are to be given and—perhaps the most important of all—what matters are to be separately specified.

Some instances, taken at random, will serve to illustrate the importance of these provisions. Under the heading "Excavation" the rules provide: "Where practicable the nature of the soil shall be described and attention shall be drawn to existing trial holes. Excavation in rock shall be given separately." Under "Bricklayer": "Walls built battering shall be given separately and so described. Rough cutting shall be measured at each change of direction," and under "Plasterer": "Arrises, quirks and rounded angles (internal and external), whether to ceiling or wall plastering, and junctions of new and old work shall be given in feet run. The mitres, etc., to rounded angles of 1-in. radius and over shall be enumerated." While with regard to moulding generally it is provided that "raking and circular portions shall be given separately, and all mitres, ramps, stops, etc., enumerated."

If a bill of quantities has been prepared in accordance with these rules, the contractor will be able by reading the bills of quantities alone, and without reference to the other contract documents, fully to inform himself of all matters to be taken into consideration when pricing the bills and of any circumstances which are likely to make the operations which he is being asked to perform more expensive than usual; and if these rules, detailed as they are, are made obligatory and binding upon the employer, the vexed question as to whether there is or is not an "error in the bills of quantities" can no longer be the source of dispute which it has been in the past; for if anything is not described in the manner laid down by the rules or any item of work required to be given separately is not so given, there will clearly be an error in the bills.

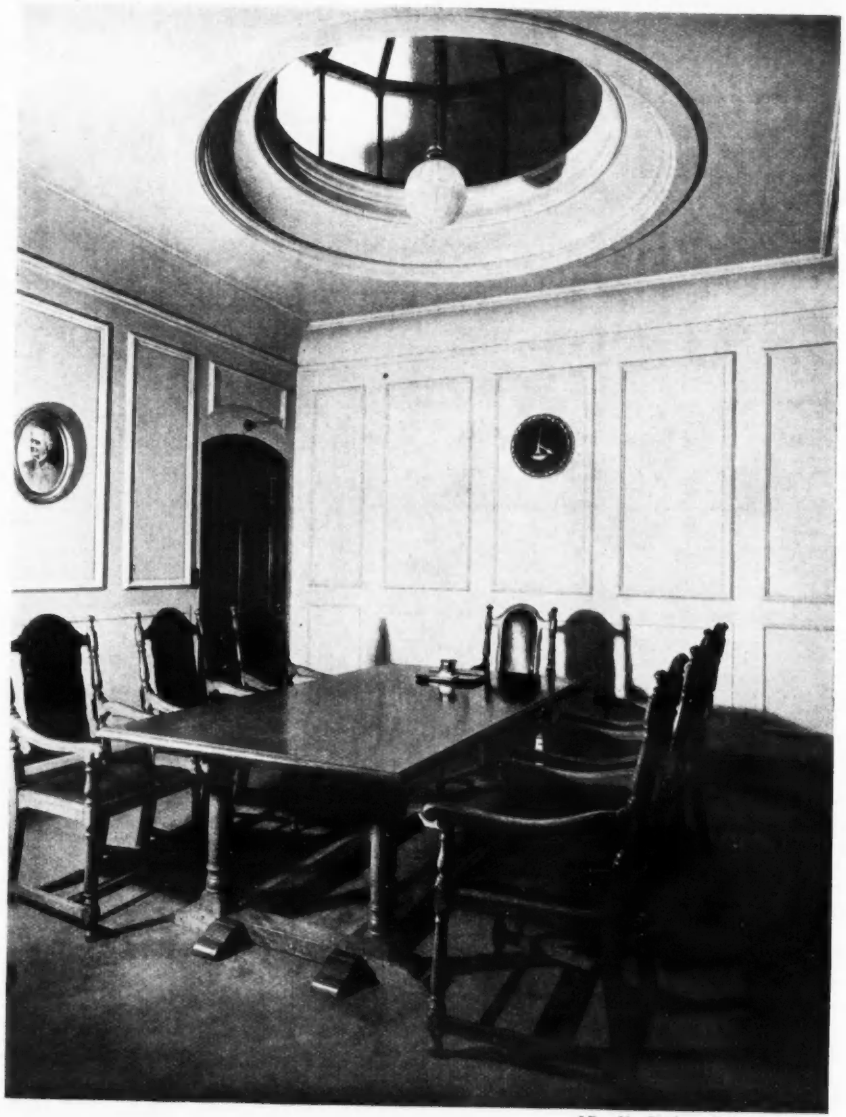
The new form, therefore, while retaining the old provision that "any error in description or in quantity in or omission of items from the bills of quantities shall . . . be rectified and treated as an extra or omission," also provides that "the quality and quantity of the work included in the contract sum shall be deemed to be that which is set out in the bills of quantities, which bills, unless otherwise stated, shall be deemed to have been prepared in accordance with the Standard Method of Measurement of Building Works last before issued by the Chartered Surveyors' Institution." And, in order to remove any uncertainty which might still remain and to make plain the new importance which for the future is to attach to the bills of quantities, the conditions require the contractor to provide everything necessary according to the true intent and meaning not only—as hitherto—of the drawings and specification taken together, but according to the true intent and meaning of those two documents and the bills of quantities taken together.

It is not the contractor alone who will benefit by this innovation: immunity from the possibility of dispute is equally beneficial to both parties, while the precise description in the bills of the work to be done and the plain definition of what is "an error in the bills" will relieve the contractor of the arduous and often lengthy task of examining and checking the bills, and so give the employer the advantage of close tendering at a keen price.

[*To be concluded—the first article on this subject appeared on December 2.*]

Ninth Church of Christ, Scientist, Westminster, S.W.]

In the article commencing on the facing page, tribute is paid to the manner in which this building meets the comprehensive programme of requirements laid down—among them, ample cloak and lavatory accommodation. The cloak room and curved corridor here shown are under the main auditorium, and may be identified near the centre of section A-A, reproduced on page 809.



[*By Sir Herbert Baker, A.R.A.*

Christian Scientists take a very wide view of the social obligations associated with their tenets: to fulfil their needs, a church must be very much more than a mere place of worship. Accordingly, adjacent to the entrance hall giving access to church proper and Sunday school, a number of offices are provided, on several floors. This photograph is of the top-lit board room.

CHRISTIAN SCIENCE CHURCHES

Their Plan Requirements as Exemplified in the Latest London Building

BY J. S. BRAITHWAITE

A considerable number of Christian Science churches have been put up in England since the war. Several of them have been the work of distinguished architects, and have formed splendid and lasting contributions to the architecture of today. The Christian Science church presents a novel and somewhat complicated problem of design, and in the latest of these churches, the Ninth Church of Christ, Scientist, in Marsham Street, by Sir Herbert Baker, A.R.A., this problem is solved more completely and in a more representative manner than in any previous church of this kind. The architect, in this case, had an unusually full and carefully-thought-out programme put before him, with the result that his work is rich in subtleties of planning and arrangement. The following notes on the arrangement of the church will doubtless establish a precedent for many years to come. They have been written for THE ARCHITECTS' JOURNAL by a prominent member of the Building Committee.

IN THE ARCHITECTS' JOURNAL for May 25, 1927, there appeared an article entitled "Church Form and Christian Science," by Hope Bagenal, dealing with the acoustic problems that confront an architect approaching the question of designing a Christian Science church building.

What Mr. Bagenal did not touch on, however, was the accommodation which is necessary in order to present a completed structure for use as a Christian Science church.

CHRISTIAN SCIENCE NEEDS

What *are* the needs of a Christian Science church? Undoubtedly Mrs. Eddy has given to the world an idea of Church which is different from that ordinarily entertained. She does not restrict the use of a church building to the holding of services, or the provision of a Sunday school. She envisages an institution that has a definite educational purpose. She requires that it shall afford proof of its utility, and this is to take the form of elevating the race and "rousing the dormant understanding from material beliefs to the apprehension of spiritual ideas." (*Science and Health*). All this is included in the healing of sickness and sin, which she postulates as being part of the normal activity of the true followers of Christ.

THE NINTH CHURCH OF CHRIST, SCIENTIST

For the purposes of illustration we select the latest completed church edifice —that of Ninth Church of Christ, Scientist, London, in Marsham Street, Westminster, the building designed by Sir Herbert Baker, of which a brief notice appeared in this JOURNAL in January, 1931.

The main auditorium, which has a seating capacity of 1,100, is circular in form, and is entirely free from pillars or cornices at the floor level, so that the audience in any part of the hall can see and hear the Reader at the desk and *vice versa*—a very important point.

THE SUNDAY SCHOOL

The Sunday school, with its "primitive" form, seats about 500, and in a very simple manner lends itself to subdivision into numerous class-rooms. The architectural merits of both these halls have been dealt with elsewhere. Let us revert briefly to the remainder of the accommodation provided by this building, which meets ideally the requirements of its membership.

ROOMS FOR INDIVIDUALS

In the first place, there are two Readers' rooms, each with lavatory accommodation attached, and giving easy access to the platform. These rooms, which are sometimes used for study, or for interviewing purposes, are pleasant rooms, of a fair size. There is also a room for the organist, and a room for the soloist. These are secondary rooms, as a rule, used only for the brief period of waiting before taking part in the service. The superintendent of the Sunday school has a room, in connection with the Sunday school.

THE BOARD ROOM

The most important of the offices is the board room, which is both well lit and well ventilated, and provides accommodation for a board of seven to nine members. Within easy reach of the board room is the clerk's office, which is itself readily accessible to the main entrance hall, and thus to members, or intending applicants. There is also a treasurer's office.

DRESSING-ROOMS

In close communication with the main auditorium there are two rooms, which might be called dressing-rooms, one for the men ushers, the other for the women ushers. This is rather an important item that is sometimes overlooked, but it is only fair to ushers, who have to present a tidy appearance, to give them quarters where they can complete their toilet. The church supervisor has an office, centrally located, as all the arrangements in connection with the engineering work, the cleaning work, the preparation of committee rooms, etc., must pass through his hands. Then there is the boiler house, where the heating, ventilating and electrical installation is housed; and leading out of this is the engineer's room, which can be used partly as workshop and partly as sitting-room. There is also a room for the use of the women cleaners.

LAVATORIES

Lavatory accommodation is, of course, important, and care has been taken to see that adequate provision is made in this respect, not only for adults, but separately for children as well. Adjacent to one of the lavatories is a room with a specially provided sink for arranging flowers. A large cloak-room, immediately below the auditorium, and from which stairs lead up to the centre of the auditorium, is an important feature, allowing ample space for overcoats, hats and umbrellas, to be checked in before people take their seats in the well warmed and ventilated auditorium.

All of the above accommodation might, perhaps, be looked for in any church building that undertook to provide for a large congregation and Sunday school, though, as a matter of fact, they are seldom to be found in such completeness.

SPECIAL ACCOMMODATION

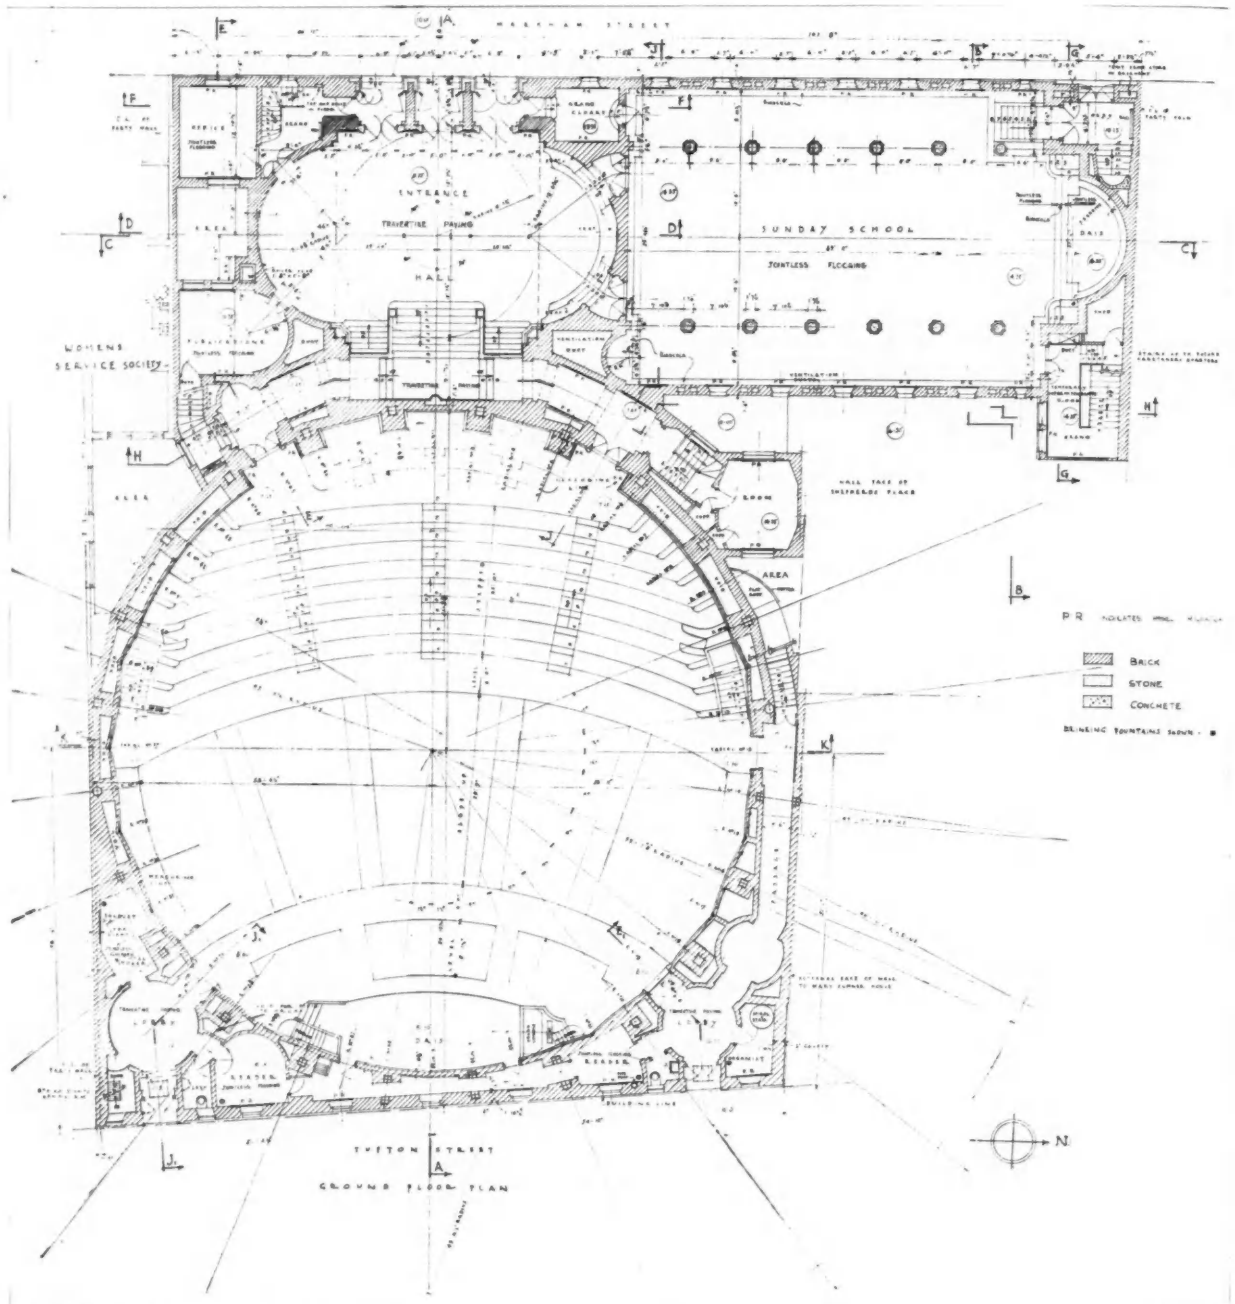
We come now to the special accommodation, which is, perhaps, peculiar to the needs of a Christian Science church. Foremost among this is the entrance hall. Christian Science meetings are regarded as providing an opportunity for the exchange of friendly intercourse before and after the services. This takes place in considerable degree in the beautiful entrance hall which Sir Herbert Baker has provided in the Marsham Street building. Where churches have wide open spaces in front of them the conversations often take place in front of the church; but such a thing would be impossible in a narrow street such as Marsham Street, and the architect wisely took this point into consideration.

ROOMS FOR EDUCATIONAL ACTIVITIES

Next, in regard to the educational activities referred to at the beginning of this article, committees are appointed to deal with such questions as the giving

here shown are under the main auditorium, and may be identified near the centre of section A-A, reproduced on page 809.

and Sunday school, a number of offices are provided, on several floors. This photograph is of the top-lit board room.

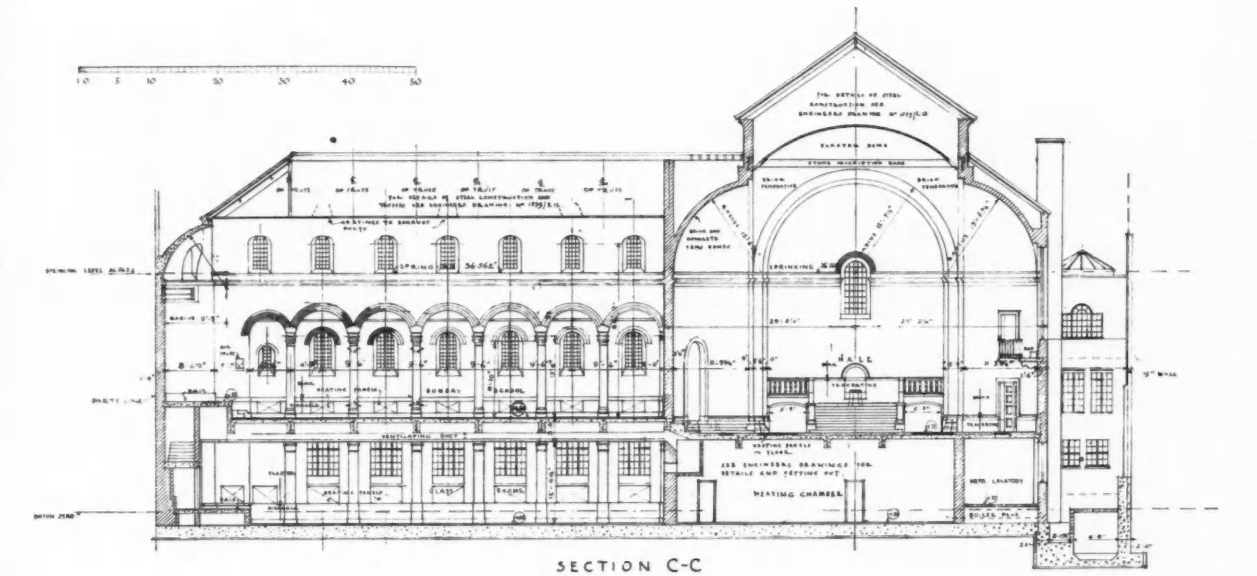


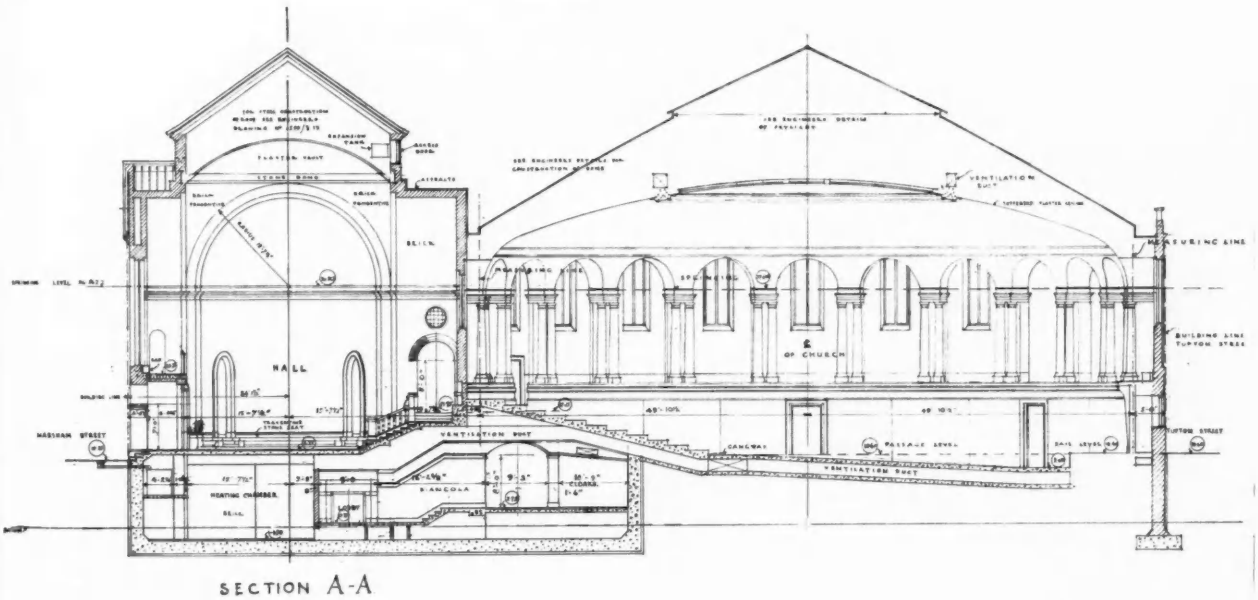
Ninth Church of Christ, Scientist, Westminster, S.W.]

The ground-floor plan will repay the closest comparative scrutiny with the accompanying article. Readers are, no doubt, already familiar with the main lines of Sir Herbert Baker's layout; but it is only by reading the planning details in the light of what he was enjoined to provide that the achievement is fully revealed. As a single instance, it may be pointed out that it is possible for invalids in chairs to be wheeled from the street level into the centre of the auditorium without negotiating any steps; yet steps are a vital element in the design, not only of the beautiful entrance hall, but actually of the auditorium itself.

of lectures and the distribution of literature. There are also a number of other church activities calling for the use of committee rooms. Sir Herbert Baker has provided two committee rooms adjoining the entrance hall, each of which will accommodate a committee of from five to ten people. The actual distribution of literature calls for more space than can be provided by an ordinary committee room, and a large lower hall beneath the Sunday school amply takes care of this committee's requirements, which include the storing of literature and the packing of it into the required parcel form for distribution. This lower hall will also seat about 400, and when the church building is used for a lecture, amplifying arrangements are made both in the Sunday school and in this lower hall, which will thus, in practice, bring the total seating capacity of the church to over 2,000.

This practically completes the list of accommodation, though mention should perhaps be made of a special telephone room and archives room, as well as of





[*By Sir Herbert Baker, A.R.A.*

These two sections are reproduced to the same scale as the plan on the facing page. Section C-C is taken along the centre line of the Sunday school and the major axis of the entrance hall; below the former are a number of class-rooms; adjacent to the latter, several floors of offices. Section A-A is taken along the minor axis of the entrance hall and through the centre of the auditorium. A portion of the floor of the latter nearest the dais is raked, while that farthest away is stepped; by this means, and the circular form of the church, there is not a seat in it which does not afford a direct view of the Reader upon the dais.

the wall drinking founts which are conveniently placed in the corridors.

One other unusual feature, which deserves a place all to itself, is the fact that invalids, in wheel-chairs, can be wheeled along a passage into a space specially roped off at the centre edge of the auditorium, without coming up any steps, and without attracting any attention. This provision is proving itself a great boon.

A MODEL OF ACCOMMODATION

It would be difficult to improve upon the accommodation provided by this latest Christian Science edifice, and the architect is to be congratulated on having so completely interpreted the needs of his clients. There can be no doubt that Christian Scientists require that their buildings shall comply with an exacting test, and they expect them to manifest the qualities of completeness, and orderly and harmonious arrangement, expressive of the Principle which the Christian Scientists themselves are claiming to demonstrate.

LITERATURE

PLATES OF LETTERING

THE Victoria and Albert Museum have just issued four collotype plates (17 ins. by 12 ins., excluding margins) of Eric Gill's lettering. Two, the alphabets of roman capitals and of the lower-case (roman and italic, and the figures 0–9) are reissues of those in circulation among craftsmen for the last twenty-five years. Here they have been enlarged, with some loss of precision, and in the italic alphabet the lighted and shadowed sides of the "V"-cut are barely distinguishable.

In the new panel of roman capitals, printed in black, red and blue, the same essential forms are preserved, cut with more ease and freedom. Curiously, the most attractive of the four is the brushwork lettering from a painted panel, which shows a supreme mastery of the brush as a "writing" instrument, the more so as the forms follow, more closely than is perhaps theoretically plausible, pen-forms. The practice, however, is beyond criticism except for the mannered (and traditional—but that's no real excuse !) DE and CE (the inscription is in French) where the E is painted within the D, thus making these two unimportant words stand out with startling and absurd emphasis.

J. P. T.

APPROXIMATE ESTIMATES

THIS pocket-book for estimating has now reached its sixth edition. It contains measured and prime costs of all building and engineering materials and works used today, as well as much information with regard to military services not to be found in the usual textbooks. The book is arranged in alphabetical order, with each item of the various trades under its own heading. All the prices throughout the book have been carefully revised to accord with the present market prices and rates of wages.

Approximate Estimates. By Colonel T. E. Colman (Staff for Royal Engineer Services). Revised by Clyde Young, F.R.I.B.A. Sixth edition. London: E. and F. N. Spon, Ltd. Price 10s. 6d. net.

ART IN THE LIFE OF MANKIND

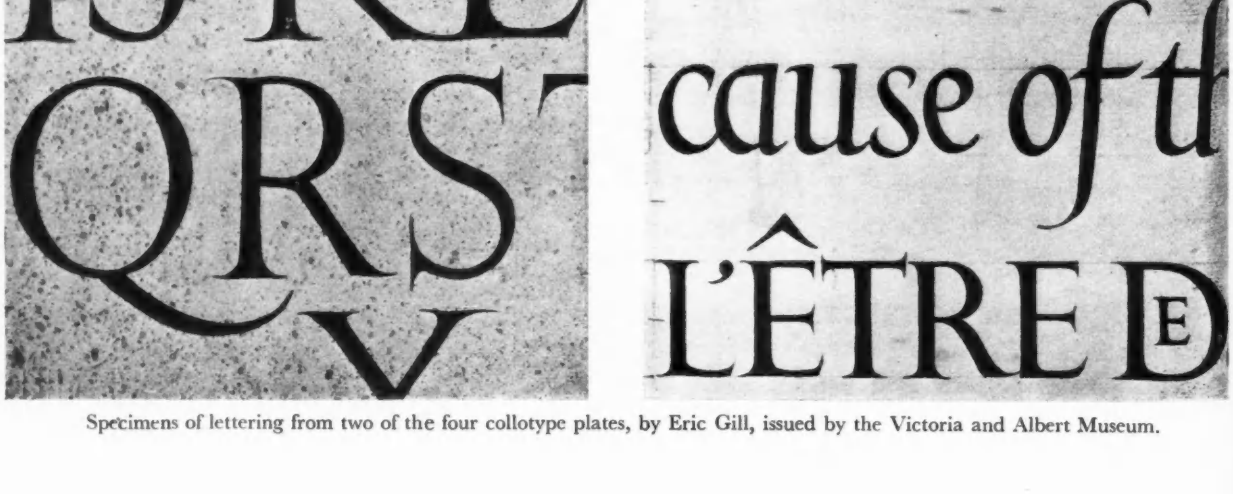
IN these little, well-produced, well-illustrated books, Professor Seaby, of Reading University, has provided a brief survey of two of the most important epochs in the history of art. They are so brief that there is no difficulty in avoiding the impact of the two facts that at once strike the eye.

First, the overwhelming importance of art in the world's history as a record; second, the equally obvious domination of the art of architecture. It is from these brevities that the real significance of art in history emerges. The two hundred pages of these books cover at least two millenia and comprise what we have come to recognize as the great ages of pagan and Early Christian art. From archaic Greek to the merging of Romanesque into Gothic is a wide stretch, not only in art history but in human imagination. There was already in the world great art, the prehistoric, the primitive, Assyrian, Egyptian, yet the Greek seemed to arise of itself, maintain itself throughout a thousand years, and, what is more, to modify the arts with which it was contemporary and to impregnate the succeeding era.

It has, moreover, more profoundly affected all manifestations of the urge to art in all subsequent periods than any other. In point of fact, it has probably had so profound an effect that it has seriously delayed the later evolution of art. The Renaissance paraded the Greek forms, if not the Greek spirit, after Gothic had so nobly striven for freedom. So successfully did it accomplish the classical revival that its influence still persists. We are Greek today and it would seem that only science will liberate us. Greek art is not scientific. Greek architectural structure is stone placed on stone in magnificent form and with a richness of decoration which in its pure beauty has never been equalled. Roman architectural structure was scientific; it developed the arch and made the best use of concrete.

The most noble union of art and science is found in the further development of the arch, the buttress, and the human motive in Gothic. In Greek architecture, sculpture and drawing, however, pure form holds sway throughout. There was representation, but its realism was modified by an aloof and dignified abstraction which has dominated representative art ever since; abstraction of pure beauty in recognizable human forms.

Roman art was not only imitative, but in the secondary degree it actually copied Greek. Its decorative work, figure and geometrical, is not original in form, and only in its extension of realism in the domain of portraiture did it assert an individualistic direction and scheme. In this it was distinctive,



Specimens of lettering from two of the four collotype plates, by Eric Gill, issued by the Victoria and Albert Museum.

sufficiently so as to place upon all future work the mark of the Roman—a mark which almost all the portrait busts of today still bear. All the further influences which radiate from Roman and Romanesque art during its thousand years are dealt with by the author, who includes useful chapters on Early Christian Byzantine, Sasanian, Coptic and Scandinavian manifestations.

Perhaps the most useful feature of the work is that it is so compact as to make possible a simple orientation of these two great phases with the further phases of the world's art.

R.I.B.A. PAMPHLET

The 1931–1932 edition of the R.I.B.A. pamphlet *Membership of the R.I.B.A.* has just been published. Copies may be obtained from the Secretary, R.I.B.A., price 1s. each, exclusive of postage.

The pamphlet, in addition to information regarding the examinations and membership of the R.I.B.A., contains full particulars with regard to architectural training, scholarships available at the schools of architecture recognized for exemption from the R.I.B.A. examinations, and a selected list of books on architectural subjects, etc. Maps showing the local distribution of facilities available for architectural education in England, Wales, Scotland and Ireland, are an important feature of the pamphlet. These maps are accompanied by lists of schools throughout the countries and by a schedule showing the local distribution of facilities. This schedule gives the R.I.B.A. allied societies and their provinces, and states the educational facilities available in the area of each allied society.

BIRMINGHAM ARCHITECTURAL ASSOCIATION

Mr. H. S. Goodhart-Rendel, F.R.I.B.A., lecturing on "The Use of Precedent" at a meeting of the Birmingham Architectural Association, held on December 4, said the domestic architecture of England today appeared to divide into three currents, which he would caricature by calling them the stark, the safe and the winsome. The stark scorned precedent; the safe was greatly indebted to Georgian tradition, reimposed upon it when mid-Victorian ideals faded; the winsome, with its waney weather-boarding and its weeny windows, its crookity-nookity planning and its lovesome little gardens would, he imagined, go on its silly way until there were no more beaches and golf courses to afford it frontage. Its use of precedent was extensive but capricious.

Church architecture nowadays was usually cheap and seldom Gothic. When it was Gothic, or alleged to be so, it redeveloped, in the hands of all but a very few, the crude incompetence shown in the earlier days of the Gothic Revival. The painfully-acquired technique that flowered in such works as the churches in Birmingham by Pearson and Mr. Bidlake had disappeared as though it had never been. With some distinguished exceptions, the pseudo-Romanesque stuff now in vogue seemed to him of no architectural value at all.

A problem of restoration might make an architect something of a copyist, a complication of sentiment might make him an eclectic, his own good schooling might make him in principle an academic, and the necessities of these days must make him a modernist. And in each of these capacities he would have some use for precedent.

In suggesting what that use should be, the lecturer said an architect should never copy in architecture unless he was forced to. Should an architect decide to make an eclectic architectural language in which to express himself, it must be a clear, unequivocal language, free from ready-made phrases and used with absolute logic and consistency. He could often be prudent in risking the accusation of academicism and in taking his language from tradition and authority, provided he did not lose his freedom of self-expression. In doing so he would not forfeit his claim to be a modernist, since new problems called for new combinations that developed themselves into the only kind of new forms that had ever had any real currency or value in their art.

It was better for architects today to keep to their particular problem of giving a soul to the uncouth body of modern engineering than to set their faltering feet in the path up which the

giants of other days made such splendid progress. But it was also good to look back to the triumphs of the past to see what perfection could be.

Mr. J. B. Surman, F.R.I.B.A., presided.

NORFOLK AND NORWICH ASSOCIATION OF ARCHITECTS

"What is Architecture?" was the title of a lecture delivered by Mr. Robert Atkinson, F.R.I.B.A., at a meeting of the above Association, held at Norwich on December 4. Mr. Basil Cozens-Hardy presided.

There were, said Mr. Atkinson, many important buildings which were overdone in design. They were so overelaborated and broken up that in the aggregate they were objectionable. In a general way, however, the public were not deceived. They were never enthusiastic, for instance, on the Gothic revival. What they wanted to see was a building which fulfilled its modern functions. Modern things, such as aeroplanes and great engines and great liners were intensely interesting, and he thought the public expected a development along these lines from the architect. They were quite willing to accept modernity if it was reasonable and good and a development of the function of the building. He thought the present tendency in architecture was to make the bulk of the work simple and to concentrate upon a few very, very, fine things which would have the greater effect because of their contrast with the simplicity of the background.

WEST YORKSHIRE SOCIETY OF ARCHITECTS

Mr. Stephen Simpson presided at a meeting of associate members of the above Society, held at the Leeds College of Art on November 26, when Mr. F. F. Johnson, the winner of the Society's travelling studentship, gave his impressions of Vienna and Prague.

The speaker remarked that, apart from the churches of Vienna, which showed the characteristic faults of German Gothic, by far the most interesting feature of the city was its Baroque architecture. There were, owing to the formerly unsettled state of the country, few examples of the earlier Renaissance. Baroque was the plaything, not of the Emperor, but of his courtiers, who had made Vienna a city of palaces; though there was one church, St. Peter's, built about 1722, which was a charming example of Baroque.

Very little had been heard about the architecture of Prague, though, to the speaker's mind, it was a more romantic city than Vienna. Nowadays, it was simply rampant with architectural experiment which was ruining the aspect of the city. The square of St. Wenceslaus showed a terrible gamut of architectural styles, and had now only one of its old Baroque palaces remaining as a pathetic reminder of a more cultured past. Most of the new work showed a marked departure from Continental traditions in the sense that the sliding sash had almost ousted the double casement. Plate-glass was the rage in Prague—huge, desolate sheets of it, shorn of any subdivisions.

Short papers on their travels in France and Italy were afterwards given by Messrs. A. Tattersfield and W. Bailey, winners of William Nicholson travelling scholarships, controlled by the Society.

ARCHITECTURAL LIGHTING

The seventh and last lecture of the Faraday Illumination Design Course was given by Mr. W. Maitland, A.R.I.B.A., at the E.L.M.A. Lighting Service Bureau on November 23.

The lecturer said the development of lighting during the past two years showed a definite elimination of point sources and a tendency towards the illumination of large interiors. This was made possible by the modern lamp, the absence of fire risk, remote control and comparative cheapness. Architects had, therefore, seized the opportunity of incorporating in their buildings light sources which had a definite relationship to their design. The engineer, as a result, had found himself faced with the task of setting aside lighting in terms of foot candles only, and was now obliged to consider quality of light at least as much as quantity. Today he must be thoroughly conversant with the different diffusing and reflecting materials, and be able to inform the architect of the position of the light sources, so that the desired effects required by the architect were fulfilled.

FACULTY OF ARCHITECTS' AND SURVEYORS' ANNUAL DINNER

The fifth annual dinner of the Faculty of Architects and Surveyors was held at the Hotel Metropole, Northumberland Avenue, W.C., on Friday last. About 200 members and guests were present.

Sir Charles Allom, F.R.S.A. (President), in reply to the toast of the "Faculty of Architects and Surveyors," proposed by Sir William Arbuthnot Lane, Bart., after stating that the Association now comprised about 1,200 members, said we suffered at the present time from building bylaws, local Acts, etc., which were not up to date in many respects and interfered with the creation of new methods which he more strongly advocated than he did new architecture. He hoped that in the near future legislation would be passed to enable new methods to be adopted. Architects of today would be wise to get away from the old customs set by architects of the past. Britain had yet to show that it had contributed its share to the architecture of the future.

The toast "Our Guests and Kindred Societies" was proposed and responded to by Mr. E. F. Harmer (Past President) and Mr. Harry Stanger, A.M.INST.C.E., respectively. Other speakers included Sir Clement Kinloch-Cooke, M.P., Captain Montague Evans, F.S.I., and Mrs. W. P. Reynolds.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Lords and Commons Adjourn

BOTH Houses adjourned for the Christmas Recess on December 11, and will reassemble on February 2, 1932.

Valuation and the Land Tax

Mr. Chamberlain, the Chancellor of the Exchequer, announced that the valuation under the land tax scheme was to be suspended.

The total cost of the valuation, he said, was estimated at from £1,000,000 to £1,500,000. A certain amount of money had already been spent, but the great bulk of the expenditure was still to come. In the meantime, the need for economy had become paramount, and the Government felt that, in present financial conditions, they would not be justified in incurring further expenditure on an object which, in any case, could not produce any return for a considerable time. Without prejudice to the merits of the scheme, which had not been under consideration, the Government therefore purposed to suspend the work.

Proposed Statue of Lord Haig

Brigadier-General Nation asked the First Commissioner of Works if he would state what the present position was regarding the proposed statue of Lord Haig that was to be erected in London; what was the total estimated cost; and what proportion of this sum had been spent up to date.

Mr. Ormsby-Gore said that Mr. Hardiman, the sculptor, was now engaged on the full-size figure: the total estimated cost of the statue, excluding the foundations, but including the fees paid to the unsuccessful competitors, was £9,000: the amount paid to Mr. Hardiman to date was £2,150.

Montagu House Site

Sir Vivian Henderson asked the estimated cost of the erection of the new block of Government buildings it was proposed to erect on the Montagu House site; and the total annual rental paid for accommodation hired for Government staffs which it was

intended to house in this new building.

Mr. Ormsby-Gore said that the estimated cost of the erection of the new block of Government buildings, which it was proposed to erect on the site of Whitehall Gardens and Montagu House was £2,215,000. The total annual rental at present paid for hired premises, which would be vacated on completion of the new building, was £144,062. In addition, Government property of an annual value of £22,168 would be available for disposal.

The Subsidy Council House

Captain Erskine-Bolst asked the Minister of Health if he could give the present cost of construction of the average subsidy council house, with parlour and without, at the present time as compared with the corresponding period for each of the last three years; whether he could state the cheapest type of house which had been erected at an economic rate; and whether, in view of the still existing shortage of houses, he could bring to the notice of other local authorities the full facts of cheap construction in this particular case.

Sir E. Hilton Young said that the following statement showed the average cost of non-parlour and parlour houses (excluding flats and small houses for aged persons) in contracts let by, or in direct labour schemes of, local authorities (other than the London County Council).

Year ended December 31	Cost of building, exclusive of land, roads and sewers	
	Non-parlour houses	Parlour houses
	£	£
1927	413	481
1928	361	429
1929	344	409
1930	339	404

He was not certain to what type of house his hon. friend referred as having been erected at an economic rate, but he was always willing to investigate economics in building and would in suitable cases bring any particular building methods to the notice of all local authorities who might be assisted thereby.

Unemployed in Building Industry

Sir H. Betterton, the Minister of Labour, informed Mr. McGovern that the number of insured persons in the building industry recorded as unemployed on October 26, 1931, the latest date for which statistics of unemployed by industries were available, was 205,219. Accounts were not kept of benefit or transitional payments paid in separate trades but, assuming that the average rates for men and boys applied to this trade, the approximate total cost would be £175,000 for the week.

Housing (Rural Workers) Act, 1931

Replying to several questions as to what progress had been made under the powers under the Housing (Rural Authorities) Act, 1931, Sir E. Hilton Young said that the Committee appointed under the Act held a meeting in September. Applications had been received from 136 rural district councils in respect of 7,003 houses, and were under investigation, but they had not yet been considered by the Committee, and none had yet been approved.

Dwellings Converted to Industrial Use

Major Nathan asked the Minister whether he was aware of the increase in overcrowding in the East End of London, caused by the diversion of dwelling-houses to industrial purposes; and whether he proposed to take any action to prevent such diversion in the future.

Sir E. Hilton Young said that he was aware that a number of dwellings had been converted to industrial use. Control over development of this kind could best be secured by legislation for extending planning powers to built-up areas, and the question of such legislation was under consideration.

COMPETITIONS OPEN

December 31.—Sending-in day. Latest date for conditions was September 30. Proposed New Town Hall and Municipal Buildings, for the Walthamstow Corporation. Assessor: H. Austen Hall, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Conditions were obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

January 1, 1932.—Sending-in day. Proposed Church at Low Shiregreen, Sheffield, in connection with the Bishop of Sheffield's 100,000 guineas appeal (limited to architects with an office in the Sheffield Diocese). Assessor: C. C. Thompson, F.R.I.B.A. Full particulars obtainable from the Hon. Secretary, Sheffield, South Yorkshire and District Society of Architects and Surveyors, 15 St. James' Row, Sheffield.

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors: Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium: £500; also a further amount of £750 will be awarded to other designs according to merit.

September 31, 1932.—Sending-in day. All-British House (cost: £1,000 or less) for the Incorporated Association of Architects and Surveyors. Premiums: 50 guineas, 20 guineas and 10 guineas. Conditions, etc., from the Secretary, I.A.A.S., 1 Wilbraham Place, S.W.1.

THE ARCHITECTS' DIARY

WEDNESDAY, DECEMBER 16

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Pantomime, 8.15 p.m. Also Exhibition of photographs and drawings of Russia's new buildings. Until December 18. **8.15 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "The Churches and Later Palaces of France." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

CHARTERED SURVEYORS INSTITUTION. Annual dinner of the quantity surveyor members, to be held at the Hotel Victoria, Northumberland Avenue, W.C.2. **7.30 p.m.**

SOCIETY OF WOOD ENGRAVERS. At the Redfern Gallery, Arcade House, 27 Old Bond Street, W.1, Twelfth Annual Exhibition. Until January 2. 10 a.m. to 6 p.m. (Saturdays, 10 a.m. to 1 p.m.). **10 a.m.**

THURSDAY, DECEMBER 17

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Pantomime. **8.15 p.m.**

THANET SCHOOLS OF ART LECTURES ON ARCHITECTURE. At Chatham House School, Ramsgate. "Elizabethan England." By R. Goulburn Lovell, A.R.I.B.A. **7.45 p.m.**

FRIDAY, DECEMBER 18

LONDON SOCIETY. At the Royal Society of Arts, John Street, Adelphi, W.C.2. "The Portent of Concrete." By Sir E. Owen Williams, K.B.E. **5 p.m.**

HASTINGS MUNICIPAL SCHOOL OF ART LECTURES ON ARCHITECTURE. "Elizabethan England." By R. Goulburn Lovell, A.R.I.B.A. **7.30 p.m.**

SATURDAY, DECEMBER 19

Sunrise, 8.1 a.m. Sunset, 3.52 p.m.

INSTITUTION OF CIVIL ENGINEERS. Students (after noon) visit to the Southgate extension of the Under ground Railway.

SATURDAY, DECEMBER 26

Sunrise, 8.5. a.m. Sunset, 3.56 p.m.

MONDAY, DECEMBER 28

R.I.B.A., 9 Conduit Street, W.1. First of three Christmas holiday lectures for boys and girls. "Houses of the Ancients." By E. R. Jarrett, A.R.I.B.A. **3.30 p.m.**

WEDNESDAY, DECEMBER 30

R.I.B.A., 9 Conduit Street, W.1. Second of three Christmas holiday lectures for boys and girls. "Mediæval and Renaissance Houses." By E. R. Jarrett, A.R.I.B.A. **3.30 p.m.**

FRIDAY, JANUARY 1, 1932

R.I.B.A., 9 Conduit Street, W.1. Last of three Christmas holiday lectures for boys and girls. "Houses of the Moderns." By E. R. Jarrett, A.R.I.B.A. **3.30 p.m.**

SATURDAY, JANUARY 2

Sunrise, 8.6 a.m. Sunset, 4.2 p.m.

MONDAY, JANUARY 4

R.I.B.A., 9 Conduit Street, W.1. Award of prizes and studentships. Criticism by E. Berry Webber, A.R.I.B.A., on work submitted. **8 p.m.**

WEDNESDAY, JANUARY 6

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "German Renaissance (1500–1900)." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

THURSDAY, JANUARY 7

INCORPORATED INSTITUTE OF BRITISH DECORATORS, Painters' Hall, Little Trinity Lane, E.C.4. "The Future of Domestic Decoration." By C. O. Masters.

SATURDAY, JANUARY 9

Sunrise, 8.4 a.m. Sunset, 4.10 p.m.

MONDAY, JANUARY 11

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. "The A.A. Excursion to Austria, 1931." By Grahame B. Tubbs, A.R.I.B.A. Also exhibition of photographs of buildings visited on the excursion. Until January 22. **8 p.m.**

WEDNESDAY, JANUARY 13

MANCHESTER SOCIETY OF ARCHITECTURE. "Rational Architecture." By Joseph Emberton, F.R.I.B.A. **6.30 p.m.**

LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. "Housing on the Continent." By L. H. Keay, F.R.I.B.A. **6 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Belgian and Dutch Renaissance." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

THURSDAY, JANUARY 14

THANET SCHOOL OF ART LECTURES ON ARCHITECTURE. At Chatham House School, Ramsgate. "Renaissance and Reformation." By R. Goulburn Lovell, A.R.I.B.A. **7.45 p.m.**

FRIDAY, JANUARY 15

HASTINGS MUNICIPAL SCHOOL OF ART LECTURES ON ARCHITECTURE. "Renaissance and Reformation." By R. Goulburn Lovell, A.R.I.B.A. **7.30 p.m.**

SATURDAY, JANUARY 16

Sunrise, 8.0 a.m. Sunset, 4.20 p.m.

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS. Visit (afternoon) to the Tower of London.

LAW REPORT

ARCHITECT'S CLAIM FOR FEES

Payne v. *Marshall. Official Referee's Court. Before Sir William Hansell, K.C.*

THE Official Referee sat to ascertain the sum due to Mr. Edward Harding Payne, A.R.I.B.A., of John Street, Bedford Row, from Mr. G. E. Marshall, of Raymond's Buildings, Gray's Inn, in respect of services rendered by him to Mr. Marshall between 1922 and 1928.

For the plaintiff it was pleaded that he allowed the defendant to use his office on condition that he paid half the amount of any services the plaintiff rendered. Plaintiff claimed for services he rendered the defendant in connection with a building in Cheapside and with certain greyhound racing tracks at Brighton.

Defendant, by his defence, denied that any services were rendered in connection with the racing tracks. He also pleaded that they assisted each other gratuitously, and that the plaintiff had been paid sufficient for anything he had done.

Sir William Coventry, K.C., for plaintiff, said the defendant, when he met the plaintiff, was a builder in Liverpool and was anxious to practise in London as an architect. Plaintiff did a considerable amount of work in connection with the racing tracks.

The Official Referee assessed the damages at £37, which he held was due to plaintiff from defendant.

Judgment accordingly.

TRADE NOTES

Messrs. William Newman and Sons, Ltd., of Hospital Street, Birmingham, have just issued a pamphlet illustrating and describing one of their latest devices for the silent closing of doors. This new patent is entirely British in conception, design, etc., and has been named the Vanguard spring hinge and check hinge. An illustration is reproduced on this page, from which it will be seen that when fixed it is most inconspicuous, and does not detract in any way from the appearance of the door or its surrounding architectural details. This is only one of the advantages claimed for this device, another being the extreme ease of fixing; just the cutting away of a little woodwork, without cutting into the floor itself and subsequent levelling and making up. The fact that the Vanguard spring and check is fixed in the same position as ordinary butt hinges means that they will never be troubled or damaged by water when floor cleaning is in progress. The Vanguard assumes complete control of the door immediately it is released, owing to the powerful spring, which is curbed in action by the patent hydraulic check, with the result that the door closes into position without noise. Any size of single-action door can be adequately controlled by varying the number of springs used in conjunction with one check, and each spring and check is adjustable. Messrs. William Newman and Sons, Ltd., are also manufacturers of all types of door springs and checks, panic bolts, window-opening gear, and best-class builders' brassfoundry. Amongst their specialities are fittings for doors and windows in brass, bronze, Birmabright, Monel, Silveroid, and stainless steel.

*

An illustrated booklet has recently been published by the British Steelwork Association, entitled *Steel and the Attendant Industries*, in which are described the processes by which steel girders are made and other subsidiary processes involved in steel manufacture. The text is admirably written, and is lavishly illustrated by numerous photographs. The booklet is obtainable from the British Steelwork Association, Artillery House, Westminster, S.W.1.

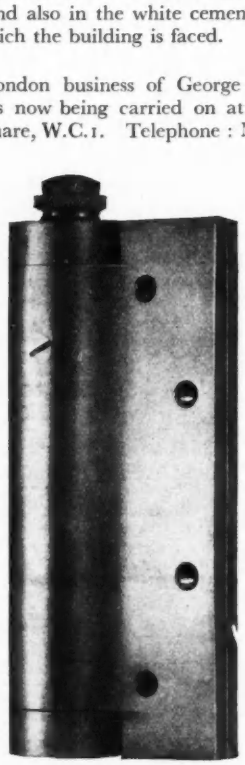
*

It is interesting to note that Messrs. James H. Lamont & Co., Ltd.'s Securex patent fittings for copper tubes will be used exclusively for cold and hot-water supply in the Cumberland Hotel, London. This hotel will have 1,000 bedrooms, each with its own bath and wash-hand basin, with hot and cold water.

*

In the list of sub-contractors for the Maternity Home at Oxford, illustrated in THE ARCHITECTS' JOURNAL for December 9, the name of Messrs. Kerner-Greenwood & Co., Ltd., was inadvertently omitted. This firm's 'Pudlo' brand cement waterproofer was used to waterproof the white cement facings to the whole of the artificial stonework, and also in the white cement stucco with which the building is faced.

The London business of George Parnall & Co. is now being carried on at 4 Bedford Square, W.C.1. Telephone: Museum 7101.



Vanguard spring hinge and check hinge.

A.R.P. STUDIOS

Following are the names of the general contractors and some of the sub-contractors for the Associated Radio Pictures Studios, Ealing Green, illustrated on pages 792, 795–8 of this issue:

General contractors: C. Miskin and Sons, Ltd. Sub-contractors: Horseley Bridge and Engineering Co., Ltd., and Fleming Bros., Ltd., steelwork; Gorford Bros., Ltd., heating and ventilation, canteen service and equipment; Boulton and Paul, Ltd., rehearsal hall and canteen building; Parry & Co., Ltd., roads; H. W. Smiths, Gore & Co.; two houses, Temple Lane, Copmanthorpe, for Mr. G. Fairburn; bungalow, Temple Lane, for Mr. W. Wright.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

MAIN ALTAR AND REREDOS

IN THE NEW CHURCH, AMPLEFORTH ABBEY, YORKS.

[*Sir Giles Gilbert Scott, R.A., Architect.*

THE VIEW FROM THE RETRO-CHOIR

THIS main altar and reredos are not only unusual in architectural treatment, but they occupy an uncommon position in the church. They stand towards the centre of the interior and separate the nave in which the congregation assembles from the retro-choir which is used by the monks. In fact, the position is similar to that occupied by the screen in cathedrals and conventional churches to separate the nave from the choir.

Due to this unusual position, the altar and the reredos have been designed with two faces, one towards the nave and the other towards the retro-choir, so that services can be conducted in either direction.

The stone is blue Hornton, and has been carved by William D. Gough, the sculptor. Wide cream-coloured flush jointing has been adopted. The front of the wood cross facing the monks' side is painted, and that facing the congregation is carved and picked out in colour. The candlesticks are of bronze.

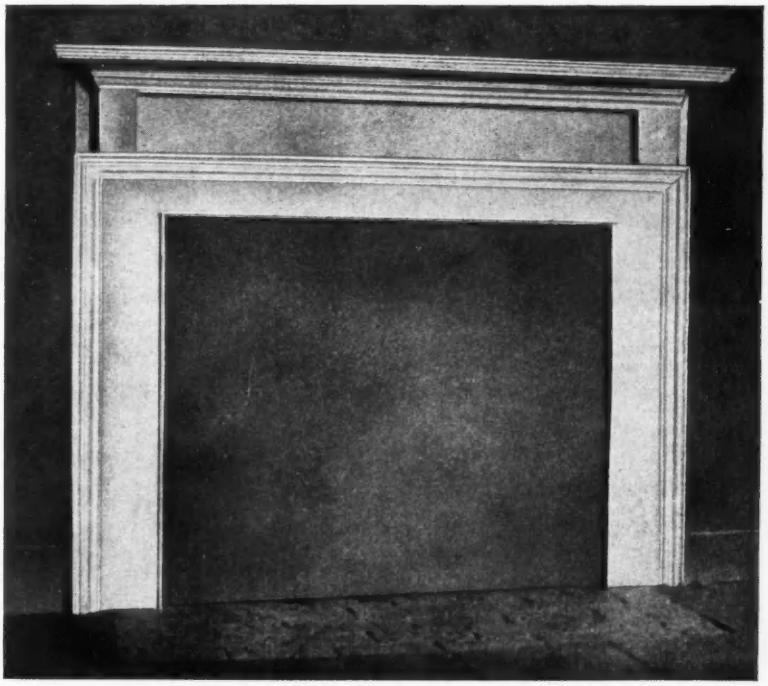
MEASURED DRAWINGS OF AMERICAN COLONIAL DETAILS



MANTEL IN A COTTAGE NEAR SANDWICH, MASS.

THE drawing within is devoted to mouldings from the Plymouth District. Much of the work shows a pronounced tendency towards the Greek profile—the echinus and Greek cymas being used in preference to the coarser Roman type so much favoured in the English Renaissance of the period preceding the work of the Adam Brothers and Thompson.

This Greek feeling is evident in the little cottage mantel, of which a photograph appears above, as well as in the more ambitious designs.

On the last page are several examples of fences and trellis-work. Throughout the length and breadth of the Eastern States are to be found old wooden fences of excellent design. The straight-grained pine—weather-resisting to a remarkable degree—was eminently suited for the purpose, and there is no limit to the variation played upon the simple squared or plain rounded baluster. In most instances any elaboration was confined to the posts, both at the corners and at the entrance gates. These posts were often exquisitely designed and excellently proportioned, the terminals being frequently reminiscent of Adam design.

The drawings are the work of R. Keith Harris.

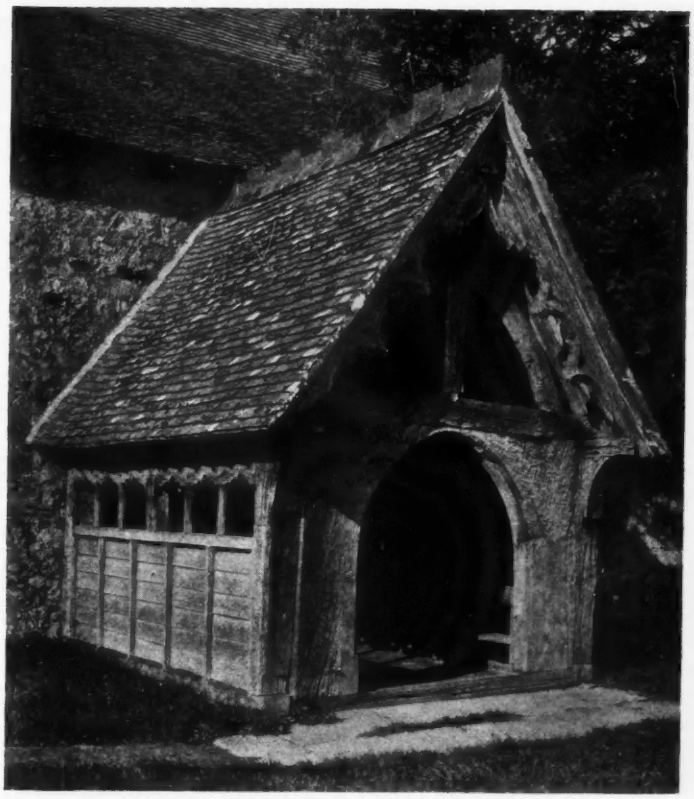
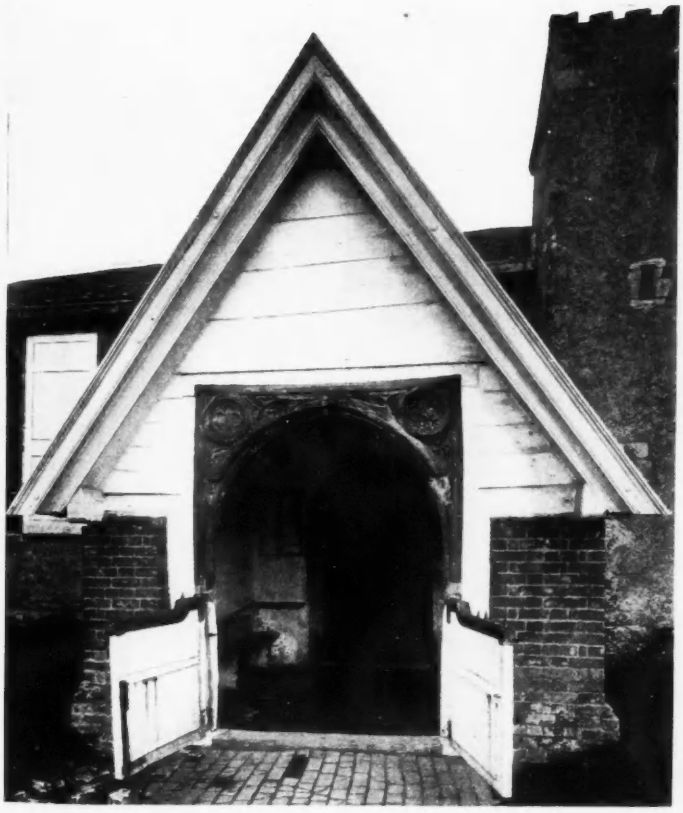
SELECTED PRECEDENTS:
TIMBER PORCHES, CHURCH AND LAY

THE south porch of the church at High Halden, Kent (figure 1), is one of those timber structures found attached to many fifteenth-century parish churches. The jambs and arch are formed of two oak planks, cut from a trunk having a widely-splayed root, which forms the arch proper. The cusping of the bargeboards is particularly fine and well preserved, having regard to the aspect, and must have been cut from the heart oak of a large tree. The mullions of the arcading have perished, but the cusping and tracery are still in good condition. The king-post is of the usual construction, but the addition of two curved braces is not so often seen and, in addition to stiffening the roof structure, furnishes the opening in a very attractive way. The roof tiling and crested ridge tiles are modern, but have weathered to a good colour.

Brookland Church, Kent, stands in the marsh, and is still fortunate in not having undergone recent restoration. The north porch (figure 2) originally must have been a timber structure, of which the arch spandrels only remain. The design and carving of these are excellent



1. HIGH HALDEN, KENT: SOUTH PORCH.



and are up to the standard of similar masons' work.

The porch to a little house at Yalding, Kent (figure 3), is a practical piece of work, which, except for the balusters, has no detail not strictly essential to its purpose; yet the total cost of eight balusters would be trifling and the result achieved is notable.

Great Sir Hugh's, near Great Baddow, Essex, has an open loggia of five bays (figure 4), from the back of which the entrance door opens. Fluted, square columns, standing on panelled pedestals, support the carved bressumer, and each bay is sub-divided into two semi-elliptical arches, separated by square pendants; but it is apparent that the brackets which spring from these pendants are merely hung on the bressumer. The lower portion of one of the three oriel windows above is shown in the illustration: the supporting brackets are prolonged downwards to an unusual distance. The whole has considerable charm, notwithstanding its clumsiness.

HOUSING THE VERY POOR

THE voluntary housing organizations of London and the Under Forty Club together promoted the exhibition briefly noticed by Astragal last week. Let us consider its bearing. It was an exhibition of very far-reaching importance, because it gave what was probably the first comprehensive picture of what is being done upon a purely voluntary basis to solve the problem of the housing of the very poor.

It is a curious fact that although the Government appears to be a machine for the co-ordination of effort deployed over a wide front, its powers of effective action are limited, as are those of any ordinary man, to doing one thing, or at most a few things, with equal zeal at any one time. Thus it was that while every resource of the State was bent to the task of building houses, the attack was found to be centred upon a certain type of house at the expense of all other types; and while one saw spreading wider and wider the sea of housing set loose by Governmental action, inside the towns the evils of congestion were multiplying themselves with but little hindrance.

Suddenly comes a cessation from suburb-building; and all eyes centre upon the slums.

It is hard to think why we should proceed thus in a series of leaps from one thing to another, and why we have no plan of action extending into the future, to guide our expenditure and safeguard our steps. It is hard to think why in days of practical socialism we should allow voluntary organizations to tackle with devotion the fringes of a problem that belongs properly to the State, especially when the chief difficulties lie bedded in landed interests with which State action can alone deal adequately and fairly.

But in the present state of affairs these questions of major policy go unanswered—leaving for our solution the baffling economics of cheap tenement and house building. These, if we can solve them, offer such possibilities for the extension of re-housing developments as may carry us as far as we can go for the next few years. Re-housing has cost us very dearly in the past. We have allowed haphazard development to create a vested interest in overcrowding which has fought hard against efforts to replace it with more humane conditions. In time past the authorities had no effective weapons at their disposal, for it must be remembered that local authorities may only take such action as the law allows them, and that until the passing of the last Slum Clearance Act the law was not directed to make their powers extensive.

Power has come now to deal effectively and to plan ahead. But still in London we have no plan which can fit slum clearance into an economical working scheme for the central areas, and no incentive is presented for the type of long-term re-housing plan which would call forth such constructive thinking as made Ernst May and Frankfort famous throughout Europe.

It is obvious that re-housing costs can be reduced still further, and that without substantial lowering of the high standards set to date. We still build Georgian. We still employ the expensive wooden sash window, the tile roof and other features which are matters of taste, and are not dictated either by economy or good structure. Working within restrictive building ordinances, we still build too heavily, carrying heavy walls upon steelwork originally too heavy, and made heavier by the imposition of too heavy materials.

There is not brought to the problem of this building the searching inquiry out of which modern Continental architecture has arisen with such strength, such lightness and such promise of fine living.

When all praise is given for the efforts made and the good work done in England, this final testing stands before us. It is a matter of money, like everything else; and, like everything else, much more than money can ever stand for.

[*A. H. Wegerif Gzn., Architect.*

AN EXAMPLE OF DUTCH DOMESTIC ARCHITECTURE

The contrast between the white walls and the well-proportioned bay window gives this house at Wassenaar, Holland, a southern appearance. The austere lines, however, blend harmoniously with the wide horizons of the flat Dutch landscape. A review of *Modern Cottages and Country Houses in Holland*, by Professor J. G. Wattjes, from which the above illustration has been reproduced, is published elsewhere in this issue.

NEWS & TOPICS

"BUY BRITISH" MEANS "MAKE BRITISH"

IT is interesting to speculate upon the probable results, apart from the almost certain reprisals and undercutting from abroad, of tariffs and the "Buy British" campaign. Very many articles associated with modern architecture, and especially such things as electric light fittings, come to us from the Continent, but will no longer come. Our own fittings are generally of execrable design. Who is going to produce the right stuff, in sufficient quantity?

★

This is a pertinent question, because we have been importers of ideas as well as goods, and we as architects are faced now with the unenviable job of convincing our own manufacturers that the foreign designs we like are better, and must be made *and designed* in the future in England. These designs involve shaped glass and moulds, are mass productions, and must therefore be selected with the greatest care.

PEAT FOR INSULATING BOARDS

There are, of course, innumerable ways of overcoming our indebtedness to foreign countries, if this is to be the be-all and end-all of existence. For instance, we import enormous quantities of insulating board from abroad. Some is made here, but from imported raw materials. Now the Germans, despite considerable reserves of the right timbers, use large quantities of peat, both loose and in slab form, for every type of thermal insulation. We have plenty of peat in this country, which brains and organization can put on the market in place of imported insulators. It is a particularly apt substitute for cork, which has not even the saving grace of being an Empire product. It appears to have definitely high thermal and sound-insulating qualities.

THE L.C.C. AND "GRADE A" STEEL

I understand that the L.C.C. are to be presented with an Interim Report recommending the adoption of a code that will make it compulsory to use Grade A steel in the framework of London buildings. Grade A steel, which is British, can be stressed up to 18,000 lb. per sq. inch. Grade B steel, which is foreign, to 16,000 lb. only. The immediate results of such a policy would be two-fold. One, a large increase in the use of British steel, and two, a lowering of existing factors of safety, both of which are economies of the right sort.

★

Since a great deal of foreign steel is being used on buildings being erected in London at this moment it is to be hoped that the L.C.C. will be able to act at once.

THE A.A. PANTOMIME

Three strokes on a gong. The drawn curtains disclose, against a brilliant green-white background, a statue seen in silhouette.

Little god, Pan,
Little god, Pan—

sings the chorus; then, just as the feet begin to move to the lilt of it :

Little god, Pan-tomime !

On come the lights; H. C. Inglis, that subtle comedian, slowly revolves and steps down from his pedestal and is seen to be no traditional satyr, perhaps, but rather a figure of satire in a leopard-skin and a top-hat and what-not. The A.A. Pantomime has arrived, with its iridescent hues and humours, its lovely ladies, its high spirits.

★

An outsider, like myself, is bound to miss a good many of the points that tickle the students most in this highly original annual revue. For it is essentially their own particular show—words, music, *personae*, scenery, and, not least, the marvellous lighting that they contrive in the lecture-hall. But who could fail to chuckle at the priceless guide-patter of that other comedian of the company, W. P. Dyson, reeling off his piece to the American tourist in "Erechtheion," or ranting, as Captain Bloodenough, through that fearful melodrama, "Penny Plain or Two-pence Coloured"? This year, again, there was a charming operetta among the twenty turns, and a ballet, most cleverly mimed — of a young man who worshipped a machine, and, since it is a sewing machine, is stabbed to death by its bodkin.

★

"Operatic Architecture" went with intoxicating swing to well-known airs : to "John Brown's Body" the chorus somehow became :

Glory, glory, Edwin Coo-oo-per !
Glory, glory, Edwin Lu-ut-yens !

And M. A. S. Dugdale's mock-lecture, "Architecture and all That," with the names and references all twisted, after the manner of the (very) lay Press, evoked a dropping fire of laughter. But a moment of pathos arrived. Three young diplomees are on their knees for a job to a full-fledged architect. They chant :

We can build you a church in concrete
Or an aerodrome in steel;
But we can't get a job
And we haven't a bob—

Ay, there, with a vengeance, is the rub, with the £ sinking despite Britannia's Empire (and quite empirical) window-dressing.

ADVERTISEMENT PROSECUTION FAILS

Another attempt to prosecute under one or other of the advertisement Acts has failed, as much by the lack of applied psychology as by anything else. It was one of the county councils who took as an example for the exercise of their powers a little building that had borne the fluttering little scraps of advertising paper these twenty years. To support them in their case they produced leaders of preservation, worthy ones of the Academy. And the defence, not to be outdone, brought artists and men of taste, no less articulate. The Bench decided in favour of the *status quo*.

★

The moral of this is, O high and mighty County Council, that you may only govern by consent. If it appears that the control of advertisements has not yet reached the Bench as a thing to be desired and sought after, then it behoves you to deal gently and lovingly with the misguided advertiser, and should your patience be at last exhausted, to approach the Bench only after the administration of fitting education in the matters in hand.

ASTRAGAL

FISH BAR

No. 1 Barrett Street, W.

DESIGNED BY FORBES AND TATE

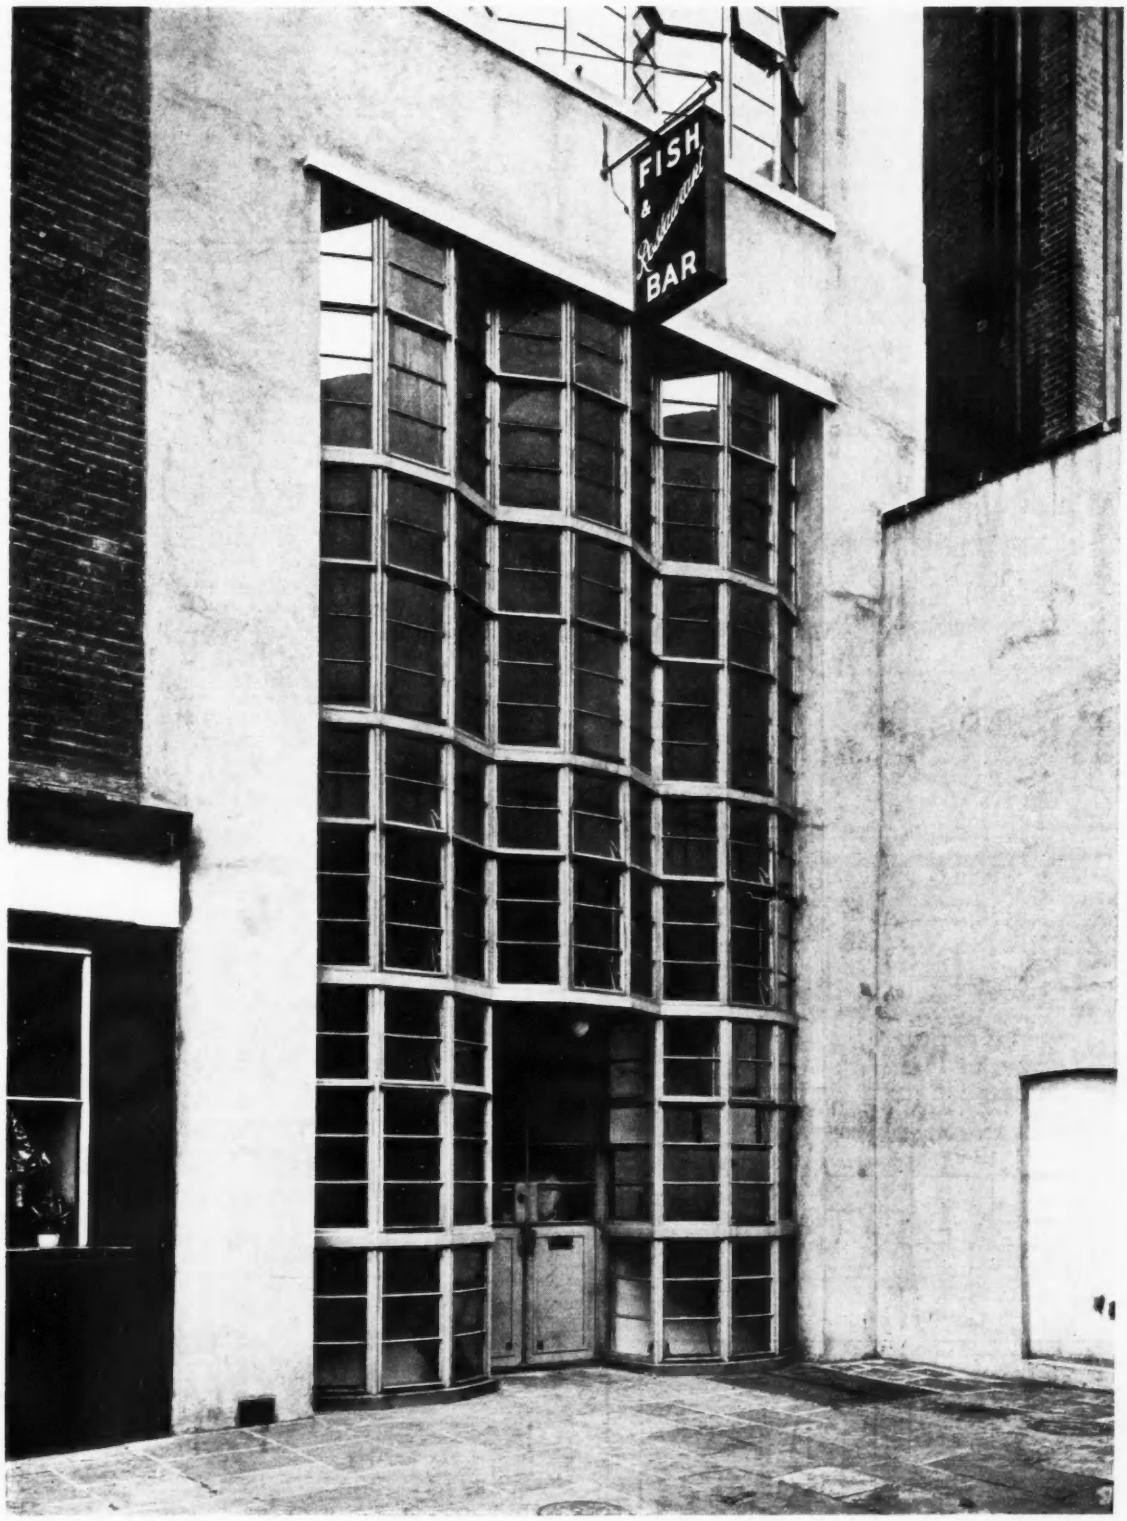
THERE is something in the sound of the words "Fish and Chips Shop" which gives one great uneasiness, architecturally. The whole character of such a shop differs materially from that of any other building, but the outstanding cause for anxiety is the smell of the frying fish—a smell that can annoy one almost beyond endurance.

In designing the fish shop illustrated herewith, the architects have solved the problem by providing strong ventilation in each room, with a very large outlet at ceiling level, the air being drawn up by extract fans to the roof. The force of this ventilation, although not unpleasant in the restaurant, is so great that, if an envelope is thrown up towards the ceiling and within a few feet of the extract opening, it is immediately drawn and held by the force of the air!

The architects have endeavoured also to obtain as much light and sun as possible into the building and to treat the walls and floors in such a manner that they can be kept scrupulously clean and so again avoid smell.

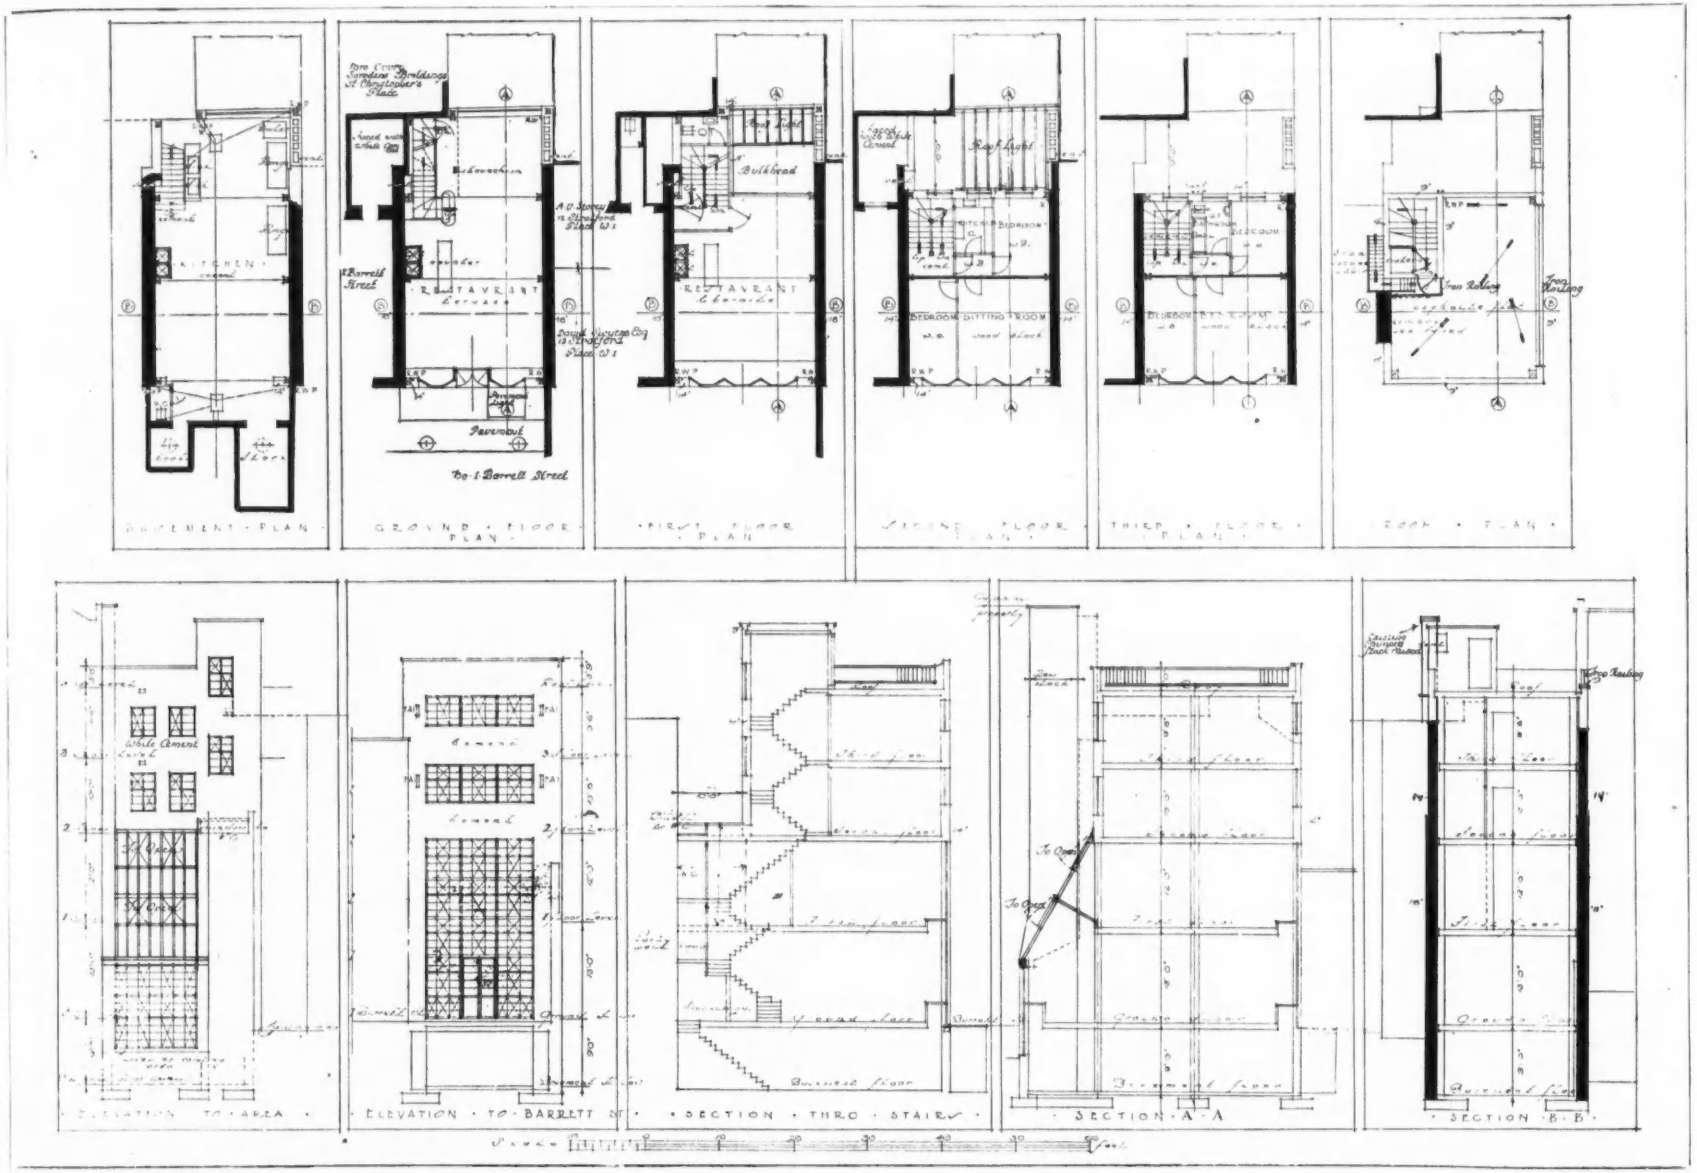
In the restaurant on the ground floor, looking towards the Barrett Street front. The floor is of terrazzo and the table tops are of glass.

Another view in the restaurant on the ground floor. The walls are lined with marbled marmorene, $\frac{1}{4}$ in. in thickness, with black marmorene bands. The ceiling is of opal plate glass, fixed in wooden beads.



Fish Bar, Barrett Street, W.] [*By Forbes and Tate*

This photograph of the first two stories of the Barrett Street façade should be studied in conjunction with the architects' elevational drawings, reproduced on page 828. In the basement is the kitchen, and on the ground and first floors are two restaurants, nearly 20 ft. wide by 35 ft. deep and 25 ft. deep, respectively. Above the hanging sign are two more stories containing the living quarters, and consisting of a kitchen, sitting-room, bathroom and five bedrooms.



Fish Bar, Barrett Street, W.] [*By Forbes and Tate*

The architects' drawings of the plans, sections and elevations. The main problems to be solved were to eliminate the objectionable smell which usually emanates from fish and chip shops, to obtain as much light and sun as possible into the interior, and to treat the walls and floors in such a manner that they could be kept scrupulously clean.

THE PORTENT OF CONCRETE

BY SIR E. OWEN WILLIAMS, K.B.E.

THE outstanding property or quality of concrete which makes it valuable in building construction is its compressive strength, i.e., its resistance to crushing. It is this compressive strength that has been so improved in recent years and which also has the unique property of increasing in value, even after the concrete has been made. It can be moulded to any shape, in fact so easily that it becomes a menace if its dangers, as well as values, are not equally studied.

There is one outstanding property which concrete lacks, namely, any high degree of tensile strength. It does not withstand, with any great resistance, being torn apart. Although it lacks this property it cannot be termed a defect, as its correction by the introduction of reinforcing steel gives to the combination a value which is greater than would be found in a concrete possessing a high tensile strength.

Crushing and Tearing Tendencies

All structures are subjected to crushing and tearing tendencies in various parts or members of the structure, and it is the science of engineering to determine where these two tendencies exist, and to what extent. Where there is only a crushing tendency, then concrete unassisted is able to take it. Where there is a tearing tendency concrete alone might be lacking and certainly would be uneconomical. The introduction of steel rods into concrete corrects that tearing tendency, so that reinforced concrete becomes a material capable of taking crushing loads by virtue of the concrete, and capable of taking tearing loads by virtue of the steel rods, an ideal combination, and allowing a degree of flexibility in design not possible as far as I know with any other material. For example, a homogenous material such as timber has for definite sizes of timbers definite strengths, and similarly with any other homogeneous material, such as steel or stone, the measurements of the external dimensions of members made of those materials can give you immediately an idea of their strength. With reinforced concrete, because it is a mixture of two materials, the same rule does not apply. The strength of a reinforced concrete member depends upon the proportions of steel and concrete inside it. Two members in reinforced concrete of identical sizes externally can be very different in strength because one has been more highly reinforced than the other. The value of this possibility in what may be termed regularizing design is considerable.

The Uses of Reinforced Concrete

Reinforced concrete has been used almost exclusively as a substitute for other materials, i.e., the requirements have stretched other materials to their extreme, and as in extremes the older materials became uneconomic, reinforced concrete was found to be an economic substitute. This has been carried to such an extent that I would almost say that there is not yet in being a building which could be termed purely reinforced concrete, that is, to some extent at any rate, it is only playing the part which could be played by other materials, perhaps not so conveniently or economically, but still within their limits. For this reason it is wise to suspend judgment on what a reinforced concrete building looks like, because I do not think there has yet been one.

It is only natural that the material should have been used as a substitute during the period of its apprenticeship and whilst we are learning all about it, and as such it has given extraordinarily good service. I would point out that as a substitute it only becomes to be economical during the limits of other materials, that is, when other materials are almost beginning to impinge upon the realm of concrete. For the types of structure which are well within the reach of timber and bricks, concrete is not an economical substitute. It was not intended to be a cheaper way of doing such things, but rather has been given to us to do different because bigger things.

Steel and Concrete

Many of you will be interested in the controversy as to whether structural steelwork or reinforced concrete is the material for the present or the future. It is a matter of economics. Reinforced concrete does not ignore steel—it claims to take one property of steel and one property of concrete and combine them. It can strictly claim to be neither a steel building nor a concrete building but claims to be the economical combination of both.

Sir E. Owen Williams.

Incidentally it is an interesting mathematical fact that, in the logical constructions of concrete, by which I mean not where it has been used solely as a substitute, the cost of a reinforced concrete building is least when the cost of the steel is precisely equal to the cost of the concrete. In structural steelwork they also use steel in tension: therefore the bone of contention is whether steel in compression is more economical than concrete in compression. I think the onus of proof is strictly on the structural steel advocate because reinforced concrete has as much steel as concrete, and therefore is based on an appreciation of both.

Definite calculations show that to carry equal compressive loads the cost of doing this in structural steel is three times as great as in reinforced concrete, that is, if you had 1,000 tons load on a column the structural steel column would cost £3 in every £1 expended on a reinforced concrete column, not allowing for the fact that the structural steel column would be increased in cost by fireproofing, for which they are driven to adopt concrete.

Steel in compression can therefore be said to be three times as expensive as concrete in compression. Further, in tension a structural steel member is, by virtue of the labour required for fabrication, very much more expensive than the same area of steel bars in a reinforced concrete member. It will be argued that the sizes of the concrete columns are greater. This is not necessarily so in view of the greatly improved reliable compressive properties of concrete. At the moment a concrete column need not be any bigger than the usual type of structural steel column; and as research is going on in concrete, there are grounds for believing that the relative proportions between the costs of concrete and steel will be even further increased.

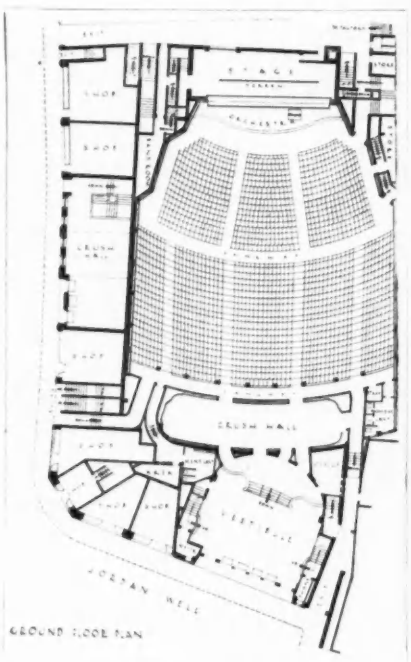
You will see therefore that I dismiss steel as being a lasting competitor of concrete as a compressive medium. Steel is in its right place as a tensile medium and concrete is in its right place as a compressive medium, and the combination will, in the end, wear down all competition.

Extracts from a paper read by the author at a meeting of the London Society, held at the Royal Society of Arts on Friday last.

THE GAUMONT PALACE, COVENTRY

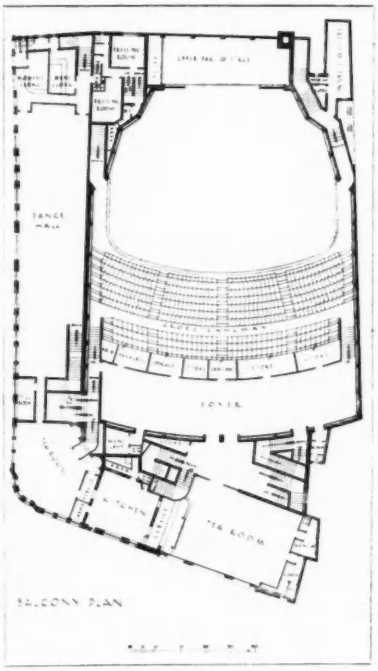
DESIGNED BY

W. H. WATKINS



Features of the street level plan are the ample vestibule and crush halls, enabling patrons to wait in comfort.

The main entrance to Jordan Well. The building is faced with cream terra-cotta. The windows are bronze.



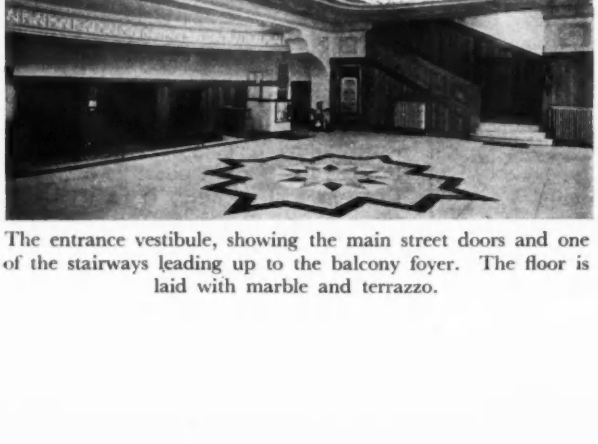
Alongside the balcony a dance hall has been designed, with a café. The kitchen also serves the main tea room.

THIS cinema is situated at the junction of Jordan Well and Whitefriars Street, Coventry, with entrances and exits to each thoroughfare. The seating capacity is over 2,600 (stalls : 1,750: balcony : 900). It was the proprietors' desire to eliminate queues, and, accordingly, crush-hall accommodation has been designed with this in mind; if necessary it is possible for 1,000 people to wait under cover in comfort.

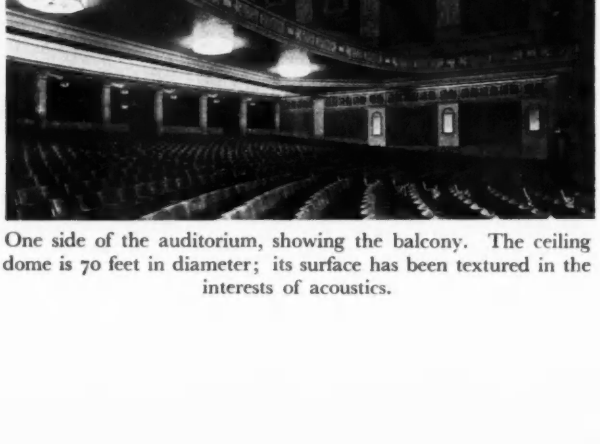
The building is a steel-framed, fire-resisting structure, and is equipped in accordance with the latest practice in lighting, heating and ventilation, picture projection and acoustics. It was designed by Mr. W. H. Watkins who has built cinemas for the company at Bristol, Plymouth, Exeter and Barnstaple.

The main entrance façade, to Jordan Well, is 65 ft. wide and has been carried out in cream terra-cotta to match the facings of adjoining the premises. The deep architrave surrounding the bronze casements and panels to the café and foyer is in a warm green, and colour has also been introduced in the pilaster caps and bases.

Within, the main vestibule is spacious and gives access to the café and balcony foyer by means of wide, easy staircases at each side. A broad flight of steps at the apsed end leads to the stalls, crush - hall and auditorium. The



The entrance vestibule, showing the main street doors and one of the stairways leading up to the balcony foyer. The floor is laid with marble and terrazzo.



One side of the auditorium, showing the balcony. The ceiling dome is 70 feet in diameter; its surface has been textured in the interests of acoustics.

[*Gaumont Palace, Coventry.* *By W. H. Watkins.*]

Looking towards the proscenium from the balcony. This view also shows the gilt and enamelled grille in the centre of the ceiling dome. The stage is fully equipped for every form of entertainment.

secondary entrance, from Whitefriars Street, gives access to the front stalls, and here again a large crush-hall has been provided for the convenience of patrons. The vestibule floors are laid with marble and terrazzo, and those of the crush-halls with rubber and carpets. The walls are panelled in pine, stained silver-grey. From the foyer access is gained to the front of the balcony by means of two vomitories and to its rear via two wide staircases leading to a further crush-lobby. The spacious lounges have been treated in a modern manner, and restraint is the keynote of the decoration, although much use is made of colour to give, together with the subdued lighting effects, an effect of comfort and repose.

The auditorium has been treated in a manner reminiscent of the Italian Renaissance style, allowing, as it does, free use of colour. The main interest is centred in the proscenium and the domed ceiling. The proscenium is of generous proportions, and in the design subtle tones of jade, lemon and rose, relieved with gold, are used. With the aid of the skilful lighting effects this creates a fitting frame for the picture.

The main ceiling dome, which is 70 ft. in diameter, is worthy of notice; its surface has been textured to ensure good acoustics, and there is a fine gilded and enamelled circular grille above. Here again the lighting effects have been blended to create rich and harmonious effects. The walls are treated in a more restrained manner and are covered with fabric which destroys reverberation and allows of perfect sound results. The rose-coloured seating and carpets, together with the tableaux curtains, harmonize with the subtle tints of blue, primrose, green and gold to create an atmosphere of luxury.

At the balcony foyer level there is a café restaurant over, where 200 patrons can be comfortably accommodated. This apartment has been treated in a distinctly modern manner, Continental in style; tones of eau-de-nil and coral pink predominate. Well-proportioned mirrors line the walls and foster a feeling of space.

Adjoining the theatre is a spacious ballroom, brilliantly lighted, as a modern ballroom should be, and decorated in tones of magenta, jade and silver, having a café lounge adjoining, decorated *en suite*, where dancing patrons are catered for. Ample cloakroom accommodation is conveniently arranged adjoining the entrance vestibule.

The stage, which has a floor area of over 1,200 square feet, is fitted up with all the latest equipment of every description, has dressing-rooms adjacent, and is suitable for the production of all forms of entertainment.

The heating and ventilation is carried out on the plenum system, the plant occupying extensive basements. Purified and warmed air is delivered through a main duct to various points, whence it issues through grilles into the auditorium and crush-hall in such a manner as to prevent any suggestion of draught.

Competition Result

MR. A. H. MOBERLY, F.R I.B.A., the assessor in the competition for the proposed new Orphanage in Woolton Road, Wavertree, for the Committee of the Liverpool Orphanage, has made his adjudication as follows :

First premium (£200), Messrs. Barnish, Silcock and Thearle, F. AND AA.R.I.B.A., of 58 Rodney Street, Liverpool.

Second premium (£100), Messrs. Willink and Dodd, F.R.I.B.A., of Cunard Building, Liverpool.

Third premium (£50), Messrs. Briggs and Thornely, F.R.I.B.A., of Royal Liver Buildings, Liverpool.

The competition was limited to architects who were resident or had an office within a ten-mile radius of Liverpool Town Hall.

LETTERS FROM READERS

Stereotyped Clichés

SIR,—The reporter of the Liverpool Architectural Society's discussion, "Functionalism means the Overthrow of Tradition," who really did wonders in condensing a very varied and complex discussion, got my words wrong (page 751, December 2 issue). I did not deplore the establishing of a strong tradition in modern design. This is what we all want. I pointed out that there was, as always, the danger of people seizing upon new *details* and working them to death in the form of stereotyped clichés: in other words, having disburdened the ship of a lot of overworked and wearied junk, taking a lot of new stuff aboard, which becomes tedious sooner than the old.

This has happened most grievously during the past few years: indeed, there is a danger of some of the hangers-on of the modern movement producing the same swift tedium of cliché that occurred in the Rococo, that modernizing period of the Renaissance.

As Professor Adshead said recently, no manner is more difficult than the present Modern: may I add also that none lends itself more easily to a cheap ignorant imitation.

PATRICK ABERCROMBIE

Plaster for Concrete Ceiling

SIR,—We quite agree with the writer of the letter, "Plaster for Concrete Ceiling" in the JOURNAL for November 25, that the method of hacking under concrete slabs and plastering direct has proved none too reliable. As a rule, there are just a series of holes made with a pick, and if the underside of the concrete is smooth there is no reliable key. The consequence is that during vibration, or even without vibration, it frequently happens that the skimming or plastering falls off.

The new material that your correspondent mentions is well known to us. We have used it extensively, and so far as we know there have been no failures. It is easily applied during the course of putting in the concrete slab, and forms a good key for the plaster.

With regard to using only one instead of two coats of plaster, we are afraid this is impracticable, as you are much more likely to get an even coat on the uneven surface which is usually left on the underside of concrete floors by two-coat than by one-coat work. Moreover, you would have to use in one-coat work a much fatter material, which would not be so satisfactory as the usual two-coat work.

In factories, it is true, you can well reduce the two-coat to one-coat work, as we have recently done on a very large surface, but in this case it is not a suitable finish for domestic work. For this purpose, however, the one-coat work is gauged with cement.

W. AND T. R. MILBURN

SIR,—Your correspondent, F.R.I.B.A., asks, "Why use two coats of plaster" on concrete ceilings? This, like many other questions in regard to standard specifications applied to modern forms of construction, cannot be disposed of in a few words. The Plasterers' Association have given a good deal of consideration to the growing practice of surveyors of measuring one-coat work on concrete, and it is agreed by the trade that it is a difficult item to price when tendering.

Some surveyors cover themselves by specifying the work to be ruled and brought to an even surface. Provided the concrete is true and level, a good job can be made with one coat by using gauged instead of ordinary material, but it is not to be thought that the cost of one coat is saved, nor should any but experienced plasterers be left to get over the job with one coat.

My own view is that architects should continue to specify, render and set on concrete ceilings, but that if the master plasterer gives an equally good finish by the use of gauged material and the employment of skilled workmen who know their job, then it should not be considered that he "is getting away with anything."

G. M. SHEER
(PLASTERING, LTD.)

SIR,—I have read with interest F.R.I.B.A.'s letter on "Plaster for Concrete Ceiling." I note he suggests reducing the weight and expense of two-coat plaster work to ceilings by substituting one coat of lime putty gauged with cement.

The usual practice on all good-class work is to use the render-float-and-set method, or, as it is sometimes called, the three-coat method. The render coat is used to obtain a key for the floating coat, which, in turn, provides a level surface for the setting or finishing coat. This latter coat must, of necessity, have a smooth finish (being invariably carried out in some form of plaster). In this type of work the render and float coats usually consist of sand and cement in proportions of three parts sand to one part of cement, the render coat being applied in slurry form and the float coat averaging three-eighths inch in thickness.

One-coat work, such as is suggested in F.R.I.B.A.'s letter, is not, to my mind, a practical suggestion. It has been used on jobs where price is the predominating factor, but has rarely proven satisfactory. Owing to the thinness of the rendering, uneven and fast drying take place, which are certain to result in cracking.

Where a really efficient key can be assured by the use of a liquid material, two-coat work, which is commonly known as render-and-set or float-and-set, can be relied upon. F.R.I.B.A. states that hacking is none too reliable unless strict supervision is attendant on the work, but he does not appear to realize that, even were the concrete well hacked, a key would be obtained on less than 25 per cent. of the total area. Furthermore, to quote from the Building Research Station's report on construction joints in concrete: "when chipping and wire brushing had been resorted to, fracture occurred close up to the joint, but in the old concrete." Even should a bond be obtained, the concrete becomes weakened by the hacking, with the result that it is liable to pull away with the new rendering. If a reliable cement retarder is used, a perfect natural key is obtained, and this trouble entirely eliminated.

(REDALON, LTD.)

Fire Testing

[Following are extracts from a letter that is being addressed, writes Dr. Stradling, to firms in the building industry regarding the institution of a laboratory for testing the resistance of building structures to fire.—Ed. A.J.]

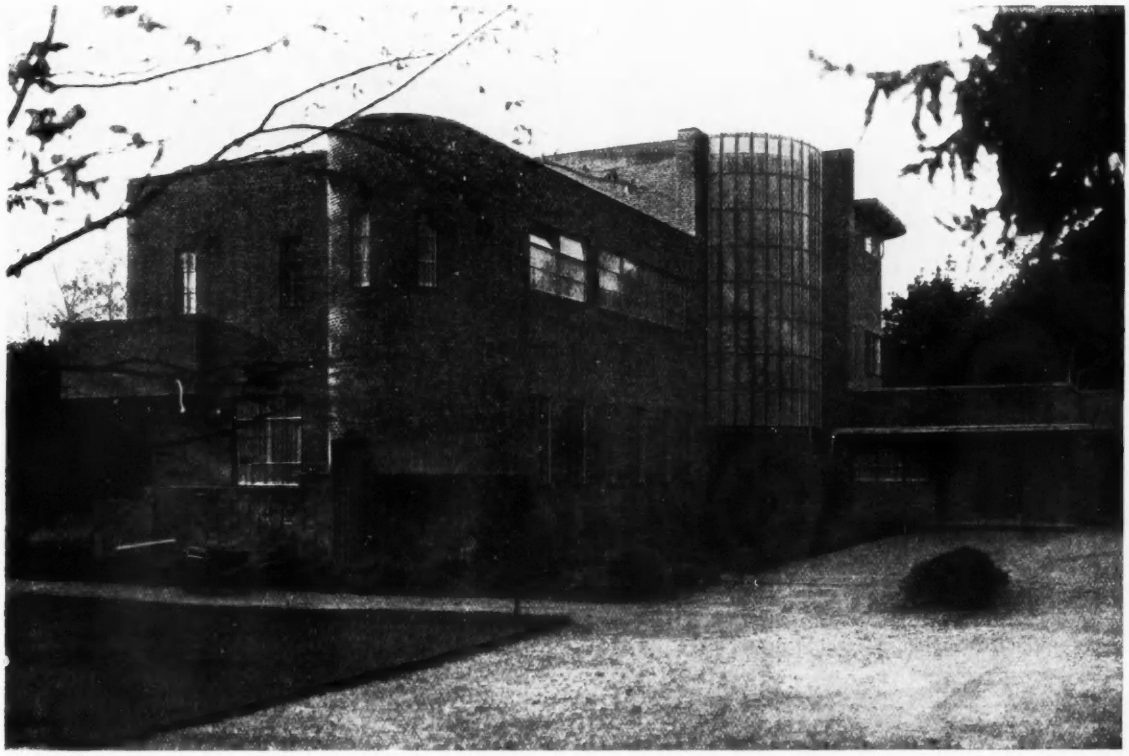
It is not surprising, in view of the direct importance of fire tests to the building industries, that many requests for tests on building materials and methods of construction have been put to the Building Research Station during recent years. But it has not been possible to meet these requests, first, because a sound basis for fire-testing had not been enunciated: secondly, because the necessary technique had not been developed at the Station: and, thirdly, because the necessary testing facilities are not available either at the Building Research Station or elsewhere.

In these circumstances the Department considers it expedient to invite those firms who are interested in the provision of these facilities in a central and authoritative testing laboratory, and who are prepared to bear a share of the financial support necessary for the establishment of such facilities, to attend a conference to discuss how best to attain the desired end.

Any persons or bodies who are sufficiently interested to be willing to contribute to the cost of such a laboratory, and who may not be approached directly, should communicate with me at the Building Research Station.

R. E. STRADLING
(DIRECTOR OF BUILDING RESEARCH)

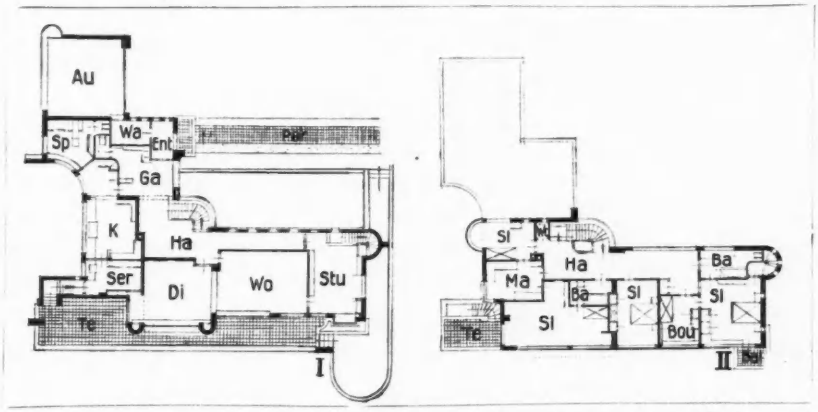
MODERN COTTAGES AND HOUSES IN HOLLAND



A house at Hilversum. Designed by H. Th. Wijdeveld. The entrance is on the right, adjoining the garage. The large semicircular glass window lights the hall staircase.

WHEN Dr. Slothouwer lectured before the R.I.B.A. in 1924, his illustrations seemed to show that post-war Holland was about to produce a truly national architecture. Following on the pioneer work of Berlage and de Bazel, the younger generation, led by men like de Klerk, L. M. Luthman and W. M. Dudok, were adapting to modern needs the traditional Dutch brickwork, and were developing a style that would eventually vitalize all types of building.

The illustrations in this book[1] of lesser domestic architecture suggest that such expectations have not been wholly realized. Among the four hundred odd photographs and plans of modern country houses, there is no common denominator; a few have a recognizable relationship to such well-known buildings as the Hilversum Bath House and de Kleck's Post Office at Amsterdam, some are just transplanted Latins and Teutons from Paris and Berlin, others again follow the tradition of the old Dutch farmhouses with their gables and pantiled roofs, one or two are freaks, and of the remainder a great number have a distinctly English appearance, though lacking the incommunicable charm of our best domestic work. At the beginning of the century English influence among the architectural students of the Technical High School at Delft was very strong, and Dr. Slothouwer has admitted that in his time the names of Ernest Newton, C. F. A. Voysey and Baillie Scott were better known than those of the Dutch architects of the past. Dr. Wattjes, who is Professor of Architecture at Delft, has written a polyglot introduction in Dutch, German, French and English, and his architectural outlook is more catholic.



Ground- and first-floor plans of the house illustrated above. Scale = 1 : 500. References : Ent = entrance; Wa = waiting-room; Ga = dressing-room; Ha = hall; Di = dining-room; Wo = living-room; Stu = study; Ser = serving-room; K = kitchen; Te = terrace; Sp = scullery; Per = pergola; Au = garage; Sl = bedroom; Ma = mangling or sewing-room; Ba = bath; Bou = boudoir.

[1] *Moderne Nederlandsche Villa's en Landhuizen.* By Professor Ir. J. G. Wattjes, B.I. Amsterdam: N. V. Uitgevers-Maatsch. "Kosmos." Price F. 17.50.

"Elly's Home," Huizen, Holland. Designed by J. P. Vos. The walls are of brick up to first-floor level, and weather-boarded above. The roof is thatched. A small terrace has been provided on the right of the chimney stack.

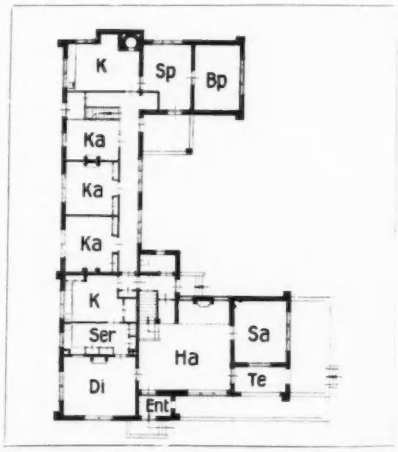
From Modern Cottages and Country Houses in Holland.]

The garden front of "Gaudeamus," Bilthoven, Holland. Designed by Frants E. Röntgen. The walls are of brick and the roof is thatched. The circular one-story projection on the left houses the music room.

He has chosen to illustrate all types of suburban and country houses, from the semi-detached villa to the large rambling plan, which in this country would cost about £4,000 or more to erect. No mention of prices is made throughout the book, which is perhaps a pity, for although at the present time exact comparisons in international

"De Dierik," Oudelande, Holland. Designed by H. A. J. and Jan Baanders. The walls are of brick and the roof is covered with tiles.

currencies are difficult, it would have been of interest to know whether a Dutchman paid more or less for similar accommodation than an Englishman. From the excellent plans it appears that the domestic requirements of the countries are much the same, and the owner of one of Ernest Newton's country houses would feel quite at home in Herr Arnhem's charming "St. Amaland," Vught, with its long low English roof-line and thatching. The method of finishing the thatch with a half-round tile at the ridge gives a hard line, but seems to be a common practice in Holland. Many of these thatched villas, with the long slope of the roof unbroken and with deep overhanging eaves, are pleasing examples, but the book contains, as well, illustrations of almost every crime that can be committed with this material.



Ground-floor plan of the house illustrated above. Scale = 1 : 500. References: Ka = room; K = kitchen; Bp = storeroom or workshop; Di = dining-room; Ha = hall; Sa = drawing-room; Sp = scullery; Te = terrace.

The invasion of the country by the town, due to increased transport facilities and begun in Holland some thirty-five years ago, is rapidly urbanizing districts which up till then had been entirely rural. The new garden suburbs of Rotterdam, Amsterdam and The Hague are well known, but although the author mentions the "villa park," there is no indication among these illustrations of any co-ordinated layout of an estate. In districts where the land is expensive, i.e., in the proximity of large towns, the houses are being erected to a greater height and are "divided by mere strips of garden." Such a prospect is not encouraging, and without co-ordination might result in a replica of some of the most depressing of late Victorian suburbs around London. But the Dutch architects who have done so many good things since 1918 are not likely to fall into this error.

Both type and plates are excellent. The binding, which has been designed by a Dutch architect, Herr Wiersma, is in keeping with the high standard of production.

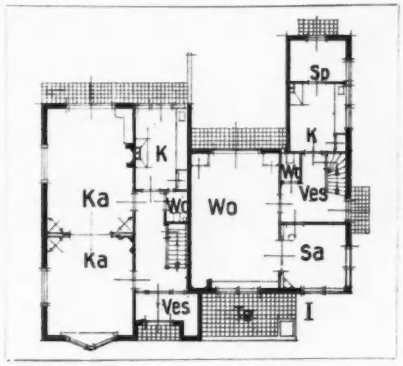
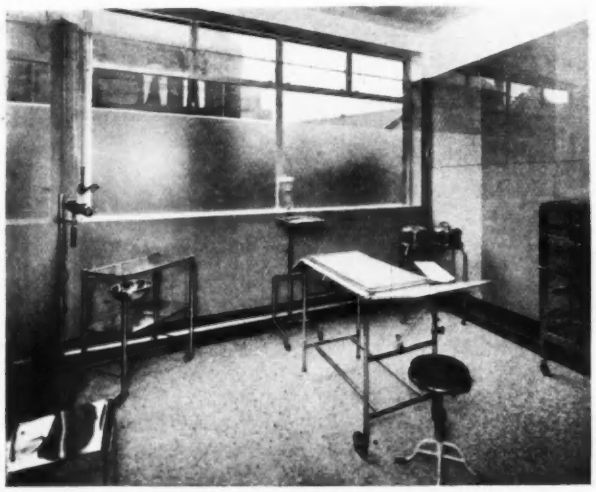
Ground-floor plan of "Gaudeamus," Bilthoven. Designed by Frants E. Röntgen. Scale = 1 : 400. See also facing page.



Ground-floor plan of "Elly's Home," Huizen. Designed by J. P. Vos. Scale = 1 : 300. See photograph on facing page.



The operating theatre by day. The large window is in steel, with opening gear controlling the upper panes. The floor is of terrazzo.

The operating theatre after dark. The walls of this and the anæsthetic room are lined with green opal glass. All angles are coved.

SURGERY FOR A FACTORY

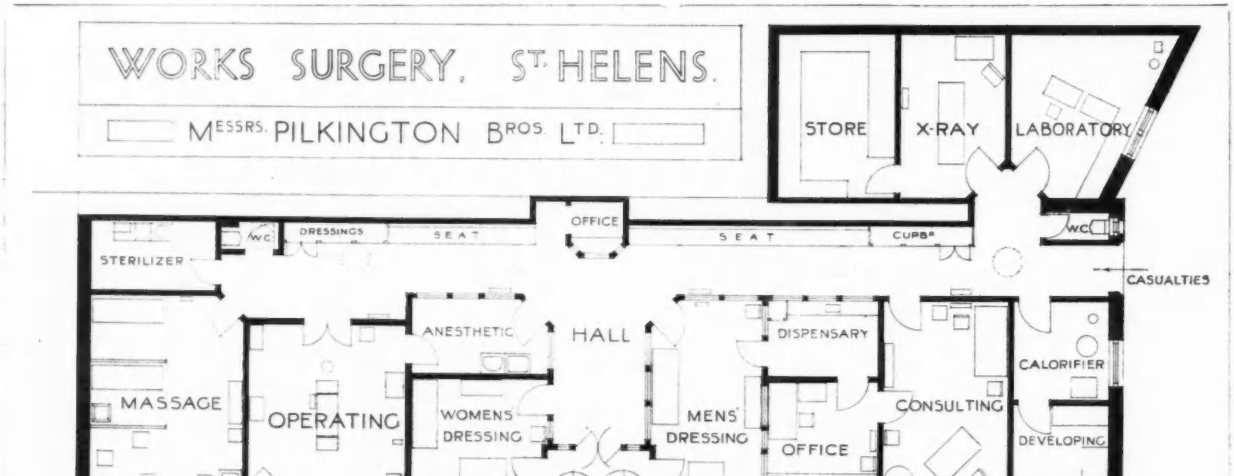
DESIGNED BY BIRAM & FLETCHER

THIS surgery has been obtained by converting an existing building and dividing it up as shown on the plan. A new flat ceiling was put in and the corridor lit with dome lights. The window sills were dropped to a lower level and windows with steel hopper vents and fanlights inserted. The window to the operating theatre is of steel, in two large lower panes and four upper panes with opening gearing. A new entrance doorway was formed in artificial stone.

The floors of the hall, corridor, operating theatre and anæsthetic rooms are finished in terrazzo; those of the store, calorifier and sterilizing rooms in granolithic; and those of the remainder of the rooms in triolin composition flooring on a bitumen base, both cemented down solidly with waterproof cement. The division walls are built in brick on edge in cement, with borrowed lights where shown.

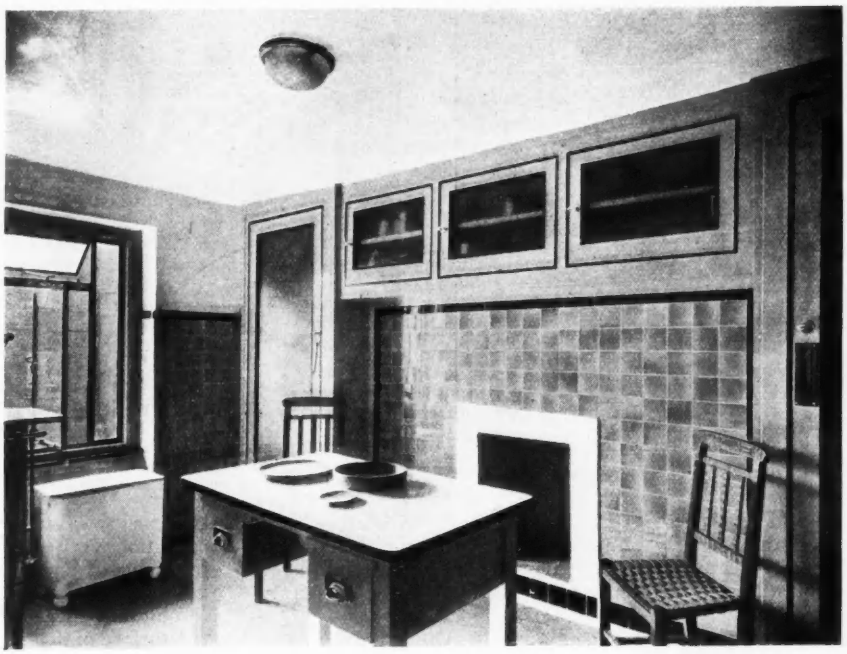
The operating theatre and anæsthetic rooms are lined with green opal glass, fixed to cement rendering with special mastic putty; all angles are coved with glass bent to radius. The hall and corridor, massage rooms, men's and women's dressing-rooms are lined to a height of 4 ft. with white opal glass, similarly fixed, and the borrowed lights are glazed with stippled plate glass. All walls have an 8-in. terrazzo skirting with coved angle to floor. All brackets carrying heating pipes and radiators project from the skirting. The remaining walls are finished in Keene's cement.

The heating and hot-water supplies are by low pressure from calorifiers fitted from the works steam mains. Radiators are of the hospital type and, where under windows, are fixed in recesses with white enamelled inlet vents. The ventilation is by extractors in the ceiling. The sanitary fittings are also of modern hospital type.



The plan. An existing building was modified as regards lighting, divided up, and lined and floored with modern materials.

EFFICIENCY IN THE KITCHEN



This view of the fireplace wall shows the disposal of a series of built-in cupboards surrounding the tiled recess.

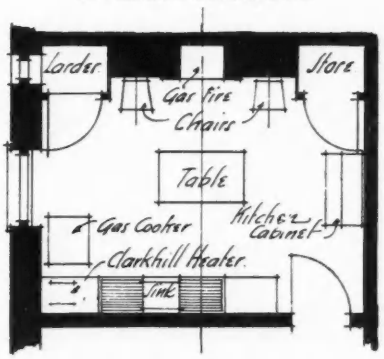
A Compact Modern Example in a London Flat

DESIGNED BY
G. ALAN FORTESCUE

THE importance of the kitchen in contributing to comfort throughout the entire house, and in making work more enjoyable and leisure more abundant for womenfolk, is today much more widely recognized than was the case even eight or ten years ago. In pre-war days the kitchen was sometimes despised and neglected; to-day the greatest possible attention is paid to this section of the modern house. It is planned so that work may be done with ease, in fresh air and a good light, and with as little running to and fro as possible; and it is fitted so that it may be kept spotlessly clean with the minimum of labour.

In the achievement of this reformation the architectural profession has played a leading rôle, and the utmost ingenuity has been devoted to planning such features as built-in cabinets and dressers, service hatches communicating with the dining-room, tiled recesses, and the installation of up-to-date plant for heating and cooking. Among the pioneers in this movement is Alan Fortescue, who has been responsible for planning many kitchens that have rarely failed to include features of utility and originality. The example here illustrated is part of a flat which the architect recently re-conditioned for his own use in Beauchamp Place, London.

This kitchen has a colour scheme. A cheerful tone of pale brown, putty colour and black are its chief components, the tiles which line the walls being of the first-mentioned hue, and the woodwork being putty-coloured, picked out with black. Above the dado, which is carried well up, so that any dirt marks or splashes may fall upon the tiled surface, the wall is finished in Keene's cement and painted white, the ceiling having been similarly treated. The door is of cathedral glass with flat iron bars painted black, repeating the black elements in the woodwork.



The plan reveals the forethought that has been taken to avoid unnecessary walking about.

Stainless steel is used for all taps, and also for finger plates on doors and cupboards; it may be noted, too, that the taps have square stainless steel bosses, which may be built into the tiled wall with convenience and produce an agreeable effect.

The kitchen cabinet is interesting. This is a Drytone model, but instead of being of limed or chemically tinted timber, as are most of the Drytone cabinets, this example has been painted with putty-coloured cellulose lacquer. The result is an article which not only harmonizes perfectly with the interior, but is exceptionally pleasing in itself.

The windows are hung on pivots, so that both sides of the glass may be cleaned from within the room. As the kitchen is on the second floor, above street level, this is no small advantage, and it is in any event a device which saves time and labour when cleaning windows, even if the kitchen is on the ground floor. There is also a hopper light for ventilation in winter.

The gas range is a Smoothtop model, and is fitted with a pilot light, so that gas may be turned on and lit instantaneously without having to strike matches; and a Clarkhill heater gives an abundant and speedy supply of hot water not only to the sink, but also to the bathroom on another floor. The draining boards at either side of the sink are removable.

The wall opposite that where the sink has been installed has a tiled recess with accommodation for a gas fire, for use

Among the fittings are a kitchen cabinet and removable draining boards to the sink.

The sink taps are of stainless steel, and the windows are pivot-hung, for easy cleaning.

if additional heating should be needed, and around this recess is an extremely serviceable arrangement of built-in cupboards with sliding glass doors.

The floor is covered with a high quality linoleum, and has a sub-floor of Linovent, giving greater softness and resilience to the tread. B. B.

IN THAT CONTINGENCY

The following abstracts of inquiries represent a number of those recently submitted to the Building Research Station. The information given in the replies quoted is based on available knowledge. It has to be borne in mind that further scientific investigations may, in the course of time, indicate directions in which the replies might be supplemented or modified. Moreover, the replies relate to the specific subject of each inquiry, and are not necessarily suitable for application to all similar problems. Crown Copyright Reserved.

A Damp Wall Problem

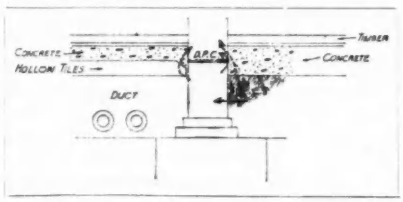
THE architect for a block of recently-erected flats requested the assistance of the Station in tracing the cause of dampness in a wall in one of the apartments on the ground floor.

An inspection carried out at the building by an officer of the Building Research Station showed that on one side of the affected wall was a solid concrete floor, finished with wood bearers and flooring, while on the other side was a pipe duct with a hollow tile and concrete cover, also finished with wood bearers and flooring. (A sketch, supplied by the Building Research Station, showing the construction, is reproduced on this page).

It is obvious from our inspection that the trouble is most probably due to the capillary rise of ground moisture at the point where the concrete is in contact with the wall above the damp proof course; the arrows on the sketch indicate the manner in which it is thought that the moisture is rising. It is, perhaps, not generally realized that even a dense well-made concrete may not be a barrier to the capillary movement of moisture, although the amount actually transmitted may be small. The fact that one flat alone is affected may be the result of some peculiarity in the distribution of ground moisture on the site : in this connection. it is observed that the corner of the building where the flat is situated, appears to be at a rather lower level, in relation to the general ground level, than the rest of the building.

To prevent the rise of moisture in the walls, it will be necessary to provide a vertical damp course; this might be satisfactorily accomplished by cutting a chase in the concrete adjoining the wall to a depth sufficient to leave the full thickness of the damp proof course exposed, and filling up the chase with hot bitumen.

With the construction as carried out, the floor timbers are also liable to



A sketch showing the construction of the wall referred to in a query on this page.

become saturated with moisture, a condition very liable to result in an outbreak of dry-rot, and it would be advisable to introduce some form of insulation between the timbers and the top surface of the concrete. A bitumen coating would probably provide satisfactory insulation from moisture, but to be effective it would be necessary to ensure that the layer of bitumen over the concrete is continuous.

Watertightness of Brickwork

An engineer inquired about the comparative watertightness of brickwork built in lime mortar and cement mortar.

Throughout recent literature there have been numerous references to this subject. For example, a summary of investigations carried out at the Mellon Institute of Industrial Research (America) is given by F. O. Anderegg in the American *Architectural Record* for September, 1931. In this article it is pointed out that lime mortar has greater "flexibility" than cement mortar; the latter imparts rigidity to a structure, but this, in brickwork, is unnecessary, and may be harmful, since cracking is more liable to occur. Lime mortars, however, are more absorbent than mortars containing cement, and are less weather resistant. Percolation of moisture through brickwork seldom occurs in the first place through the body of the brick or through the mortar, but more often by way of depressions in the mortar surface in contact with the bricks, caused, apparently, by incomplete wetting of the brick by the mortar, or by too rapid moisture removal while the mortar is still plastic. Since the erection of a watertight brick wall is well-nigh impossible because of the human element involved in bricklaying, it is

advocated that, in exposed situations, cavity construction, the use of hollow building units, or the erection of furred-out internal renderings should be adopted. Mention is also made of a school of thought which advocates the use of materials permitting comparatively easy absorption, and consequently, quicker evaporation, precautions again being taken to insulate the internal renderings from the body of the wall. It is suggested by the investigator that the most suitable all-round building mortar is a lean lime mortar, gauged with cement and containing a clean well-graded sand.

From the limited number of experiments carried out to date at the Building Research Station there is some evidence, generally that brickwork in which a moderately hydraulic, lime-sand mortar has been employed is rather more resistant to water-penetration than that in which a cement-sand mortar has been used. The first penetration in either case has been observed to occur at the bottom of the vertical mortar joints.

Recurring Rot in Timbers

A firm of building contractors was called upon some time ago to replace a wood floor where an outbreak of rot had been discovered. The floor was of wood flooring-boards on sleeper joists, resting on a sleeper wall, and was ventilated in the usual manner by air gratings in the outer walls and openings in the sleeper wall; the centre portion of the floor was covered with carpet and the room had a linoleum surround. The decay was confined to the section of the floor adjoining a party wall having a projecting chimney-breast and hearth walls. Although every precaution against a recurrence of the trouble was taken, the rot broke out again in the new timbers.

Trouble of this kind is by no means uncommon, and it is considered that it is primarily due to a lack of efficient ventilation in the recess formed by the projection of the chimney breast and hearth. In a serious outbreak of dry rot recently investigated by the Station, and where some hundreds of houses were affected, it was found that in nearly every case the rot had commenced in exactly the position described in this instance. The remedy in a case of this nature lies in the provision of an air passage under the hearth to avoid the formation of a stagnant air pocket in the recess. The insertion of a 6-in. drain pipe under the hearth will probably effect considerable improvement.

The use of linoleum frequently gives rise to trouble of this kind, since it is so impermeable that any condensed moisture is unable to evaporate into the air of the room. If, in this case, it were possible to dispense with the linoleum surround where moisture conditions are troublesome, this would be highly advantageous.

The subject of dry-rot in wood has been dealt with comprehensively in Forest Products Research Bulletin No. 1 (H.M. Stationery Office, price 1s. 6d. net), and it is suggested that this publication may be found helpful.

In renewing the timber, where there has been an outbreak of dry-rot, it is particularly desirable to apply a preservative treatment to the new wood. Thorough impregnation with the preservative is to be recommended, as brush-applied coatings have been known to fail to prevent further infection.

Corrosion of Lead Pipes Embedded in Clay

A firm of builders engaged in the development of a housing estate had experienced repeated failures of lead water-supply pipes embedded in a virgin clay soil. In each case the pipe was found to be severely corroded, in some instances to the extent of the full thickness of the wall of the pipe. A section of the corroded pipe was submitted by the builders, together with a request for the opinion of the Station on the probable cause of the corrosion and a note of any preventive measures which could be taken.

An examination of the corroded pipe showed that the corrosion product was of the lead carbonate or white lead type, that is, of the kind produced by the action of organic, acidic substances on lead. In certain soils, such as peaty soils, clays containing comparatively high proportions of organic matter, and made-up ground containing coal residues, serious corrosion of embedded lead is liable to occur, the organic acids contained in these soils acting on the lead and resulting in the formation of lead carbonate. Apparently, in this instance, the clay soil in which the pipes were embedded contained sufficient organic acids to corrode the lead seriously; several instances of this type of corrosion have previously been reported to the Station.

Since it is obviously impossible to expect the normal life from lead pipes embedded in this clay, the insertion of some form of insulating medium between the pipe and the soil seems advisable; to pack round the lead pipes with chalk, limestone, or old, well-carbonated mortar would probably give beneficial results, though at future renewals it might be better to lay the pipes in wood troughs and fill in with bitumen or tar, or, again, the use of felt strips impregnated with bitumen and wrapped spirally round the pipes, would probably provide adequate insulation.

Much useful information regarding the causes of corrosion of lead in buildings and its prevention is contained in the Building Research Technical Paper No. 8, *The Corrosion of Lead in Buildings*, and Building Research Bulletin No. 6, *The Prevention of Corrosion of Lead in Buildings*.

Putty for Glazing in Steel Sashes

An architect had been experiencing trouble with the putty used for glazing in steel sashes. His specification called for a genuine linseed oil putty, and, although he could neither find fault with the quality of the putty used nor with the workmanship, the putty on some of his recent work had failed to harden and presented a rippled appearance. He inquired whether it was possible to suggest the cause of this trouble and how to overcome this deficiency in future work.

It is known that in certain cases additions are made to putty to prevent hardening, particularly where large individual panes are glazed, or where considerable temperature movements are to be expected. It is possible that a non-hardening putty of this type had been used on the work. Alternatively, the use of an excessive quantity of linseed oil would result in a soft putty, for which the normal small amount of hardening in the form of a surface skin would be inadequate, particularly in steel sashes, since, with these, there is no absorption of the oil, as in the case of wood sashes. The addition of gold-size is sometimes made to increase the rate of hardening of a putty; though its use may be quite effective in this respect, its inclusion increases the shrinkage of the putty, and the practice is one which cannot be recommended.

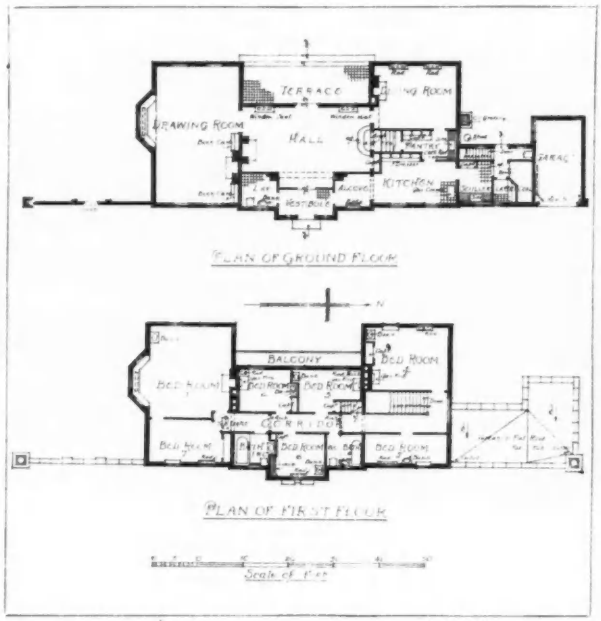
For use in metal frames, the addition of a hardening agent to a putty is desirable. White lead and red lead are often used for this purpose, and a good putty for glazing in steel sashes can be made by adding about 10 per cent. by weight of one of these substances to ordinary linseed oil putty, the desired plasticity being restored, if necessary, by a small addition of turpentine. If this mixture is used at a fairly stiff consistence—rather stiffer than that ordinarily used for glazing in wood frames—and the metal frames have been painted at least a few days previously, good adhesion and satisfactory hardening should result. After a few days the putty should receive one or two coats of paint to give a surface hardness, and at the same time to prevent excessive hardening of the underlying putty.

Research Laboratories

Sir Frank Smith, Secretary of the Department of Scientific and Industrial Research, lecturing last week on "Chemistry and the Community," at a meeting of the Institute of Chemistry, said it was worthy of note in these times of industrial depression that the most prosperous industries were those which maintained adequate research laboratories and strove continually to acquire new knowledge and to manufacture new products. It was significant that there could be but few cases (he knew of none) of failure of a firm which had adopted such a policy.

TWO HOUSES AT FOLKESTONE, KENT

DESIGNED BY J. SEATON DAHL



"MARINERS"

The garden front; and ground and first-floor plans. The walls are of hand-made, sand-faced, multi-coloured bricks, with cherry quoins and plinth. The roof is covered with local hand-made, dark, sand-faced tiles.

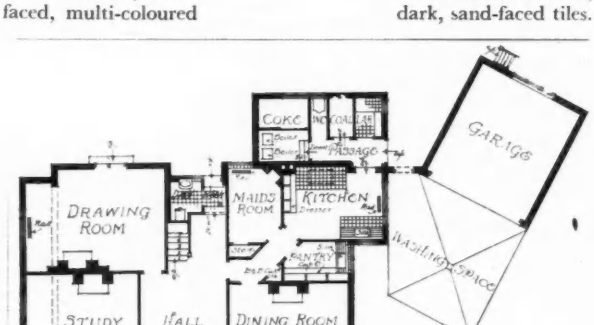
ON this page are illustrated two examples of domestic work by Mr. J. Seaton Dahl.

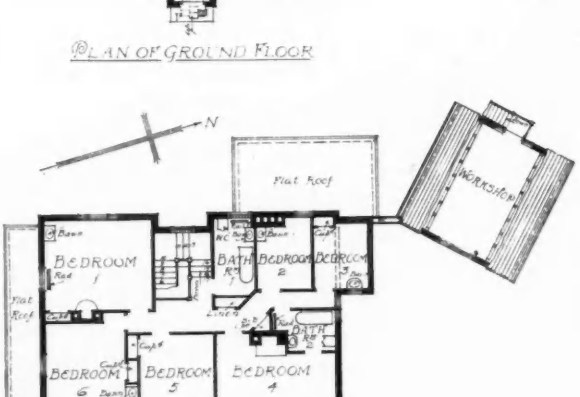
It will be noted from the ground-floor plan of "Mariners," above, that access to the front door is obtained without entering the hall, which forms a third sitting-room. There is a large nursery in the attic, with the doors leading on to the flat roofs, for the children.

"Pelham Court," illustrated below, is fitted with separate boilers for the domestic and central heating, which, can be coupled up by means of valves, and one boiler, in mild winter weather, used for heating purposes. This is possible as the domestic supply is on the indirect system, with a coil in the cylinder.

"PELHAM COURT"

A general view of the entrance front; and ground and first-floor plans. The materials used for the walls and roof are the same as those incorporated in the house illustrated above.





THE FUTURE OF DOMESTIC ARCHITECTURE

BY DARCY BRADDELL

THEORIES today have no time to become absorbed and matured by any one nation and become part of its recognized being, much as Dutch architecture became absorbed in England, to be known now as "William and Mary." They become the common property of all nations instead. Some die a very rapid death, and that is because they are only fashions and bear no direct relation to life, like the Art Nouveau of the early days of this century and the Gothic revival of the last. Others, on the other hand, have come to stay and flower into something that can be called a definite style. Of this class is mechanism.

National Life

The national life of each country outside of the Far East is becoming daily more and more alike, because people of all classes are beginning to want exactly the same things. That is caused by intercommunication of ideas and the rapid spread of democracy. If you travel in Europe today, you see everywhere the same clothes, you hear the same music, dance the same kind of dance to it, and eat the same food. You see the same kind of things in the same kind of shops; for example, it is quite impossible to find anything novel in the way of furnishings for the house which you have not already seen somewhere else. The recent exhibition at Stockholm, the home of tradition, had exactly the same steel tube furniture as can be seen in London, Paris and Berlin.

Every big movement in art has been based on some universal desire of mankind. Humanism and the determination to be free from the shackles of the church were the real causes of the Italian Renaissance, not the discovery of the remains of antique sculpture and architecture. So, today, we have the birth of mechanism, because the world, particularly the young world, is passionately interested in mechanics. The moment man is really interested in anything he makes, he becomes serious about it, and sooner or later understands it. With true understanding will come beauty.

Evolution of the Motor Car

Consider for a moment the case of the motor car. It began designed exactly like a horseless carriage. Then it gradually began to change its lines to fit themselves into its function. Now a car is probably as satisfactory an object to look at as anything that is made today. Exactly the same reasoning might be applied to the design of our future houses, were it not that a house is a far more complex thing than a motor car.

All through the nineteenth century only fashions not styles were made, because mankind, not realizing what machinery really meant, was still thinking in terms of an age when there was none, just like the early motor car designers thought of horse carriages. But the world is changing and the machine has come into its own. So our houses are going to change, and a true new style is beginning life.

We have a new material—reinforced concrete. When this method of building was first used, it made no change in the architectural tradition in vogue. Buildings showed from their external handling no suggestion that they were constructed in a new way. The amazing potentialities of reinforced concrete were completely ignored. All the old treatment of pilasters, pediments, cornices, was still clung to with tenacity during the first few years. Then gradually a change came over the scene, and a school sprang up in Europe with entirely fresh views as to the proper usage of reinforced concrete.

The New Materials

It argued that an entirely new material must have an entirely new method of design, that it was absurd to shackle it with the conventional treatment that bygone ages had given to stone and brick. This school began by flying to the other extreme and denying all ornament to its building—that is to say, extraneous ornament that could in any way be associated with the past—and relied entirely on mass and proportion of solids to voids and that sense of pleasure that an engineer will have in the purely functional, to give whatever interest its buildings were to possess. It further argued that a window was intended to look out of, and the world now being capable of rolling a sheet of glass of almost any size, it was clearly ridiculous to cut that glass up into small window panes. It put aside, not only the accepted ornament, but traditional canons of good design in stone or brick buildings, as, for instance, the necessity of supporting overhanging projections, such as balconies, with some visible means, and the leaving of the corners of a building as solid piers to give real and visible strength.

Le Corbusier was, I think, the first man to introduce the angle window which deliberately cut away the external angle and left it a series of jags like a dovetailed joint. His example has been extensively followed all over Europe. The new style precludes any form of pitched roof that is not behind a parapet and consequently hidden, because a tiled or slated roof that can be seen savours too much of the past, and the new school was determined that, whatever else might be said of it, it was not going to be accused of anything like traditionalism.

Together with concrete and glass, another material is now to hand, and that is stainless steel. This last is clearly going to play a very great part and may help the modernists out of their roofing difficulties, for there is no good denying that being tied to a flat roof is a great handicap in a northern climate. Stainless steel, of course, has still to be proved and certainly has not arrived at the state where it can be used for such purposes as I suggest, but I believe the time is not far away when it will be so used.

The New School

Nobody is going to quarrel with the arguments of the new school. They are quite sound as far as they go, but the trouble is they do not go nearly far enough. They are much too limited. Like all theories based on nothing but logic, they will not satisfy the needs of that complex animal, man.

As a case in point, the mechanists will argue something like this: If you want to design a balcony to one of your houses, the best and only way to make it is to project a slab of reinforced concrete as thin as is safe, and then, to protect yourself from falling off, to erect round it a dwarf wall of concrete. There is not the slightest necessity to ornament this wall. So long as it fulfils its function of protection, that is all that is demanded. In other words, the function only of any feature dictates its design. By this means, they will tell you, simplicity is achieved. Directness, yes; but not simplicity, because that is the result of a deduction from riches within. The Parthenon is a simple building, but it was not arrived at by thought on these lines. When primitive man made his first timber dwelling, he did not achieve simplicity, but only directness; and that is all, in my judgment, that these mechanists have done so far. I think they are perfectly right to say that the time has now come to realize that we live in a new world with new building materials, and that it is no good applying to these materials the worn-out traditions of others. I also agree with them that

Extracts from a paper read by the author at a meeting of the Sheffield, South Yorkshire and District Society of Architects.

they have got to go right back to the very beginning and start with fresh principles, but where I do *not* agree with them is that there are no lessons to be gained from a study of the past, and that the architecture of yesterday cannot help in any way that of today. A house is not, and never can be, quite in the same category as a motor car or an aeroplane, and the æsthetics of one can never entirely be applied to the other. Imagine if you went to China, for instance, and saw the Chinese building houses exactly like the English, you would be shocked beyond expression, and rightly so, because you would say, "these people have nothing in common with us, their whole conception of life is different. Why then do they build their houses like Europeans?" But on the other hand, if you saw a Chinese aeroplane you would not expect it to look any different from an English one. And that is the weak spot of the arguments of the present-day mechanists, it seems to me. Man is too old to cast aside, like worn-out clothes, all the experience he has gained in making a house. It is too much to ask of him; and, passionately interested in machines as he is, he is not one himself.

Danger of Mechanism

Another very great danger I can foresee in this present phase of mechanism is that hundreds of people will try it and not understand in the least what they are doing, and some very dreadful little houses will result. Perhaps you will say "no more dreadful than the houses built by ignorant practitioners in other days." Nearly two hundred years ago Pope wrote these lines to Lord Burlington :

Yet shall, my Lord, your just, your noble rules,
Fill half the land with imitating fools,
Who random drawings from your sheets shall take
And of one beauty many blunders make.

LAW REPORT

STREET IMPROVEMENT : CLAIM AGAINST BOROUGH COUNCIL

Foster v. *Woolwich Borough Council. Chancery Division. Before Mr. Justice Eve*

THIS was an action in which Messrs. Walter Laurence Foster, Douglas Marley Foster, and Horace Gibbard Foster, estate agents, of Blackwater and Lewisham, where they trade as Foster and Foster, the owners of freehold land on which formerly stood 136 to 140 High Street, Eltham, and certain houses in Pound Place, Eltham, part of which had been transferred to the Woolwich Borough Council for the purposes of widening Eltham High Street, claimed damages against the Council for alleged breach of a covenant of July 30, 1928, to demolish the buildings, clear the land of all materials and rubbish, and to widen and pave the footway and make up the road with all reasonable expediency.

Mr. Galbraith, K.C., and Mr. Blanco White appeared for the plaintiffs, and Mr. Morton, K.C., and Mr. Hodson for the defendants.

Mr. Galbraith stated that the negotiations for the land took place in 1926, and in July, 1928, it was transferred, the price being £1,000. The Council undertook to obtain vacant possession of the land and demolish the buildings and clear the site, so that the new building line would be available for the plaintiffs' shops on or before November 8, 1928, and that they would proceed with the work of widening and paving the footway and making up the road with all reasonable expediency and without cost to the plaintiffs. The Council had obtained possession of the land, but had made delay in the paving of the footway, which was only partly done, and making up the road, where practically nothing had been done. Through this delay the plaintiffs had suffered substantial loss.

Mr. W. L. Foster estimated the loss that the plaintiffs had suffered at over £800 a year.

Mr. Morton, for the Council, submitted that on the true construction of the deed of July, 1928, there had been no breach of contract by the Council, but if there had been any breach, no damages had been proved. What the Council consented to do was to demolish the buildings and clear the land so that the new building line would be free by a particular date. He submitted that the Council had done their part so long as they removed everything which prevented the plaintiffs erecting their shops. Plaintiffs could have built at any time. The Council's case was that it was not expedient to widen a street in patches, and that they had done the paving with reasonable expediency, having regard to the obstructions placed there by the plaintiffs' contractors. He further submitted that the damages claimed were too remote.

JUDGMENT

His lordship, in giving judgment, commented on the fact that the buildings in question were very old buildings, and they were found to be in an unsatisfactory condition, and the defendants' engineer came to the conclusion that one of the walls would collapse if something were not done. He therefore decided to leave the chimney breast as a support. If this support had not been left, it would have been necessary to secure the wall. There were other interests to acquire besides the plaintiffs', and this took time. The widening of the road was accordingly a long process owing to the various interests concerned. It could only proceed, if any regard was to be paid to expenditure, when a long and continuous stretch of the road could be completed, and it was a matter of uncertainty when the widening of a particular stretch could be put in hand. The question of whether or not there had been a breach of covenant fell to be determined on the construction of the covenant. Did the non-removal of the chimney breast, of which the plaintiffs complained, involve a breach of covenant? The non-removal of the chimney breast did not interfere with the plaintiffs' building line, and therefore, in his lordship's opinion, the defendants were entitled to succeed on the construction of the covenant.

In any case, the plaintiffs would not be entitled to more than nominal damages, but in view of the construction he had put on the covenant the action on this issue must be dismissed. The plaintiffs alleged a cause of action against the defendants for not having made up and paved the footway with all reasonable expediency. But his lordship had to bear in mind that there had been many obstacles to be overcome by the defendants, and there was a long correspondence, which closed with a letter from the Town Clerk explaining the position. Then the writ was issued.

Plaintiffs complained that they had suffered at the rate of about £800 per annum. The plaintiffs had contended that all reasonable expediency was with all reasonable expedition. His lordship did not agree. So long as the defendants acted reasonably was all he had to consider. There was no evidence that the defendants acted otherwise than reasonably, and they widened and paved the footway as soon as requested by the plaintiffs.

The plaintiffs had failed to establish any cause of action against the defendants, and he dismissed the action with costs.

Northern Polytechnic

At the end of this year Dr. Clay is resigning the principalship of the Northern Polytechnic, a post he has occupied for twenty-nine years. The governors, staff, students and members of clubs and societies who have been associated with him during this period wish to assist in offering some token of their regard and affection. A committee has been set up to give effect to this general desire. Old students and others who would like to contribute are asked to send their donations to W. M. Macbeth, hon. treasurer of the committee, Northern Polytechnic, Holloway, London, N.7.

THE SPECIFICATION WRITER

Substituting Electric for Coal Heating

A striking example of the progress which is being made with the electric heating of buildings is the electrical installation just completed at the Royal Scottish Automobile Club, Glasgow.

Until recently the heating of the building, the domestic hot-water supply and the supply of steam for the kitchen were all obtained from a central Cornish boiler, but, as time passed, this was found to be insufficient for the work, and something had to be done to improve matters. Situated as the boiler was, in the centre of the buildings, it was clearly a difficult matter to increase its size, and, for that matter, the only possible place for another boiler, either for oil or coal, was in the space now occupied by the club garage—a space which has considerable value to the club as a convenience for members. It was here that electricity came into its own, because, without any trouble whatever, the electrical equipment has all been placed in the small space hitherto used for coal storage and for firing the boiler, and no longer required for that purpose.

The electrical equipment has been installed under the direction of J. Campbell Murray, M.I.E.E., of Glasgow, and has been designed so that the minimum space is taken for the apparatus itself, while the existing plant is made use of to its fullest extent; and the change over from coal to electricity was effected without inconvenience or, in fact, without the members or domestic staff knowing that it had taken place.

The diagram gives a general idea of what has been done. The existing Cornish boiler was converted into thermal storage for the domestic hot-water supply by blanking up the furnaces and inserting a steam coil (1) at the bottom; this is heated at night by either of the two boilers (A) or (B), which are of 150 and 350 kw. respectively, to the desired temperature. In order to reduce the heat losses in circulating, the temperature of the water in the piping is kept down to as low a point as is consistent with good service by means of a mixing valve (5), and while the temperature is adequate for wash basins and baths, it is not so for kitchen purposes. A second existing storage is therefore used, also heated by either of the boilers (A) or (B) during the night up to a temperature of 200° F. Both storages are controlled automatically in that a steam valve (3) closes when the storage (2) is hot and a thermostat stops the boiler pump and so shuts down the boiler itself when the main storage is up to temperature.

The hot-water supply to the kitchen is thus taken in the first place from the special kitchen storage, and in the second place from the main storage, while any emergency steam can also be taken from the boiler, which is running during certain hours of the day for providing steam for the kitchen cooking equipment. This consists of :

4 boiling pans.
2 steaming ovens.
1 steam oven, 6 ft. by 3 ft.
1 hot closet, 20 ft. by 3 ft. by 3 ft.
3 urns.
2 washing machines.

Steam cooking is the popular method because of its quick results and easy manipulation, and the small electrode boilers, with their quick steam-raising and automatic control, are very suitable indeed for this work.

The boiler for day work has the ordinary patent controls, so that the steam supply and pressure are regulated by the steam demand, and, in addition, if the steam demand decreases and the pressure rises, the feed pump is automatically stopped to shut down the boiler. The beauty of the system is that the steam output automatically regulates itself to meet the demand of the moment, and as steam is required for more or fewer cooking pans, the load on the boiler is opened out or shut off, so that no more steam is generated than is actually required, and if none is wanted, none is supplied or paid for. The second boiler is left connected to the storage control and automatically starts up with a time clock, shutting down when the storage is up to temperature. As will be seen from the diagram, the condensed steam is returned to the main feed tank and the heat units therein saved.

The heating of the building is on more simple lines. A 250 kw. electrode circulator (C) is joined directly on to the existing heating system, the hot water passing through the pipes (6), radiators (7), and return pipes (8), accelerated when necessary by a motor-driven pump (9). This circulator is controlled in the main by water thermostats and contactors and the load altered between 50 kw. and 250 kw. maximum to meet actual needs. The radiator circuits are themselves controlled by magnetic valves and room thermostats to keep check on the room temperatures, which in practice reduce the running costs to a considerable extent, with an improvement in the general comfort of the building.

The existing calorifier (10) through which steam was taken from the Cornish boiler has been retained as an auxiliary if and when the main circulator requires attention.

The photograph, which was taken under considerable difficulty owing to the narrow space, and is very foreshortened, shows the two steam boilers in the front, the 250 kw. circulator midway and, at the back, the existing Cornish boiler before being lagged. It gives particularly well the diminutive size of the electrical equipment in comparison with that for coal.

The method of changing over adopted was, first, to instal the two boilers and circulator, heat being provided in the building through the auxiliary

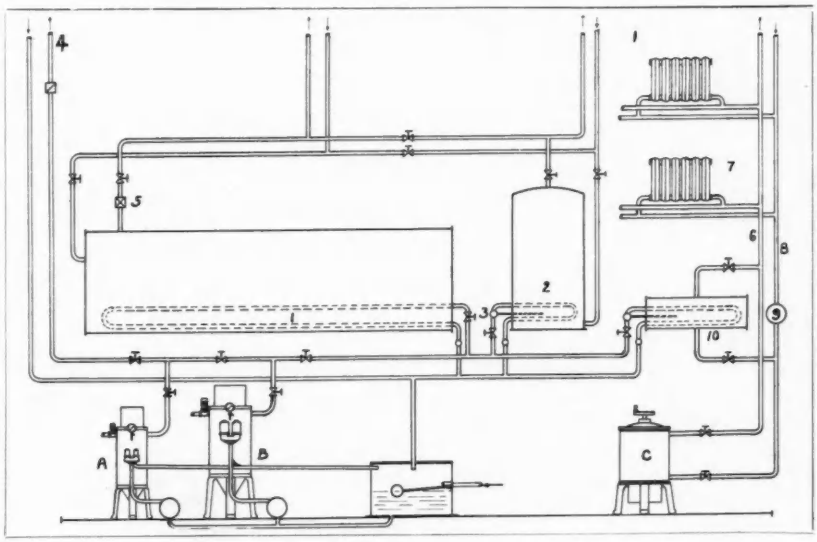


Diagram of the new electric water-heating installation at the Royal Scottish Automobile Club, Glasgow, described on this page.

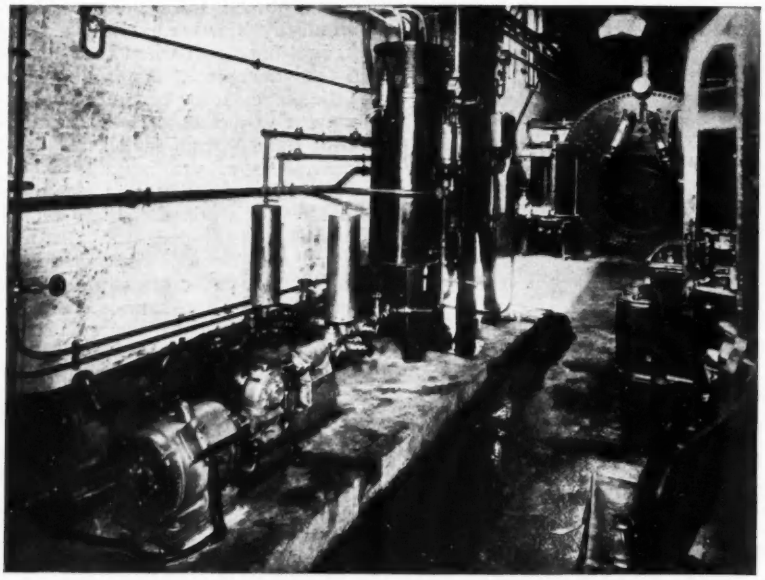

By courtesy of Bastian & Allen, Ltd.

The installation, including, in the foreground, the two new electric boilers, and, in the background, the old Cornish boiler.

calorifier (10) while the circulator was joined up, and the domestic supply taken from the kitchen storage. The Cornish boiler was then altered and joined up, the whole being effected without material interference.

As will be seen, there is no thermal storage for the heating, but in a building such as this it is preferable to have a smaller amount of heat continually day and night, while the residual heat in the system and building is sufficient to cover any short peak load. The rates given at present are £10 per kw. per annum, lighting demand; thereafter, the current taken is charged at power rates—½d. per unit during the day and ⅜d. by night. The equipment was installed by Bastian and Allen, Ltd., of London.

SOCIETIES AND INSTITUTIONS

UNEMPLOYED IN BUILDING INDUSTRY

THE following letter has been addressed by the President of the R.I.B.A. to the Prime Minister, together with the extract from the Prime Minister's speech to which Dr. Unwin refers :

DEAR PRIME MINISTER,

I wish on behalf of the Royal Institute of British Architects to express to you our gratitude for the pronouncement made by you in the House of Commons on December 9, and recorded on pages 1915 and 1916 of *Hansard*. This statement in regard to the danger of unnecessarily arresting all kinds of work, and thus adding to the extent of unemployment, has forestalled a letter which was about to be sent to you asking for just such a statement to be made.

The Institute have been much disturbed at the extent to which building operations were being arrested and unemployment in the building industry increased. May I venture to hope that your valuable statement, which, unfortunately, was not reported in all the papers, will be brought to the attention of Government departments, local authorities and other bodies concerned. It only remains for me to thank you on behalf of the building industry for having set out the position so clearly.

Believe me,
Yours faithfully,
RAYMOND UNWIN
(PRESIDENT OF THE R.I.B.A.)

The Right Hon. J. Ramsay Macdonald, M.P.,
Prime Minister,
10 Downing Street,
Westminster, S.W.1.

Following is the extract from the speech by the Prime Minister in the House of Commons on December 9, 1931 :

I would emphasize to the House and to the country that the action which the Government took, and which the last Government took, was forced upon them by the national conditions and had to be taken swiftly. May I offer one word of warning both to individuals and public authorities ? I hope that this cry of economy is not going to be made a stunt.

I repeat that I hope that this cry of economy is not going to be made a stunt. There are too many people, both private individuals and public authorities, who imagine that simply by cutting down expenditure they are doing a service to the nation. There are circumstances under which a cutting down for the sake of cutting down is, especially at this moment, the greatest disservice that people can do to the nation. The most uneconomic place for money is a stocking, and the most uneconomical use for capital is to fail to find employment for the working man. Therefore, the policy of public authorities and private individuals, while economical and while following the same rules that we have had to lay down for ourselves, must always have regard to the relative value of cutting expenditure and reducing demands for labour; and, unless every public authority proposing to cut down examines its proposals from that point of view, it may not be giving the assistance to the nation which we all wish it to give.

MANCHESTER SOCIETY OF ARCHITECTS

"Internal Decoration" was the subject of an address by Mrs. Edward Maufe at a meeting of the Manchester Society of Architects, held on December 9.

Mrs. Maufe first mentioned some of the problems left by the architect for the person responsible for the furnishing of the rooms. It frequently occurred that in windows with semi-circular heads there was no seemly way of hanging the curtains, and the necessity for forethought in this and other matters was emphasized.

The lecturer then discussed internal design and decoration in general, showing the characteristics of town and country rooms. The elimination of the unnecessary appeared to be Mrs. Maufe's watchword, and some of her most interesting photographs were of very successful rooms with the minimum of decoration.

Mrs. Maufe showed the ease with which carpets could be obtained in any specially desired design, at moderate cost, making it unnecessary to use Oriental carpets in every position irrespective of their suitability, and also deplored the comparative neglect of the use of curtains as a decorative motive in this country.

Mr. J. R. Adamson proposed, and Miss Sadie Speight seconded a vote of thanks.

WELSH SCHOOL OF ARCHITECTURE

Mr. Percy Thomas, O.B.E., F.R.I.B.A., presiding at the annual prize distribution and exhibition of designs of the Welsh School of Architecture, held at the Technical College, Cardiff, on December 10, said the standard of work this year was even higher than it had been in the past. He advised students not to be discouraged nor to forsake the profession if they found it difficult to secure a post. Theirs was not the only profession suffering through the bad times, and they must all hope for a return to prosperity.

In his address on the work of the school, Mr. W. S. Purchon, A.R.I.B.A., said such had been its development from small beginnings (it was opened in March, 1920) that they were now working as one of the leading schools in the scheme administered by the R.I.B.A. Their examinations were recognized as exempting their successful

students from the whole of the examinations leading to the Associateship of the R.I.B.A., including, for the first time, the subject of Professional Practice.

Referring to the policy of the school, Mr. Purchon said they were not striving at specialization in one direction, but rather were they aiming at a thoroughly well balanced scheme of architectural education. They were trying to build up that scheme on as uniform and as sound a foundation as possible, and were endeavouring to base their work in design on a sound knowledge of the theory of design, of the best work of the past, of modern requirements and of modern construction, both theoretical and applied.

The Mayor of Cardiff (Ald. C. W. Melhuish) presented the prizes and diplomas to the successful students.

A vote of thanks to the Lord Mayor and to Mr. Percy Thomas was proposed by Mr. J. Herbert Jones, F.R.I.B.A. (President of the South Wales Institute of Architects), and seconded by Councillor Frederick Jones, Chairman of the Technical College Committee, supported by Principal Charles Coles, B.SC.

THE CHARTERED SURVEYORS' INSTITUTION

On Wednesday last the annual dinner of the Chartered Quantity Surveyors' section of the above institution was held at Edward VII. Rooms, Hotel Victoria, London.

Mr. Oswald Healing, the chairman, proposed the toast of "Architecture, Engineering and the Building Industry." In grouping together for that purpose the three great callings of engineer, architect and contractor, he said they desired to acknowledge and emphasize the essential contribution that each made to the success of the building industry.

The great changes which had taken place during the last twenty or thirty years in methods of construction, and the improvement in the quality of manufactured materials, had made possible the erection of buildings of a character never before attempted. In the case of reinforced concrete and steel-frame buildings, for instance, there had been evolved an architectural technique suitable for those particular constructions which had produced some notable and dignified elevations. Architecture was an art which had its roots in tradition, but those traditions were innovations at one time. So we found that what would yesterday have been heresy to the critics was today mere orthodoxy.

The engineer had made possible this revolution in building methods by his examination and determination of the scientific principles upon which design of those constructions was based. Thus, valuable work had been done by the Steel Structures Research Committee under the chairmanship of Sir Clement Hindley. The code of practice for structural steel which that committee had produced should go far to remedy the lack of precise knowledge upon which our present building laws were based, and, it was hoped, would eventually lead to their revision.

Another committee had just been appointed, with Sir George Humphreys as chairman, to deal with reinforced concrete structures on the same lines, by reviewing the present regulations governing this construction and making recommendations for a code of practice which would embody the best available technical information and the results of recent experience.

It might confidently be expected that both these committees, set up by the Department of Scientific and Industrial Research, would be able to make recommendations which would lead to the simplification of practice and more efficient and economical design.

The decisions which had recently been taken by Government Departments and local authorities to curtail building and public works indicated a policy which would undoubtedly have a very serious effect both on the building industry and on the trading public. The estimated cost of schemes which had been postponed or abandoned amounted to nearly £40,000,000. It was to be feared that the first results of such curtailment would be to create widespread unemployment in the building trades, with corresponding increased charges on the national exchequer for unemployment benefit.

Another equally urgent consideration was that, while it was recognized that national economy was a vital necessity, the desired result would not be achieved by cutting down expenditure on schemes which would be revenue-producing or which would contribute to the re-establishment or extension of other industries. Industrial development depended to a great extent on a wisely chosen programme of public works—roads, harbours, housing. No industry expected or desired that public money should be expended on non-productive undertakings, but properly planned national constructive works in the improvement of industrial facilities were essentially revenue - producing. The prosecution of a far-sighted policy for fostering our home industries was of the essence of constructive statesmanship; and it was earnestly suggested that one of the first questions to be decided was, not so much whether we could afford the immediate outlay involved in constructing these public utility works, but could we afford to stop them.

Mr. Sydney Tatchell, V.P.R.I.B.A., in responding to the toast, said that architecture was too large and too serious a subject to be dealt with adequately in the brief moments of an after-dinner speech, although he had no doubt many of his younger brethren would cheerfully accept the responsibility.

One, perhaps, would assert with all the confidence of youth that architecture could only adequately be expressed in terms of bent wire and glass furniture; whilst another, equally confident, would extol the virtues of horizontal masses of concrete, supported, apparently, by horizontal sheets of plate-glass.

Yet another youthful enthusiast would argue that the architecture of today should find its expression not in horizontality but in verticality. He would probably use the phrase "modernism," and would enlarge upon colour values.

A fourth exponent would combine the efforts of all the others and assert that the only architecture worth having was in the form of a draught-board, in which horizontal and vertical lines were equally distributed; that your colour values could only be obtained by apportioning equal squares of black marble and yellow facing bricks, with, perhaps, a few windows thrown in as make-weight, and that in any case the plan need bear no relation whatsoever to the elevation.

Mercifully, some of us still clung to tradition, and preferred to build on those foundations which had been laid with such care and skill by the old master-craftsmen; and it was to foster and encourage the study and practice of architecture on these, he believed, somewhat saner lines that the R.I.B.A. devoted a very large proportion of its activities.

Sir Cyril Kirkpatrick, President of the Institution of Civil Engineers, and Mr. R. L. Roberts, President of the Institute of Builders, also responded.

"The Guests" was proposed by Mr. Horace W. Langdon, vice-chairman of the Quantity Surveyors' Committee, and responded to by Sir Lynden Macassey, K.C., K.B.E.

MAIDSTONE ARTS AND CRAFTS SOCIETY

At a meeting of the Maidstone Arts and Crafts Society, held in the School of Art on Wednesday, December 2, Mr. W. E. Brooks, A.R.I.B.A., lectured on "The Function of Art in Every-Day Life." Mrs. Herbert Green presided.

Mr. Brooks outlined briefly the development of the arts and crafts from the Egyptian to the Renaissance eras and down to the present day. Art, he said, unlike science, never became a "back number," and what was held as beautiful at one time was still a joy for ever, even in these materialistic times, when a motor car was prized by most people more than an old

master. Formerly arts and crafts played a very important part in the everyday life of the people. Their pottery, their textiles and their household implements were made by craftsmen, and because they were made by hand and by men who took a pride in their work, they were beautiful and simple, and successful as a piece of craftsmanship. For art, like religion, was a striving after Truth.

With the advent of the industrial revolution, however, men lost that pride in craftsmanship, and art was displaced by utility. But there was a reaction to everything, and he believed that a new era was beginning when the arts and crafts would come into their own again. This was apparent in the wider interest taken by the man in the street in art in general, in old furniture and in architecture. The standard of commercial art was on the up-grade.

In the discussion that ensued the lecturer referred to the spoliation of our towns and countryside, and suggested that the Maidstone Arts and Crafts Society should form a civic committee to protect Maidstone from vandalism.

The vote of thanks was proposed and seconded by Mr. S. H. Loweth, F.R.I.B.A., and H. B. Green respectively.

FRENCH RENAISSANCE ARCHITECTURE

Sir Banister Fletcher, PP.R.I.B.A., F.S.A., in the last lecture of the Michaelmas term at the L.C.C. Central School of Arts and Crafts on Wednesday last, dealt with the later Renaissance and modern architecture in France, bringing the story of its evolution up to the present day.

With the aid of numerous lantern slides Sir Banister described some of the best-known churches of Paris: St. Etienne du Mont, with its fine arcaded aisles and gallery; the Church of the Monastery of the Val de Grâce, from which it was believed Wren drew inspiration in the designing of the interior of St. Paul's, London; and the famous Hôtel des Invalides, the "Chelsea Hospital" of France, with its mighty dome sheltering the tomb of Napoleon; the Panthéon, Soufflot's great work, with a dome resembling that of St. Paul's Cathedral, and yet so unlike it in detail, with a weak dome-colonnade unstrengthened by piers; and the Madeleine, in imitation of a pagan Roman temple.

Regarding the later palaces of the seventeenth and eighteenth centuries, Sir Banister described the Luxembourg Palace and the Palace of Versailles with its gardens, and the Petit Trianon, and concluded with a description of the modern architecture of France, which, he said, had largely remained faithful to the Classical styles.

SOUTH WALES INSTITUTES OF ARCHITECTS AND BUILDERS

Under the auspices of the South Wales Institute of Architects (Central Branch) and the Institute of Builders (South Wales Branch) a lantern lecture on "The Development of Architecture in Concrete" was given by Major R. A. B. Smith, M.C., at the Engineers' Institute, Cardiff, on Thursday, December 3. Mr. J. Herbert Jones, F.R.I.B.A., presided.

The lecturer, who had recently returned from a visit to the United States of America, dealt with the completed buildings, and also the methods of construction and shuttering, and with various ways of obtaining finished surfaces in concrete in that country.

A vote of thanks was proposed by Mr. W. S. Purchon, A.R.I.B.A., and seconded by Mr. A. G. Thompson.

OBITUARY

F. A. WALTERS: 1848-1891

WE regret to record the death of Mr. Frederick Arthur Walters, F.S.A., F.R.I.B.A., in his eighty-third year.

Mr. Walters was responsible for the design of over forty Catholic churches, including the Abbey Church at Buckfast, the home of the monk-builders, which is to be consecrated in August of next year; the Sacred Heart, Wimbledon; the Guardian Angels, Mile End Road; SS. Anselm and Cecilia's, Kingsway; St. Anne's, Vauxhall; St. Mary's, Croydon; the Precious Blood, Worcester Street, S.E.; St. Anselm's, Dartford; and others at Anerley, Camberley, Deal, Eastbourne, East Grinstead, Godalming, Grayshott, Haslemere, Hull, Newington, Penarth, Sevenoaks, Sydenham, Cardiff, and South Wimbledon.

He also designed many collegiate and domestic works, among them being St. Mary's College at Woolhampton; Wonersh Seminary; portions of Downside Abbey; and orphanages and convents.

Besides being an architect, Mr. Walters was a noted antiquarian and master of heraldic art.

Major Harry Barnes, F.R.I.B.A., F.S.I., who has been elected Chairman of the Preparatory Committee appointed by the Home Secretary under the provisions of The Architects (Registration) Act.

TRADE NOTES

A catalogue illustrating and describing Saro doors and Plytex panelling has recently been issued by the Merchant Trading Co., Ltd., of 52 Bishopsgate, E.C.2. Saro all-flush laminated doors are manufactured by the Laminated Wood Products, Ltd., and marketed by the Merchant Trading Co., Ltd. The materials used for these doors are obtained from this country, the Dominions and the Colonies; the manufacture and labour is British. Saro doors, therefore, represent an all-British product, and are suitable for use in all types of buildings, such as hospitals, offices, cinemas, theatres, flats, etc. They are available in many finishes, as will be noted from the catalogue, which illustrates a comprehensive range.

Plytex panelling is a patented building material comprising artificial lumber or fibre board, combined with plywood or metal. By combining the lightness and insulating properties of fibre board or artificial lumber with the great strength of plywood, a material can be built up for all types of partitioning. The method of combining these materials is by pressing plywood, by means of waterproof cement, to both faces of one or more thicknesses of the fibre board. The thickness of the multiply face is varied according to the size of the panels and the degree of stiffness required. The Plytex panels, thus produced, are claimed to assure rigidity, prevent drumming, and, being unaffected by changes of temperature, to eliminate all warping, shrinking and splitting. For rigidity and strength, Plytex is said to be equal to solid wood of equal thickness, and is only about one-half of the weight of solid wood. Any sizes up to 4 ft. wide by 12 ft. long constitute normal standard production, but single panels can be supplied up to 8 ft. wide and any lengths. Plytex can be used for partitioning, ship partitioning and decoration, shop fitting, cabinets, telephone booths, etc.

*

Messrs. Johns-Manville Co., Ltd., of 46 Victoria Street, S.W.1, have recently issued a brochure illustrating and describing their system of acoustical treatment. In addition, a page has been devoted to a tabulation of the various types of acoustical materials with their sound-absorbing efficiencies.

For more than half a century Johns-Manville have taken a prominent part in supplying materials for building construction, for the conservation of power in industry and for fire protection generally. The primary products of Johns-Manville are asbestos and its derivatives, such as textiles, fibre, etc. The secondary products

are formed by combination with other elements and by the processing of other minerals.

From the four basic mineral materials—asbestos, magnesium carbonate, diatomaceous silica (celite) and rock wool from argillaceous limestone — Johns - Manville furnish insulation in the form of sectional pipe coverings; insulation sheets, blocks, bricks and blankets; insulating cements, fillers and finishes, insulating paper and felts; as well as light-weight aggregate used with Portland cement for making insulating concrete. Also various types of packings, steam traps, friction blocks and refractories.

For the field of building construction, the firm make the following materials: rigid asbestos slates, asphalt slate surfaced tiles, roll roofing, special roofings for special conditions, asbestos cement sheets, both flat and corrugated, for roofing, siding, sheathing and partitions; waterproofing and damp-proofing, celite for concrete, insulating and sound deadening felts and boards, flooring and acoustical service and materials, insulations for pipes, furnaces and heaters.

A copy of the brochure is obtainable, free of charge, on application to the firm at the above address.

*

Messrs. W. H. Gaze and Sons, Ltd., have recently secured the following contracts: Presbyterian Church Hall, Walton-on-Thames, for Percy G. Overall, L.R.I.B.A.; house at Esher, for Messrs. W. Curtis Green and Partners; block of offices, Kingston-on-Thames, for Stanley P. Anderson, F.R.I.B.A.; house at Worplesdon, for Messrs. Wood and Rose, AA.R.I.B.A.; and additions to the Keystone Knitting Mills, Elstree, for Messrs. Grace and Hughes.

*

The Stanton Ironworks Co., Ltd., near Nottingham, having acquired a financial interest in Wilson Brothers Pipe Fittings, Ltd., of Bridgeton Foundry, Glasgow, have entered into a working arrangement whereby the Glasgow works will be utilized by Stanton for assisting in dealing with Scottish orders; also for enabling the Stanton Company to carry a varied stock of their standard sand-cast and De Lavaud spun iron pipes, and specials, for Scottish requirements.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

Fish Bar, No. 1 Barrett Street, Oxford Street, W.1. (pages 826–828). General contractors, Y. J. Lovell and Son. Sub-contractors: Crittall Manufacturing Co., Ltd., patent glazing and casements; Jos. Ebner and Sons, ebonite flooring; G. E. Wallis and Sons, Ltd., fireproof doors; Haywards, Ltd., iron staircases.

Gaumont Palace, Coventry (pages 830–831). General contractors: McLaughlin and Harvey, Ltd. Sub-contractors: John Lysaght, Ltd., constructional steelwork; Clark and Fenn, Ltd., fibrous plaster and decorations; J. Jeffreys & Co., Ltd., heating, ventilation and hot-water supply; Shaws Glazed Brick Co., Ltd., terra-cotta facings to elevations; Benham and Sons, Ltd., kitchen equipment; Garton and Thorne, Ltd., canopy, balustrade, door grilles and poster frames; Gardiner, Sons & Co., Ltd., metal windows, hand-power kitchen lift and entrance gates; Crittall Manufacturing Co., Ltd., lantern lights; The Kleine Company, Ltd., reinforced concrete floors; Marble Mosaic Co., Ltd., marble and terrazzo floors and staircases; George Spencer, Moulton & Co., Ltd., rubber flooring; W. W. Turner & Co., Ltd., seating and carpeting; John Mallin & Co., Ltd., fireproof curtain and drencher; Shapland and Petter, Ltd., entrance doors, etc.; Mather and Platt, Ltd., fireproof roller shutter to back of stage; A. E. Davies, ironmongery; John Compton Organ Co., Ltd., organ installation; Jensen & Co., organ console lift; Arthur Scull and Son, Ltd., fire hydrant installation.

Works Surgery for Messrs. Pilkington Bros., Ltd. (page 836). General contractor, T. Winstanley. Sub-contractors: Robert Walsh, heating and hot-water supplies; Henry Hargreaves and Sons, ventilation; Pilkington Bros., Ltd., electric wiring and lighting.

COMPETITIONS OPEN

December 31.—Sending-in day. Latest date for conditions was September 30. Proposed New Town Hall and Municipal Buildings, for the Walthamstow Corporation. Assessor: H. Austen Hall, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Conditions were obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

January 1, 1932.—Sending-in day. Proposed Church at Low Shiregreen, Sheffield, in connection with the Bishop of Sheffield's 100,000 guineas appeal (limited to architects with an office in the Sheffield Diocese). Assessor: C. C. Thompson, F.R.I.B.A. Full particulars obtainable from the Hon. Secretary, Sheffield, South Yorkshire and District Society of Architects and Surveyors, 15 St. James' Row, Sheffield.

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. CAMPANILE : PORTMEIRION

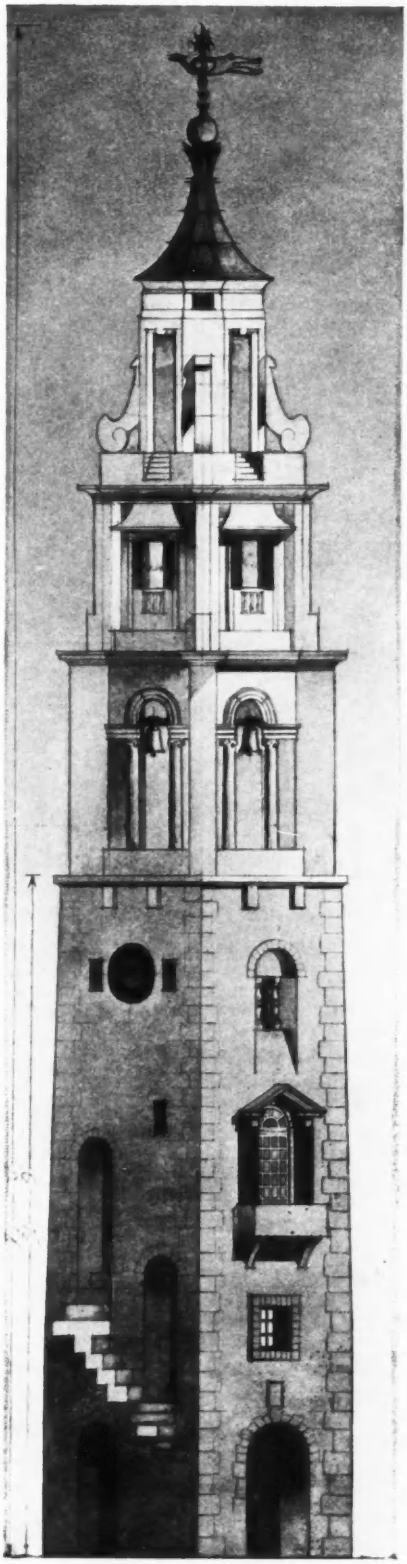
CLOUGH WILLIAMS-ELLIS : : ARCHITECT



A PERSPECTIVE DRAWING OF THE BELFRY

THE belfry tower that dominates the citadel at Portmeirion, Merionethshire, has been described by at least one archæologically-minded visitor as "being obviously of two periods, a Baroque superstructure raised on an earlier, but mutilated, Saxon stump." Its actual origin is more truly given by a tablet within the tower itself:

"This Tower embodies sundry scattered remnants of the Castle of Gryffydd ap Cynau, King of North Wales, that stood on an eminence 150 yards north-west of this spot.

"It was finally razed to the ground *circa* 1869 by the then tenant of the property, Sir William Fothergill Cook, inventor of the Electric Telegraph, lest, so it is said, the ruins should become known and thus attract visitors to the place. This Tower is piously erected to the remote memory of his obscurely royal ancestor, the first builder on this peninsula, after an interval of some eight centuries, by Clough Williams-Ellis of Brondanw, architect and publican, the fear of attracting visitors being no longer operative."

The tower carries a clock and chime of bells hung in the Venetian archways of the fourth story. Above this are two outlook stages, and below it the clock room, another belvedere, a small bedroom and a loggia—seven stories in all. The total height from the rock foundation to the top of the gilded weather-vane is approximately 80 ft.

The butt of the tower is mostly of local granite, and the upper works are of brickwork, roughly rendered, the lantern of artificial stone and its roof of copper. All the floors are of concrete. The colour ranges from a warm greyish-brown at the base, through pale apricot, to a light cream at the cupola, in which are concealed occulting coloured lights.

The whole structure, and the cliff on which it stands, that rises sheer from the sea, is flood-lit at night from the terrace of the hotel below, the whole illuminated picture being reflected in the little harbour.

The drawings on the centre pages give working details of the structure; those on the last page show some of its features to a larger scale.

BANNERS IN THE PORCH OF HONOUR

THE porch of honour is constructed in reinforced concrete and faced with slabs of French limestone. The doors are of bronze, and so are the banner- and torch-holders. In the ceiling the reinforced concrete structure is left visible. The modern conception of the whole is blended with a fine feeling for form, directly in the great tradition that is still alive, particularly in South Germany.

There are several graphic representations of figure subjects cut on the walls of the hall of remembrance by the Nuremberg painter and sculptor, Jobst Kuch. These represent a new departure in technique, of which the effect may be judged from the winged figure above the inscription reproduced on the last page. The light portions are sunk a little below the surface of the slabs of facing stone, and are roughened.

The previous supplement on this subject appeared with the issue for December 9.

FOUR DOORS OF THE XVITH AND XVIITH CENTURIES

THE doorway at Romden Farm, Smarden (figure 1) has been moved from another position in the same building—a hall house, converted into stables and oast house—but preserves its character. The frame, like others of its period, has the lintel tenoned into the jambs, and it will be noticed that the joints where the mouldings of head and jambs intersect are alternately horizontal and mitres of 45°, changing at each moulding. The spandrels are furnished with a rose and pomegranate, the latter the badge of Catharine of Aragon, which places the date as before the marriage of Henry VIII with Anne Boleyn in 1533. The door is of unmoulded oak boards, nailed to ledges.

The frame of the street door at Elham (figure 2) is of similar design to that at Smarden but of less massive timbers, and the mouldings are stopped—the stops much worn—in the Elizabethan manner. The door itself is divided into three groups of square panels—six, three and six. The rails dividing the groups are channelled. The mouldings on rails, frames and muntins are run in lengths, cut off and mitred. A missing muntin shows the method clearly. The whole are put together and fixed to the backing with large hexagonal studs. Such doors were made in the late-sixteenth- and early-seventeenth-centuries.

Figure 3 shows a door at Great Wigsell, Bodiam, dated 1641, of the Jacobean type which is divided into small panels, in the centre of each of which is a raised lozenge or rectangle. The frame, rails and muntins are channelled and moulded on their edges. The knocker is of spur pattern. It and the pear-shaped ring are contemporary. The heads of such doors often bore armorial carving, for which a shield is here provided, but on it no charge has ever been carved.

The folding doors, with wicket, at Ightham Moat, Kent (in an earlier doorway), figure 4, are of mid-seventeenth-century date. The moulded framing is heavy and deep, the panels are ribbed and stopped, some with perfect linen pattern, others less definitely. The whole are fixed to the backing with iron studs as clearly shown in the photograph.

THE R.I.B.A. TO THE RESCUE

UNEMPLOYMENT among architects has reached alarming proportions. The effects of world depression have been evident for some time in a heavy diminution in the volume of general practice, but this, mercifully, was to some extent countered by the extensive programmes of social reconstruction carried out by municipalities, who kept large staffs in continuous employment. Government economy strictures, delivered in moments of panic, and not since countermanded with sufficient force, have knocked away this remaining prop, and now there can be no disguising the extent of the misfortune to which so many members of the profession are, and will continue to be, exposed.

In times such as this, when the structure of our social system seems to tremble and its economy no longer gives shelter to its most useful and devoted members, it becomes a duty of architects to help themselves within their own straitened economy by spreading whatever benefits fall to them over as large a proportion as possible.

Nothing could fit their case better than the plan proposed by the President of the R.I.B.A., which appears in this issue of THE ARCHITECTS' JOURNAL. It is quite obvious that any plan designed to relieve the pressure of unemployment calls for contributions of money from those who can best afford to contribute; but, as has been realized for long, the deprivations suffered through unemployment cannot be properly made good by anything short of active and congenial work, and this the scheme provides for in the institution of civic survey groups, similar to those which performed a valuable service to the profession and to society at large during the lean days of the war.

Since those days town planning has gone a long way and has discovered the enormous extent of territory to be covered by such a measure as the Town and Country Planning Bill. The problems of urban town re-development are innumerable and pressing, far too large to be adequately investigated by the staffs of local authorities, even if these were constituted with that end in view. Here lies a field of activity for which any State should find fitting reward. Properly directed and financed it will be of incalculable value.

There can be no doubts as to the usefulness of the work proposed, but we would like to think that the appeal to the profession for funds will be answered not only generously but to the full capacity of the profession to pay for its own salvation.

Dr. Unwin's appeal is worded in such a manner as expresses the situation in the clearest and most vivid light, but in this matter, as in any other that carries a general appeal, success follows closely where machinery is provided to prompt and direct the giver. We would like to see the appeal put forward as a simple question of will you or will you not help to carry the thing through, to be followed by some form to carry the amounts of weekly contribution.

The scheme must not be left in the air, and it must not be left to a small section of the profession to carry through in no way commensurate with its real seriousness to all.

A great deal remains to be organized before the financial results of Dr. Unwin's appeal can be turned into constructive activity. It is not thought that civic survey work can be found for all those that are without work, but although the scheme has its base in London, there is nothing to prevent its extension to other and provincial centres—to such places as Manchester and Birmingham, where civic problems are acute, and where there are organizations, similar to the London Society, which may unite with the R.I.B.A. and Town Planning Institute and with the local councils to make the survey of the greatest possible value.

Similarly, it may be supposed that any other measures which may be evolved to deal with the situation and are put forward to the proper quarters will be considered in their bearing upon the central problem.

The main fact to be realized at this moment is that through no fault of their own a large section of the profession is without the promise of any sort of employment, and that through the nature of world depression they are unlikely to find alleviation for many months to come.

We think also it is a mistaken policy that Government economies should add to the burdens of architects by foregoing the programmes of necessary reconstruction which would have kept many working, and we lose no opportunity of seconding Dr. Unwin's appeal for reconsideration of this disastrous policy.

Raymond M. Hood, Architects

THE NEWS BUILDING, NEW YORK

Some outstanding features are described by Astragal on the facing page

NEWS & TOPICS

ONE BUILDING AUTHORITY NEEDED

IT has been suggested that the reform of building legislation in London should include the transference of district surveyors from the L.C.C. to the borough councils. A comparison of procedure in the provinces and in London shows that where in Liverpool, say, an architect deposits plans to one authority, here he must go to two or three authorities often miles apart. Among these the district surveyor figures as a sort of half-way authority who, without giving definite indication of future conduct, may examine work as it proceeds and give directions, which may very well prove expensive. The rival powers of L.C.C. and district surveyor very often give rise to confusion, and invariably cause delay.

★

It might be argued that the district surveyor is a very necessary instrument of the Building Act, a watch-dog upon the spot : but for the building owner or his architect, who are men to be considered, it is galling to have to go to the L.C.C. for one thing, to the district surveyor for another, to the engineer of the local borough council for yet another, and so on. Centralization would be, in this case, simplification.

THE NEWS BUILDING, NEW YORK

Of this thirty-six-story office skyscraper the architects are credited with saying that the exterior "created itself." Each window is 4 ft. high and 4 ft. wide, occupying 9 ft. overall : hence the elevation. $150,000 was allocated to decoration. The whole of this they spent upon the entrance to the building, of which the newspaper occupies a nine-story wing, for, otherwise, as they say, it would only have run to a thin layer of decoration over the fronts. The vertical members of these they have faced with white bricks, the horizontal with red, aiming thereby at a highly novel patterning of stripes that should distinguish this skyscraper from its fellows. The entrance hall runs through three stories and is entirely lined with black glass. In the centre there revolves, in a circular opening in the floor, lit from below, a globe of the world, having a diameter of nearly ten feet, intended to excite the curiosity of the passer-by.

THE NEW R.I.B.A. FORM OF CONTRACT

It is to be hoped that the changes in the R.I.B.A. form of contract which Mr. Michael Hoare has been elucidating for us elsewhere in this JOURNAL will achieve, as they are intended to achieve, efficiency and the avoidance of dispute. The simplification of the position of the architect and the definition of his functions as those of an agent of the employer should go far to secure the technical efficiency of the work of construction for the minimum expenditure, both of time and money. The majority of disputes between employers and contractors arises from complaints by contractors that they have been insufficiently remunerated, so that the introduction of provisions enabling the amount of a contractor's remuneration to be more easily adjusted without recourse to arbitration, or rendering more remote the chance of such adjustment being necessary, is most welcome.

THOMAS HARDY'S S.P.A.B. REPORTS

Reports on old buildings prepared by Thomas Hardy, when he was a young architect for the Society for the Protection of Ancient Buildings, have just been sold by the society for £1,000. What a metamorphosis ! Hardy, the young man full of dreams, descending the worn stairs of some ancient village tower to go to his cottage lodging where these reports would be written—with what else beside ! How much these reports have become both the first and the last of that long life—that church tower, perhaps, the substance of the intense, nearly melodramatic story called *Two in a Tower* !

★

There is something in this posthumous reward for his youthful labour that makes one feel small and perishable. The thought of his long life and all its bitter mental experience passing away and being no more than a long day in the life of those ancient churches for whose preservation he was the nearly unwilling instrument, is itself such a thought as troubled the young Hardy.

ASTRAGAL

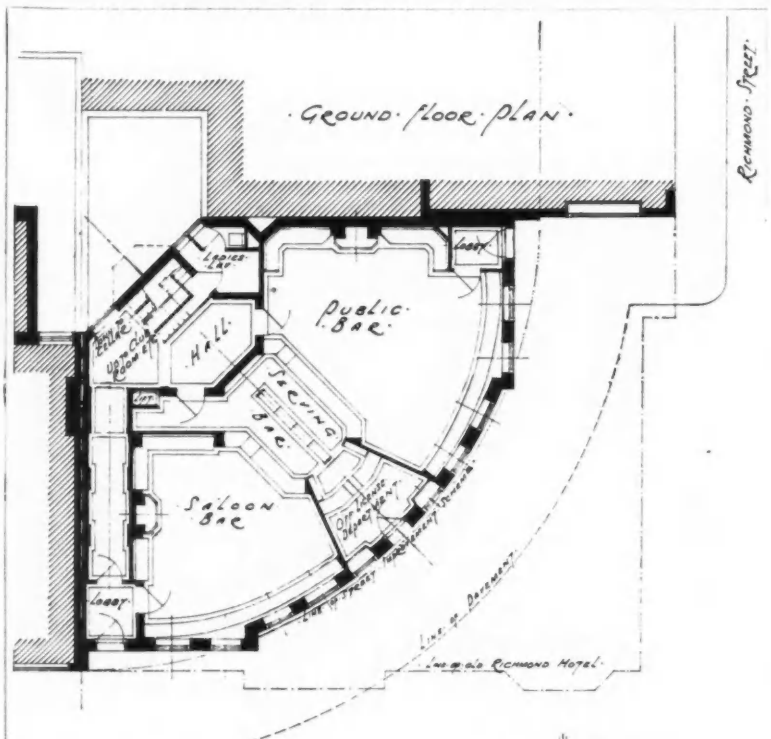
Next Year's Supplements

FROM the next issue onwards, the loose supplements in THE ARCHITECTS' JOURNAL *will no longer be printed on the stiff boards with which readers have become familiar during the year now ending. Instead, a thinner paper will be used, similar to that composing the main body of the* JOURNAL. *The whole of the supplements for 1932 will be produced on this paper.*

It will be recalled that the stiff boards were introduced at the beginning of 1931 in response to many requests for a form of supplement that could be filed for reference in a vertical filing cabinet. Readers who have introduced this system of filing into their offices have written us enthusiastic letters on the new departure. A twelvemonth's trial, however, has taught us that such readers are as yet few. It would seem that nothing resembling a standard filing practice has as yet been adopted by the bulk of the architectural profession. Certainly, vertical filing has won fewer adherents than we were led to believe.

It is recognized that the stiff boards do not make for ease of handling THE ARCHITECTS' JOURNAL. *The letters that have reached us, pointing out this fact, are in a majority. It is therefore only reasonable, pending a more general adoption of modern filing methods, to change over to the more agreeable thin paper.*

The site of the Richmond Hotel, belonging to the Kemp Town Brewery, is at the corner of Richmond Street and Richmond Place, Brighton. These are the fidgetty frontages it used to present to the world.



Richmond Place being an important thoroughfare, the corner has been rounded off, and the pavement set back, under a street-improvement scheme. There is cellar storage and a heating chamber in the basement.

THE RICHMOND

DESIGNED BY

THE planning of the building is adapted to suit the peculiar circumstances of a corner site, with its boldly-curved façade, terminated by pavilion end wings, generally of a Georgian character, having externally-shuttered, line-hung sash-windows, with multi-coloured red facing bricks and stone dressings to doorways and copings. The mansard roof is of sand-faced tiling, pierced with dormer windows and with a balcony treatment at the second-floor level. Bronze enamelled lettering has been affixed to the façade at the lower level, and a neon sign on the parapet for night illumination.

Internally the bars are fitted in the most up-to-date manner, the saloon bar having walnut-faced and inlaid panelling and counter, and walnut fitments with green leather-covered seats. The room is lighted by means of flush ceiling fittings, augmented by bracket lights fixed to peach glass mirrors set in the wall panelling above the seats. The floor of the room is of composition cork of marble pattern, with a star pattern feature in the centre, and the fireplace is fitted with a modern electric fire, with a clock of modern design in the space over.

The wine office has been finished with oak panelling, counter and fitments.

The public bar is fitted with oak

The front of the rebuilt hotel, a steel-framed structure, is faced with multi-coloured red bricks, and has stone dressings to doorways and copings. The roof is of sand-faced tiles, and the lettering is in bronze, enamelled.

HOTEL, BRIGHTON

DENMAN AND SON

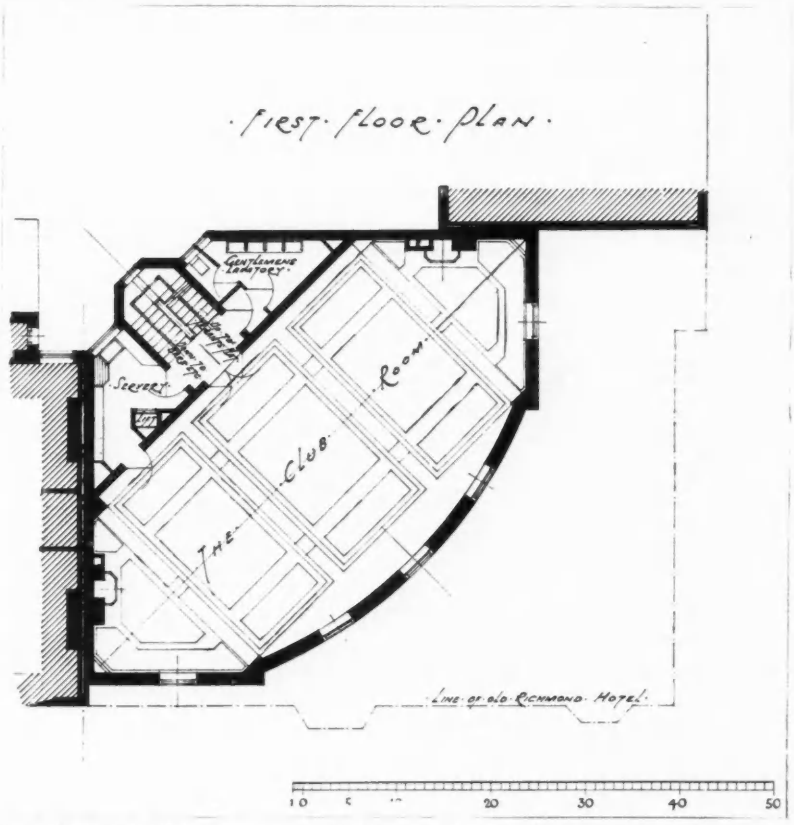
counters, seats and dado panelling, and brick fireplace surround, and lighted with a large ceiling fitting and wall brackets, and has a floor of composition cork in wood block basket pattern.

The corridor and staircase which give access to the large club-room, occupying almost the whole area of the first floor, is finished with terrazzo paving and steps. There is an ornamental wrought-iron balustrade to the stairs; and the walls have been brightly decorated.

The club room is of ample height, with a ceiling of fibrous plaster, walls papered green, and an oak plywood dado. The floor is of oak, and over the fireplaces at either end of the room shaped peach glass mirrors have been placed, the shape of the room and the angle at which these are fixed assisting greatly the general appearance.

Service is by means of a servery adjoining the club room, connected with the kitchen on the second floor over by means of a lift, while lavatories are placed at mezzanine levels for both sexes.

The second floor has been utilized to form a flat for the hotel manager, while the basement gives adequate accommodation for beer cellars, storage and the heating chamber.

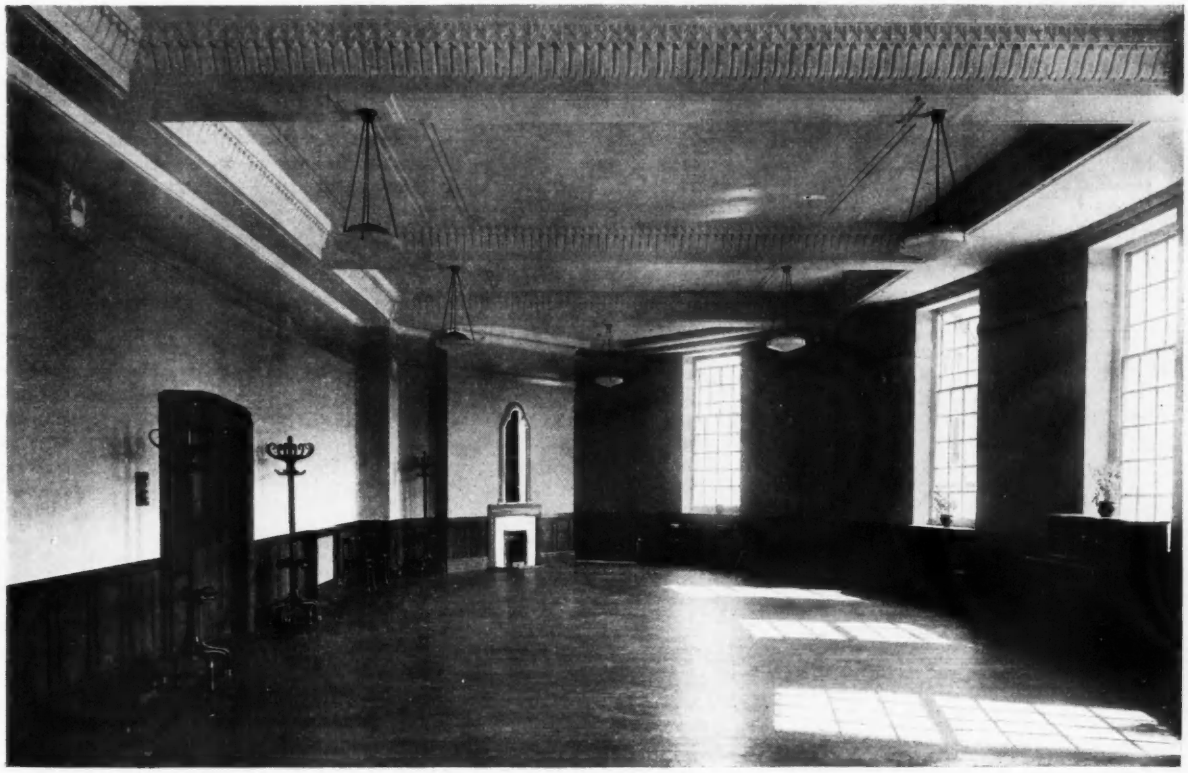


The adjustment of the site suggested planning about a diagonal axis, and gave the opportunity of providing a fine club room with a widely-curved range of windows, on the first floor. Above is the hotel manager's flat.

In the saloon bar : the bar itself. The panelling is walnut-faced and inlaid, and the room has walnut fitments, with green leather-covered seating. One of the flush ceiling lights is seen; there are also bracket lights fixed to peach glass mirrors set in the wall panelling. Behind the panelling on the right is the off-licence department.

Richmond Hotel, Brighton.] [*By Denman and Son.*

In the saloon bar : the fireplace. The fire is of the modern electric type, and reinforces the radiator system by which the whole building is heated. The floor is of composition cork, marbled, and having a symmetrical patterned centre-piece. The door seen on the left is to the entrance lobby communicating with the street.



Richmond Hotel, Brighton.] [*By Denman and Son.*

The club room, which can also be used for the service of refreshments, occupies nearly the whole of the first floor, and describes a rectangle, with the addition of triangles at either end and a very obtuse bow on the side facing the roadway. Entrance is by double doors in the centre of the opposite side. There is a subsidiary door in close proximity to a service lift

THE LONDON REGIONAL PLAN

DR. RAYMOND UNWIN, P.R.I.B.A., technical adviser to the Greater London Regional Planning Committee, states, in *The Times* for Thursday last, that the work of that body, which seeks to secure more ordered development of a wide area round the Metropolis, including the preservation of a green belt and other suitable open spaces, has narrowly escaped an untimely end in the present financial crisis. He points out, however, that this has been averted by the decision of the L.C.C. at its last meeting to continue a grant, though on a very much reduced scale, towards the expenses of the committee for another year. The committee have reason to believe that the contributions from other local authorities will also be continued on a similarly reduced scale, and that therefore it should just be possible to keep up to date the surveys already made, and to issue in due course the report on the proposed planning of the area, for which much of the material is already prepared.

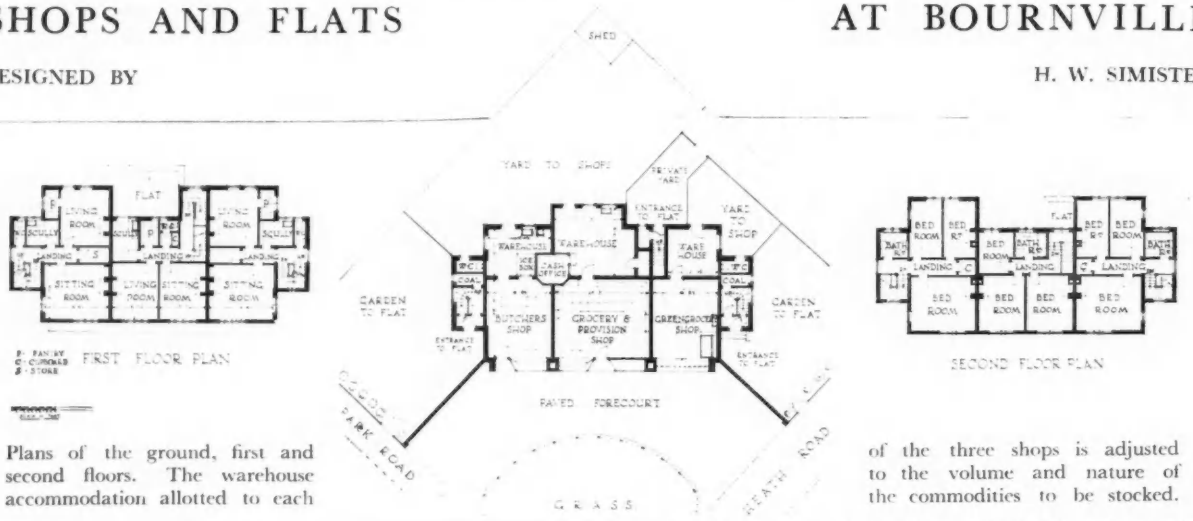
This curtailment, he says, will imply a severe contraction of the work of the committee at a time when its urgency and importance are increasing owing to the rapid developments taking place within the region.

It is evident that many great and difficult problems, needing comprehensive handling, have been created in the outer region, which in addition to its own natural increase of population has had to absorb an annual average of over 38,500 people flowing out from the county area, and anything up to 39,000 flowing inward from the outside. The relative responsibilities for housing, education, health, etc., of the L.C.C. and of the 130 odd local authorities in the outer area, the best way to co-ordinate their efforts and those of private enterprise, and a proper relation between industrial and housing development, are some of such problems. The necessary transport for these large numbers and the enormous volume of unnecessary movement due to the haphazard character of the sporadic building, and to the want of proper relations between the people's dwelling, working, and playing places, present other serious problems. Another problem, urgently raised by the present disorganized development, is that of preserving open space for the growing population.

Before the period of extreme financial stringency arose, Dr. Unwin concludes, there appeared to be good prospect that effective steps would be taken as regards the proposed green belt round London, which would do so much to meet this urgent and growing need for open space. There seemed also every likelihood that the Town and Country Planning Bill would have become law before the end of the year, and that its various new powers would have been available to help in this work and would have afforded the opportunity for the activities of the present advisory body to be put on a permanent basis by the creation of a statutory Joint Committee. Fortunately for the progress of town and regional planning, the present Minister of Health has again introduced the Town and Country Planning Bill, and has announced that the second reading will be taken at the opening of the next Session. If the committee's regional report is to be useful to those concerned, it should be based on the town planning powers and procedure as they may be extended or modified by the Bill. For this and other reasons also it appears desirable in the changed circumstances to postpone the issue of the report till later in the year.

SHOPS AND FLATS AT BOURNVILLE

DESIGNED BY H. W. SIMISTER



Plans of the ground, first and second floors. The warehouse accommodation allotted to each of the three shops is adjusted to the volume and nature of the commodities to be stocked.

THESE premises were erected recently on the Woodlands Park estate, which was in process of development by the Bournville Village Trust, the land on which they stand being leased to the Ten Acres and Stirchley Co-operative Society, Ltd. They comprise three shops for grocery, butchery and greengrocery, together with three flats over, all separately approached and with independent staircases. The main walls are of brick and the roof is of slates. It will be noticed that there are top-hung casements in the bedrooms. The accommodation in the flats is that of a moderate-sized cottage, and gives, in each, living-room, scullery and sitting-room, with three bedrooms and bathroom on the second floor, and the usual offices. As will be seen from the plans of all the floors, reproduced above, the layout is of a compact and practical order, affording main rooms of good size, together with very convenient working quarters.

The site is a prominent one in the middle of the estate, and, being ample for the purpose, the buildings were set on the angle. By this means a paved forecourt has been provided, with an oval grass plot at the junction of the two roads concerned. Two of the flats also have the unusual advantage of gardens.

The shops, which occupy a corner site, with a paved forecourt and oval of turf in front, have three flats, each of five rooms and offices, over, and each with a separate entrance—two, of which one is here seen, being at the front, and the other at the back of the building. Both the side flats have gardens.

THE NEW R.I.B.A. FORM OF CONTRACT

BY MICHAEL HOARE, B.A.

Joint Author of The Standard Form of Building Contract

(The two previous instalments appeared in the issues for December 2 and 16 last)

THE issue of the new form of contract is the outcome of prolonged negotiations between the R.I.B.A. and the National Federation of Building Trades Employers. It is common knowledge that a building owner—or at all events a private building owner—relies largely, if not entirely, upon his architect to advise him as to the form of contract which he shall make with the contractor whom he intends to employ, and it is in the interests of the building owner and not of himself that the architect is concerned in examining the terms of any proposed form of contract. It is in this capacity, therefore, that the R.I.B.A., representing the profession as a whole, has again taken upon itself the task of preparing, in conjunction with a body representative of contractors generally, a form which shall be acceptable to building owners and contractors alike.

In these circumstances it is of importance to examine the reasons for some of the changes made by the new form, which at first sight might appear to be unnecessary concessions in favour of contractors; and in order to understand the effect of these changes it will be convenient to regard them from the point of view of the draftsman of a contract form, whose functions in the present case have been discharged jointly by the two bodies.

The predominant consideration in his mind should be to provide a form of words which shall ensure, so far as the terms of a contract by themselves can ensure, an efficient job at low cost to the employer but with fair remuneration for the contractor; and in view of the nature of the works which are the subject of these contracts, and the unforeseen obstacles and difficulties which so often present themselves while the works are in course of execution, the task of devising a formula suitable for general use is far more difficult than it would at first sight appear.

It might be supposed that a draftsman who had at heart only the interests of the building owner would be well advised to put before a prospective contractor a form of contract whereby the risk of the possibility that the works will ultimately be more expensive to complete than anyone at the outset imagines shall be borne wholly by the contractor. But this, in effect, is asking the contractor to insure the building owner against an almost infinite number of contingencies, and for this every contractor will properly exact his premium by way of a considerable enhancement of price; so that it is plain that the fewer the contingencies of which the contractor is required to bear the risk, the lower will be the prices inserted by him in making up his tender.

What, generally speaking, are the risks which a contractor has to consider when submitting his tender?

First of all, there is always the possibility that the execution of variations or extra works may involve the contractor in a great deal more expense than the mere cost of executing the extra work: in some cases an order for variations might interfere with the progress of the whole of the works and involve the contractor in extra expense compared with which the cost of executing the variation was negligible.

Secondly, it may happen that, during the course of construction, some injury will be caused to individuals or to adjacent property as a result of the execution of the works, and in some cases — particularly in the case of adjacent property—the injury may be such as is necessarily incidental to the performance of the contract. The design of the building, for which, be it remembered, the architect is, as a rule, responsible, or the position of the site provided by the building owner, may make the infliction of some such injury inevitable.

Thirdly, the execution of the works may be delayed by causes over which the contractor has no control. Bad weather or strikes affecting the men employed on the works may easily change a profitable contract into a dead loss.

As we have already observed, it is simple enough but not expedient, even from the point of view of the employer, the building owner, to throw the burden of all these risks upon the contractor; but it would be equally inexpedient to throw the whole burden upon the employer. The task of the draftsman, then, is concerned with apportioning the risk as fairly as possible between the two parties, and it is in this respect that several improvements have been made by the new form of contract.

The 1909 form provided for the authorization by the architect of variations, extras and omissions; and that the amount to be allowed on either side in respect of variations so authorised should be added to or deducted from the contract sum. The amount to be allowed was to be ascertained by valuing the variation at the rates contained in the priced bills of quantities, or, when these might not apply, at rates proportionate to the prices contained in the bills. There was not a word in the contract about making an allowance to the contractor beyond the amount of the valuation so calculated for any extra expense in which he might be involved in executing the variation. As many contractors know to their cost, the execution of a variation upon one portion of the works may cause disorganization and delay, with a consequent increase of expenses generally over the whole works, but such increase would not, under the old provision, form any part of the valuation which is the basis of the extra allowance to the contractor.

The new form has remedied this defect; and, in addition to prescribing the method of calculating the prices to be allowed for extras, provides that, if compliance with the architect's instructions in regard to, *inter alia*, variation or modification of the design, quality or quantity of the works, or addition or omission or substitution of any work, involves expense or loss beyond that reasonably contemplated by the contract, then, unless the architect's instruction has been issued owing to some breach of the contract by the contractor, the amount of such expense or loss shall be ascertained and added to the contract sum. As a consequence, extra expense to the contractor, incurred as the result of executing a variation, though not forming part of the actual price to be allowed for the extra work, will in future be recoverable as "expense or loss beyond that reasonably contemplated by the contract," and an unfair burden upon the contractor will be removed.

The wisdom of this change, as facilitating closer tendering by contractors without involving them in the risk of incurring heavy and unforeseen expenses which cannot be recovered from the employer, is so apparent that its significance from the point of view of the architect, as the building owner's professional adviser, is in danger of being overlooked. In that capacity it is often the duty of the architect to advise the building owner whether it is desirable to call upon the contractor to execute some extra item of work, and in so advising he must, of course, have regard to the extra cost to the building owner which the acceptance of such advice will ultimately entail.

If in any particular case the 1909 form of contract was being used, the architect, in tendering such advice, needed only to have regard to the actual cost of executing the extra work in question, since that alone was the amount which the contractor was entitled to recover. In view of the provisions of the new form, entitling the contractor to recover any "expense or loss beyond that reasonably contemplated by the contract," the architect, when considering the probable cost of ordering extra work or other variations, will have to take into account the consequential as well as the actual cost to the contractor of complying with his instructions before he can advise his principal that any particular variation is desirable.

With regard to injury and damage to persons and property, it will be remembered that the 1909 form provided that the contractor should be responsible for all structural and decorative damage to property and for injury caused by the works or workmen to persons, animals or things, and should hold the employer harmless (i.e. should indemnify the employer against any claims) in respect thereof. This provision took no account whatever of the various ways in which such damage or injury might be caused, and, besides leaving the contractor to bear responsibility for his own negligence, constituted him as insurer of the employer against the consequences of the employer's own negligence as well as the negligence of the architect or any other of the employer's agents.

By the provisions of the new form the contractor is, of course, still responsible to third parties for any injury or damage inflicted by him or by any persons for whom he is responsible, but he undertakes to indemnify the employer against claims in respect of injury to persons only when the injury in question is not due to the "act or neglect of the employer or his servants," and in respect of injury to property only when the injury is due to the "negligence, omission or default of himself his agents or his servants or of any sub-contractor or to any circumstances within his contract."

It will be seen at once that this alteration in the wording of the clause which has done so much to mitigate the unfairness of the provisions of the 1909 form in some measure affects the responsibilities of the architect. The indemnity given by the contractor under that form amounted in effect to a guarantee by the contractor of the architect's design and an insurance of the employer against liability for damage, such as, for example, damage to adjoining property, consequent upon the design of the building under construction. Under the new form, this guarantee and insurance no longer exists, and if the employer is made liable to an adjoining owner for damage due solely to faulty design, his remedy —if in the circumstances he has any remedy—will be against the architect alone.

In this connection it may be convenient to note another change made by the new form affecting the question of liability for infringing the rights of owners and occupiers of adjoining property: this is to be found in the provisions with regard to setting out the works. It will be remembered that the 1909 form provided: "The contractor shall set out the works, and during the progress of the building shall amend at his own cost any errors arising from inaccurate setting out unless the architect shall decide to the contrary." This provision put a heavy responsibility upon the contractor, who had to bear not only the cost of amending his errors, but also the risk of becoming liable in damages for trespass to occupiers of adjoining property. The employer was relieved from all responsibility so long as the site provided was capable of receiving the building shown upon the drawings, however sketchy those drawings might be; and if the contractor, in setting out the main lines of the building, encroached upon some adjoining property, he, and he alone, in normal circumstances was liable for the trespass so occasioned. It is true that the problem of setting out is primarily a builder's problem, but it is clearly unfair to expect him to solve it upon insufficient data, especially if the effect of a mistaken solution will be to involve him in liability to a third party.

In view of these considerations, the new form provides: "The architect shall furnish to the contractor, either by way of carefully-dimensioned drawings, or by personal supervision at the time of setting out the works, such information as shall enable the contractor to set out the enclosing walls of the building at ground level," after which the contractor is responsible as before. The contractor, it will be observed, is still to do the actual work of setting out, but for the purpose of setting out the enclosing walls of the building—i.e. for that part of the process in which there is a possibility of trespassing on adjoining property—he is entitled to have, and to rely upon, carefully-dimensioned drawings prepared by the architect, or upon instructions given personally by the architect at the time of setting out. The contractor's obligation is to follow the drawings or instructions: for the accuracy of those the architect and ultimately the employer is to be responsible.

As to the effect of bad weather, strikes, lockouts and the like upon the ultimate cost of the works, neither the 1909 form nor the new form contain any special provision, and any loss or expense incurred as a consequence of these occurrences is left to be borne by the party upon whom it falls; and, upon reflection, it will be seen that no amendment of the 1909 form could properly have been made in this respect. Fortuitous occurrences of such a nature are outside the control of contractor and employer alike, and the possibility of loss resulting from these occurrences is a risk which is necessarily incidental to the work of every building contractor, and presumably is one in respect of which a contractor can, if he so desires, take out a policy of insurance in the ordinary way instead of attempting to insure himself at the expense of the employer by a general enhancement of the prices in his tender.

[Concluded]

Unemployment Relief for Architects

UNEMPLOYMENT in the architectural profession is reaching alarming proportions, and the Council of the Institute, in consultation with the A.A.S.T.A., have met to discuss a means of alleviating the very serious and widespread distress. The suggestion put forward is that every architect in work should be asked to contribute towards a fund to help architects who are out of work. The money thus collected will be used to provide work as far as possible, and maintenance till work can be found. An outline of the scheme is given in a letter from Dr. Raymond Unwin, P.R.I.B.A., from which the following is summarized:

The R.I.B.A. and the London Society are already taking steps to carry further the survey and planning of London, with special reference to providing practical suggestions for the clearance of slums, and for the improvement of the City which may be a guide for the future. On this work some of those who are out of employment and need assistance can be occupied, thus reviving an organization which proved very useful during a difficult period caused by the Great War. It is proposed that similar steps should be taken in other cities.

Funds will be required to pay men for whom such work can be found, but the number who can be employed under this proposal is obviously limited, and the distress of those who cannot be given work must also be relieved. The method proposed of collecting the necessary money is that all those who do not at present contribute to the National Unemployment Insurance Fund by means of the official stamps, i.e. everyone earning more than £250 a year, should give as a minimum the equivalent, i.e. 1s. 7d. per week, to the Architects' Unemployment Fund; and the employer, also as a minimum, should contribute the same amount per week for every such man in his employment. The money would be collected in the different offices throughout the country and sent monthly to the Secretary of the Unemployment Committee, c/o the R.I.B.A.

It would be of great assistance to the Unemployment Committee if in all offices where the employer or staff are prepared to adopt these proposals, one of their number could be asked to communicate with the R.I.B.A., giving the date when they would be able to commence the contributions.

NEW CHURCH OF ST. ANNE, BLACKBURN, LANCS.

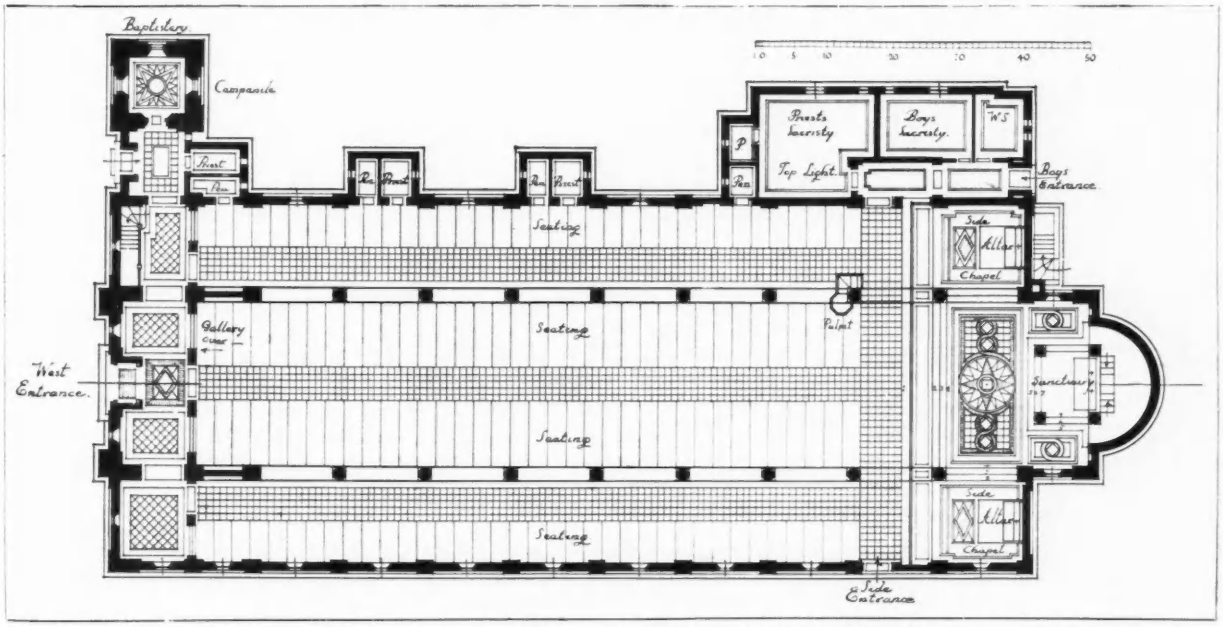
DESIGNED BY E. BOWER NORRIS (SANDY AND NORRIS)

The west end. The designs include a campanile, yet to be built, on the extreme left.

The interior, looking towards the sanctuary. The columns are of Italian marble, from Sienna.

THIS church, erected to serve a very large parish in industrial Lancashire, was designed to provide a large capacity at an economical cost. For that reason the main architectural lines of the building were accentuated and ornament was reduced to a minimum. The style adopted was Lombard Romanesque, and the materials and marble were the simplest of their various kinds. The exterior was carried out in a small local brick, with white joints, and the stone dressings are of local sandstone. A campanile was designed to complete the architectural group, but, owing to lack of funds, the lower portion only, which also serves as a baptistry, has been built.

In the interior, devotional effect is due to the colour of the marble columns, which come from Sienna, Italy, and the stained-glass windows, which relieve what might otherwise be a tendency towards monotony. The apse at the sanctuary end is to be covered with mosaic, and the walls of the sanctuary are to be lined with marble. The floors are of oak wood blocks under all seating, and are laid with strip rubber in the aisles.

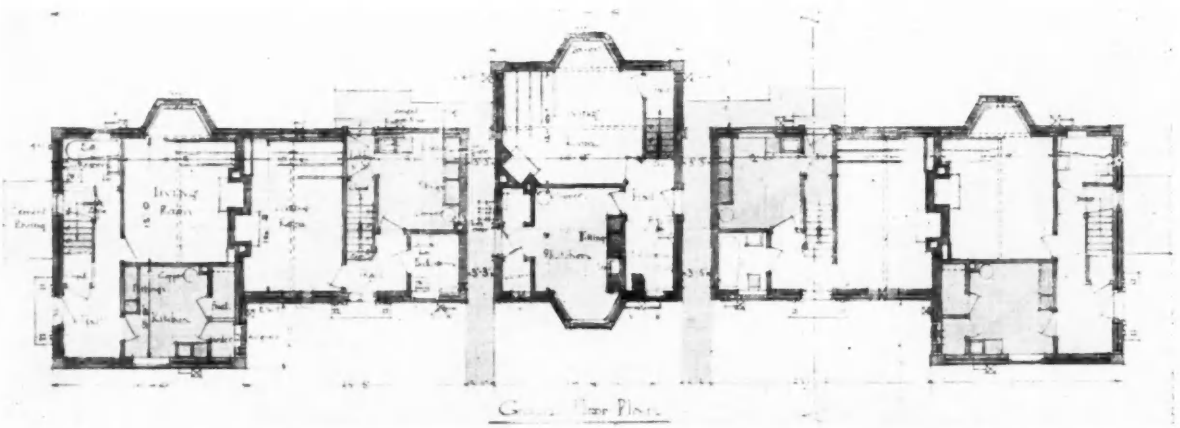


The ground plan. A straightforward layout and the use of simple materials were dictated by the need for economy.

DOUGLAS HAIG MEMORIAL HOMES AT PENZANCE

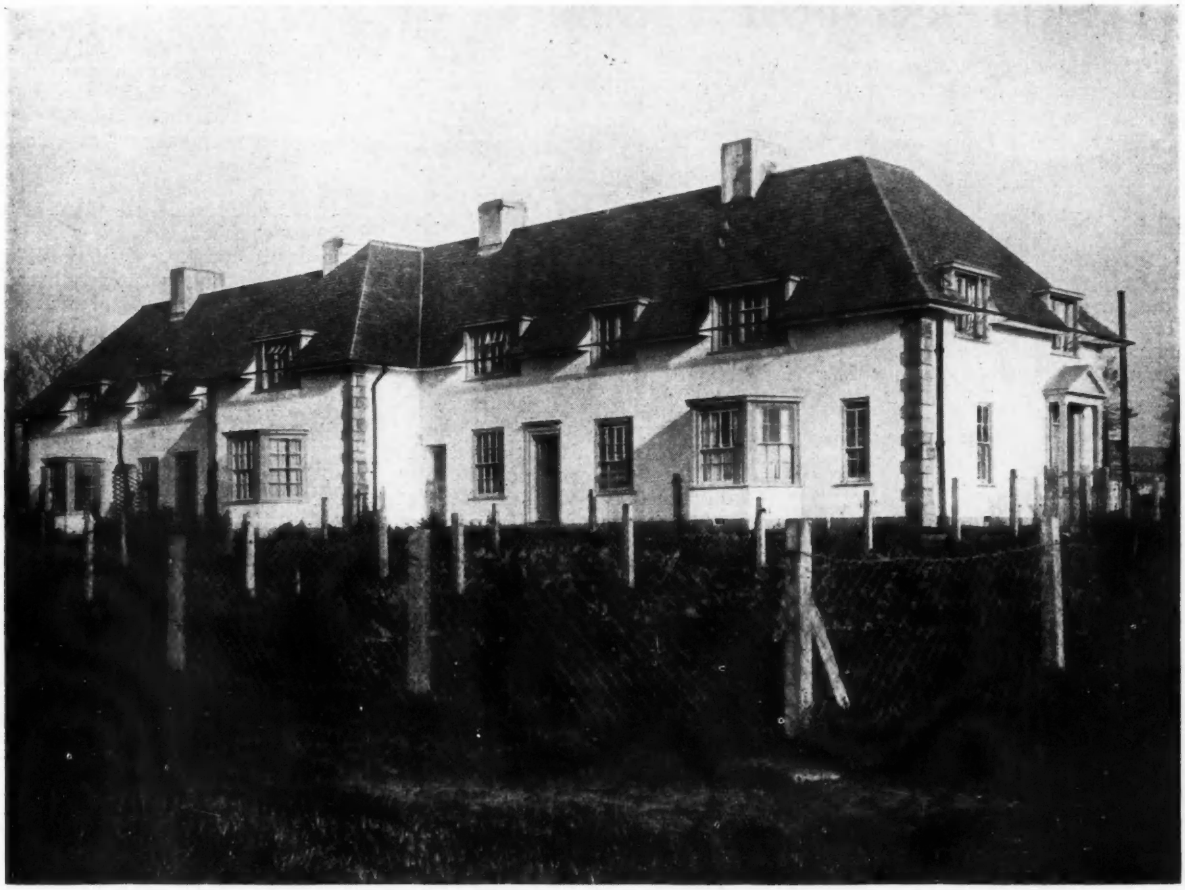
DE SOISSONS AND WORNUM — *Joint Architects* — COWELL, DREWITT AND WHEATLY

The north-east front and south-east end. On the right are seen the walls of the entrance forecourt with, on either side of it, garden space. Each home has its separate entrance. Two of these are seen above; the arrangement of the others will be followed from the plan reproduced below.

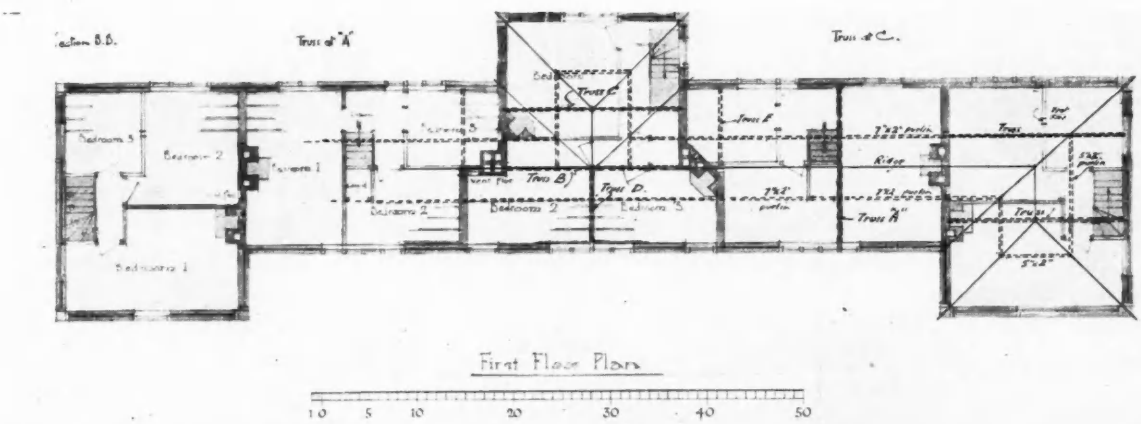


In each home there are, on the ground floor, hall, living-room, kitchen and bathroom, besides larder and fuel store, etc.; three of the living-rooms have bay windows facing south-west. There are two entries running through the block on the ground floor; both give access to the centre house.

THE housing scheme here illustrated provides five homes for disabled men under the Douglas Haig Memorial organization. It was built on a site at Heamoor, Penzance, Cornwall, which was presented by Colonel E. H. W. Bolitho. The land available resembles a T with a very heavy head and the foot pointing north-east, which is therefore the aspect of the main front of the building. This narrow foot forms an entrance drive, between adjoining properties, from the main road, and has been planted on either side with Lombardy poplars inside a concrete



The south-west front. The walls are built of brick, plastered, with dressings and quoins of granite. The roofs are covered with small green Cornish slates. It will be noticed that the rainwater gutters are carried in an unbroken line across the dormer windows, wherever these occur.



On the first floor there are provided three bedrooms apiece to all the houses, one with a fireplace (two in the centre house). In all cases the rooms are graded in size, and all are of ample dimensions. They are all lit by dormer windows having top-hung transom ventilating lights.

wall. The buildings occupy the centre of the head, have before them a grassed forecourt, with a paved surround, and are enclosed by allotments and by gardens, in each of which a timber shed has been provided.

Each home is self-contained, having its own separate entrance, and separate staircase to the bedrooms on the first floor. The accommodation given consists of a hall, living-room, kitchen, bathroom, etc., on the ground floor, with three bedrooms above.

The buildings are timber-framed. The outside walls are of 9 in. brick, plastered, with granite quoins and dressings. The roofs are covered with small green Cornish slates.

LETTERS FROM READERS

Architects and Advertising

SIR,—At the present time many members of the architectural profession are unable to earn a living owing to the shortage of work. I believe that this is not so much due to the slump as to the fact that the profession has failed to adapt itself to the changed conditions since 1914.

There are no longer enough five- and ten-thousand pound houses to keep us all busy; we must, therefore, look for clients among that larger class which can only pay £750 to £1,500 for their houses—the class which has hitherto been accustomed to buy the badly planned and ugly villas provided by the speculator. The prospective householder of this class believes that architects are only for the rich, and because the profession makes no effort to deny this or to explain why it would be worth his while to employ an architect, he quite naturally buys the builder's house.

As architects, we are not pulling our weight in the community—the country is rapidly being covered with rows of half-timbered rubbish, many of us are out of work, and yet we do nothing about it.

If the standard of housing is to be raised, it must surely be by the efforts of the architectural profession. This can be achieved in two ways : by the example of cheap, well-designed houses and by newspaper publicity. The former can be seen at Welwyn and elsewhere; the latter has never been tried in England, but has been adopted in Germany and America. Newspaper publicity will reach people who have never seen the best housing schemes, and who have not the faintest idea of the uses of an architect.

I suggest to your readers that the time has come for the R.I.B.A. and similar bodies to launch an advertising campaign in the newspapers and non-technical magazines, explaining the services which the architectural profession has to offer, what these services cost, and why it is in the interests of the public to employ an architect for all building work.

The public do not know these things, and it is merely common sense that we should tell them.

ANTHONY MINOPRIO

British Roofing Materials

SIR,—I have followed with interest the recent notes in the Press regarding the importation of foreign roofing material into this country. Will you permit me, therefore, to make a few observations on the subject which I think are pertinent at this juncture ?

In the past, Welsh slates have been widely used in this country for roofing houses and other buildings. Their life is known to be approximately a hundred years, and innumerable cases are on record where they have stood for much longer periods.

It is true that imported foreign roofing material can be obtained at cheaper prices than Welsh slates. However, the question of maintenance costs is just as important as initial capital outlay. It has been stated that some of the foreign material used in British housing schemes has proved so unsatisfactory that re-roofing with British material has been necessary within a short time. It would certainly be interesting to know the whole truth of this matter. In the long run the British product wins.

The question of providing employment for British workers is of paramount importance. "Buy British" should be the universal slogan. By using Welsh slates, local authorities, architects and builders can safeguard their own interests, and can also alleviate distress in the quarry areas.

PATRIOT

Plaster for Concrete Ceiling

SIR,—I was very interested in the letter on "Plaster for Concrete Ceiling," because of the importance to reinforced concrete that an efficient method shall be found to clothe it. I quite agree with your correspondent as to the difficulties in obtaining an adequate "key" to concrete. We have had experience of various liquids designed to provide this "key" through the medium of the retardation of the setting of the cement on the surface of the concrete.

Our experience is that the results of this method are quite satisfactory, and with it there appears to be no reason why single-coat work should not be used for the plastering, except that three-coat work is usually specified in order to allow sufficient thickness to compensate for irregularities in the level of the concrete. This irregularity is not necessarily the result of bad workmanship. It must be remembered that the concrete is cast on a temporary staging. This staging is usually made of timber; however carefully the timber work is executed, there must be a certain amount of warping while the timber is in position waiting for the concrete.

Again, the dead weight of the concrete has to be supported by the timber, and there must be a certain "take up" under this load, both as a slight deflection in the timbers themselves and a compression at the joints. This "take up" will be irregular, owing to the various strengths of timber scantlings and varying softness of the wood—for example, where a transom rests on a prop, the initial contact is probably at a few points only, which will compress under the load. This compression will vary according to whether the contact is at a knot or at a soft spot.

Again, it is necessary to allow a certain amount of camber in a floor, to compensate for the "take up" in the centering, and the deflection of the floor under the dead load when the centering is struck. It is impossible to design this camber accurately because, in ordinary circumstances, it will come out to varying degrees. In consequence, it is impossible to guarantee that any floor soffit will not vary less than ¼ in. either way, making ½ in. in total. This variation is quite apart from any slight errors in workmanship.

If, therefore, it is necessary for the finished ceiling to be dead level, a certain thickness is required for the plaster in order to make up the variations. It may be a moot point as to whether exact alignment is really necessary; although a variation is not apparent in the middle of the ceiling, it is usually important at the cornices, the degree of importance depending upon the nature of the cornice selected.

I think the main difficulty is that the thickness of the plaster has to be specified before the floors are cast. In actual practice it might be possible to use a one-coat process on one-third of the ceilings, a two-coat process on another one-third, and a three-coat process would be necessary for the remaining third. In order to cover himself against eventualities, it is usual for the architect to specify three-coat work at the beginning. Difficulties in altering the specification after the contract is let usually result in the three-coat specification being used throughout.

[The Editor would be glad to publish readers' experiences on the above subjects.]

HOUSING AT HOME AND ABROAD:

TWO RECENT BOOKS REVIEWED

A general view of Newlyn House, East Hill Estate, Wandsworth, S.W. The development of this estate was completed in June, 1929.

L.C.C. HOUSING

THE novel architectural forms which post-war Continental housing has assumed have served to attract the attention of English architects to an extent that obscures the magnificent record of house building in this country. Worse still, our generous praises of other peoples' work have engendered an idea that we have not much to show.

The reverse is the case, for this record of L.C.C. housing over three years proves abundantly that we have not only completed an unparalleled amount of building, but that we have maintained, and raised still further, standards of living not reached by other countries.

The work of the L.C.C. can be divided into three main branches: cottage estates in the suburbs, block dwellings in urban areas, and similar dwellings built upon congested and unhealthy sites.

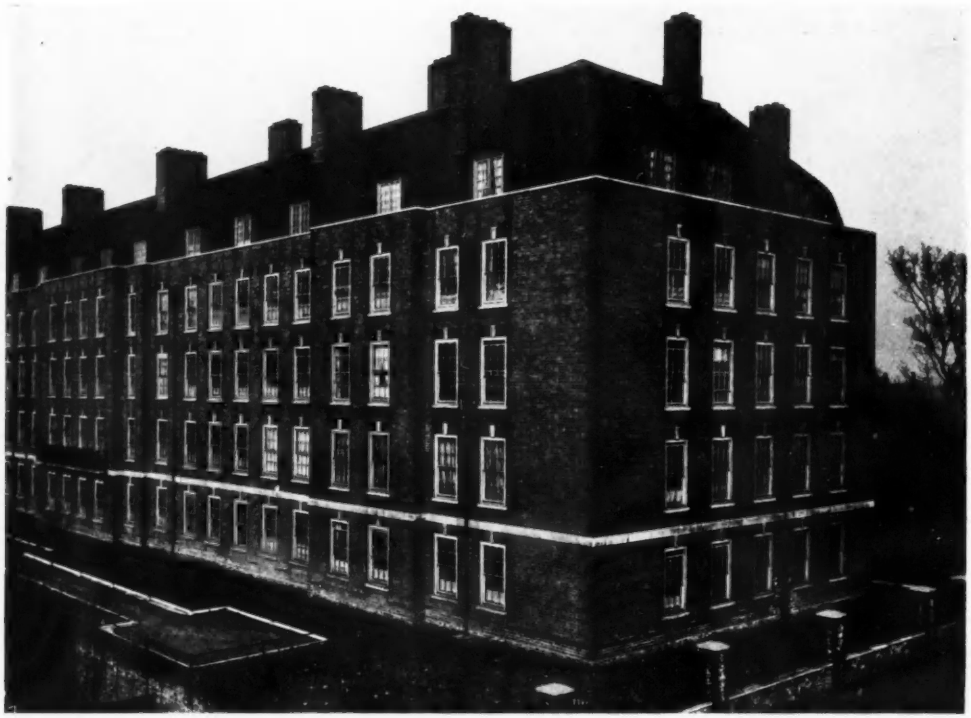
The three proceed concurrently, though after the war, so acute was the need for houses that urban rebuilding gave place in the main to the building of large cottage estates upon cheap land on the outskirts of London.

Every few years the policy has been reviewed in order that housing should follow real needs, so that we find that at the moment, while the St. Helier estate is being rapidly completed, there is a significant programme of clearance and improvement in the heart of the congested urban centre.

The housing estate work is too well known to require comment here, though it should be said that the effect of so much gathered together in one volume is to underline the value of the L.C.C. contribution, and to increase our respect. Move in any direction through London and you will find the well-proportioned Georgian architecture of the L.C.C. dwellings. Whether it be Streatham, Hammersmith, Westminster,

[*From* L.C.C. Housing, 1926–30.

Nos. 19 to 30, Watergate Houses, Hughes Fields Estate, Deptford. Completed in 1930.



Moffatt House, a five-story block of dwellings on the Comber Estate, Camberwell, S.E. Completed October, 1928.

[*From* L.C.C. Housing, 1928–30.

or as far afield as Wapping, their pleasant brick façades and dark tile roofs cut through masses of depression, bringing order, symmetry and something of elegance to dirty chaos.

One may complain of uniformity and standardization, but never of dullness, for the days of Peabody barracks are over, and the re-housed of London have an enlightened landlord, whose care for his tenants' standards of living comprehends the psychological effect of pleasant architectural environment.

Pity it is that these remodelled areas have to make the best of bad conditions, and cannot be related in anything but a fortuitous way with a town plan of London as a whole.

Be that as it may, I wish those who so constantly enlarge upon the wonders of Continental housing would make the tour of the buildings shown in this book. I think they would agree that while the schemes lack nothing of the science and proper study of dwelling and house building, they speak in every line the true and native style of English architecture. The Ossulston estate is a perfect combination of these qualities, and this is but one of many.

MODERN HOUSING

THIS book, now enjoying its third impression since May this year, gives a review of present housing requirements in Great Britain, a *résumé* of post-war work at home and abroad, and some practical suggestions for the future. Every country in Europe, of course, and even America, has its post-war housing problem. Thus it is intensely interesting to accompany the author on his illustrated tour round the civic housing developments in the United States, France, Belgium, Holland, Germany and Vienna, with a brief glance at the other countries in Europe, and then make some comparisons with developments at home.

Reviewing the post-war requirements and conditions of today, he asks, "How many . . . realize that nearly a million people in Scotland are still living in conditions of overcrowding to the extent of more than three persons per room (rooms including kitchens, living-rooms and bedrooms)? Or . . . that half the population of the whole country is living more than two per room? Or . . . that more than half of Scotland's population is living in one-roomed or two-roomed houses? Over half a million children under ten are being reared in two-roomed houses, and probably some quarter of a million in single-roomed houses."

Then again it is staggering to learn that "the average overcrowding in Scotland is worse than the worst

[*From* Modern Housing

Block of flats in Amsterdam. By the late de Klerck.

[*From* Modern Housing

conditions in England, which exist on Tyneside. . . . All the highest places in this race for the greatest misery in overcrowding conditions are taken by Scottish burghs and the municipal wards of Glasgow with their appalling figures . . . three times as bad as the average for all England, with the slums of London, Manchester and Birmingham included."

An outstanding feature of the book is the very fine collection of illustrations of dwellings in various countries. Among the many schemes of more than usual interest are a slum-clearance housing block in Grand Street, New York, by Springsteen and Goldhammer; a block of flats in Amsterdam, by the late de Klerck; and the workmen's dwellings in Frankfurt, by Ernst May; and the author's comments are no less interesting.

In the case of the New York scheme there is no suggestion of philanthropy. It is the result of a self-supporting, business-like venture, economically as well as humanistically sound; it represents a landmark—with its recreation roof-gardens, one for adults and another for children, and its drinking fountain—in the housing development of New York City.

The Amsterdam flats have circular stairs, and the shape of those stairs shows to the outside because it suits the plan of the block; cantilevered pulley-blocks for raising furniture also show, because they are the necessary and economic method of installing the massive heirlooms than the Dutch folk have not yet learnt to replace by more efficient furniture !

But perhaps the most interesting of all is the workmen's dwellings in Frankfurt. Here the building is of "saw tooth" design, with the windows pushed out as far as possible into the sunlight, and there are individual gardens on all the roofs, even although there are common gardens in the area enclosed by the block. The relief of any monotony that might be threatened by such a large block constructed of standardized units is accomplished by the use of coloured roughcasts. The wall to first-floor height is blue, and above that white; this colour is further varied by the brown wing walls in the background, and the "whole effect, with the enclosed green space, is most charming—and all obtained for very little more cost than the monotonous uniformity of grey walls."

The author puts forward many arguments in favour of "cavity walls," and advocates the adoption of the flat roof, so that we can make more use of the tops of our houses.

Modern Housing. By John R. H. McDonald, B.SC., A.M.INST.B.E., with a preface by Sir William E. Whyte, O.B.E. London: John Tiranti & Co. Price 25s. net.

MODERN ARCHITECTURE: A LAYMAN'S VIEW

BY E. H. BLAKE

THERE is a belief cherished by laymen the world over, that no one is so competent as themselves to grapple with the intricate problem of architectural criticism. Our views on some of the other arts—on painting and music, for instance—may not always be quite precise; but in the case of such familiar objects as buildings, we are most of us ready to demonstrate with confidence our enthusiasms and our prejudices. We may not know the difference between plinths and pediments; but we do know, and with an instinctive certainty of its merit, we *do* know what we like.

The revival of public interest in architecture is accompanied, and no doubt stimulated, by the dispute which rages today in almost every civilized country over the form of architectural design. The struggle centres, of course, around the question of the style most suitable to the new materials of steel and reinforced-concrete. On the one hand, the moderns insist that these materials, having produced something like a revolution in architectural practice, demand a form expressive of themselves and of the mechanical age that has produced them—a form stark and geometrical, unweakened by the outworn decorations of the past. On the other hand, the more formal practitioners of architecture, while admitting the inappropriateness of dressing the new materials exactly in the old styles, complete with every detail of classical convention or Gothic ornament, do still assure us that the forms and motives of the past can be developed and adapted to meet the new facts of construction, and that, only so, can the tradition of fine building be preserved.

Before we allow ourselves to be drawn into the contest on either side, let us scrutinize a little more closely the theory that provokes so much interest and so much rancour. It may be formulated in three simple axioms:

First: That architecture, to be good, must be straightforward, logical and truthful. The *appearance* of a building must correspond with the *facts* of its construction. Good building must reveal the mechanical laws upon which its structure depends. Everything that conceals or disguises the real structure, such as classical ornamentation on a steel building, is false, ugly, and architecturally vicious.

Secondly: That architecture, to be good, must be not only straightforward and truthful, but also economical in structure, and exactly appropriate to the purpose for which it is to be used. There must be no waste either in materials or decoration. The building that is functionally perfect (that is, economical and practical) is bound to be, in the modern view, artistically satisfying.

Thirdly (and this is really only a guide to the application of the two preceding axioms): That, in the modern world of machinery, we must learn the practice of structural truth and structural economy not from the traditional schools of architecture but from the engineer—the engineer who, says Corbusier, "inspired by the law of economy, and governed by mathematical calculation, puts us in accord with universal law." And in consequence of this engineering inspiration, all good building will assume mechanical forms. "We claim," says Corbusier, "in the name of the steamship, of the aeroplane, and of the motor car, the right to health, logic, daring, harmony, perfection."

In short, say the modern school, it is only by making use of the new materials for building and decoration, in forms distinctively mechanical, that we can achieve a domestic architecture, consonant with modern ideas of hygiene, and satisfactory to the modern intelligence.

It is almost entirely an urban style. Mechanical architecture does not yet seem to have adapted itself to the countryside. But in whatever surroundings they may be built, it is difficult to conceive of anybody wanting to live in houses like these, except the advance guard of the modern movement itself, and even they will probably sicken of them before long, just as their predecessors sickened of the naturalistic forms and the built-in inglenooks of the *art nouveau* of the nineties.

We may all of us be in revolt against the stuffy over-decoration and the distracting gimcracks of the Victorian age, but we still want books and pictures; we still want colour and pattern. And we want, too, the privacy that can only be got from the use of curtains; and the quiet that can only be got from the use of rugs—and from plumbing that is both thoroughly concealed and insulated. We do not find in concrete a suitable or pleasant material for domestic building; and we fail to see that a steamer's superstructure presents the most appropriate or even the most healthy model for an urban dwelling.

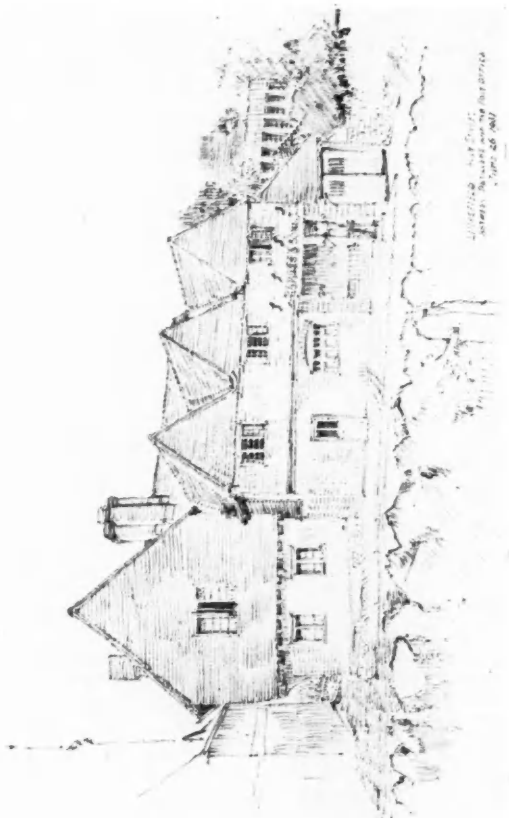
Now I believe that, in this prejudice against the logical creations of modern architecture, and in this preference for traditional forms, we, the general public, and our architects here in Ontario, who apparently agree with us, are right—*actually theoretically right;* for I am convinced that in its extreme form the theory of modern architecture is a false theory. I believe that the two plausible axioms of the modern doctrine, the axioms of structural truth and structural utility, are, when taken in isolation, equally false.

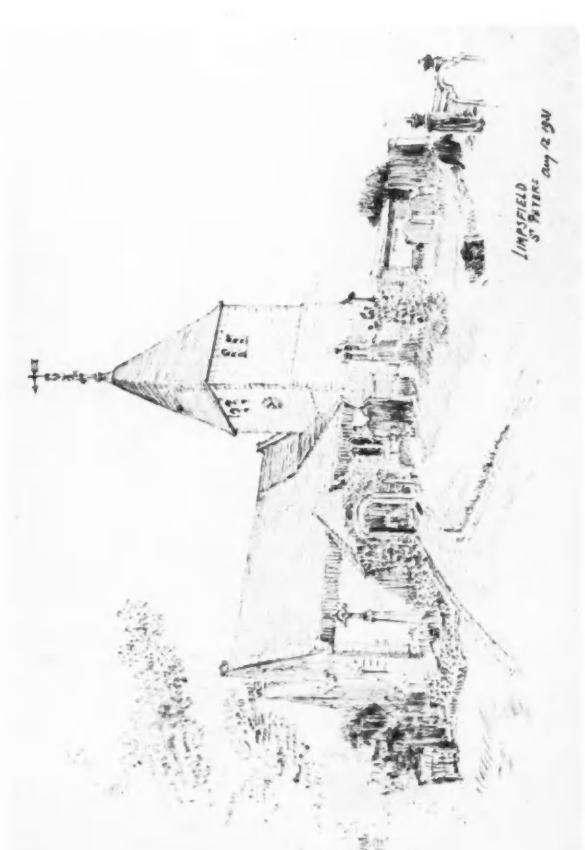
Are the Doric columns of the Acropolis, which M. Le Corbusier in his traditional moments so much admires, adequate only to their task? No. They are excessive, excessively wasteful. Is Michael Angelo's dome of St. Peter's truthful, straightforward construction? It is not. To contain the thrust occasioned by its imposing height, it requires a series of six great chains concealed in the masonry of the drum. Do the side buttresses of St. Paul's reveal their function? They do not; because Wren, in pursuit of a great design, deliberately concealed them behind a false façade. Yet the Greek Temples would look grotesque with entablatures supported on spidery columns merely adequate to their purpose, like Corbusier's City on Wings; St. Paul's, with its buttresses all exposed, would be the sad skeleton of its full magnificence; and St. Peter's, with a squat, self-sufficing dome, would be a squat, disproportioned church.

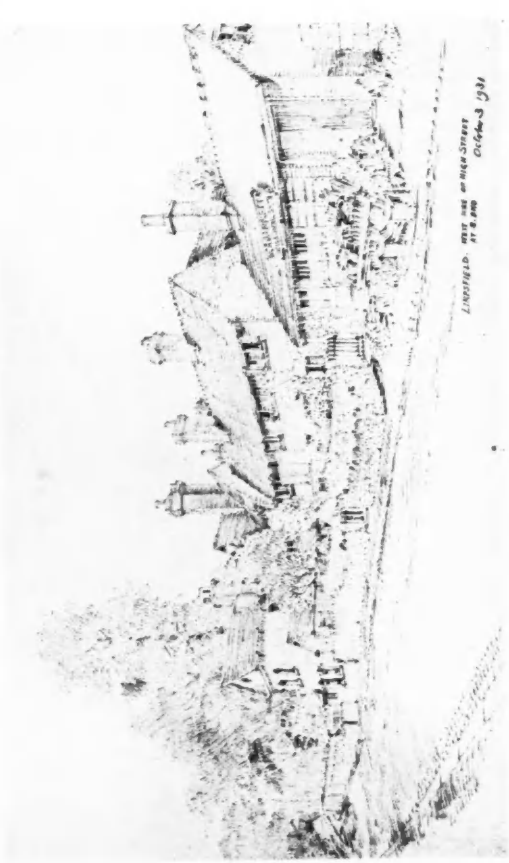
Architecture is, in the same sense as is literature, a traditional art. It is a continuing and ever-developing process that has its roots in history and custom, in climate and country. Today it is the fashion to talk of a revolution in architecture. There can no more be a revolution in architecture than there can be a revolution in literature, though we hear of that, too.

Architects in every country today are confronted afresh with the age-old problem of subduing new methods of construction and new materials to the central purpose—of design. In this contest, old conventions are often being modified; old styles and familiar decorative motives are being re-treated and re-formed. But the best work of our day, work that is truly modern, is still informed by the living spirit of tradition; and composition, that is, the abstract disposition of material in coherent form, takes, as it always has taken in fine building, precedence over structure and utility.

Extracts from a paper read at an exhibition of architecture at Toronto.







FORTY-FOURTH SESSION

THE SKETCH CLUB

MR. ARTHUR KEEN'S SKETCHES OF OXTED AND LIMPSFIELD

QUESTIONS THAT ARISE

Cracking of Plaster

M. C. L. writes : "*An acquaintance of mine recently came to me regarding a bungalow he had built in 1923, which was of brick construction with a roughcasted exterior. During the past two years a horizontal crack, running round the house and penetrating the thickness of 9-in. walls at a height of approximately 5 ft. from ground level, has appeared. He has had the plaster cut out twice and repaired, but still the crack persists. The house was, to my knowledge, properly constructed on good foundations, and I would like your expert's opinion as to the cause, and a suggested remedy.*"

Any reply to this question must necessarily be in the form of suggested lines of inquiry.

1 : The height mentioned rules out the likelihood that the walls have moved on a bituminous dampcourse, but suggests that untied roof-pressure may be tending to bend the walls at that point, which presumably would coincide with the level where the greatest number of external openings reduce the solids and voids to their lowest proportion. A bungalow roof is apt to be of wide span and flat pitch—producing this tendency. If confirmed, the remedy is obvious.

2 : The possibility of the existence of hoop iron or metal bonding may presumably be dismissed—if present it might be oxidizing and swelling.

E. G.

Cavity Walls

B. S. writes : "*I have been interested in the controversy that has recently been waged in your* JOURNAL *on the subject of cavity walls. In your issue for November 25, under the heading of 'In That Contingency,' the answer given by the Building Research Station to the architect for a syndicate is not, in my opinion, a very careful one. As he is quoted, the architect who asks the question about his proposed alternative to a cavity wall does not criticize the cavity wall on the grounds of possible inefficiency. Of course, in his letter he may have done so, but there are other objections which weigh with some of us.*

"*Again, the Research Station writer says that there would be a difficulty in making the cement mortar waterproof round any ties, though the architect appears to indicate that he intended no ties, which, indeed, in the type of building indicated, would hardly be necessary if the work were properly carried out. I am not advocating this type of construction, but I do think that the possibility of some such form of construction with a waterproofed cement might be worth consideration, and that careful attention to the subject and clear thinking are demanded.*"

In connection with the criticism levelled by your correspondent at our reply on the efficacy of a wall constructed of two leaves of 4½-in. brickwork with the 1-in. space between the leaves filled with cement mortar, our original published reply to this inquiry made it clear that a wall of this construction had not been subjected to test at this Station, and that the observations given in the reply were based on our knowledge of the principles involved in the movement of moisture in walls, consideration of the materials to be used, and the structural defects attendant on the use of these materials.

It is very questionable whether a wall constructed in the above manner, even with a thoroughly compacted mortar core, without ties, would be as stable structurally as either a wall of 9-in. bonded brickwork or an ordinary 11-in. cavity wall with ties. It was considered that to make the two leaves act as one unit some form of tying, other than that which may be provided by the mortar core, would be essential.

In conclusion, for your correspondent's information, I may state that it is easily conceivable that the structural defects likely to occur in an ordinary cement mortar core would be in no way less liable to occur with a mortar core containing a waterproof cement, or one containing a waterproofing admixture.

LIVERPOOL SOCIETY OF ARCHITECTS

Lord Gerald Wellesley, F.R.I.B.A., lecturing on "Borromini" at a meeting of the above society, said he thought a revival was upon us of interest in the late phase of Italian art, and Italian baroque was a vast and untouched field. Borromini was the greatest and most representative and most influential of baroque architects.

The nineteenth century felt a moral disapproval of the turgid magnificence of baroque, but the twentieth century was realizing that misplaced humility was quite as ludicrous as misplaced magnificence, and that it was absurd to admire what was humble chiefly because it was humble. When that absurdity was fully recognized, Roman art of the seventeenth century would come into its own, and it would be seen that at no period in the history of modern art did talent find more opportunity of expression, and at no period was the creative artist less hampered by restrictions, technical, financial, or political.

OLD MANCUNIANS ASSOCIATION

The 132nd dinner of the Old Mancunians' Association was held, on December 19, for the first time in the Memorial Hall of the new building, designed by Dr. Percy Worthington, F.R.I.B.A., and Mr. Francis Jones, F.R.I.B.A.

Dr. Worthington, replying to the toast of "The Architects," proposed by Mr. Maxwell Reekie, said that this was a most unusual experience for an architect. They might have noticed that in press accounts of buildings there were usually photographs of the building committee and the mayor, but the architect was nowhere to be seen. Also, when a man had a house built and invited his friends to see it, he always managed, if he liked the house, to give the impression that he designed it himself. If the stairs had been left out, then, of course, it was the architect's fault.

The business of the architect was primarily that of a burglar. He had to pick the brains of his client and find out

exactly what he was after, and then represent it in bricks and mortar.

Mr. Francis Jones also spoke.

GLASGOW SCHOOL OF ARCHITECTURE

Mr. J. R. Richmond, speaking at the prize-giving ceremony at the Glasgow School of Architecture, said though the world seemed impoverished at present, there would be opportunities for architects with courage and imagination to meet the demands for new construction brought about by the rapidly changing conditions due to scientific discovery.

He had no doubt students were being told they were entering upon a profession already overcrowded. They might have questioned where all the clients were to come from in an impoverished world. They might even have asked themselves whether the stream of banks, insurance offices, and cinemas requiring new and palatial premises was not soon likely to cease. To answer questions like those, he thought they must have recourse to first principles, and say that so long as their people as a people retained their energy and their enterprise, so long would there be a demand for accommodation and housing for their activities, which were the products of their enterprise and energy.

In all the arts in recent years there were startling inventions, manifestations of unrest, and strivings after new forms of expression, crude perhaps, but arresting and provocative. Architecture had withstood those shocks probably better than any of the kindred arts, possibly on account of its concrete and permanent character. Students should not treat such examples as totally unworthy of study, nor shut them out from their minds either on account of simplicity, novelty, or break from tradition. It was a great and fatal mistake to allow the arteries of the mind to harden. They should keep an open and responsible spirit and they would be rewarded.

Following is the list of prize-winners :

Diplomas : James B. Cairns, Robert A. Collie, John W. MacDonald, David S. Paterson, Lennox D. Paterson, James W. C. Wingate. Certificates: Archibald M. Duncan, Robert Rennie.

Glasgow Institute of Architects' Prizes : (Design) David G. MacConville; (measured drawings) Sydney E. Manchester; (freehand drawing), William J. Fairweather.

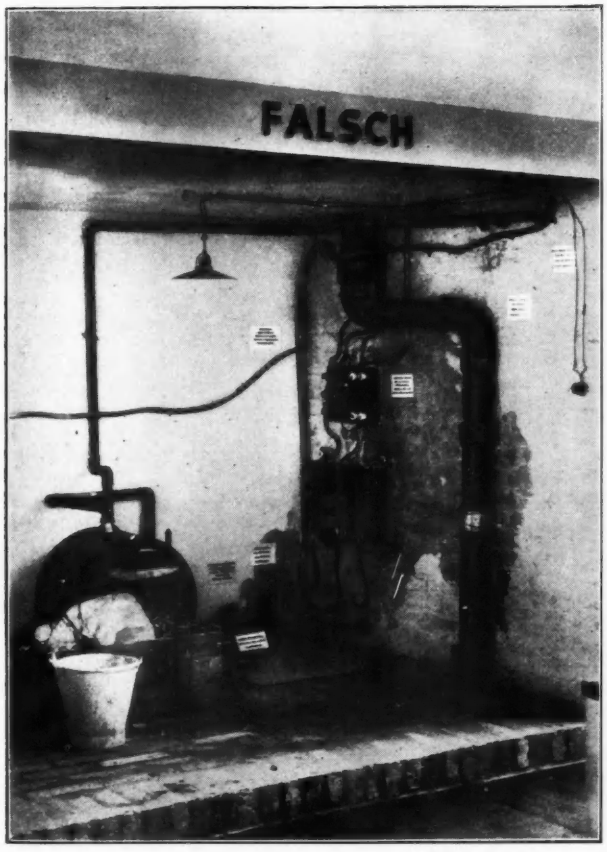
J. B. Wilson Prize : William A. Jack.

T. L. Watson Memorial Prize and Professor C. Gourlay Memorial Prize : William J. Fairweather.

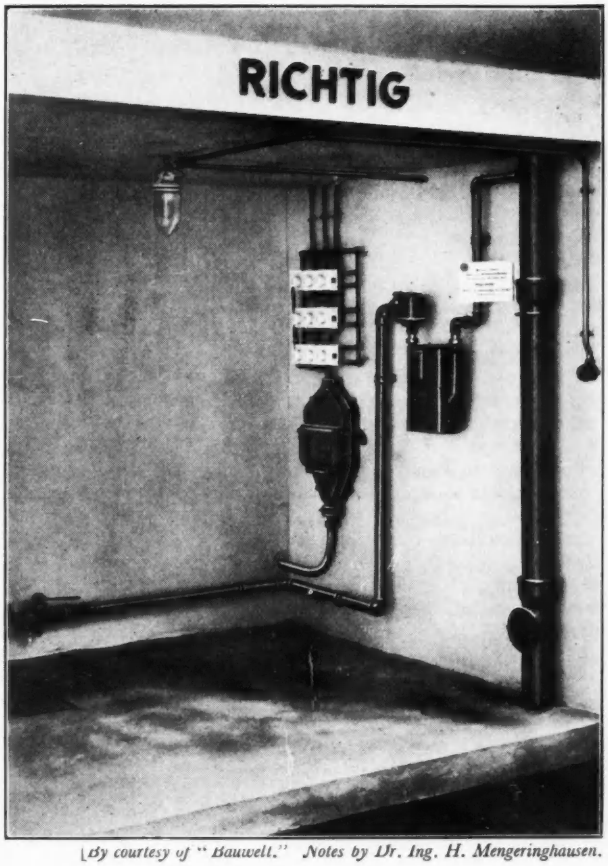
The A. L. Hamilton Memorial Studentship (£30) and Medal and The Bourdon Memorial Studentship (£35) : David S. Paterson.

Minor travelling bursaries of £10 each : Thomas W. Kennedy and Ronald M. W. Young.

ORDER AND DISORDER IN THE CELLAR



Disorder in the cellar. The pipes and conduits are run without regard for one another : they cross; the lead service water-pipes show bad plumbing and defective fixing; the union to the old-fashioned wet gas-meter is untidy and inefficient; the waste-water pipe is badly arranged and insufficiently caulked (hence the damp wall) and has no cleaning plug; the electricity junction box is antiquated and corroded from oxidation, etc. ; the fixing cleats are patched up and the lead-in conduits do not comply with the regulations (i.e. not attached to porcelain insulators).



[By courtesy of "Bauwelt." Notes by Dr. Ing. H. Mengeringhausen.

Order in the cellar. Here all the same services are shown laid out on a plan, prepared before building was begun, so that no crossings of pipes will occur; water supply, gas supply and drain are laid in a common pipe-duct and led through prearranged openings left in the walls at the time of building; at these wall crossings and at other vulnerable places various means are taken to prevent corrosion occurring; a high-efficiency gas-meter; lighting conduits answering to the before-mentioned insulation requirements, a lamp with enclosed glass shield, etc., are installed.

LAW REPORTS

INJUNCTION AGAINST DEMOLITION

Simmons v. *Warwick. Chancery Division. Before Mr. Justice Luxmore*

AN interesting point as to the right of a landlord to carry out alterations to premises was raised in the claim brought by Mr. G. Simmons, carrying on business at 79 Queen's Road, Bayswater, as the Universal Estate Agency, against Mr. T. Warwick, of Hyde Park Square, for an injunction restraining the defendant from entering upon and partially demolishing premises of which plaintiff is the tenant under the defendant.

Mr. Gallop, for the plaintiff, said his client in September, 1927, by agreement took for a period of seven years at a rental of £110 per annum, two rooms and a lock-up shop from a Mr. Olivieri, at 79 Queen's Road. In 1929 Mr. Olivieri assigned his interest in the premises to the present defendant. Plaintiff's case was that later the defendant desired to carry out certain alterations to the front of the premises so as to give better access to the back of the premises, which were used as a dancing club. Though there were negotiations, counsel said no concluded agreement resulted, and his client now alleged that in 1931 the defendant threatened to demolish part of defendant's premises and to carry out the alterations without his client's consent.

Mr. Robert Fortune, for the defendant, said his client alleged that early in 1931 it was agreed between the plaintiff and the defendant that the entrance to the premises should be improved, a condition being that the plaintiff should have a showcase on each front of the entrance angle. In addition, it was a term that the plaintiff should receive £1 a day as compensation for each day that he was deprived of his display owing to the work to be carried out. Under these circumstances the defendant commenced the work. Counsel submitted that the plaintiff was now estopped from obtaining relief, having regard to the agreement he had entered into.

Mr. Gallop said many matters were discussed between the parties, including the proposed payment of £1 a day as his learned friend had stated, but all those negotiations completely broke down.

JUDGMENT

His lordship, after hearing the evidence, gave judgment for the plaintiff, granting him an injunction and ordering the defendant to pay the costs. His lordship said he had come to the conclusion that in this case there was no concluded agreement by the plaintiff for the rearrangement of the premises. The defendant, in his opinion, was wrong in threatening to carry out the work against the wish of the plaintiff, and therefore the plaintiff was entitled to prevent interference with the property he held under his agreement.

BUILDERS' APPEAL ON GAS FUMES DEATHS : APPEAL ALLOWED

Bottomley and Another v. *Bannister and Another. Court of Appeal. Before Lords Justices Scrutton, Greer and Romer*

The Court delivered its reserved judgment in the appeal by Messrs. G. W. Bannister and Walter Harris, builders, of Moyser Road, Streatham, from the verdict and judgment in an action tried by Mr. Justice Hawke and a jury in April last, arising out of the death of Mr. Charles Henry Bottomley and his wife Enid, in the bathroom of a house where they were living at Denmark Road, Carshalton, on October 26, 1929, from carbon monoxide fumes, which were alleged to have come from a gas boiler in the kitchenette, which did not have a flue.

The plaintiffs in the action and the respondents to the appeal were Mr. J. H. Bottomley, of The Wrythe, Carshalton, and his co-administrator, Mr. C. E. Wilson, and they had sued Messrs. Bannister and Harris on behalf of the infant daughter of the late Mr. and Mrs. Bottomley, and recovered a verdict for £1,700 damages against them.

Mr. Justice Hawke, after legal arguments, entered judgment for plaintiffs for the amount awarded by the jury.

The grounds of the appeal were that on the facts judgment should have been given for defendants, and that there was a misdirection both as to law and the facts. It appeared that in 1929 the appellants were developing an estate in the Denmark Road area, and the late Mr. Bottomley, who was then parliamentary agent for Sir Alfred Butt, called upon Messrs. Bannister and Harris with reference to purchasing a house on the estate. In September, 1929, an agreement was entered into and Mr. Bottomley and his wife took possession. On October 26, two days before the contract for purchase was due to be completed, they were both found dead in the bathroom. The house was fitted with a gas boiler in the kitchenette, where there was also a linen shoot leading up to the bathroom. It was supposed that the fumes went up the shoot and into the bathroom and caused the death of Mr. and Mrs. Bottomley.

The case for the plaintiffs was that the builders were negligent in fitting the boiler without a flue, and also negligent in making a linen shoot which opened into the bathroom.

The defendants, the builders, denied that they had failed or neglected to complete the house in a workmanlike manner. They denied that the boiler was negligently installed, or that the various products of combustion were emitted directly into the house or at all. One of the features of the design of all the houses built by the defendants was that hot water for the bath and sink was provided by a boiler heated by a Bunsen gas burner, with no flue to carry off waste products. It was in evidence that some 15,000 of these boilers had been sold. It was also proved that the Aerated Bread Co. used over 500 of the boilers in the kitchens of their various shops, that that company selected them because they needed no flues, that no difficulty had occurred with them, and that they were still being fixed at the date of the trial.

For the respondents it was argued that liability on the part of the builders arose apart from any contract, and that the landlord was responsible for dangers he had created on the premises.

JUDGMENT

Lord Justice Scrutton, in giving judgment, said the case raised difficult points of law, and the questions left to the jury did not make the legal questions any easier. It had been stated that 15,000 of the boilers had been sold, and it was established that such an installation, properly regulated, was not dangerous; that the defendants had nothing to do with the regulating; and that as the alternation of the needle in the boiler was done by the occupier or his wife, the defendants could not be held liable.

There was no evidence on which the jury could find that when the needle of the boiler was in proper position the house was not fit for habitation. In his view the judgment in the Court below should be set aside and judgment entered for the defendants. He could understand that the jury might have sympathized with the child, but their sympathy must not be allowed to do an injustice to the defendants. The judgment in the Court below would be set aside and judgment entered for the defendants, Mr. Bannister and Mr. Harris.

Lords Justices Greer and Romer concurred, and judgment was entered for the defendants, with costs.

The £1,700 paid into court was ordered to be paid out to the defendants.

IMPROVEMENT SCHEME—HOUSING ACT

Vauxhall Estates, Ltd. v. *Liverpool Corporation. King's Bench Divisional Court. Before Justices Avory, Humphreys and Macnaghten*

This case raised a point in regard to land acquired compulsorily by the Liverpool Corporation for an improvement scheme, and came before the Court on an appeal in a special case stated by an arbitrator, following an award in a dispute between the Vauxhall Estates, Ltd., and the Corporation, under the Acquisition of Land (Assessment of Compensation) Act, 1919.

It appeared that the Corporation, acting under powers conferred upon them by the Housing Act, 1925, had dealt with certain "unhealthy areas" in Liverpool and, having devised a scheme for the improvement of those areas, had acquired land with a view to carrying out that scheme. A dispute arose as to the amount of compensation payable to the owners, and the arbitrator had arrived at alternative amounts. The question before the Court was which of two Acts of Parliament prevailed in regard to the payment of compensation. The Housing Act, 1925, provided a special and narrower basis of compensation, assessing it on the value of the site clear of the buildings, while the earlier Acquisition of Land Act, 1919, allowed compensation for land with the buildings on it.

Mr. R. A. Hill, for the Vauxhall Estates, Ltd., said he relied on certain words in section 7 of the Act of 1919, which set out that if any section in the Housing Act was inconsistent with the provisions of the Acquisition of Land Act, 1919, then that section should cease to have any effect. He rested his case on the statement in the section that it should cease to have any effect. His submission was that here section 46 of the Housing Act had no effect, as it was clear that it provided for compensation on an entirely different basis from that provided for under the Acquisition of Land Act, section 2.

Mr. Montgomery, K.C., for the Corporation, said his case was that the Act of 1925 impliedly repealed the section of the Acquisition of Land Act relied upon by his learned friend. In his opinion section 2 of the Acquisition of Land Act was repugnant on the ground that it sought to bind the hands of Parliament with regard to later legislation, and further, that it only dealt with Acts that preceded it.

The Court dismissed the appeal with costs, and it was stated that the decision affected a number of other cases which centred around the same improvement scheme in Liverpool.

Mr. Justice Avory, in giving judgment, after reviewing the facts of the case, said the Court was asked to hold that in 1919, by an Act of that year, the hands of Parliament were tied in such a way that it could not, by any subsequent Act, enact something that was inconsistent with the provisions of the 1919 Act. In his view such a contention was not consistent with the legal constitution of this country. It must be borne in mind that before the passing of the Acquisition of Land Act, 1919, there had been passed a Housing Act, and in section 9 of that Act there were provisions with regard to compensation that were re-enacted in the 1925 Act in section 46. He therefore came to the conclusion that the answer to the question they were asked in the case was that compensation must be assessed on the basis of the Housing Act, 1925, section 46, as a site clear of buildings and available for development within the requirements of the Corporation's bylaws and subject to the reduction factor provided by the section. The appeal would therefore be dismissed with costs.

Justices Humphreys and Macnaghten agreed.

COMPETITIONS OPEN

December 31.—Sending-in day. Latest date for conditions was September 30. Proposed New Town Hall and Municipal Buildings, for the Walthamstow Corporation. Assessor: H. Austen Hall, F.R.I.B.A. Premiums: £500, £300, £200 and £100. Conditions were obtainable from F. C. Gardner, Town Clerk, Town Hall, Walthamstow, E.17. (Deposit, £3 3s.)

January 1, 1932.—Sending-in day. Proposed Church at Low Shiregreen, Sheffield, in connection with the Bishop of Sheffield's 100,000 guineas appeal (limited to architects with an office in the Sheffield Diocese). Assessor: C. C. Thompson, F.R.I.B.A. Full particulars obtainable from the Hon. Secretary, Sheffield, South Yorkshire and District Society of Architects and Surveyors, 15 St. James' Row, Sheffield.

March 1, 1932.—Sending-in day. Proposed new Municipal Offices and Police Station on a site fronting St. Peter Street, Bethel Street and St. Giles Street, Norwich. Assessor: Robert Atkinson, F.R.I.B.A. Premiums: 1st, £500; and for the next three designs £700 will be divided according to merit at the Assessor's discretion. Conditions, etc., obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. (Deposit £1 1s.)

March 31, 1932.—Sending-in day. Last day for questions was August 4. New Headquarters for the R.I.B.A., corner of Portland Place and Weymouth Street, W.1. Assessors: Robert Atkinson, F.R.I.B.A., Charles Holden, F.R.I.B.A., H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., Dr. Percy S. Worthington, F.R.I.B.A. Premium: £500; also a further amount of £750 will be awarded to other designs according to merit.

September 31, 1932.—Sending-in day. All-British House (cost: £1,000 or less) for the Incorporated Association of Architects and Surveyors. Premiums: 50 guineas, 20 guineas and 10 guineas. Conditions, etc., from the Secretary, I.A.A.S., 1 Wilbraham Place, S.W.1.

THE ARCHITECTS' DIARY

WEDNESDAY, DECEMBER 30

R.I.B.A., 9 Conduit Street, W.1. Second of three Christmas holiday lectures for boys and girls. "Mediæval and Renaissance Houses." By E. R. Jarrett, A.R.I.B.A. **3.30 p.m.**

FRIDAY, JANUARY 1, 1932

R.I.B.A., 9 Conduit Street, W.1. Last of three Christmas holiday lectures for boys and girls. "Houses of the Moderns." By E. R. Jarrett, A.R.I.B.A. **3.30 p.m.**

SATURDAY, JANUARY 2

Sunrise, 8.6 a.m. Sunset, 4.2 p.m.

MONDAY, JANUARY 4

R.I.B.A., 9 Conduit Street, W.1. Award of prizes and studentships. Criticism by E. Berry Webber, A.R.I.B.A., on work submitted. **8 p.m.**

WEDNESDAY, JANUARY 6

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "German Renaissance (1500–1900)." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

THURSDAY, JANUARY 7

INCORPORATED INSTITUTE OF BRITISH DECORATORS, Painters' Hall, Little Trinity Lane, E.C.4. "The Future of Domestic Decoration." By C. O. Masters.

SATURDAY, JANUARY 9

Sunrise, 8.4 a.m. Sunset, 4.10 p.m.

MONDAY, JANUARY 11

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. "The A.A. Excursion to Austria, 1931." By Grahame B. Tubbs, A.R.I.B.A. Also exhibition of photographs of buildings visited on the excursion. Until January 22. **8 p.m.**

WEDNESDAY, JANUARY 13

MANCHESTER SOCIETY OF ARCHITECTURE. "Rational Architecture." By Joseph Emberton, F.R.I.B.A. **6.30 p.m.**

LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. "Housing on the Continent." By L. H. Keay, F.R.I.B.A. **6 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Belgian and Dutch Renaissance." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

THURSDAY, JANUARY 14

THANET SCHOOL OF ART LECTURES ON ARCHITECTURE. At Chatham House School, Ramsgate. "Renaissance and Reformation." By R. Goulburn Lovell, A.R.I.B.A. **7.45 p.m.**

FRIDAY, JANUARY 15

HASTINGS MUNICIPAL SCHOOL OF ART LECTURES ON ARCHITECTURE. "Renaissance and Reformation." By R. Goulburn Lovell, A.R.I.B.A. **7.30 p.m.**

SATURDAY, JANUARY 16

Sunrise, 8.0 a.m. Sunset, 4.20 p.m.

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS. Visit (afternoon) to the Tower of London.

MONDAY, JANUARY 18

R.I.B.A., 9 Conduit Street, W.1. President's address to students and presentation of medals and prizes, 1931. **8 p.m.**

WEDNESDAY, JANUARY 20

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Spanish Renaissance (1500–1900)." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

THURSDAY, JANUARY 21

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. 'Fourteenth-Century Architecture." By Herbert Mansford. **7.30 p.m.**

WEST YORKSHIRE SOCIETY OF ARCHITECTS. At the College of Art, Leeds. "Competitions." By Percy E. Thomas, O.B.E., F.R.I.B.A. **7 p.m.**

THANET SCHOOL OF ART LECTURES ON ARCHITECTURE. At Chatham House School, Ramsgate. "Awakening of Florence." By R. Goulburn Lovell, A.R.I.B.A. **7.45 p.m.**

FRIDAY, JANUARY 22

HASTINGS SCHOOL OF ART LECTURES ON ARCHITECTURE. "Awakening of Florence." By R. Goulburn Lovell, A.R.I.B.A. **7.30 p.m.**

SATURDAY, JANUARY 23

Sunrise, 7.53 a.m. Sunset, 4.31 p.m.

MONDAY, JANUARY 25

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. "A Layman's Evening." Speakers: Lionel Smith-Gordon, A. P. Herbert and E. V. Lucas. **8 p.m.**

TUESDAY, JANUARY 26

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, S.W.1. "Housing Acts, 1928–30." By Leslie Maddock. **7 p.m.**

WEDNESDAY, JANUARY 27

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "English Renaissance (1500–1900)." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

BRITISH WOOD PRESERVING ASSOCIATION. At the Auctioneers' and Estate Agents' Institute, 29 Lincoln's Inn Fields, W.C.2. "Diseases of Timber." E. St. G. Cartwright. **6 p.m.**

TRADE NOTES

Surrounding the stand of the Silicate Paint Co. (J. B. Orr & Co., Ltd.), at the Newcastle Exhibition of the National Federation of Master Painters and Decorators, was a series of fifteen decorated panels, each carried out by craftsmen and lady artists who had entered for the Duresco prize competition, which is organized by the Silicate Paint Co., every two years, partly with the object of fostering the advance of decorative art, and also to show the very practical and beautiful colour effects which can be obtained by the sole use of Duresco. There were over eighty entries for the competition.

The five prize-winners are as follows :

First Prize : Six Guineas. J. Wilson, Decorative Artist, Marley Cottage, Marley Avenue, New Milton, Hants.

Second Prize : Four Guineas. H. Mawdsley, Decorator, Sandbank, 32 Botoner Road, Coventry.

Third Prize : Three Guineas. H. Butler, Artist, 18 Carmalt Gardens, London, S.W.

Fourth Prize : Two Guineas. Miss Margaret Linnell, Artist, "Arnwood," Trinity Lane, Waltham Cross.

Fifth Prize : One Guinea. Miss Kathleen M. Linnell, Artist. "Arnwood," Trinity Lane, Waltham Cross.

Highly commended by the judges : Messrs. W. Simpson, F. L. Walker, A. G. Griffin, M. S. Outwin, C. R. Lee, W. Sleath, S. C. Heward, P. Egan, H. Roberts, and F. Marshall.

*

The new patented tubular waterway back section which is fitted to Messrs. Lumbys, Ltd., new "B" series of solar cast sectional central heating boilers, is claimed to be a definite improvement on the ordinary type of sectional boilers, where the back section has hitherto been regarded as its weakest part.

The new construction, as will be seen from the illustration on this page, eliminates the necessity of stays in the back section. It is interesting to note that one of the small-size sections, tested to destruction, resisted a hydraulic pressure of 300 lb. before fracture. The conservative rating of 4,400 B.T.U. per square foot of heating surface, together with the larger firebox capacity, gives, it is stated, an output for six hours at the full rated duty of the boiler. Among the advantages claimed are the following : Increased fuel capacity, extra deep waterway over fire, longer burning, and twelve hours with one charge of fuel.

*

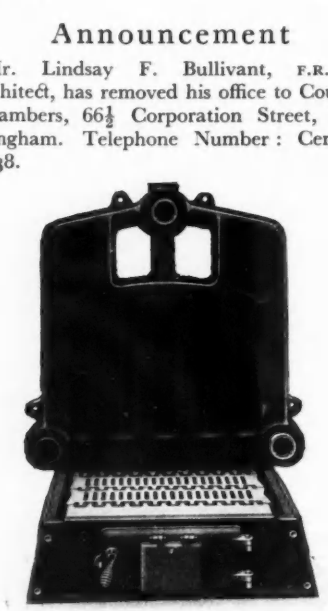
In order to correct the prevalent but erroneous impression that stainless steel requires no attention once it has been installed, Messrs. E. Pollard & Co., Ltd., of St. John Street, E.C.1, have issued a leaflet entitled *The Care and Maintenance of Steel*. It is stated that in an exceptionally dirty locality, in the presence of considerable smoke, soot and fumes, it is necessary to clean the steel more often than under less severe conditions, and accessibility for cleaning becomes of very great importance. In towns, stainless steel should be washed down every week or ten days to give the clean appearance needed. The following simple method for cleansing is advocated by the firm : "Wipe over the surface with a damp cloth or leather, using a little soap and warm water if necessary. A scrubbing brush is useful for reaching corners and crevices. The steel should be dried and polished with a soft dry cloth or leather. Coarse fabrics, grit and metal polish should be avoided, as liable to scratch the polished surfaces."

*

Messrs. W. T. Henley's Telegraph Works Co., Ltd., of Holborn Viaduct, E.C.1, have just issued a new booklet describing their three wiring systems, entitled *For Complete Installations or Extensions*. Designed in its entirety by the firm's advertising staff, the booklet also contains numerous coloured illustrations of important buildings, both at home and abroad, which have been installed with Henley's wiring systems. The three systems—the Henley wiring system, the Henley "Nomet" wiring system, and the Henley "Bondit" wiring system, patent 236786—enable, it is stated, the electrical contractor to carry out a neat surface installation without disfiguring such features as picture rails, door architraves and other structural and decorative features. No matter how irregular the contour, the wires can be so installed as to take advantage of it, being made to lie flat and fit snugly. These systems are, it is claimed, as suitable for alterations or extensions to existing installations as for complete installations.

Announcement

Mr. Lindsay F. Bullivant, F.R.S.A., architect, has removed his office to County Chambers, 66½ Corporation Street, Birmingham. Telephone Number : Central 1738.



The tubular waterway back section for central heating boilers. See note on this page.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

The Richmond Hotel, Richmond Place, Brighton (pages 856–9). General contractors, Rice and Son, Ltd. Sub-contractors : G. Asserati, Ltd., asphalt and terrazzo flooring and staircase; Dorking Brick Co., Ltd., bricks; J. Rooke and Son, Ltd., Clipsham stone; A. E. Watson & Co., structural steel; Ames and Finnis, tiles; Cox and Barnard, leaded lights; The London Sand Blast Decorative Works, Ltd., special peach-coloured mirrors; The British Challenge Glazing Co., Ltd., skylights; Haywards, Ltd., pavement lights; Korkoid Decorative Floors, Korkoid flooring; W. H. Fellingham and Sons, Ltd., central heating and boilers; J. J. G. Saunders and Sons, stoves, grates, mantels and sanitary fittings; The Brighton, Hove and Worthing Gas Co., gas fixtures and gas-fitting; Ralph Garrett, electric wiring, light fixtures and heating, bells and telephones; Parker, Winder and Achurch, Ltd., door and window furniture; Crittall Manufacturing Co., Ltd., metal casements; James Walker (Architectural Decorations), Ltd., decorative plaster; "Ye Olde Forge," iron grilles to fanlights; W. Saunders and Son, iron balustrade to stairs; R. G. C. Panels, Ltd., walnut panelling (remainder by General Contractors); J. Rooke and Son, Ltd., stonework; F. W. Giebeler, service lifts; Arthur Lyon & Co., special clock in saloon; Franco-Neon Signs, Ltd., Neon sign ; The Birmingham Guild, Ltd., bronze and blue enamel lettering; Gaskell and Chambers, Ltd., beer engines.

Shops and Flats, Woodlands Park Estate, near Bournville, Birmingham (page 860). General contractor, P. Cox. Sub-contractors : Blockleys, Ltd., facing bricks; D. Wiseman, Ltd., plumbers' work; Co-operative Wholesale Society, Ltd., fitting-up of the grocery shop, including the shop fronts; Ten Acres Society's Works Department, fitting-up of the greengrocery shop and the butchery; Parker, Winder and Achurch, Ltd., ironmongery and grates; T. Glover, electric lighting and power.

St. Anne's Church, Blackburn (page 863). General contractors, Messrs. Cronshaw, Woof, Ltd. Sub-contractors : The Stratford - upon - Avon Guild, stained glass windows; Jos. F. Ebner, wood block floors ; Leyland and Birmingham Rubber Co., Ltd., rubber flooring; Boulton, Ltd., marble work; W. H. Fraley and Sons, marble columns.

Douglas Haig Homes, Penzance (pages 864–5). General contractor, W. H. Trounson and Son. Sub - contractors : Shanks & Co., Ltd., sanitary fittings; Treseder & Co., gardens.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The BERMONDSEY B.C. has prepared a scheme for the development of a site in the Odessa Street and Elgar Street area, providing for the erection of 193 flats and 12 shops.

Plans passed by the BERMONDSEY B.C. : Buildings, Mark Brown's wharf, Potters Fields, for Proprietors of Hay's Wharf; shop, 24 Lower Road, for Mr. R. E. Bustin; boiler house, Alaska Works, Grange Road, for Messrs. Wallis, Gilbert and Partners; boiler house, Kirby's Refineries, Clack Street, for Messrs. Geo. Green (Beckenham), Ltd.

The CROYDON Corporation is to erect flats in Windmill Street, at a cost of £5,115.

Plans passed by the CROYDON Corporation : Shops, offices and flats, 341–3 Purley Way, for Mr. A. J. Caney; two shops, London Road, for Mr. G. M. Mitchell; three houses, off Haling Park Road, for Messrs. G. and C. A. Parris; hall, Manor Road, for Mr. S. A. Bull; five houses, Midhurst Avenue, for Mrs. B. Calcot; alterations and additions, "Crown and Sceptre" public-house, Junction Road, for Mr. C. R. Riches; alterations and additions, 42–4 North End, for Messrs. Boots, Ltd.

A block of flats is to be built on the Border Crescent Estate, CRYSTAL PALACE, from the designs of Mr. G. Alan Fortescue, A.R.I.B.A.

Five houses are to be built on the Border Crescent Estate, CRYSTAL PALACE, from the designs of Mr. G. Alan Fortescue, A.R.I.B.A.

Plans passed by the EAST HAM Corporation : Three houses, Rectory Road, and 8 houses, Market Place, for Mr. J. H. Lohden; alterations, 245 High Road North, for Messrs. Parnall and Sons, Ltd.; rebuilding the "Roman Urn" public-house, Roman Road, for Mr. S. A. S. Yeo; stores for Austins, Ltd., Barking Road, for Mr. R. Slater; four houses, Tyronne Road, for Mr. H. Joseph.

Plans passed by the FRIERN BARNET U.D.C. : House, Friary Road, for Mr. C. Cooper; schoolroom, Oakleigh Road, for Whetstone Congregational Trustees; house, Friary Road, for Mr. H. C. Hitchmen; house, Temple Avenue, for Messrs. Auburn and Sons.

Plans passed by the FULHAM B.C. : Alterations and extensions to flats, Hurlingham Court, for London County Freehold and Leasehold Properties, Ltd.; new buildings, 298, 300–2 North End Road, for Mr. A. E. Batzer; extensions, 42 Vereker Road, for Messrs. W. J. Marston and Son; additions, 2 Stonor Road, for L. F. Smith West London Property Co.

Messrs. Morris Estates, Ltd., are to erect buildings in Finchley Road, Barrand Street, and Ingham Street, HAMPSTEAD.

Mr. H. J. Janes had purchased land in Danehurst Gardens, ILFORD, for the erection of fifteen houses.

Mr. A. W. Jaggers is to erect a sweets factory in Dane Road, ILFORD.

Messrs. Suburban Developments, Ltd., are to erect shops in Victoria Parade, Cranbrook Road, ILFORD.

Plans passed by the ILFORD Corporation : Nine shops and houses, Clarence Terrace; six shops and houses, Lington Terrace, and two houses, Roy Gardens, for Mr. G. F. Siegerts; factory buildings for B.I.M., Ltd., Roden Road, for Mr. Henry Potter; additions, Ilford Steam Laundry, Ley Street, for Messrs. B.Bailey & Co.; public house, Chadwell Heath Lane, and sixty-four houses, Oak Drive, for Mr. E. Meredith; boiler and engine house, Uphall Road, for Messrs. Howards and Sons, Ltd.; two houses, Danehurst Gardens, for Mr. J. Moon; additions, 23–5 Clements Road; and five houses, Youngs Road, for Messrs. Haines and Warwick, Ltd.; forty houses, Vista Drive, for Messrs. P. G. Ashton and Sons; coach works, Cranbrook Road, shop and two houses Redbridge Lane, house, Sunnymede Drive, twelve houses, Ridgway Gardens, seven houses, Valentines Road, and fifty-six houses, Queensborough Gardens, for Mr. T. Anders; eighteen houses, Glenwood Gardens, for Mr. F. M. Smith; fifteen houses, Danehurst Gardens, for Mr. H. J. Hains; seven houses, Campbell Avenue, for Mr. W. Wakeling; three houses, Bel Royal Gardens, for Mr. F. S. Russell; two houses, Danehurst Gardens, for Mr. T. J. S. Blake; twenty houses, Highwood Gardens, for Mr. A. Smith; four shops and houses, Eastern Avenue, for Seymour Construction Co., Ltd.; rebuilding warehouses, etc., Havelock Street, for Harrison Gibsons, Ltd.; nine houses, Fernhall Drive, for Messrs. Matthews and Goodman; three houses, Southdene Gardens, for Mr. J. Aldridge; ten houses, Roxy Avenue, for Mr. F. Stimpson; fifteen houses, South Park Drive, for Mr. W. M. Edwards; three houses, Westrow Gardens, for Messrs. J. W. Moore and Sons; workshops, Albert Road, for Messrs. H. T. Loxley, Ltd.; two bungalows, Oak Lane, for Mr. R. W. King; three houses, Donaldson Gardens, for Mr. H. G. Needham.

Plans passed by the LEWISHAM B.C. : Eight houses, Bankhurst Road, for Highfield Estate Co.; garage and workshop, Castlands Road, for Mr. D. T. Walters; rebuilding, 65–7 High Street, for Mr. S. W. Ackroyd; additions, Forbanks Sports Pavilion, for Messrs. Holland & Hannen and Cubitts, Ltd.; shelters and balconies at proposed cinema, Loampit Vale, for Mr. W. E. Trent; development of Northbrook estate, Lee, for Messrs. Farebrother, Ellis & Co.

Plans passed by the POPLAR B.C. : Presbytery, St. Mary's Church, Canton Street, for Mr. W. C. Morgan; additions, 297 West Ferry Road, for Mr. W. Stratton and Millgate; bungalow, Field Place, for Mr. West; stores, joinery works, etc., Trafalgar Road, for Mr. Frank Chiverton; four bungalows, Beech Road, for Mr. Wm. Basterfield; additions, 41 South Street, for Mr. G. H. Heaton.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

FROM THE NEW WORLD: 10

MEASURED DRAWINGS OF AMERICAN COLONIAL DETAILS

ENTRANCE PORCH AT NEWBURYPORT, MASS.

FOR this week, two entrance subjects are selected for illustration, photographically and by means of details measured and drawn by R. Keith Harris.

The interest in the simple porch of which a view appears above rests more upon its studied proportions and suitability of design, as regards material and setting, than upon any outstanding detail. In this connection, however, it is worthy of note that an air of lightness has been maintained by substituting a circular plinth to the free-standing column in place of the square one that is so universally accepted.

The doorway at Gloucester, shown (much dilapidated) on the last page, is an interesting example of a cottage entrance, and shows the result of simplification of classic detail. The pilasters still retain the entasis, but the entablature is treated in logical wooden fashion. The triglyph-and-metope motif is ingenuously suggested by "planting on" strips cut from a grooved board, while added enrichment is provided by similarly applying sections cut from a cavetto mould.
